Joseph P. Fagan, Huntington, Conn., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Continuation-in-part of Ser. No. 633,837, Nov. 20, 1975, abandoned. This application Mar. 23, 1976, Ser. No. 669,602
Int. Cl.² D04H *1/44*
U.S. Cl. 428—280 **4 Claims**

1. A felt-like article comprised of filamentary polytetrafluoroethylene characterized by

a. predominantly horizontal coplanar superimposed layers of filamentary polytetrafluoroethylene components interrupted by occasional interlayered orientation, and

b. fibrils of polytetrafluoroethylene criss-crossing interstices of the felt-like article;

Wherein the article has a filter efficiency greater than 95% and an air porosity, measured at 0.5 inch W.G., of greater than 45 cubic feet per minute.

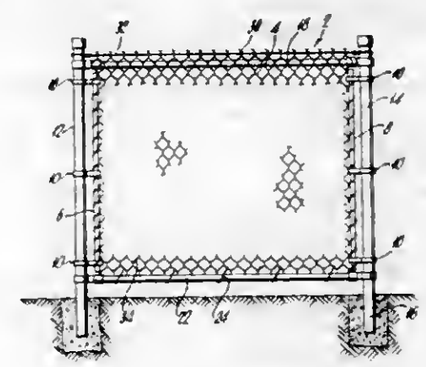
4,031,284

INSULATED AND GROUNDED FENCE FABRIC

Glen E. Ingraham, Lebanon, N.J., assignor to Colorguard Corporation, Raritan, N.Y.

Filed June 2, 1975, Ser. No. 582,834
Int. Cl.² D03D *15/02;* **A01K** *3/00;* **E04H** *17/04;* **B21F** *27/00*
U.S. Cl. 428—222 **14 Claims**

1. In a fence fabric construction formed of a plurality of individually coated wires each composed of a metal core enveloped by a heat-distintegrable electrically non-conductive coating, adjoining pairs of said coated wires being engaged at, at least, one point along their length, the improvement that comprises an elongated metal conductor element permanently interlocked by, and defining a passage through, each of said adjoining pairs of coated wires at the point of engagement



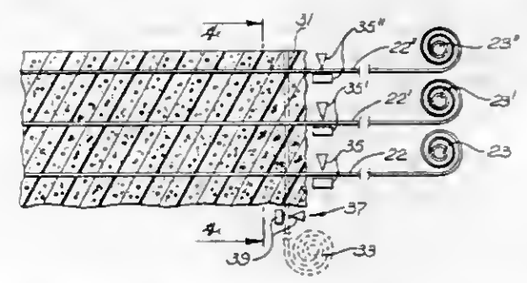
thereof with each other; said conductor element being disposed in electrical connection with the metal cores of each of said adjoining coated wires at each if said points of engagement.

4,031,285

LIGHTWEIGHT, REINFORCED FOAMED ORGANIC POLYMER AND CEMENTITIOUS MATERIAL STRUCTURE

Charles H. Miller, 54-065 Avenida Carranza, La Quinta, Calif. 92253, and Jose A. Mayrl, Centenario 1222 San Pedro Garza Garcia, N. Leon, Mexico

Division of Ser. No. 191,276, Oct. 21, 1971, Pat. No. 3,878,278. This application Dec. 16, 1974, Ser. No. 532,974
Int. Cl.² B32B *3/26*
U.S. Cl. 428—294 **14 Claims**



1. A lightweight reinforced structure having a substantial length dimension and greater width dimension than depth dimension,

comprising; a mixture obtained as a result of foaming organic polymer material insitu throughout cementitious material; and

at least one elongate reinforcing member embedded in said mixture intimately joined thereto under tension and gripped by said material substantially along its entire length, said elongate member being elongate in said length direction and relatively rigid in the depth dimension of said mixture.

4,031,286
FLUOROCARBON POLYMER COATING COMPOSITIONS CONTAINING MICA PARTICLES

Herman Ernest Seyman, Lint, Belgium, assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Continuation-in-part of Ser. No. 400,040, Sept. 24, 1973, Pat. No. 3,970,627. This application Feb. 25, 1976, Ser. No. 661,331

The portion of the term of this patent subsequent to July 20, 1993, has been disclaimed.

Int. Cl.² B32B *5/16*; **C08L** *27/18*; **B32B** *15/08*

U.S. Cl. 428—324 **7 Claims**

1. An aqueous coating composition consisting essentially of:

a. about 40–93%, by weight of the total of (*a*), (*b*) and (*c*) solids, of a particulate fluorocarbon polymer,

b. about 5–35%, by weight of the total of (*a*), (*b*) and (*c*) solids, of colloidal silica stabilized with sodium ions, having a particle size of 7–25 millimicrons, a specific surface area of 125–420 square meters per gram, a silica content of 30–50% by weight, and a pH of 8.4–9.9 at 25° C., or a mixture of said silica with water-soluble alkali metal silicate, in a ratio in the range between 75:25 and 10:90 by weight respectively,

about 2–25%, by weight of the total of (*a*), (*b*) and (*c*) solids, of irregularly shaped mica platelets 80% of which are 0.05–0.15 micron thick and 4–50 microns wide (longest dimension) and

d. water as a carrier.

5. An article bearing a fused coating of the composition of claim 1.

4,031,287
SELF-BONDING INSULATED WIRE

Kazuo Suzuki; Yoshiaki Hayashi, and Seiichi Nagamine, all of Ootsu, Japan, assignors to Kanegafuchi Chemical Industries Co., Ltd., Osaka, Japan

Continuation-in-part of Ser. No. 349,885, April 10, 1973, abandoned. This application Apr. 17, 1975, Ser. No. 569,330

Claims priority, application Japan, Apr. 13, 1972, 47-37529

Int. Cl.² B32B *15/00*; **B05D** *3/02*

U.S. Cl. 428—379 **10 Claims**

1. A self-bonding insulated wire which comprises an electro-conductive wire and a varnish composition containing 100 parts by weight of a copolyamide and 10 to 25 parts by weight of a thermoplastic linear polyhydroxypolyetherester resin coated thereon.

4,031,288
BONDING TIRE CORD TO RUBBER

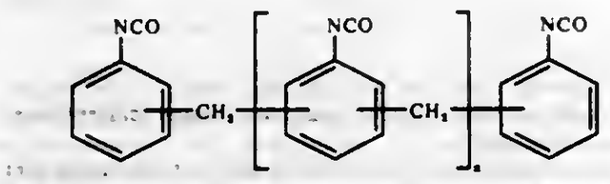
Roop S. Bhakuni, Copley, and Grover W. Rye, Cuyahoga Falls, both of Ohio, assignors to The Goodyear Tire & Rubber Company, Akron, Ohio

Continuation of Ser. No. 197,942, Nov. 11, 1971, abandoned. This application June 18, 1975, Ser. No. 587,938

Int. Cl.² B29H *9/02*, *17/28*

U.S. Cl. 428—395 **12 Claims**

1. A tire polyester cord the surface of which contains an effective amount and less than 0.5 part by weight per 100 parts of cord of a polyisocyanate having the following structural formula



where *n* is greater than 1.2 and has a Brookfield viscosity measured at 25° C. using a No. 3 spindle revolving at 250 rpm of at least 1000 cps, said polyisocyanate being deposited from a solvent solution thereof as a first treatment and deposited thereon a second coating containing the addition product of a polyisocyanate and a water-soluble thermoplastic resin resulting from the reaction of an formaldehyde and a resorcinol, a resinous reaction product of a resorcinol and an formaldehyde and a rubber latex.

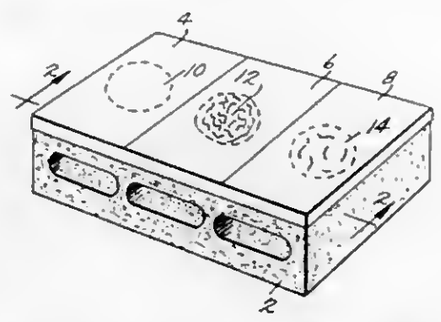
4,031,289
STAIN RESISTANT POLYESTER-COATED BLOCK

John A. Sergovic, Severna Park, Md., assignor to The Burns & Russell Company of Baltimore City, Baltimore, Md.

Filed May 11, 1976, Ser. No. 685,254

Int. Cl.² B32B *13/12*, *5/16*, *27/36*

U.S. Cl. 428—451 **32 Claims**



1. In a cast article of a cured resinous composition of an ethylenically-unsaturated polymerizable polyester resin and sand particles, said sand particles comprising at least about 50% by weight of said composition, and in which said sand particles and cured resin are bonded to one another by a bonding agent comprising an unsaturated silane also having attached to the silicon a group which reacts with the hydroxyl groups present in sand or moisture present in the surface of sand, and wherein the resinous composition also comprises styrene, p-methyl styrene, methyl methacrylate, vinyl acetate, diallyl phthalate, cyclopentadiene or ethyl acrylate as a polymerizable solvent, the improvement comprising employing as the polyester resin, a polyester made from a glycol component consisting of neopentyl glycol, or a mixture of neopentyl glycol, with up to 42 molar percent based on the total glycol of a glycol selected from the group consisting of propylene glycol, ethylene glycol and diethylene glycol, and a component consisting of isophthalic acid and maleic anhydride, the maleic anhydride being 10 to 33% of the total polyester resin by weight, said cast article having improved stain resistance.

6. In a masonry unit having an integral molded facing layer of a cured resinous composition of an ethylenically-unsaturated polymerizable polyester resin and sand particles, said sand particles comprising at least about 50% by weight of said composition and in which said sand particles and cured resin are bonded to one another by a bonding agent comprising an unsaturated silane also having attached to the silicon a group which reacts with the hydroxyl groups present in sand or moisture present in the surface of sand, and wherein the resinous composition also comprises styrene, p-methyl styrene, methyl methacrylate, vinyl acetate, diallyl phthalate, cyclopentadiene or ethyl acrylate as a polymerizable solvent, the improvement comprising, as the polyester resin, a polyester made from a glycol component consisting of neopentyl glycol or a mixture of neopentyl glycol with up to 42 molar percent based on the total glycol of a glycol selected from the group consisting of propylene glycol, ethylene glycol and diethylene glycol, and a component consisting of isophthalic acid and maleic anhydride, the maleic anhydride being 10 to 33% of the total polyester resin by weight, said masonry unit having improved stain resistance.

4,031,290
MERCAPTAN BLOCKED THERMOSETTING COPOLYMERS

Carl Clement Anderson, Menomonee Falls, Wis., and Rostyslaw Dowbenko, Bigsonia, Pa., assignors to PPG Industries, Inc., Pittsburgh, Pa.

Division of Ser. No. 248,846, May 1, 1972. This application Sept. 20, 1976, Ser. No. 724,900

Int. Cl.² C08F *28/02*; **C08L** *67/06*, *67/08*

U.S. Cl. 428—480 **13 Claims**

1. A polymer prepared by the process comprising:

a. reacting

1. a polyester and

2. a mercaptan comprising an organic compound containing an —SH group and another group which is reactive with said polyester

to provide a mercapto-terminated reaction product;

b. reacting said mercapto-terminated reaction product with one or more ethylenically unsaturated monomers in the presence of a peroxygen or azo catalyst to form said polymer.

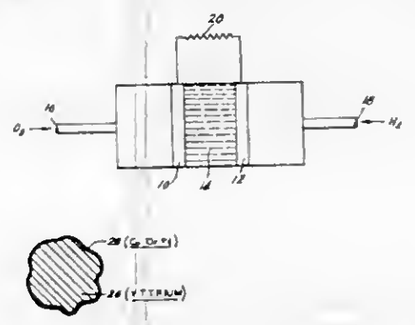
4,031,291
HYDROGEN-OXIDIZING CATALYST, AND FUEL CELL ELECTRODE USING SAME

Malcolm A. Fullenwider, Whitehall, Pa., assignor to Malcolm A. Fullenwider and Richard L. Ament, II, both of Allentown, Pa.

Filed Apr. 5, 1976, Ser. No. 673,670

Int. Cl.² H01M *4/86*, *4/94*

U.S. Cl. 429—40 **15 Claims**



1. A hydrogen-oxidizing catalyst, comprising a body of yttrium having thereon a thin surface layer of copper or platinum.

4,031,292
METHOD FOR THE PREPARATION OF AN ELECTROCATALYST

George L. Hervert, Woodstock, Ill., assignor to UOP Inc., Des Plaines, Ill.

Filed Apr. 19, 1976, Ser. No. 678,003

Int. Cl.² H01M *4/00*

U.S. Cl. 429—40 **15 Claims**

1. A method for the preparation of an electrocatalyst which comprises treating a refractory inorganic oxide with a pyrolyzable organic compound at pyrolysis conditions to form at least a monolayer of a carbonaceous pyropolymer on the surface of said refractory inorganic oxide, thereafter impregnating the resulting composite with a complex of a soluble salt of at least one catalytically active metal and a sulfur-containing carboxylic acid, heating the impregnated composite to a temperature sufficient to remove the solvent, reducing the dried composite and recovering the resultant electrocatalyst.

4,031,293
MAINTENANCE FREE LEAD STORAGE BATTERY

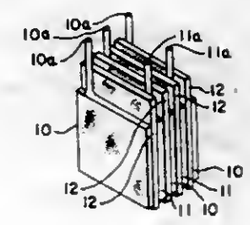
Ernst Voss, Niederhofheim, and Heinrich Rabeneick, Ffm.-Zeilsheim, both of Germany, assignors to Varta Batterie Aktiengesellschaft, Hannover, Germany

Filed Feb. 20, 1976, Ser. No. 659,959

Claims priority, application Germany, Mar. 6, 1975, 2509779

Int. Cl.² H01M *10/14*

U.S. Cl. 429—60 **5 Claims**



1. A maintenance-free lead storage battery having an electrode grid of lead or antimony-free lead alloy, a separator and sulfuric acid electrolyte in the pores of the separator and the active mass, and characterized in that

the weight of the negative active mass is less than 80% of the weight of the positive active mass, the quantity and concentration of the electrolyte is so proportioned that the acid density is no more than 1.07 grams per cm² after 20-hour current discharge; and comprising N negative electrodes and N+1 positive electrodes positioned in alternating positive and negative arrangement.

4,031,294
SPLASH-PROOF DEVICE FOR USE IN A STORAGE BATTERY

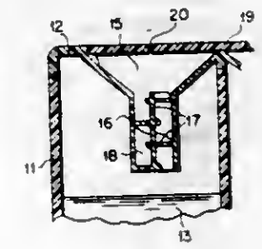
Ichiro Sano, Yokohama, Japan, assignor to The Furukawa Battery Co., Ltd., Yokohama, Japan

Filed Feb. 25, 1976, Ser. No. 661,266

Claims priority, application Japan, Feb. 27, 1975, 50-26727

Int. Cl.² H01M *2/12*

U.S. Cl. 429—82 **6 Claims**

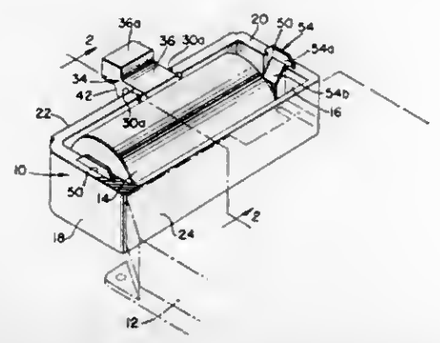


1. A splash-proof device for use in a storage battery comprising a cylindrical member provided in a cell cover of a storage battery integrally therewith and open at its bottom with a diameter of the resulting opening being equal to the inner diameter of the cylindrical member, and at least one helical splash-proof baffle having a width equal to at least ½ of the inner diameter of the cylindrical member, said baffle provided inside said cylindrical member.

4,031,295
COMBINATION HOUSING WITH COMPARTMENT AND EJECTOR MECHANISM FOR EJECTING A BATTERY THEREFROM

Anthony W. Rigazio, Oglesby, Ill., assignor to General Time Corporation, Thomaston, Conn.

Filed Mar. 11, 1976, Ser. No. 665,793
Int. Cl.² H01M 2/10
U.S. Cl. 429—100 **5 Claims**

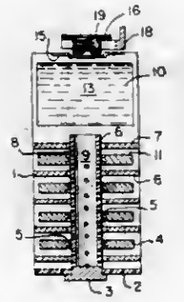


1. In combination a housing and an ejection means adapted for ejection of a battery from a seated position in a compartment within said housing, said compartment formed by a plurality of side walls and a bottom wall which surround closely and substantially encase said battery, said ejection means including a member substantially of Z-shaped outline having first and second lever arms and a pivot axis therebetween, said pivot axis comprised of a hinge formed integral with one of said walls and said member and in the region of the entrance to said compartment, both said one wall and bottom wall having a cutout, said first lever arm extending from said hinge within said cutouts and terminating below said battery whereby upon pivot movement of said member said first lever arm moves within said cutout into the area of said compartment for ejection of said battery, and said second lever arm having a finger engaging surface laterally removed from said compartment.

4,031,296
ELECTROCHEMICAL ENERGY CELL

Robert I. Sarbacher, Marina Del Ray, and John C. Bogue, Santa Monica, both of Calif., assignors to John C. Bogue, Santa Monica, Calif.

Continuation of Ser. No. 358,896, May 10, 1973, abandoned. This application Aug. 11, 1975, Ser. No. 603,786
Int. Cl.² H01M 6/36
U.S. Cl. 429—116 **10 Claims**



1. A reserve battery that remains in an inactive state until activated comprising:

a. a hollow cylindrical battery case being open at one end and having a circular opening at its other end, the axis of said circular opening being substantially coincident with the vertical axis of said cylindrical battery case;

b. an insulating disc closing said open end of said battery case, said insulating disc having a circular opening in substantially the center thereof;

c. a perforated hollow anode cylinder located inside said battery case, the vertical axis of said anode cylinder being substantially coincident with the vertical axis of said battery case and the axis of said circular opening of said insulating disc;

d. a plurality of anode electrodes surrounding said anode cylinder and electrically secured thereto, said plurality of anode electrodes being spaced apart along the length of said anode cylinder;

e. a plurality of cathode electrodes surrounding said anode cylinder, said cathode electrodes being electrically connected to said battery case, said plurality of cathode electrodes being spaced along the length of said anode cylinder in such a manner that said plurality of anode electrodes and said plurality of cathode electrodes are alternately spaced along the length of said anode cylinder;

f. a substantially cylindrical shaped anode terminal secured to said insulating disc and to one end of said anode cylinder, the other end of said anode cylinder being unsecured, said anode terminal covering said opening in said insulating disc;

g. a frangible envelope containing an electrolyte, said frangible envelope being located inside said battery case adjacent said other end of said battery case;

h. a flexible disc having a gas vent in substantially the center thereof, said flexible disc being secured to said other end of said battery case to close said circular opening in said other end of said battery case;

i. a gas valve located over said gas vent in said flexible disc, said gas valve being free to move under pressure from gas generated inside said battery case to permit gas to escape through said gas vent in said flexible disc; and

j. a spring biased plunger secured to said flexible disc for depressing said flexible disc to thereby break said frangible envelope to permit said electrolyte to flow into the area of said battery case housing said anode and cathode electrodes to activate said battery and said plunger having a gas vent therein communicating with said gas vent in said flexible disc.

4,031,297
POLYMERIZATION OF MONOMERS

Edwin Studley Smith, Cuyahoga Falls, Ohio, assignor to The Goodyear Tire & Rubber Company, Akron, Ohio

Continuation of Ser. No. 281,903, Aug. 18, 1972, which is a continuation of Ser. No. 881,870, Dec. 3, 1969, abandoned, which is a continuation-in-part of Ser. No. 335,413, Jan. 2, 1964, abandoned. This application Aug. 27, 1973, Ser. No. 391,905
Int. Cl.² C08F 2/02
U.S. Cl. 526—87 **3 Claims**

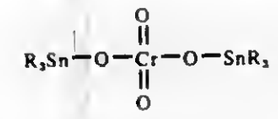
1. In a batch polymerization process for making a copolymer of uniform composition wherein a liquid mixture of polymerizable monomers is added to a reactor and a polymerization reaction commenced to form an initial volume of a polymerization medium comprised of (1) a liquid phase of the mixture of polymerizable monomers and (2) a solid phase of copolymer product and wherein the initial volume of the polymerization medium gradually decreases during the course of the polymerization reaction due to the copolymer being formed having a greater density than the polymerizable monomers being consumed, resulting in a final copolymer product of nonuniform composition, the improvement consisting of maintaining said initial volume of the polymerization medium constant throughout the polymerization reaction by continuously adding additional polymerizable monomers at that rate necessary to maintain said volume constant and in a ratio necessary to produce the desired copolymer of uniform composition.

4,031,298
POLYMERIZATION CATALYST AND METHOD

Thomas J. Pullukat, Hoffman Estates, Ill., assignor to Chemplex Company, Rolling Meadows, Ill.

Filed June 30, 1975, Ser. No. 591,942
Int. Cl.² C08F 4/02, 4/78, 10/00
U.S. Cl. 526—113 **19 Claims**

1. A catalyst for polymerizing one or more 1-olefins to an ultralow molecular weight and exceptionally broad molecular weight distribution, prepared by (1) forming a substantially dry intimate mixture of a finely divided support selected from the group consisting of silica, alumina, zirconia, thoria and mixtures thereof and an alkyl ester of titanium containing about 1–7 carbon atoms in the alkyl group in an amount to give about 1–10% of titanium on said support, (2) calcining said mixture from (1) to and at a temperature between about 400°–1000° C., (3) adding to the resulting calcined mixture from (2) an organotinchromate essentially of the formula



wherein each R is an individually selected hydrocarbon radical containing from 1–14 carbon atoms in an amount to give about 0.1–10% chromium in the final catalyst, and (4) activating the product from (3) by heating to and at a temperature between about 300°–500° C. in the presence of oxygen.

4,031,299
PROCESS FOR FORMING A POLYVINYL CHLORIDE EXTENDER RESIN BY INCORPORATING IN THE SUSPENSION POLYMERIZATION MEDIUM A PREHOMOGENIZED SOLUTION OF A POLYALLYL COMPOUND AND A LOW MOLECULAR POLYMER OF PROPYLENE

Chung H. Wei, Wilmington, Del., assignor to Stauffer Chemical Company, Westport, Conn.

Filed Apr. 11, 1975, Ser. No. 567,328
Int. Cl.² C08F 4/00, 14/06, 114/06, 7/00
U.S. Cl. 526—193 **11 Claims**

1. A process for forming a polyvinyl chloride extender resin by suspension polymerization of a monomer charge containing vinyl chloride which comprises incorporating in the suspension polymerization medium an effective amount of (1) a pre-homogenized solution of a polyallyl compound selected from the group consisting of diallyl phthalate, diallyl ether, diallyl sulfide, diallyl oxalate, diallyl adipate, diallyl maleate, diallyl fumarate, triallyl cyanurate and triallyl phosphate and (2) of a low molecular weight polymer of propylene for controlling the rheological properties of the polyvinyl chloride resin.

4,031,300
HIGH MOLECULAR WEIGHT, HIGH UNSATURATION ISOBUTYLENE-CYCLOPENTADIENE COPOLYMERS

Warren A. Thaler, Matawan; Donald J. Buckley, Plainfield, both of N.J., and Joseph P. Kennedy, Akron, Ohio, assignors to Exxon Research and Engineering Company, Linden, N.J.

Continuation-in-part of Ser. No. 457,109, April 1, 1974, Pat. No. 3,928,297, which is a continuation-in-part of Ser. No. 151,038, June 8, 1971, Pat. No. 3,808,177. This application Nov. 13, 1975, Ser. No. 631,444
The portion of the term of this patent subsequent to Apr. 30, 1991, has been disclaimed.
Int. Cl.² C08F 232/06
U.S. Cl. 526—308 **2 Claims**

1. A substantially gel-free copolymer consisting of a major portion of isobutylene and about 5 to about 40 mol % cyclopentadiene, said copolymers having a number average molecular weight of about 90,000 to 120,000.

4,031,301
MICRO PARTICLE GENERATION

George Vinansky, Jr., Dover, and Emmanuel A. Lucia, Marlton, both of N.J., assignors to The United States of America as represented by the Secretary of the Army, Washington, D.C.

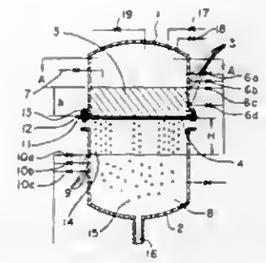
Filed Sept. 10, 1975, Ser. No. 612,052
Int. Cl.² B01J 2/04
U.S. Cl. 526—328 **8 Claims**

1. Process for generating micro particles comprising spraying one aerosal into another, the first aerosol containing solute dissolved in solvent conpletely, the second aerosol being a scavenger aerosol, said scavenger aerosol being a liquid exhibiting a greater chemical affinity for said solvent of said first aerosol than for said solute, said scavenger aerosol removing said solvent from said first aerosol thereby leaving behind said solute of said first aerosol as micro particles.

4,031,302
PROCESS FOR PREPARING GRANULAR RUBBER

Akihiko Shimizu, and Yasuhiro Sakanaka, both of Shin-nanyo, Japan, assignors to Toyo Soda Manufacturing Co., Ltd., Japan

Filed Sept. 25, 1975, Ser. No. 616,894
Claims priority, application Japan, Sept. 25, 1974, 49-110176
Int. Cl.² C08C 1/15; C08F 6/22
U.S. Cl. 528—486 **6 Claims**



1. A process for preparing granular rubber, which comprises:

allowing a latex mixture of a rubber latex and an aqueous solution of a high molecular weight polyanion containing carboxylate groups, hydroxyl groups or a mixture thereof to fall freely drop-wise for a distance of from 1 to 80 cm. into an aqueous solution of an alkaline earth metal salt; wherein:

a. from 2 to 8 parts by weight of said polyanion is admixed with 100 parts by weight of rubber in the rubber latex;

b. said latex mixture has a viscosity of from 200–8,000 cps; and

c. said aqueous solution of an alkaline earth metal salt has a concentration of from 1 to 10 wt. %;

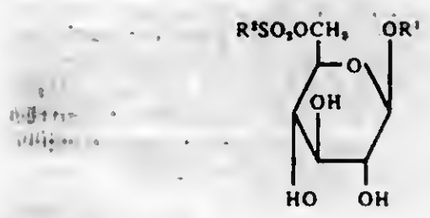
and recovering the granular rubber.

4,031,303
STERYL-β-D-GLUCOSIDE ESTERS AND METHOD OF PREPARATION

Hiromu Murai; Koji Kitaguchi; Tatsuo Suminokura; Akira Sano; Masahiro Kise; Masahiko Kitano, and Toshio Tomita, all of Kyoto, Japan, assignors to Nippon Shinyaku Co., Ltd., Japan

Filed Aug. 8, 1975, Ser. No. 603,110
Claims priority, application Japan, Aug. 14, 1974, 49-93621; Aug. 14, 1974, 49-93622
Int. Cl.² C07G 17/00
U.S. Cl. 536—5 **4 Claims**

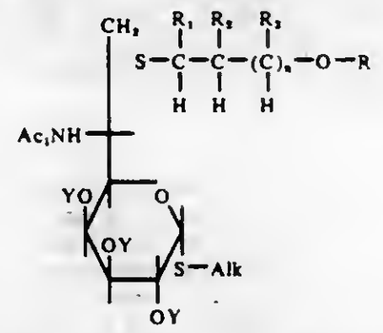
4. A compound of the formula:



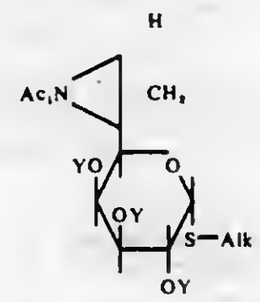
wherein
R^1 is selected from the group consisting of β-sitosteryl, campesteryl, stigmasteryl, and
R^2 is methyl, ethyl, phenyl, chlorophenyl, nitrophenyl or phenyl substituted with from 1 to 5 methyl groups.

4,031,304
PROCESS FOR PREPARING LINCOMYCIN DERIVATIVES
Brian Bannister, Kalamazoo, Mich., assignor to The Upjohn Company, Kalamazoo, Mich.
Filed Jan. 30, 1976, Ser. No. 653,938
Int. Cl.² C07H *15/16*
U.S. Cl. 536—11 **18 Claims**

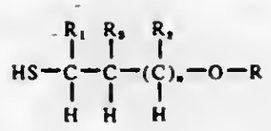
1. A process for making compounds of the formula:



wherein Alk is alkyl of not more than 4 carbon atoms; Ac_1 and Y is carboxacyl; R_1 is hydrogen, methyl or ethyl; R_2 is hydrogen, methyl or ethyl; R_3 is hydrogen, methyl or ethyl; n is 0 or 1; and R is hydrogen, alkyl of 1 to 6 carbon atoms, inclusive, or aralkyl of 7 to 12 carbon atoms, inclusive; which comprises heating at a temperature of from about 25° C. to about 180° C. compound of the formula:



wherein Ac_1 and Y are carboxacyl; and Alk is alkyl of not more than 4 carbon atoms, with a thiol of the formula:



wherein R_1 is hydrogen, methyl or ethyl; R_2 is hydrogen, methyl or ethyl; R_3 is hydrogen, methyl or ethyl; n is 0 or 1; and R is hydrogen, alkyl of 1 to 6 carbon atoms, inclusive, or aralkyl of 7 to 12 carbon atoms, inclusive, in the presence of an anhydrous lower hydrocarbon carboxylic acid.

4,031,305
POLYGALACTOMANNAN ETHER COMPOSITIONS
Ronald N. DeMartino, Wayne, N.J., assignor to Celanese Corporation, New York, N.Y.
Filed Nov. 17, 1975, Ser. No. 632,339
Int. Cl.² C08B *37/00*
U.S. Cl. 536—114 **3 Claims**

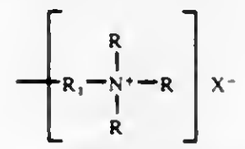
1. Sulfo-2-hydroxypropyl ethers of guar gum and the alkali metal and ammonium salts thereof having a degree of substitution between about 0.01 and 3.0.

4,031,306
POLYGALACTOMANNAN ALLYL ETHER COMPOSITIONS
Ronald N. DeMartino, Wayne, and Anthony B. Conciatori, Chatham, both of N.J., assignors to Celanese Corporation, New York, N.Y.
Filed Dec. 15, 1975, Ser. No. 640,519
Int. Cl.² C08B *37/00*
U.S. Cl. 536—114 **3 Claims**

1. Allyl ethers of guar gum having a degree of substitution between about 0.01 and 3.0.

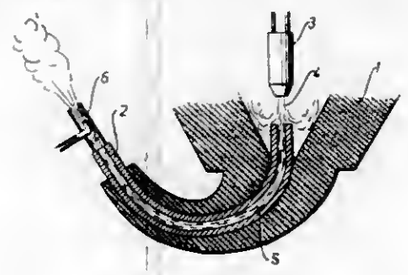
4,031,307
CATIONIC POLYGALACTOMANNAN COMPOSITIONS
Ronald N. DeMartino, Wayne, and Anthony B. Conciatori, Chatham, both of N.J., assignors to Celanese Corporation, New York, N.Y.
Filed May 3, 1976, Ser. No. 682,286
Int. Cl.² C08B *37/00*
U.S. Cl. 536—114 **3 Claims**

3. Quaternary ammonium ethers of polygalactomannan gum having a degree of substitution between about 0.01 and 3, wherein the quaternary ammonium ether substituents correspond to the formula:



wherein R is an alkyl group containing between one and about six carbon atoms, R_1 is an alkylene or alkenylene group containing between one and about six carbon atoms, and X is chlorine or bromine.

4,031,308
DIRECT CURRENT ARC FURNACE HEARTH CONNECTION INSTALLATION
Bengt Fredrickson, and Sven-Einar Stenkvist, both of Vasteras, Sweden, assignors to ASEA Aktiebolag, Vasteras, Sweden
Filed Mar. 31, 1976, Ser. No. 672,305
Claims priority, application Sweden, Apr. 1, 1975, 7503675
Int. Cl.² H05B *7/00*
U.S. Cl. 13—9 R **2 Claims**



1. A method for drying a new hearth electrode installation of a DC electric arc furnace, the new installation comprising a metal billet extending through a wall portion of the furnace, the billet having an inside end which will be contacted by a melt in the furnace during operation of the furnace, and an outside end for an electrical connection, and at least slightly moist refractory surrounding the billet; said method comprising forming a hole lengthwise through the billet and passing hot gas through the hole to heat the billet until said refractory is substantially dried.

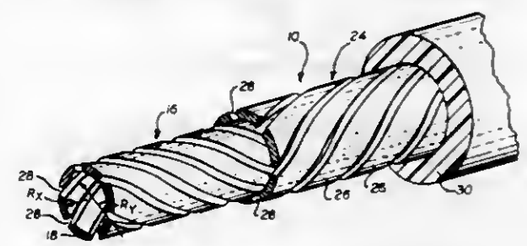
SHRINKABLE ELECTRICAL CABLE CORE FOR CRYOGENIC CABLE
Ludwik Jachimowicz, Elizabeth, N.J., assignor to General Cable Corporation, Greenwich, Conn.
Filed June 13, 1975, Ser. No. 586,561
Int. Cl.² H01B *7/34, 12/00*
U.S. Cl. 174—15 C **9 Claims**



1. A cable core construction for a cryogenic electrical cable including in combination an inner metal strip having a helical lay of a predetermined angle and with successive convolutions spaced from one another, an outer metal strip having a helical lay with its angle of lay in the opposite direction and with successive convolutions spaced from one another, whereby the angle of lay of one strip is a right hand helix and the angle of lay of the other strip is a left hand helix, the outside surfaces of the convolutions of the inner strip being immediately adjacent to the inside surfaces of the convolutions of the outer strip for mutual support of one another, means fastening the inner and outer helixes to one another at both ends of the cable, and a plastic insulating jacket for the cable extending around the outside circumference of the outer helix.

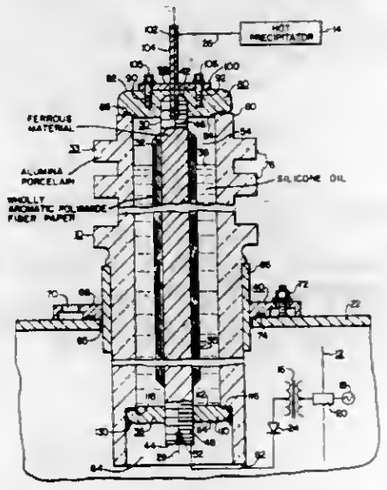
ELECTRICAL BUSHING
Alfonso J. Mazanek, Hermitage, Pa., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa.
Filed Mar. 15, 1976, Ser. No. 666,809
Int. Cl.² H01B *17/26, 17/34*
U.S. Cl. 174—31 R **1 Claim**

1. A high temperature bushing assembly for interconnecting a high voltage direct current power supply and a hot precipitator in an ambient temperature up to 150° C, comprising:
an elongated ceramic insulating member having first and second ends, and an opening which extends between its ends, said insulating member including Al_2O_3 in its formulation, to increase the electrical volume resistivity of said insulating member,
a single elongated metallic electrical conductor having first and second ends disposed coaxially within said insulating member, said electrical conductor being constructed of a ferrous material to provide a relatively low coefficient of thermal expansion,
first and second sealing means each including a gasket member associated with the first and second ends, respectively, of said electrical conductor, which cooperate with the first and second ends, respectively, of said insulating member to provide a fluid-tight cavity within said insulat-

ing member while allowing thermally induced dimensional changes in said ferrous electrical conductor and insulating member,

solid insulating means disposed about said electrical conductor intermediate its ends, said solid insulating means including a plurality of layers of fibrous overlying wrappings formed of wholly aromatic polyamide fibers,



silicone oil disposed in the fluid-tight cavity, said silicone oil impregnating the fibrous wrappings of said solid insulating means, and mounting means on the insulating member including a tubular metallic member coaxial with the longitudinal axis of the insulating member, and a flange member which extends perpendicularly outward from the tubular metallic member.

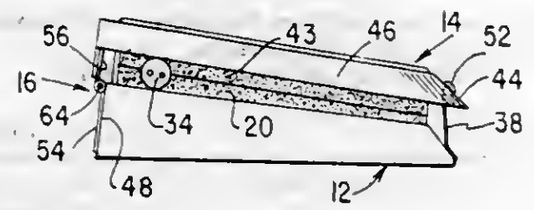
WEATHERPROOF ENCLOSURE FOR ELECTRICAL WIRING DEVICES

Allan Coleman, Highland Park, and Bernard Macklin, Rolling Meadows, both of Ill., assignors to Electrical Conductors, Inc., North Chicago, Ill.

Filed Aug. 14, 1975, Ser. No. 604,539

Int. Cl.² H05K *5/00*

U.S. Cl. 174—52 R **11 Claims**



1. A portable weatherproof enclosure comprising:

a housing;

a cover;

a spring-type hinge coupling the housing and the cover together enabling said cover to open and close upon said housing;

a gasket affixed to each of the housing and cover, wherein the gaskets are positioned within the housing and cover so that they will matingly abut each other when the cover and housing are in a closed position; and

a wiring device positioned within the housing, said wiring device being molded to an extension cord, and said extension cord passing between the gaskets of the cover and the housing.

PRINTED CIRCUITS WITH ARC-RETARDANCE

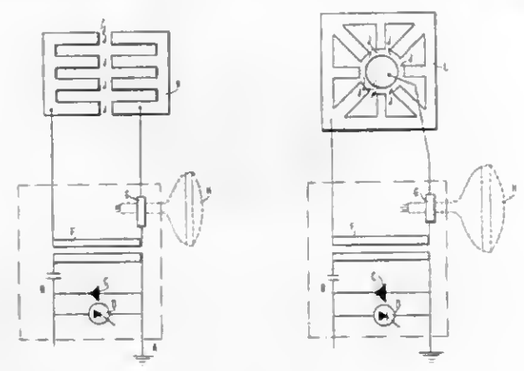
Arnold Franz, Troisdorf-Spich; Dirk Huthwelker, Troisdorf-Oberlar, and Lothar Jacob, Eckhausen, all of Germany, assignors to Dynamit Nobel Aktiengesellschaft, Germany

Filed Feb. 3, 1975, Ser. No. 546,810

Claims priority, application Germany, Feb. 1, 1974, 2404777; July 1, 1974, 2431447

Int. Cl.² H05K *1/00*; **B32B** *15/02*

U.S. Cl. 174—68.5 **9 Claims**



1. A laminated material comprising a substrate material containing resin-impregnated layers, and an electrically conductive metal foil having a thickness between 5 and 100μ disposed on said substrate and an arc-retardant layer having a high insulation resistance of more than 10^{12} ohms arranged between the metal foil and the substrate material, and said layer having a thickness of from 20 to 300μ and consisting essentially of from about 60 to about 100% by weight of a heat-stable cross-linked acrylic resin or ketone resin which is free of aromatic groupings or heterocyclic rings containing at least one hetero-atom and conjugated double bonds and which is not converted to a graphite-containing structure upon being thermally decomposed and up to 30% by weight of an epoxy resin, a phenolic resin or a melamine resin.

4,031,314

ARRANGEMENT FOR CONNECTING INFORMATION TRANSDUCERS IN PROGRAM CONTROLLED PROCESSING SYSTEMS

Hans Bittermann, Munich, Germany, assignor to Siemens Aktiengesellschaft, Munich, Germany

Continuation of Ser. No. 576,276, May 12, 1975, abandoned, which is a continuation of Ser. No. 419,230, Nov. 27, 1973, abandoned, which is a continuation of Ser. No. 225,800, Feb. 14, 1972, abandoned. This application Jan. 5, 1976, Ser. No. 646,538

Claims priority, application Germany, Feb. 12, 1971, 2106730

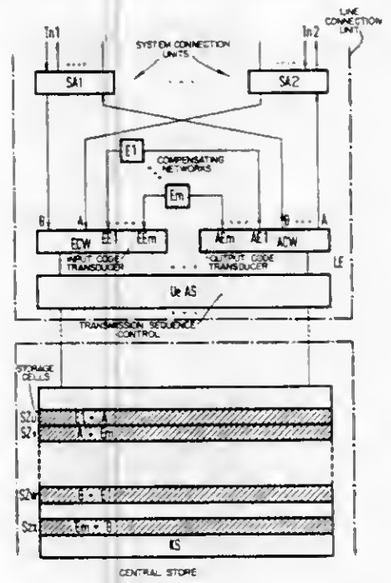
Int. Cl.² H04Q *3/54*

U.S. Cl. 178—3 **3 Claims**

1. A circuit arrangement for connecting information transducer means in a program controlled telecommunication switching system in which the transfer of information between incoming and outgoing line means occurs over a central memory, said line means being connected to a line connection unit, said central memory including a plurality of storage areas allocated to given incoming line means and accessible over input code transducers, each said storage area containing an address datum identifying an outgoing line means, each said outgoing line means being accessed, by means of said address datum, over an output code transducer, the circuit arrangement comprising:

a plurality of information transducer means having, respectively, input and output terminals, said input terminals being connected to outputs of said output code transducers, said output terminals being connected to inputs of said input code transducers,

each said information transducer means being identified by data accessible through an address contained in one of said storage areas allocated to an incoming connection through an incoming lines means,



the address identifying an outgoing connection being contained in the one of said storage areas allocated to the connected one of said information transducer means.

SOLID BODY IMAGE SENSOR HAVING CHARGE COUPLED SEMICONDUCTOR CHARGE SHIFT ELEMENTS AND METHOD OF OPERATION

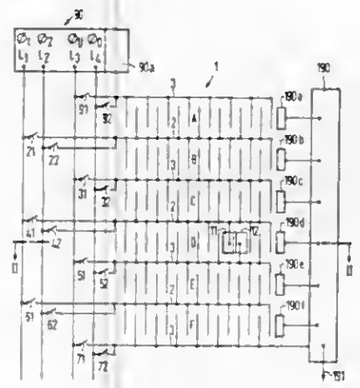
Hans-Jörg Pfleiderer, Zorneding, Germany, assignor to Siemens Aktiengesellschaft, Berlin & Munich, Germany

Filed Sept. 9, 1975, Ser. No. 611,624

Claims priority, application Germany, Sept. 27, 1974, 2446232

Int. Cl.² H04N *3/14*; **H01L** *29/78, 27/14*

U.S. Cl. 358—212 **2 Claims**



1. In an image sensor of the type having image elements arranged in a matrix, wherein each of the image elements comprises a first and a second electrode arrangement, wherein each of the image elements are photosensitive and the image elements form charge-coupled shift registers in rows, wherein all of the first electrode arrangements in each row are connected to a respective one of a plurality of first control lines and all of the second electrode arrangements of each row are connected to a respective one of a plurality of second control lines, wherein the two control lines of a row are connectible via switches to drive lines, wherein the switches are operated by drive registers, and wherein output coupling devices are provided for output coupling image information, the improvement for a single-phase mode of operation wherein:

each first control line is located between adjacent rows of image elements and is connected in common to each of said first electrode arrangements of the adjacent rows of image elements;

each second control line is located between the other adjacent rows of image elements and is connected in common to each of said second electrode arrangements of the other adjacent rows of image elements;

two pairs of drive lines each having two drive lines are provided; and

a plurality of switches is provided, respective switches connecting each of said first control lines to the two drive lines of a first pair of said two pairs of drive lines and connecting each of said second control lines to the two drive lines of a second pair of said two pairs of drive lines.

4,031,316

APPARATUS FOR THE TIME DIVISION MULTIPLEX TRANSMISSION OF BINARY SIGNALS

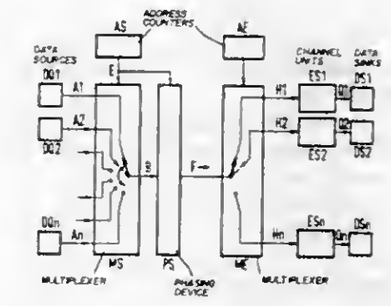
Konrad Reisinger, Zorneding, and Ludwig Hölzl, Sauerlach, both of Germany, assignors to Siemens Aktiengesellschaft, Munich, Germany

Filed Mar. 19, 1976, Ser. No. 668,521

Claims priority, application Germany, Mar. 20, 1975, 2512271

Int. Cl.² H04L *5/00*

U.S. Cl. 178—50 **3 Claims**



1. In a system for the time division multiplex (t.d.m.) transmission of binary signals emitted from a plurality of data sources, each of which is connected to a respective input of a multiplexer which during a cycle of operation establishes a conductive connection between each said input and an output for transmission to a receiver over a transmission link, the improvement comprising:

address generator means for, during each said cycle, successively emitting as many address signals as there are data sources, each said address signal being coupled to said multiplexer for establishing the said conductive connections, respectively, between said inputs and said output, and

in-phasing means connecting said output of said multiplexer to said transmission link, said in-phasing means comprising:

a number of one word binary stores corresponding to the number of said data sources,

first, second and third intermediate stores, a start element of a binary word being stored in said first intermediate store responsive to a release signal, said second and third intermediate stores being set to their zero states,

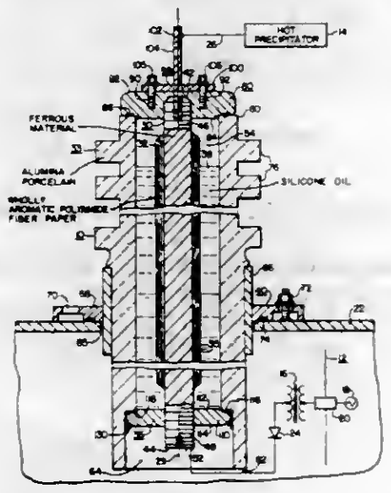
first, second and third switches for, respectively, coupling the contents of said first, second and third intermediate stores into the one of said word stores corresponding to the currently emitted address signal,

fourth, fifth and sixth switches, each having contacts connected to each of said word stores, a center contact of said fourth switch being connected to the output of said in-phasing means,

first adder means connecting a center contact of said fifth switch to an input of said second intermediate store and

ing member while allowing thermally induced dimensional changes in said ferrous electrical conductor and insulating member,

solid insulating means disposed about said electrical conductor intermediate its ends, said solid insulating means including a plurality of layers of fibrous overlying wrappings formed of wholly aromatic polyamide fibers,



silicone oil disposed in the fluid-tight cavity, said silicone oil impregnating the fibrous wrappings of said solid insulating means, and mounting means on the insulating member including a tubular metallic member coaxial with the longitudinal axis of the insulating member, and a flange member which extends perpendicularly outward from the tubular metallic member.

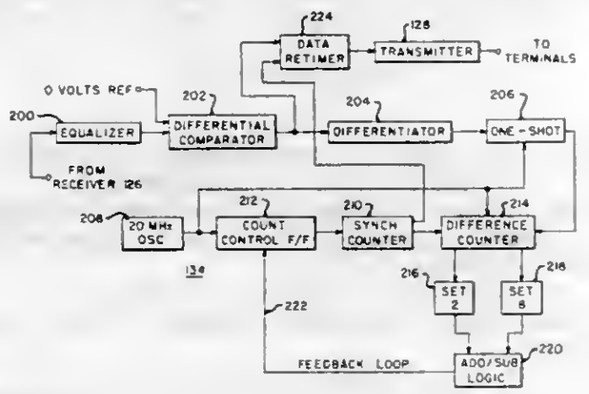
DATA COMMUNICATIONS SYSTEM WITH IMPROVED DIGITAL PHASE-LOCKED LOOP RETIMING CIRCUIT

Herbert D. McClain, Quaker City; Bipin D. Parikh, and John K. Barkey, both of Cambridge, all of Ohio, assignors to NCR Corporation, Dayton, Ohio

Filed Feb. 12, 1976, Ser. No. 657,425
Int. Cl.² H04L 7/02
U.S. Cl. 178—69.1 **48 Claims**



1. A digital phase lock loop circuit for synchronizing bit-shifted data with a retiming clock signal comprising:

means for detecting data transitions in said bit-shifted data and for generating an output data clocking signal in response thereto;

means for deriving a synchronous retiming clock signal;

for comparing said output data clocking signal with said synchronous retiming clock signal for deriving a digital count signal indicative of the phase shift of said output signal with respect to said synchronous clock signal; and

means responsive to said digital count signal for continuously digitally adjusting the phase of said retiming clock signal incrementally such that said output data clocking signal and said retiming clock signal are brought into synchronization.

HIGH FIDELITY LOUDSPEAKER SYSTEM

Lester M. Pitre, Orleans Parish, La., assignor to Innovative Electronics, Inc., Jefferson, La.

Filed Nov. 21, 1975, Ser. No. 634,239
Int. Cl.² H04R 1/02, 1/20, 3/12
U.S. Cl. 179—1 D **11 Claims**

1. A high fidelity loudspeaker system comprising:

an enclosed airtight speaker cabinet having three operative panels each having openings therein into the interior of said enclosure and speakers located within said openings closing them off with the backs of said speakers being exposed to said interior through said openings, at least some of said speakers having tubes surrounding them on their back, interior sides extending into said interior, the lengths of at least some of said tubes being substantially different, said tubes serving as anti-resonance decoupling means for said speakers.

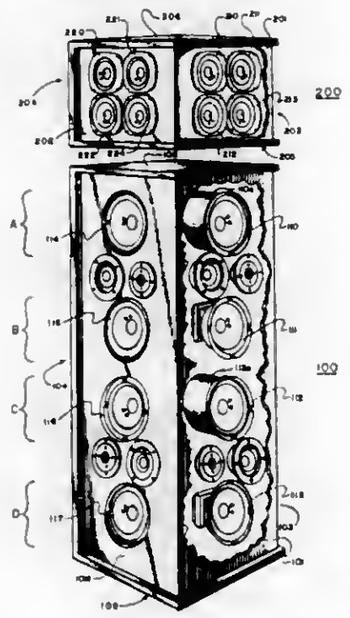
7. A high fidelity loudspeaker system comprising:

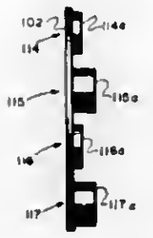
a vertically extended speaker column having three, vertical, operative speaker panels with speakers therein and a fourth back panel; and

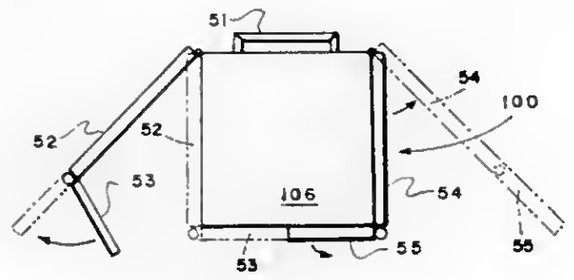
an outer, built-in protective casing for said three panels comprising two hinged wall sections each hinged to opposite side edges of said back panel which when closed cover all three panels and when open form two diagonally disposed sound reflecting surfaces, providing the reflective acoustic effect of said speaker column being located in a corner.

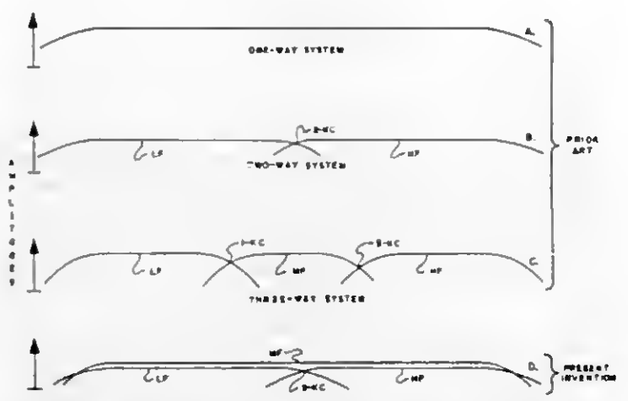
8. A high fidelity loudspeaker system comprising:

a first air-tight, closed cabinet having an array of woofer and tweeter speakers contained therein for reproducing low and high frequencies, respectively; and









a second, air-tight, closed but complementary cabinet physically separate from said first cabinet having an array of mid-range speakers contained therein for reproducing at least the mid-range frequencies, said two cabinets placeable together in juxtaposition one on top of the other, outside the enclosure of the other; the speakers in both said cabinets being driven to reproduce complementary sounds.

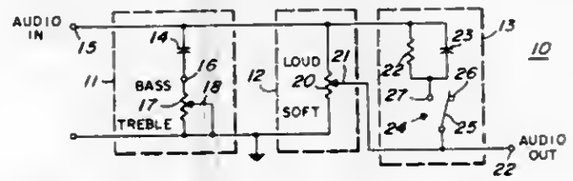
11. A high fidelity loudspeaker system comprising: an array of woofer, mid-range and tweeter speakers, having low, medium, and high frequency response respectively, wherein said woofers and tweeters include a single frequency cross-over electronic circuit means between them for feeding the low frequency signals only to said woofers and the high frequency signals only to said tweeters, respectively, for the driving thereof, and wherein said mid-range speakers include no frequency cross-over means between them and said woofers and wherein tweeters, said mid-range speakers being driven over at least substantially all of the full spectrum of audio frequencies, said woofers, tweeters and mid-range speakers being generally simultaneously driven to reproduce complementary sounds.

4,031,319

SINGLE CONTROL POWER-FREQUENCY CONTROL CIRCUIT

Samir Thakorbhai Desai, Roselle, Ill., assignor to Motorola, Inc., Schaumburg, Ill.

Filed Dec. 12, 1975, Ser. No. 640,368
Int. Cl.² H04R 3/00
U.S. Cl. 179—1 D **14 Claims**



1. An improved single control power-frequency control circuit especially adaptable for use in controlling an audio electrical signal in an automotive entertainment device, comprising:

a first terminal for receiving an audio input signal throughout an audio frequency range,

a second terminal, and

an adjustable control means coupled between said first and second terminals for receiving said audio signal and providing a modified audio signal at said second terminal, said control means providing a single adjustment for selectively emphasizing certain frequencies within said audio frequency range in the modified audio signal while simultaneously substantially increasing the magnitude of the modified audio signal throughout the audio frequency range.

4,031,320

SOUND PRODUCING DEVICE

Bridget A. Brand, and Joseph Brand, both of 133 Drexel Road, Ardmore, Pa. 19003

Filed Mar. 19, 1976, Ser. No. 668,411
Int. Cl.² A61M 21/00
U.S. Cl. 179—1 AA **7 Claims**

1. An apparatus for inducing general relaxation and sleep comprising:

a. a housing having sound ventilating channels disposed therethrough; and

b. a sound producing means disposed within said housing for producing low frequency, periodic oscillatory sound of barely audible amplitude, said sound producing means producing a pre-selected sound having any of a variety of amplitudes between 20 and 50 and decibels, said pre-selected amplitude being controlled to within ±5 decibel percent, during said oscillatory sound period whereby a soft background level is attained which masks infrequent yet annoying bursts of consciously perceived noise.

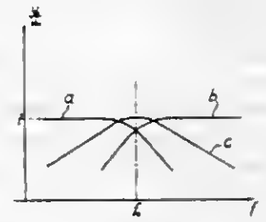
LOUDSPEAKER SYSTEMS

Knud Erik Bakgaard, Struer, Denmark, assignor to Bang & Olufsen A/S, Denmark

Continuation of Ser. No. 521,094, Nov. 5, 1974, abandoned. This application Feb. 17, 1976, Ser. No. 658,526
Claims priority, application United Kingdom, Nov. 6, 1973, 51482/73
Int. Cl.² H04R 1/24, 3/04, 3/14
U.S. Cl. 179—1 D **13 Claims**



1. A loudspeaker system comprising a first and a second main driver connected to common signal input terminals through crossover network means designed so as to pass signals of frequencies lower than a predetermined crossover frequency to said first driver and signals of frequencies higher than said crossover frequency to the second driver, while in a crossover frequency range the signals are passed to both drivers with an amplitude which for increasing frequencies is decreasing for said first driver and increasing for said second driver in such a manner that the transfer function of the loudspeaker system is approximated to a constant function inside and is substantially constant outside said crossover frequency range, characterized in that in addition to said two drivers there is provided at least one auxiliary compensation driver adapted to work in said crossover frequency range and being operable to reproduce an acoustic signal with a frequency-amplitude characteristic which, combined with the corresponding characteristics of the two main drivers, results in the total transfer function of the loudspeaker system being substantially constant inside and outside the crossover frequency range.

4,031,322

TELEPHONE OPERATED SIGNALLING SYSTEM

Steven T. Churchill, Wilton, Conn., assignor to Letot, Incorporated, Fairfield, Conn.

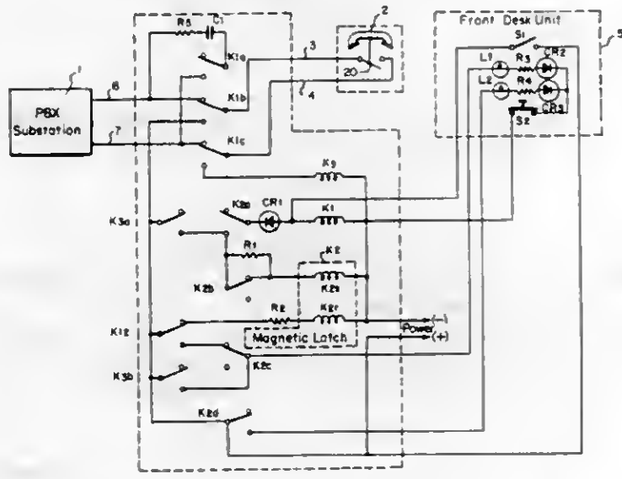
Filed Sept. 30, 1975, Ser. No. 618,148
Int. Cl.² H04M 11/02
U.S. Cl. 179—2 A **3 Claims**

1. A telephone operated signalling system having:

A. A telephone substation,

B. A telephone having a manually operated switch connected to said substation by telephone wires,

C. A desk unit having an actuation switch and indicating means for indicating status of a room,
D. Power means adapted to energize said indicating means, and
E. Circuit means including:
i. First means responsive to actuation of said actuation switch for disconnecting said telephone wires from said substation and connecting said telephone wires to said indicating means, and

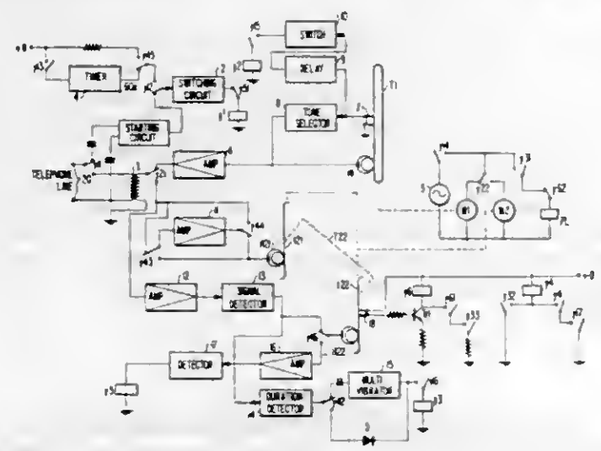


ii. Second means responsive to movement of said manually operated switch for changing energization of said indicating means;
the improvement comprising having indicator switch means positioned between said power means and said indicating means for disconnecting said indicating means from said power means during long periods of time that said telephone wires are connected to said indicating means.

4,031,323
REMOTE CONTROLLABLE TELEPHONE ANSWERING DEVICE HAVING A DUAL PLAYBACK CAPABILITY

Shizuo Ando, and Akira Okamura, both of Kawagoe, Japan, assignors to Pioneer Electronic Corporation, Tokyo, Japan

Filed Mar. 28, 1975, Ser. No. 563,031
Claims priority, application Japan, Mar. 29, 1974, 49-36215
Int. Cl.² H04M *1/64*
U.S. Cl. 179—6 E **5 Claims**

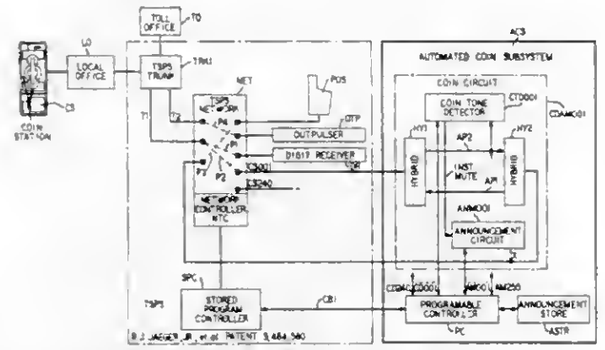


1. A remote controllable automatic telephone answering device adapted to be connected to a telephone line, said device comprising; an answer tape, means for reproducing an answer prerecorded on said answer tape and sending out said reproduced answer in response to the reception of a calling signal via said telephone line, a message tape, means for recording callers' messages on said message tape when it is unwinding, means for detecting a remote control signal received via said telephone line, first means for rewinding the message recording tape for a fixed time period in response to a first detection of a first said remote control signal and for reproducing any messages on the thus rewound part of said message tape, said fixed time period being independent of the duration of said remote control signal and independent of the amount of tape unwound, second means responsive to a subsequent detection of a second said remote control signal during the reproducing of said messages for rewinding said message tape for a period corresponding to the duration of the second remote control signal and for reproducing any messages on the part of said message tape thus rewound, and means for sending out said reproduced messages via said telephone line.

4,031,324
AUTOMATED COIN ARRANGEMENT PROVIDING INTERFERENCE FREE COIN DEPOSIT DETECTION DURING ANNOUNCEMENTS

Ronald Michael Dudonis, Englishtown, N.J., assignor to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed May 24, 1976, Ser. No. 689,600
Int. Cl.² H04M *17/00*
U.S. Cl. 179—6.3 R **19 Claims**



1. In combination,
generating means for generating voice announcements,
detecting means for detecting distinct signals originating at a telephone station, and
coupling means for coupling said generating means to a transmission path connectible to said telephone station to transmit said voice announcements thereover and for coupling said detecting means to said transmission path to detect said distinct signals received thereover from said telephone station,
said coupling means including isolating means for isolating said detecting means from said generating means.

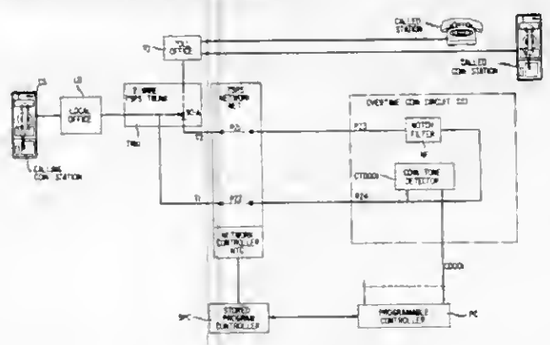
4,031,325
CALLED PARTY FRAUD PREVENTION IN AN AUTOMATED COIN SYSTEM

Ronald Michael Dudonis, Englishtown; Charles Glenn Morrison, Holmdel, both of N.J.; Robert Lawrence Potter, Naperville, Ill., and Kenneth Streisand, East Brunswick, N.J., assignors to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed June 21, 1976, Ser. No. 698,186
Int. Cl.² H04M *15/18*
U.S. Cl. 179—6.3 R **16 Claims**

1. Apparatus for preventing called party fraud in a coin station originated call wherein a connection is established between the calling coin station and a called station, which comprises
means for splitting the connection into a calling station portion and a called station portion,
a filter attenuating a frequency component in signals indicative of coin deposits,

a coin tone detector detecting signals indicative of coin deposits, and
extending means for extending said calling station portion to said coin tone detector and for extending said called station portion to said filter,



said extended called station portion being connected via said filter to said extended calling station portion to reconnect said calling and called stations.

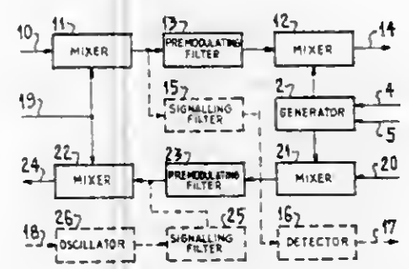
TELEPHONE ARTERY WITH MULTIPLE ACCESS POINTS AND TELEPHONE NETWORKS WITH SUCH ARTERIES

Pierre Deman, Paris, France, assignor to Thomson-CSF, Paris, France

Filed Oct. 30, 1975, Ser. No. 627,456
Claims priority, application France, Oct. 31, 1974, 74.36491
Int. Cl.² H04J *1/00*
U.S. Cl. 179—15 FS **6 Claims**



1. A two-way telephone artery, having first and second terminals, for transmitting in each direction channels forming part of a predetermined multiplexed set of g channels in a telephone system using premodulation and single sideband frequency multiplexing, said set of channels being such that any of its channels may be selectively translated into the pass-band of a premodulation filter by means of a mixer receiving said set and a carrier current associated with this channel, said artery having first and second transmission channels for transmitting telephone communication in first and second directions, and M access points, M at least equal to 3, at m of which, $1 \leq m \leq M$, m multiplexing and demultiplexing switching devices are respectively coupled to said artery for selectively inserting telephone channels in the group of channels transmitted by said first transmission channel at vacant positions of said set and selectively extracting telephone channels from the group of channels transmitted by said second transmission channel, the inserted and extracted telephone channels occupying the same frequency bands in said transmission channels, the i^{th} switching device ($i = 1, 2 \ldots m$) starting from said first terminal comprising p_i, $1 \leq p_i \leq g$ telephone channel circuits, each of said telephone channel circuits comprising first and second branches, said first branch comprising, in series, an input mixer having a first input, forming a first input of this channel circuit, for receiving a low frequency channel, and a carrier current input for receiving a current at the premodulation frequency, a premodulation filter having an output, and an output mixer having a first input coupled to said output of said premodulation filter, a carrier current input, and an output forming a first output of this channel circuit, said second branch comprising in series an input mixer having a first input forming a second input of this channel circuit and a carrier current input, a premodulation filter having an output, and an output mixer having a first input coupled to said output of said premodulation filter of said second branch, a carrier current input for receiving said current at the premodulation frequency and an output forming a second output of this channel circuit, each of said telephone channel circuits further comprising a digitally controllable variable frequency generator having an output connected to the carrier current inputs of said output mixer of said first branch and of said input mixer of said second branch, said i^{th} switching device further comprising, for $i < m$, a regrouping coupling device having inputs and an output, inserted by an input and its output in said first transmission channel, and having p_i other inputs connected respectively to the first outputs of said p_i telephone channel circuits, and a distribution coupling device having an input and outputs, inserted by its input and an output in said second transmission channel, and having p_i other outputs connected respectively to the second inputs of said p_i telephone channel circuits, said artery further comprising at said first terminal a terminal arrangement having an input coupled to said first transmission channel and an output coupled to said second transmission channel; the first inputs and second outputs of the p_m channels of the m^{th} switching device being respectively coupled to said first and second transmission channel of said artery at said second terminal through regrouping and distribution coupling devices respectively.

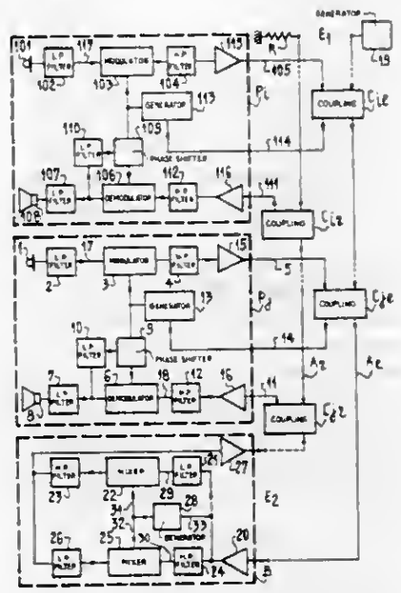
TELEPHONE SET AND SYSTEM UTILIZING FREQUENCY DIVISION MULTIPLEXING

Henri Butin, and Pierre Deman, both of Paris, France, assignors to Thomson-CSF, Paris, France

Filed Apr. 6, 1976, Ser. No. 674,676
Claims priority, application France, Apr. 11, 1975, 75.11311
Int. Cl.² H04J *1/06*
U.S. Cl. 179—15 FD **3 Claims**



1. A telephone set having first and second inputs and an output, and comprising a transmitter channel for delivering to said output a variable carrier frequency output signal with double side-band amplitude modulation and carrier component and a receiver channel having an input coupled to said telephone set first input for receiving a multiplex high fre-

quency signal including, when said set is being used for communication, a multiplexed signal having the same carrier frequency as said output signal with double side-band amplitude modulation and carrier component;

said transmitter channel comprising: a programmable generator having an output, for supplying said output signal variable carrier frequency, and a sync input; and an amplitude modulator having a first input for receiving voice signals from a microphone, a second input and an output; said sync input being coupled to said second input of said telephone set for receiving a reference frequency, said second input of said modulator being coupled to said generator output, and said modulator output being coupled to said telephone set output;

said receiver channel comprising: an electroacoustic transducer, a synchronous demodulator having a first input coupled to said receiver channel input for receiving said multiplex high frequency signal, a second input and an output for delivering to said transducer the modulating signal from said multiplexed signal and a control voltage; and a variable phase-shifter having a signal input coupled to said generator output, a control input coupled for receiving said control voltage and an output coupled to said demodulator second input.

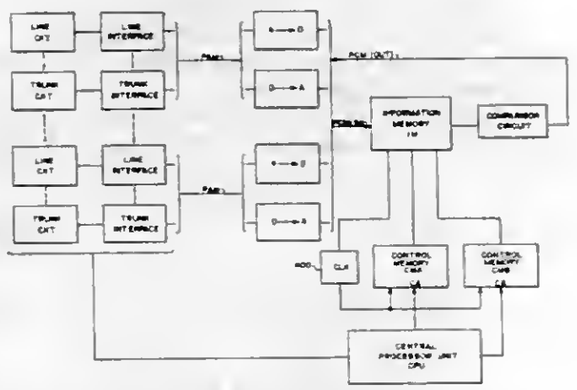
CONFERENCING ARRANGEMENT FOR USE IN A PCM SYSTEM

Satyan G. Pitroda, Villa Park, Ill., assignor to GTE Automatic Electric Laboratories Incorporated, Northlake, Ill.

Filed Sept. 18, 1975, Ser. No. 614,406
Int. Cl.² H04M *3/56*; H04Q *11/04*
U.S. Cl. 179—18 BC **4 Claims**



1. In a pulse code modulated communication system having

a. a plurality of channels, each of which is assigned a time slot,

b. an information memory for storing information from each of the plurality of channels, transmit information from each of the plurality of channels stored in a first fixed location of the information memory and receive information from each of the plurality of channels stored in a second fixed location of the information memory,

c. a first control memory having a control memory word corresponding to each of the plurality of channels for storing the address location within the information memory of the channel to which that channel is to be connected for conversation, and

d. control means for cyclically controlling the operation of the system, said control means during a time slot assigned to a channel writing the information from that channel into the information memory, reading the control memory word corresponding to that channel from the control memory to address the information memory to read out the information stored therein at the addressed location, and to transmit the information read therefrom to that channel, to thereby permit that channel to engage in conversation with another channel, the improvement comprising:

e. a second control memory having a control memory word corresponding to each of the plurality of channels for storing the address location within the information memory of a second channel to which that channel is to be connected for conversation, and

f. a comparison means for comparing and transmitting as an output thereof the larger of two samples of information coupled to it,

g. said control means during a time slot assigned to a channel writing the information from that channel into the information memory, reading the control memory words corresponding to that channel from each of the control memories for addressing the information memory to read out the information stored therein at the two addressed locations, and to transmit the information to said comparison means, the largest of the two samples of information coupled to said comparison means being coupled to that channel,

h. whereby 3-way conferencing between the plurality of channels can be provided.

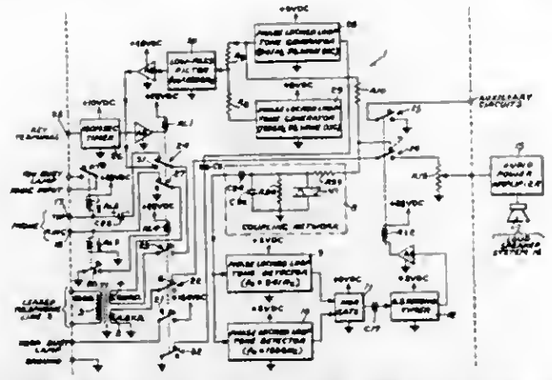
TIME LIMITED TELEPHONE PAGING EMPLOYS A RELAY SWITCH ACTUATED BY DUAL FREQUENCY TONE

B. Ronald Saxon, Harrisburg, Pa., assignor to International Telephone and Telegraph Corporation, Nutley, N.J.

Continuation of Ser. No. 479,005, June 13, 1974, abandoned. This application Apr. 2, 1976, Ser. No. 673,233
Int. Cl.² H04M *11/02*
U.S. Cl. 179—18 BF **23 Claims**



1. An arrangement to control a loud speaker system at a remote location from a local location comprising:

a telephone line having a given operating frequency band interconnecting said local location to said remote location;

said loud speaker system being normally disconnected from said telephone line;

a first source of a first audio control signal disposed at said local location, said first audio control signal having a first given frequency;

a second source of a second audio control signal disposed at said local location, said second audio control signal having a second given frequency different than said first given frequency;

first means coupled between said first and second sources and said telephone line at said local location to inject a short burst of said first and second audio control signals simultaneously into said operating frequency band of said telephone line;

second means coupled to said telephone line at said remote location to detect both said first and second audio control signals and provide only a logic "1" output signal only when both of said first and second audio control signals are detected simultaneously; and

third means coupled to said second means responsive to said output signal to actuate a relay and a contact thereof which connects said loud speaker system to said telephone line for a given period of time after cessation of said first and second audio control signals to enable said loud speaker system to broadcast a page message transmitted on said telephone line from said local location.

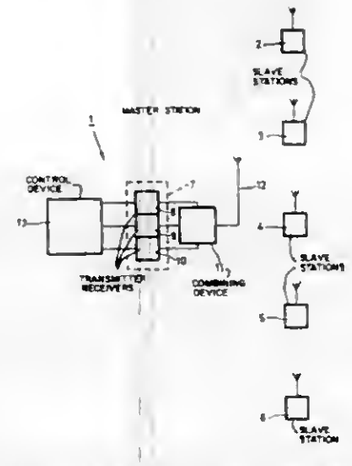
DIGITAL RADIO TRANSMISSION SYSTEM

Johannes Cornelis van Leeuwen, Hilversum, Netherlands, assignor to U.S. Philips Corporation, New York, N.Y.

Filed June 5, 1975, Ser. No. 584,187
Claims priority, application Netherlands, June 10, 1974, 7407717
Int. Cl.² H04J *3/12*
U.S. Cl. 179—41 A **10 Claims**



1. A digital transmission system comprising

a master station having a transmit-receive device for transmission of time-compressed digital signals by means of a plurality of simultaneously generated carrier frequencies, comprising

first generator means for generating a frame synchronization pattern;

second generator means for generating a plurality of different signalling code words each representive of a given function;

switching means for connecting the said generators to the transmitter; and

control means having an output for operating said switching means for periodically transmitting said frame synchronization pattern simultaneously on each of said generated carrier frequencies, and for periodically transmitting a plurality of signalling code words selected as required for each carrier frequency in fixed time intervals situated within the frame duration determined by successive frame synchronizing patterns; a plurality of slave stations each comprising a transmit-receive apparatus for transmission and reception of time-compressed digital signals under the control of said master station, and

channel selection means for tuning the receiver in a first operating condition successively for given short periods to each of the carrier frequencies of the system.

4,031,331

TELEPHONE SPEECH NETWORK

Mevblbe Gulay Sencer, Ottawa, Canada, assignor to Northern Electric Company Limited, Montreal, Canada

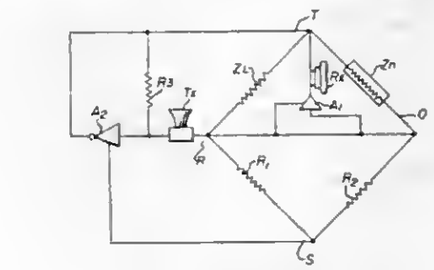
Filed Jan. 15, 1976, Ser. No. 649,557
Int. Cl.² H04M *1/58*
U.S. Cl. 179—81 A **4 Claims**

1. A telephone speech network, for connecting a transmitter and a receiver to a line powered telephone line, comprising:

a first amplifier, the output of which is connected in series with a line terminating resistance across the telephone line, the input to said amplifier being responsive to both the received signals on the telephone line and to the signals at the output of the transmitter;

a bridging resistance and a bridging impedance connected in series across said amplifier, for summing substantially equal magnitude receive signal currents and for subtracting substantially equal magnitude transmit signal currents, coupled from the output of the amplifier and from across the telephone line to the junction of said bridging resistance and impedance; and

a second amplifier means for connecting the resultant signals at said junction to said receiver.

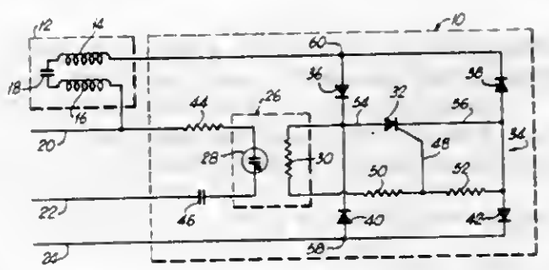


4,031,332

TELEPHONE RINGER INSOLATOR

Paul Sbylo, Arlington Heights, Ill., assignor to Cook Electric Company, Morton Grove, Ill.

Filed Feb. 2, 1976, Ser. No. 654,404
Int. Cl.² H04M *1/00*
U.S. Cl. 179—84 R **17 Claims**



1. An isolator for selectively coupling a means to be energized which is coupled to one of a pair of telephone lines to a reference potential in response to an activating signal on the telephone lines, said isolator comprising:

a controlled conduction means coupled between said means to be energized and said reference potential, and

an isolator means coupled to said telephone lines and to said controlled conduction means, said isolator means controlling said controlled conduction means to connect said means to be energized to said reference potential in response to said isolator means receiving said activating signal on said telephone lines.

4,031,333

CIRCUIT TO INDICATE THE SIMULTANEOUS OFF-HOOK CONDITION OF AT LEAST TWO OF A PLURALITY OF TELEPHONE SUBSETS ON THE SAME TELEPHONE LINE

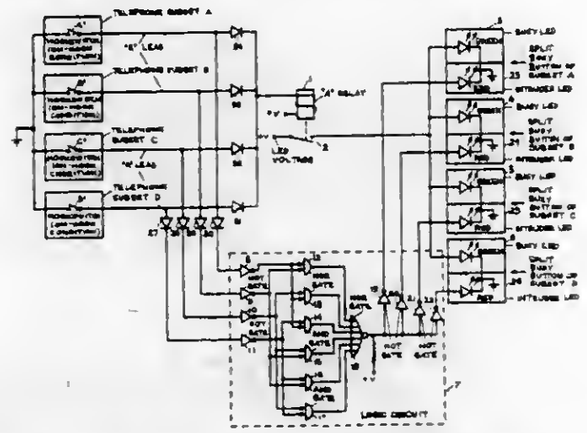
George Thomas Fouratt, Santa Maria, Calif., assignor to International Telephone and Telegraph Corporation, Nutley, N.J.

Filed July 14, 1976, Ser. No. 705,218
Int. Cl.² H04M *1/00*
U.S. Cl. 179—81 R **16 Claims**

1. An indicator circuit for a telephone system to indicate when at least two of a plurality of telephone subsets on the same telephone line are simultaneously in off-hook condition comprising:

at least one indicator contained in one of said plurality of

subsets which when activated indicates that at least said one of said plurality of subsets and another of said plurality of subsets are in said off-hook condition simultaneously; and



a logic circuit coupled between all of said plurality of subsets and said indicator to produce an output signal to activate said indicator when at least said one of said plurality of subsets and said another of said plurality of subsets are detected to be in said offhook condition simultaneously.

APPARATUS FOR MAGNETIC RECORDING AND/OR REPRODUCING OF SIGNALS RECEIVED BY ONE OR MORE SIGNAL RECEIVING DEVICES

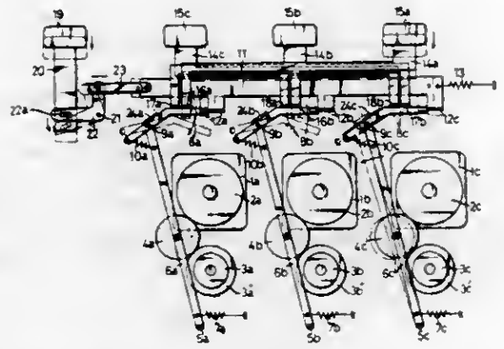
Hiroyuki Kimura, Atsugi, and Takahiko Saito, Kamakura, both of Japan, assignors to Sony Corporation, Tokyo, Japan

Filed Aug. 11, 1975, Ser. No. 603,537

Claims priority, application Japan, Aug. 14, 1974, 49-97102

Int. Cl.² G11B *31/00*

U.S. Cl. 179—100.11 **14 Claims**



1. An apparatus comprising a recording device, at least one original receiving device including tunable signal selecting means operable to tune said receiving device to any one of plural signal channels so as to select the signal received by said signal receiving device, control means selectively operable for applying the signal received by said signal receiving device to said recording device for recording by the latter, and means responsive to the operation of said control means for maintaining the tuning condition of said signal selecting means at the one signal channel to receive said signal and for preventing said signal selecting means from being tuned to a different signal channel so as to avoid changing of the signal selected for reception by said signal receiving device during recording of said signal.

4,031,335

STEREO PICK-UP WITH CASING SERVING AS COMMON POLE PIECE

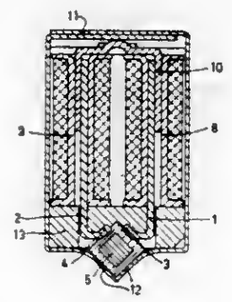
Elzo Smit, Eindhoven, Netherlands, assignor to U.S. Philips Corporation, New York, N.Y.

Filed Mar. 19, 1975, Ser. No. 559,736

Claims priority, application Netherlands, Apr. 1, 1974, 7404359

Int. Cl.² H04R *11/12*

U.S. Cl. 179—100.41 K **11 Claims**



1. A track groove transducer of the type having a stylus holder and two polepieces arranged for magnetic sensing of stylus holder oscillatory pivoting in each of two mutually perpendicular directions, and a third polepiece cooperating magnetically with said two polepieces, wherein said transducer comprises a magnetically shielding casing made of soft magnetic material, a portion of said casing forming said third polepiece.

4,031,336

ELECTROMAGNETIC PICKUP WITH MAGNETIC GAP DISPLACEMENT GENERATOR

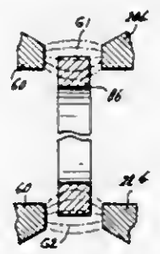
Joseph F. Grado, 4614 Seventh Ave., Brooklyn, N.Y. 11220

Filed Feb. 10, 1975, Ser. No. 548,698

The portion of the term of this patent subsequent to Apr. 29, 1992, has been disclaimed.

Int. Cl.² H04R *11/12*

U.S. Cl. 179—100.41 K **11 Claims**



1. A replaceable module for an electro-magnetic cartridge comprising a carrier, first and second magnetic members mounted in opposing relationship on said carrier and cooperatively positioned to define first and second operating gaps, a stylus lever operatively mounted on said carrier and extending generally parallel to the length dimension of said operating gaps, a generator operatively mounted on said stylus lever and extending at least partially into said operating gaps between said first and second magnetic members, said generator mounted for movement substantially perpendicular to said operating gaps in response to movement of said stylus lever.

4,031,337

LOUDSPEAKER

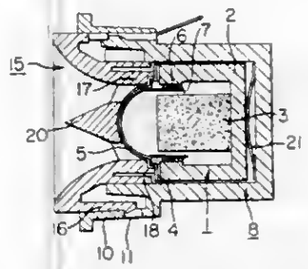
Yasushi Okamura; Kiichiro Tanaka, and Takashi Takeda, all of Fukuoka, Japan, assignors to Matsushita Electric Industrial Co., Ltd., Japan

Filed Dec. 3, 1975, Ser. No. 637,282

Claims priority, application Japan, Dec. 16, 1974, 49-152999; Dec. 16, 1974, 49-153001

Int. Cl.² H04R *9/00;* **G10K** *13/00*

U.S. Cl. 179—115.5 H **5 Claims**



1. A loudspeaker comprising:
- a cup-shaped enclosure unit having a closed end and a cylindrical side wall, a portion of said side wall remote from said end having a plurality of circumferential slots therein;
- a magnetic structure disposed in said enclosure unit and secured thereto, said structure comprising magnetic material and have (i) an annular end surface and (ii) a cylindrical air gap coaxial with the side wall of said enclosure unit;
- a flexible diaphragm having a circular outer ring adjacent the annular end surface of said magnetic structure;
- a voice coil secured to said diaphragm and disposed within said air gap;
- a horn unit having an outer cylindrical portion, a cylindrical alignment portion, and an inner cylindrical diaphragm retaining portion;
- said outer portion of said horn unit having a corresponding plurality of flexible pawl parts in interlocking engagement with the slots of said enclosure unit;
- the alignment portion of said horn unit having an outer diameter slightly less than the inner diameter of the wall portion of said enclosure unit, said alignment portion being disposed adjacent said wall portion;
- the inner portion of said horn unit having an annular end part adjacent the circular outer ring of said diaphragm, so that said diaphragm is retained in position with the circular outer ring thereof disposed between the annular end surface of said magnetic structure and the annular end part of said inner portion of said horn unit.

ECHO SUPPRESSOR USING FREQUENCY-SELECTIVE CENTER CLIPPING

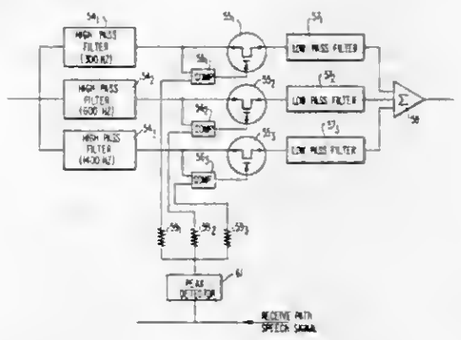
Samuel Joseph Campanella, Gaithersburg, Md.; Hans Dodel, Alexandria, Va., and Henri George Suyderhoud, Potomac, Md., assignors to Communications Satellite Corporation (COMSAT), Washington, D.C.

Filed Feb. 10, 1976, Ser. No. 656,903

Int. Cl.² H04B *3/20*

U.S. Cl. 179—170.8 **8 Claims**

1. An echo suppressor for use in long distance telephone speech communication systems having a send path and a receive path, comprising:
- a first plurality of filter networks connected in said send path for dividing a band width of the send path into a like plurality of contiguous frequency bands;
- a plurality of center-clipping networks connected to the outputs of said first plurality of filter networks on a one-to-one basis, said center-clipper networks being operative to reduce to zero a signal applied thereto whenever the signal's instantaneous absolute level is at or below a threshold level;
- summing means connected to receive the outputs of all of said center-clipper networks and providing a combined output signal; and
- threshold control means connected to receive a signal in said receive path to detect the overall peak signal level of said signal, said thresbold control means producing



plurality of threshold control signals in response to the detected overall peak signal level of a signal in said receive path which control signals are applied to respective ones of said center-clipper networks, the ratios of said threshold control signals produced by said control means being determined by the ratios of the predetermined average energy of the telephone speech in said plurality of frequency bands.

4,031,339

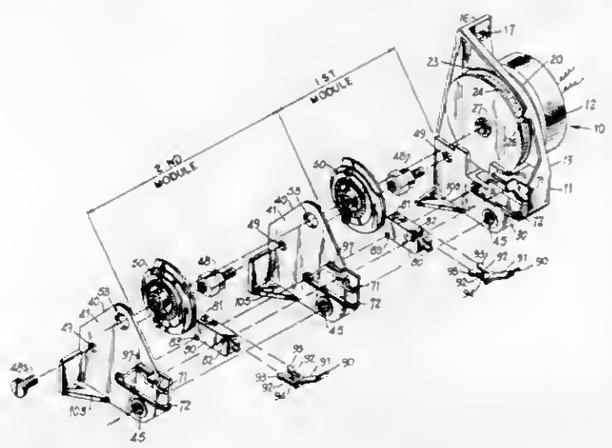
MODULAR TIME SEQUENCE CONTROLLER

Claude V. Koch, Two Rivers, Wis., assignor to AMF Incorporated, White Plains, N.Y.

Filed Dec. 15, 1975, Ser. No. 640,990

Int. Cl.² H01H *43/10, 9/02*

U.S. Cl. 200—38 BA **8 Claims**



1. In a modular time sequence controller the combination comprising
- a first rotatable switch actuator means including an axle having an axle interlock means on at least one end thereof,
- means for rotating said axle,
- a first switch having an actuator,
- means for mounting said switch proximate said first rotatable switch actuator in position to be actuated during rotation of the switch actuator means,
- a pair of support plates,
- bearing means in each support plate for rotatably supporting an axle,
- spacer and fastening means for maintaining said support

plates in spaced parallel relationship with said bearing means in axial alignment,

said first rotatable switch actuator means having its end with the interlock means thereon rotatably supported by the bearing means of the first one of said support plates,

a second rotatable switch actuator means including a second axle which has axle interlock means on each end thereof,

said second rotatable switch actuator means being positioned between the parallel support plates with one end of its axle locked with the axle of the first switch actuator means and its other end rotatably supported by the bearing means of the second support plate,

a second switch having a housing and an actuator extending therefrom,

guide means on at least one of the facing surfaces of the parallel support plates,

said guide means being adapted to slidingly receive said second switch housing and to position the second switch between said support plates with its actuator proximate the second rotatable switch actuator means, whereby the actuator means may actuate the second switch,

detent means on at least one of the facing surfaces of the parallel support plates,

detent engaging means on said second switch housing engageable with said detent means, and

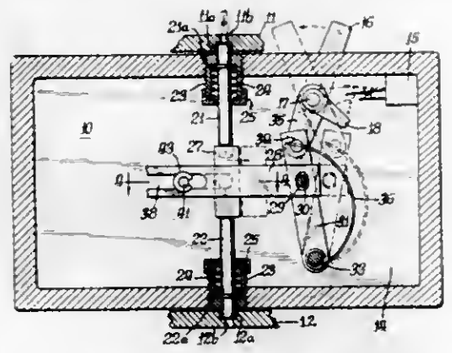
keeper means insertable transversely between said support plates and engageable with said second switch housing for urging said detent engaging means into a retaining engagement with the detent means while the keeper means is in place.

4,031,340

DEFEATER FOR MECHANICAL SAFETY INTERLOCK FOR COVERS OF EXPLOSION-PROOF ELECTRICAL HOUSING

Robert J. Pastorel, Chicago, Ill., assignor to Appleton Electric Company, Chicago, Ill.

Filed Nov. 7, 1975, Ser. No. 629,900
Int. Cl.² H01H 9/20, 33/46
U.S. Cl. 200—50 A **4 Claims**



1. In an explosion-proof electrical enclosure apparatus comprising a housing having a body with an access opening and threads therearound and a cap threaded onto said threads and covering said opening, an electrical switch within said housing and operable between a switch-open position and a switch-closed position, said switch having a member within said housing for moving the switch between said positions which member is operable from outside said housing, a locking device interengaging said cap and said body and movable between a first position at which said cap is locked at a desired location against rotation and a second position at which said cap is free to be rotated to unthread the cap for removal to expose said opening, and interlocking means operatively interconnecting the switch operating member and said cap locking device and including a locking part movable along a path between two positions respectively corresponding to said two positions of said member for retaining said locking device in said first position thereof so long as the member is in the switch-closed position while freeing the locking device for movement to the second position so long as the member is in the switch-open position, the improvement comprising:

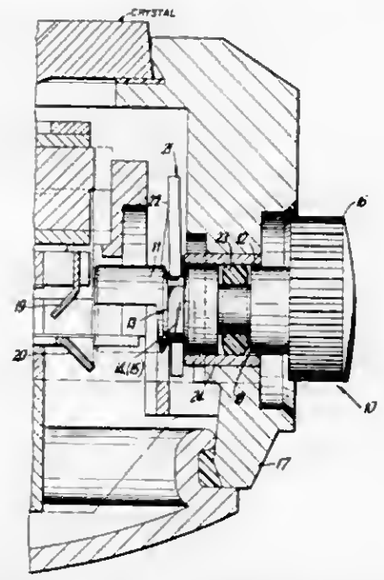
defeater means operatively engaging said interlocking means for moving said locking part along a second path between its position at the switch-closed position and a third position thereof at which it frees the locking device for movement to the second position, said defeater means includes an operating component unmanifestly located at the exterior of said body for moving said locking part along said second path.

4,031,341

DUAL FUNCTION PUSHER AND ROTATE SWITCH FOR SOLID STATE DIGITAL WATCHES HAVING DETENT SPRING

Paul Wuthrich, Watertown, and Frank P. Mascia, Bristol, both of Conn., assignors to Timex Corporation, Waterbury, Conn.

Filed Jan. 14, 1976, Ser. No. 649,115
Int. Cl.² G04C 9/00; G04B 27/00; H01H 13/52
U.S. Cl. 200—52 R **9 Claims**



1. A dual function rotate and pusher device and switch assembly for an electronic watch having a case with an opening for access to the interior thereof which comprises:

a shaft mountable in said opening for axial and rotational movement and having an eccentric tab at the interior end thereof, and a detent retainer section, and an actuating end portion;

a plurality of switch blade means mounted for selective engagement with the eccentric tab; and

biasing means engaging the detent retainer section and the shaft for providing longitudinal and detented rotational movement of the shaft to enable engagement with a selected switch blade by the eccentric tab with longitudinal and/or rotational movement of the shaft.

4,031,342

MATERIAL SENSING SWITCH

Reuben E. Peterson, 402 E. Washington Ave., Fergus Falls, Minn. 56537

Filed Feb. 11, 1976, Ser. No. 657,285
Int. Cl.² H01H 35/00
U.S. Cl. 200—61.21 **3 Claims**

1. A material sensing switch assembly comprising, a hollow body means having open opposite ends,

connection means for securing said body means to a support means,

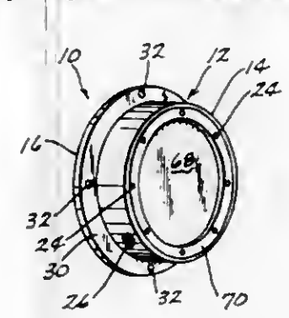
a substantially flat, circular backing plate means removably closing one of said opposite ends,

a substantially flat, circular switch support plate means removably mounted in said body means adjacent the other of said opposite ends, said switch support plate having inner end outer sides,

said switch support plate means having a centrally disposed opening formed therein,

a switch means mounted at the inner side of said switch support plate means,

switch actuator means comprising an elongated switch arm secured at one end to said inner side of said switch support plate means outwardly of the center thereof and extending towards said centrally disposed opening in a spaced relationship to said inner side, said switch arm having an end portion which extends through said centrally disposed opening and which has an actuator portion



positioned outwardly of said outer face of said switch support plate means,

a pressure plate means removably mounted adjacent the outer side of said switch support plate means for engagement with said actuator portion of said switch arm when said pressure plate means is moved towards said switch support plate means,

said switch arm being positioned outwardly of said switch means and being adapted to actuate said switch means when said pressure plate means moves said actuator portion of said switch arm inwardly with respect to said switch support plate means,

a flexible member operatively removably secured to said body means and covering said pressure plate means for sealing said other end of said body means,

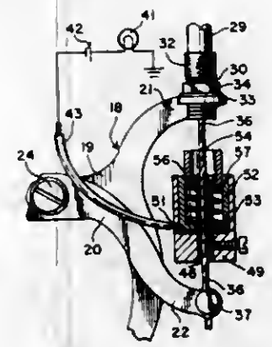
and means securing said flexible member to said body means.

4,031,343

BICYCLE BRAKE LIGHT SWITCH AND STOP LIGHT SYSTEM BEING ACTIVATED BY HAND BRAKE LEVER AND CABLE

Roy Sopko, 21 Huckleberry Lane, Holbrook, N.Y. 11741

Filed Sept. 2, 1975, Ser. No. 609,301
Int. Cl.² B60Q 1/44; B62J 5/00; H01H 3/16, 17/08
U.S. Cl. 200—61.12 **5 Claims**



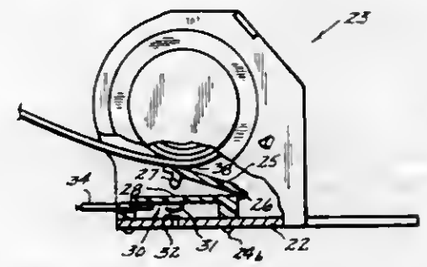
4. In combination with a bicycle having a hand operated caliper brake including a pair of relatively rockable caliper levers having first and second proximal ends remote from the lever braking ends and swingable between contracted braking and spread release positions and a sheathed control cable member having a sheath anchored to said first proximal end and a flexible cable extending through said sheath and anchored to said second proximal end, a stop light mechanism comprising an electric bulb, a source of current and normally open switching means connected in series with said bulb across said current source, and including a switch component mounted on said flexible cable between said first and second proximal ends and engageable by said first proximal end incident to the contraction of said caliper levers to transfer said switching means to a closed condition, siad first proximal end being provided with a contact member defining portion which is grounded to said bicycle frame and said swithc component comprises an insulator sleeve secured to said flexible cable, a cylinder secured to said sleeve and having an open end confronting said contact member and an opposite end wall and a peripheral wall with a radial bore proximate said cylinder end wall, a metal piston movable in and out of said cylinder, a metal sleeve coaxial with and slidably sandwiched between said piston and cylinder and having a centrally apertured inner end wall and a compressor spring entrapped between said inner end wall and said piston to bias said piston and metal sleeve outwardly and inwardly respectively, and a cable conductor passing through said radial bore and clamped between the confronting walls of said cylinder and metal sleeve, said cable conductor being connected in series with said current source and bulb to said bicycle frame.

4,031,344

INTEGRAL HINGE SENSING SWITCH

Regis Victor Pilarski, Utica, and Robert John Rumpf, Grosse Pointe, both of Mich., assignors to The Firestone Tire & Rubber Company, Akron, Ohio

Filed Mar. 15, 1976, Ser. No. 667,263
Int. Cl.² H01H 3.16
U.S. Cl. 200—61.58 B **6 Claims**



1. In an integral hinge sensing switch assembly for use in sensing a seat belt spool condition in a seat belt retractor assembly and the like comprising:

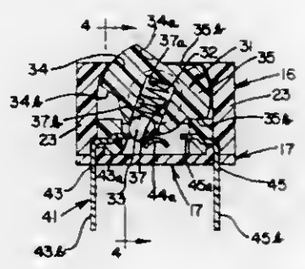
a switch housing having an integrally biased push arm follower plate integrally hinged thereto, said push arm follower plate positioned in biased pivotal follower contact with the outer surface of a seat belt rolled on the spool of a seat belt retractor assembly in register therewith, said push arm follower plate provided with an actuator pin adapted for movement into said housing when said push arm follower plate is pivotally moved in response to a selected spool condition, said switch housing provided with an actuator pin access opening in the upper surface thereof in register with said actuator pin; and

switch means provided in said housing in actuating register with said actuator pin opening, said switch means selectively actuated by selective movement of said actuator pin there against.

4,031,345
MINIATURE ELECTRICAL SWITCH

Ricardo L. Garcia, Justice, Ill., assignor to Grayhill, Inc., LaGrange, Ill.

Continuation-in-part of Ser. No. 533,882, Dec. 18, 1974, Pat. No. 3,958,090. This application Nov. 26, 1975, Ser. No. 635,652
Int. Cl.² H01H 13/28
U.S. Cl. 200—67 AA 21 Claims

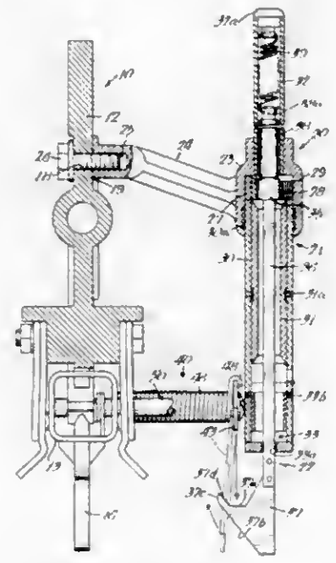


1. A miniature electrical switch for controlling the operation of circuit means comprising,
a housing of electrical insulating material,
said housing including a cover and a base plate,
said cover being generally rectangular in shape and having a top wall, opposed side and end walls and defining an opening opposite the top wall,
and switching means within the housing which includes a contact assembly, a switch actuator, a biasing means and an electrically conductive ball contactor, wherein said switch actuator, biasing means and ball contactor move together between first and second switch positions relative said contact assembly,
said base plate being sized to close the opening opposite the top wall and retain said switching means within the housing,
said cover having bearing means for pivotally mounting said actuator therein and an opening in one wall through which a part of the actuator protrudes for access to operate same,
said actuator having a recess for receiving said biasing means and said ball contactor, said recess having an end wall, whereby said biasing means seats at one end on the recess end wall and the ball contactor engages the other end thereof,
said contact assembly including a terminal support member of electrical insulating material and a set of firsts, second and third electrically conductive members, each conductive member having a contact portion and a conductor connection portion, said contact portions being spaced apart along a line transverse the pivot axis of the actuator and in alignment with the path of movement of the ball contactor for engagement therewith, and said conductor connection portions extending through holes in said base plate to the exterior of the housing,
and said biasing means urging said actuator into seated position in the bearing means and said contactor into engagement with said contact portions, said contact portions being arranged to cause positive positioning of the contactor with said first and second contact portions or said second and third contact portions thereby causing positive positioning of said actuator and electrical connection between said first and second contact portions or said second and third contact portions.

4,031,346
ELECTRICAL INTERRUPTER SWITCH

Ronald P. Bridges, 9 South 681 Brookeridge Road, Downers Grove, Ill. 60515

Filed Oct. 20, 1975, Ser. No. 623,792
Int. Cl.² H01H 33/12
U.S. Cl. 200—146 R 28 Claims



1. An electrical disconnect switch and circuit interrupter comprising, in combination:
a switch body including a fixed electrical contact structure;
a movable electrical contact structure pivoted on said switch body for movement in a path between a closed position engaging the fixed contact structure, and an open position spaced from said fixed contact structure;
an elongate, tubular circuit interrupter assembly housing which has a lining of arc-extinguishing material;
a fixed electrical interrupter contact in said housing;
a movable electrical interrupter contact in said housing which occupies a normal position abutting said fixed interrupter contact and has an integral electrically conductive actuating rod projecting out an end of the housing;
a bracket supporting said housing on the fixed contact structure and providing an electrically conductive path between the fixed interrupter contact and the fixed contact structure;
a fixed catch on the exterior of the housing which is electrically connected to the actuating rod;
an actuating catch on the outer end of the actuating rod adjacent said fixed catch;
and an electrically conductive interrupter operating arm on the movable contact structure, said operating arm being positioned to move in a path in which it sequentially engages the fixed catch and the actuating catch during movement of the movable contact structure from closed position, and serving to separate the movable interrupter contact from the fixed interrupter contact after the movable contact structure is sufficiently spaced from the fixed contact structure to avoid arcing between said structures.

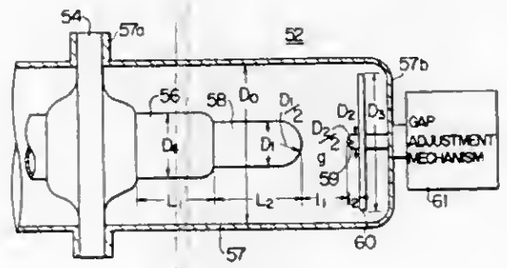
PROTECTIVE GAS CAP FOR ELECTRIC POWER APPARATUSES

Tosio Isikawa; Jun Ozawa, and Takehiro Kikuchi, all of Hitachi, Japan, assignors to Hitachi, Ltd., Japan

Filed Oct. 29, 1975, Ser. No. 626,992
Claims priority, application Japan, Nov. 11, 1974, 49-128999
Int. Cl.² H02H 33/22, 1/00
U.S. Cl. 200—148 B 9 Claims

1. A protective gas gap for electric power apparatus having

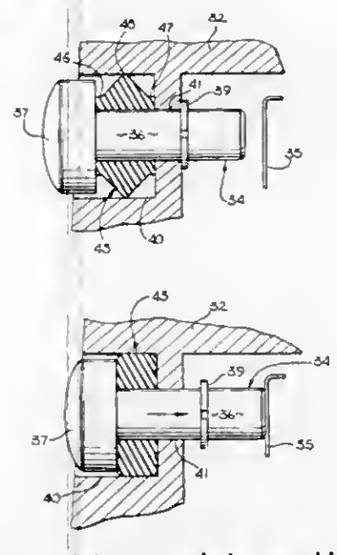
a cylindrical vessel electrically grounded and filled with an electronegative gas and a pair of electrodes oppositely disposed to each other with a predetermined gap therebetween in said cylindrical vessel substantially in alignment with the center-line of said vessel, one of said pair of electrodes being connected with a high tension charged conductor which is in turn connected to a transmission line while the other being electrically grounded; in which each of the confronting portions of said pair of electrodes is formed to have a substantially semispheric smooth surface; in which the maximum diameter of the end portion of said grounded electrode is smaller than that of the end portion of said high tension side electrode; and in which a plate-like back electrode having a diameter which is substantially equal to the inner diameter of said cylindrical vessel is closely disposed at the back of said grounded electrode.



4,031,348
PUSH-BUTTON ASSEMBLY SWITCH FOR WATCHES

Noel H. Eberhardt, Cupertino, Calif., assignor to Microma Incorporated, Cupertino, Calif.

Continuation-in-part of Ser. No. 633,853, Nov. 20, 1975, abandoned. This application Oct. 7, 1976, Ser. No. 730,527
Int. Cl.² H01H 3/12
U.S. Cl. 200—159 R 4 Claims

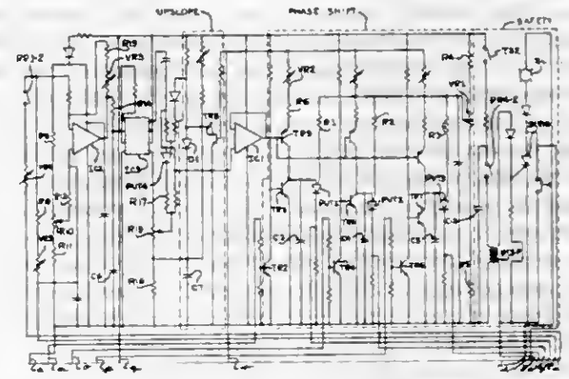


1. A low voltage push-button switch assembly for a watch for engaging a bore disposed through a watch case, said bore including a counter bore on the exterior surface of said watch case, comprising:
an electrical contact member disposed within said watch case;
a push-button member including a button and a shaft, said shaft slidingly engaging said bore for axial movement within said bore such that said shaft may be urged in contact with said electrical contact member;
a compressible, resilient, generally cylindrical integral sealing member engaging said shaft and disposed within said counter bore, the ends of said sealing member defining sleeves for engaging said shaft, the center portion of said sealing member having sloping surfaces that converge at the wall of said counter bore, said sealing member being symmetrical about a plane transverse to its axis; and
retaining means for retaining said push-button member within said bore;
whereby when said button is depressed said shaft contacts said watch case within said bore and contacts said contact member thereby completing an electrical path between said contact member and watch case and whereby said sealing member acts as a spring means and sealing means for said push-button assembly.

4,031,349
STUD WELDING CONTROL

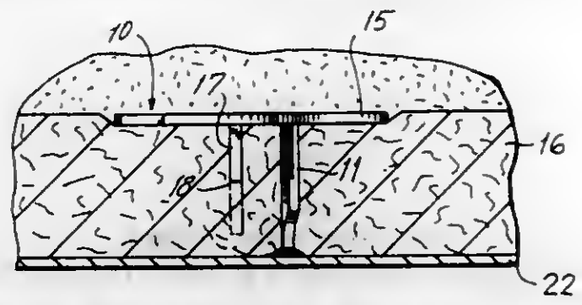
Paul A. Glorioso, Amherst, Ohio, assignor to TRW Inc., Cleveland, Ohio

Filed Sept. 19, 1975, Ser. No. 614,841
Int. Cl.² B23K 9/20
U.S. Cl. 219—98 8 Claims



1. Apparatus for welding a stud to a workpiece comprising a multi-phase power supply, electrical means for withdrawing the stud from the workpiece when said means is energized, spring means for plunging the stud toward the workpiece when said electrical means is deenergized, means connected with said power supply, the stud, and the workpiece for supplying rectified power from said supply to the stud and the workpiece to establish a pilot arc therebetween, additional means connected with said power supply, the stud, and the workpiece for supplying rectified power to the stud and the workpiece for establishing a main welding arc therebetween, said additional means including a semi-conductor controlled rectifier for each phase of the power supply, phase control means for sequentially causing said semi-conductor controlled rectifiers to conduct at predetermined times relative to the cycles of the multi-phase power supply, said phase control means including independent means for firing each of said semi-conductor controlled rectifiers, and means for energizing said firing means including a shunt in a welding circuit for the welding current, means for receiving a signal from said shunt, and hand-manipulatable means for modulating said signal and for changing the times in the cycles of the power supply at which said firing means are energized, a timing circuit connected to said electrical means to deenergize said electrical means and to enable said spring means to plunge the stud toward the workpiece, hand-manipulatable means for controlling the actuation of said timing circuit to control the time in the welding cycle at which the electrical means is deenergized and the stud is plunged toward the workpiece, said firing means comprising capacitor means effective to cause said semi-conductor controlled rectifiers to conduct when a charge on said capacitor means reaches a given value, circuit means for controlling the charging rate of said capacitor means, and up-slope circuit means for supplying power to said circuit means.

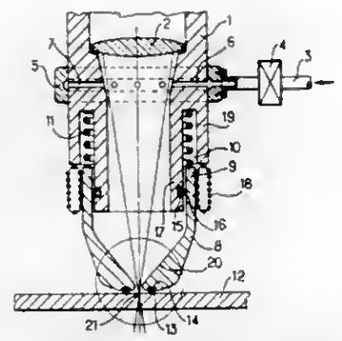
4,031,350
METHOD OF RESISTANCE WELDING
Milton Hindes, Massapequa, and Charles Giannone, North Babylon, both of N.Y., assignors to Duro-Dyne Corporation, Farmingdale, N.Y.
Filed Sept. 5, 1975, Ser. No. 610,640
Int. Cl.² B23K 11/04
U.S. Cl. 219—99 1 Claim



1. The method of attaching insulation to a sheet metal duct or the like utilizing a resistance welding pin, said welding pin being comprised of an integrally formed sheet metal blank including a head and a shank, said shank being bent at right angles to said head and including a sharpened tip disposed to one side of the plane of said head, a depending tongue portion formed from said blank, said tongue portion being disposed in parallel spaced relation to said shank and terminating in an end portion located to the same side of said plane as said shank, the spacing of said tip from said plane being greater than the spacing of said end of said tongue portion from said plane by a predetermined distance, comprising the steps of passing said shank of said pin through said insulation until said tip engages against said duct, connecting said head to one electrode of a welding transformer and said duct to the other electrode thereof, causing a welding current to flow through said shank while urging said shank toward said duct progressively to melt said tip and portions of said shank adjacent said tip to effect a welded connection between said shank and said duct, and interrupting the flow of said welding current through said shank at a point not later than when said tongue portion engages said duct, said tongue portion providing a limit stop and an alternate current path for said welding current, whereby only a limited length of said shank portion may be melted.

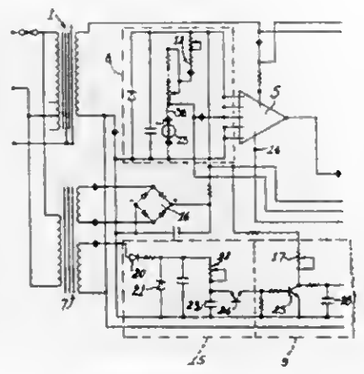
4,031,351
HIGH ENERGY LASER BEAM CUTTING METHOD AND APPARATUS
Jean Martin, Chatillon, France, assignor to Groupement Atomique Alsacienne Atlantique, Le Plessis-Robinson, France
Continuation of Ser. No. 408,910, Oct. 23, 1973, abandoned. This application July 28, 1975, Ser. No. 599,437
Claims priority, application France, Oct. 25, 1972, 72.37880
Int. Cl.² B23K 26/00
U.S. Cl. 219—121 L 4 Claims

1. In a device for cutting a work piece comprising:
a cylindrical sleeve,
a laser beam source, including a frontal lens mounted within said sleeve for directing a laser beam axially through said sleeve,
a plurality of peripheral gas inlet openings within said sleeve downstream of said lens,
a source of gas under pressure coupled to said openings, the improvement comprising:
valve means for adjusting the pressure of the gas entering said cylindrical sleeve interior through said gas inlet openings,
said cylindrical sleeve terminating on the end facing said work piece and opposite said laser beam source in an axially slidable nozzle sealably carried by said cylindrical sleeve and means for spring biasing said sleeve towards extended position,
a seal ring mounted on the end of said nozzle and contacting said work piece under said spring bias, said nozzle terminating adjacent said work piece interiorly of said



seal ring in a convergent upstream portion and a divergent downstream portion for gas discharge at the outlet of the nozzle at supersonic speed confined hy the seal ring contacting the work piece;
thereby, increasing the cutting speed of the laser beam cutting device.

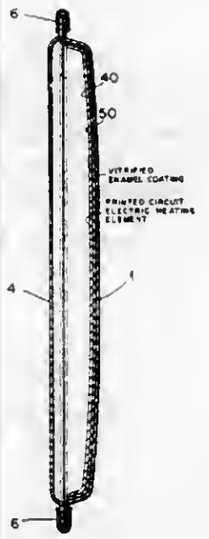
4,031,352
ELECTRIC BLANKET
Cedric Siegfried Oosterberg, Cape Town, South Africa, assignor to C. S. Oosterberg (Proprietary) Limited, Cape Town, South Africa
Filed Oct. 16, 1975, Ser. No. 623,105
Claims priority, application South Africa, Oct. 18, 1974, 74/6635
Int. Cl.² H05B 1/00
U.S. Cl. 219—212 14 Claims



1. An electric blanket assembly including a blanket having elements adapted to be heated from an electric supply source and a control circuit assembly adapted to control current through the elements to regulate the heating of the blanket and further adapted to disconnect the supply source from the heating elements under conditions of malfunction of the blanket, characterised in that the control circuit assembly includes temperature sensitive elements suitably located in the blanket and arranged to generate a control voltage, timing means adapted to generate a reference voltage and regulating means

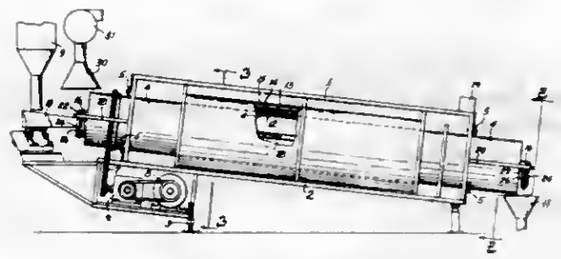
to compare the control voltage and the reference voltage and to trigger a solid state switching device which is adapted to control the current through the blanket heating elements.

4,031,353
ELECTRIC RADIANT HEATER
Eduardo Rueda Segura, Madrid, Spain, assignor to Empresa De Representaciones Unidas, S.A. (Erusa), Madrid, Spain
Filed Apr. 9, 1975, Ser. No. 566,326
Claims priority, application Germany, Apr. 11, 1974, 2417960; Apr. 11, 1974, 2417961; Apr. 11, 1974, 7412971[U]; Apr. 11, 1974, 7412972[U]
Int. Cl.² H05B 3/22; F24D 13/02; F24H 9/04; H01C 1/012
U.S. Cl. 219—345 7 Claims



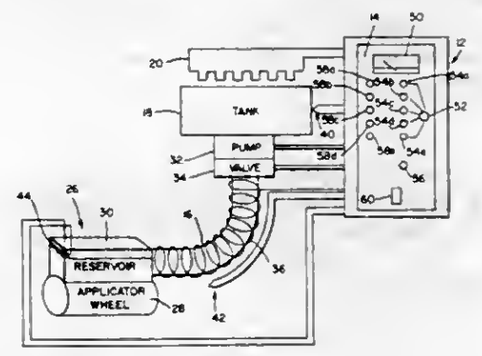
1. An electric heater comprising:
metal heating plate having at least one curved bulged portion, each of said curved bulged portions being surrounded by a flat transversely extending peripheral flange, each of said curved bulged portions having a completely concave curved inner surface and a completely convex curved outer heat radiating surface, at least said concave curved inner surface having thereon a coating of dielectric vitrified enamel covering the whole of said concave curved inner surface and a printed circuit electrical resistance heating element deposited on said enamel coating;
a thermal reflector plate having a bulged portion surrounded by a transversely extending flange;
said heating plate and said thermal reflector plate being joined with the concavities of said heating plate and said thermal reflector plate facing each other, the thus joined heating plate and thermal reflector plate forming a heating assembly;
means for energizing said heating element for heating said heating plate to radiate heat from said convex outer surface;
means for supporting said heating assembly with said convex outer surface being exposed to a zone to be heated;
said heating plate undergoing deformation of a thermal origin upon operation of said resistance heating element; and
a peripheral transition area, adjacent the intersection of each of said bulged portions and its surrounding flange of said heating plate, said transition area being so shaped as to comprise means for imparting a stress, upon deformation of said heating plate, always compressing said enamel coating covering said concave inner surface.

4,031,354
ROTARY HEATING APPARATUS FOR PUFFING BORAX
Godfrey B. D'Souza, Etobicoke, Canada, assignor to Canada Packers Limited, Toronto, Canada
Division of Ser. No. 470,295, May 15, 1974, Pat. No. 3,944,651. This application Oct. 9, 1975, Ser. No. 621,114
Int. Cl.² F27B 7/00
U.S. Cl. 219—389 8 Claims



1. A borax puffing apparatus of the rotary drum type which comprises a rotary, inclined tube and a supporting frame; means for mounting said tube on said frame for rotary motion of the tube around its axis; drive means for rotating said tube around its axis; electrical heating means extending along the exterior of said tube for a major portion of its length for heating the tube to an interior temperature of from about 220° F to 450° F; a thermal insulating jacket fixed to said frame and surrounding said heating means and tube; said heating means being fixed to the interior of said jacket and being spaced from the exterior wall of said tube; an internal scraper having means bearing against an internal surface of said tube; air suction means positioned at the upper end of said tube to draw air through the tube counter current to the direction of feedstock material; feed means at the upper end of the tube and discharge means at the lower end of the tube.

4,031,355
MULTI-CHANNEL TEMPERATURE RESPONSIVE PROCESS CONTROL SYSTEM
Stephen A. Leonik, Jr., 160 Sunrise Drive, Woodside, Calif. 94062
Filed Mar. 31, 1975, Ser. No. 563,911
Int. Cl.² H05B 1/02
U.S. Cl. 219—502 24 Claims



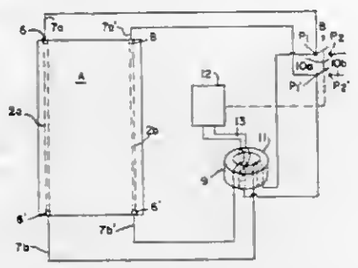
1. A control system comprising:
a sensor producing electrical signals representing a controllable physical condition;
a circuit including a first integrated circuit feedback amplifier having an input connected to said sensor for amplifying said sensor signals and a second like integrated circuit feedback amplifier having an input potentiometer connected across a power supply for adjusting the input thereto for producing set condition signals;
a meter selectively connected to receive and display said amplified sensor signals and said set condition signals in terms of the condition to be controlled;

a comparator comprising a third integrated circuit feedback amplifier connected to receive said amplified sensor signals and said set condition signals and producing a difference signal therefrom;
a switch connecting a power supply and an operator for affecting the condition to be controlled; and
an optical coupler applying said difference signal to control means of said switch for operating the switch to control said condition.

4,031,356
HEAT PANEL SAFETY SYSTEM

Akitosbi Nilbe, No. 4 Nishikubo, Sakuragawa, Shiba Minato,, Tokyo, Japan

Filed Nov. 20, 1975, Ser. No. 633,653
Int. Cl.² H05B 1/02
U.S. Cl. 219—509 **4 Claims**

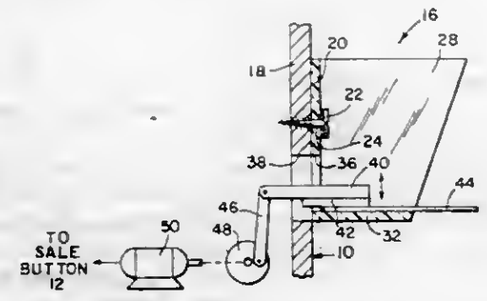


1. Safety heating panels apparatus comprising a sheet dielectric first and second electrodes connected to the sheet in spaced relationship between the electrodes, each electrode having spaced terminals connected to the electrode, electrical conductive heating layer on said dielectric sheet and connected between the electrodes, a first wire having ends connected to terminals on the first electrode and at least one turn in the first wire between its ends, a second wire having ends connected to terminals of the second electrode, and having a turn in the second wire, core means adjacent the turns, a relay having power terminals, and a relay wire connected to the power terminals and having a turn adjacent the core means, circuit breakers connected to the relay, whereby the relay operates the circuit breakers upon energization of the relay wire, the circuit breaker having first and second pairs of contacts and separate means to complete circuits between contacts in the first and second pairs, a contact in the first pair being connected to the first wire and a second contact in the first pair being connected to a power source, a contact in the second pair being connected to the second wire, and a second contact in the second contact in the second pair being connected to a power source.

4,031,357
SAFETY CHECK BILL RECEPTACLE

Wayne R. Brand, 21 Buena Vista, Corte Madera, Calif. 94925

Filed Feb. 20, 1976, Ser. No. 659,719
Int. Cl.² G07G 1/00
U.S. Cl. 235—12 **3 Claims**

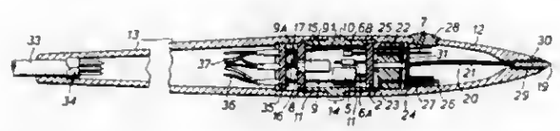


1. A receptacle for cash register comprising a rear wall adapted to be mounted on the exterior of the front plate of said register, and a bottom shelf secured to said rear wall, said rear wall including a slot along said bottom shelf, said slot being adapted to receive a paper money bill, said front plate of said register including a matching slot, said rear wall slot being aligned with said matching slot, said register including means for holding a paper money bill on said bottom shelf and for drawing said bill into said register, said means for holding and drawing said bill including an arm extending through said slots and adapted to contact a bill on said shelf, a motor and linkage connected to said arm to draw said arm and bill into said register, and a button on said register for actuating said motor upon completion of a sales transaction, said receptacle including two side walls at opposite ends of said rear wall and bottom shelf, a central partition and a front wall between said partition and one side wall, said slot being positioned between said partition and the other side wall, the portion of said receptacle with said front wall providing a tray for holding articles.

4,031,358
OPTICAL CODE READERS

Brian Robert Thornlley, Wimborne Minster, England, assignor to Plessey Handel und Investments A.G., Zug, Switzerland

Filed July 1, 1975, Ser. No. 592,264
Claims priority, application United Kingdom, July 3, 1974, 29423/74
Int. Cl.² G01N 21/30; G06K 7/10
U.S. Cl. 235—61.11 E **3 Claims**



1. A probe for scanning optically encoded data comprising a generally tubular housing including a light source, a reading head fitting slidably within the tubular housing, a plurality of optical fibres forming a light guide means wherein the optical fibres are positioned and arranged to bias by reason of their natural springiness the said reading head so that its tip is constrained normally to project from the said housing, and an optical detector arranged within the tubular housing, said light source and said optical detector being optically coupled via said optical fibres to said tip of said reading head so that light is transmitted from said light source via said fibres to illuminate data scanned and so that light reflected from data thus illuminated is returned from said tip of said reading head along another of said fibres to be received at said optical detector.

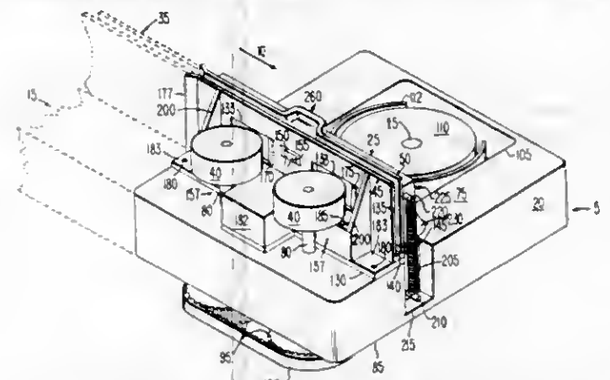
4,031,359
STRAIGHT LINE READ SYSTEM

Kyriakos Christou, Livonia; Karlis Kruklitis, Plymouth, and William R. Burger, Livonia, all of Mich., assignors to Burroughs Corporation, Detroit, Mich.

Filed Dec. 18, 1975, Ser. No. 642,061
Int. Cl.² G06K 13/07; G11B 25/04
U.S. Cl. 235—61.11 D **42 Claims**

1. A document read system disposed on a base member and having a write and read MICR head for writing and reading characters on a document comprising:
a. means defining a linear path through which the documents may be throughputted, and for operatively mounting therein the write and read MICR heads to face the documents in said linear path defining means;
b. first wall means fixably disposed on the base member for establishing one side of the document flow in said linear path defining means;
c. second wall means pivotally disposed on the base member for establishing the other side of the document flow in said linear path defining means and for providing spring-

loaded release and return for easy tactile access to documents in said linear path defining means;
d. means disposed on the base member for driving the documents to be throughputted in said linear path defining means at a relatively constant speed;
e. means disposed on said linear path defining means for maintaining good registration on the documents relative

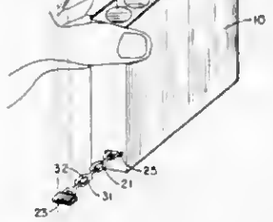


to said linear path defining means for minimizing relatively vertical spatial translations of documents of varying widths; and
f. means disposed on the base member for enabling the document in said linear path defining means as it is throughputted by said driving means to be in close proximity to the write and read MICR heads for positive communative contact therewith.

4,031,360
ELECTRONIC READ OUT TAPE MEASURE

Gustave H. Soule, Jr., Franklin, La., assignor to The Raymond Lee Organization, Inc., New York, N.Y., a part interest

Filed Nov. 17, 1975, Ser. No. 632,529
Int. Cl.² G06M 3/14; G01B 3/12
U.S. Cl. 235—92 DN **1 Claim**

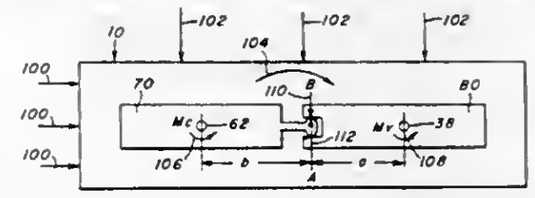


1. A tape measure device incorporating a flexible tape mounted on a spring-biased rotatable reel in a housing, said housing enclosing an electric calculator connected to an electronic digital display unit, with said calculator connected to means to sense the length of tape extended out of said housing in terms of a total of discrete units, and with said calculator incorporating means to cause the electronic digital display unit to display the said total of discrete units,
said tape fabricated of joined individual links, with each link perforated by a through hole of a size to fit over a tooth of a sprocket wheel rotatably mounted in said housing, with the links of said tape engaged about the sprocket wheel so as to cause the sprocket wheel to rotate in direct proportion to the travel of said tape into or out of said housing,
said sprocket wheel rotatably linked to switching means which transmit pulses of electrical current to said calculator in response to the rotation of said sprocket wheels, the number of said pulses being directly proportional to the degree of rotation of the sprocket wheel and the polarity of said pulses being responsive to the direction of rotation of said sprocket wheel,
such that the calculator controls the elctronic digital display unit to display a numeral representing a length of tape extended out of the housing, said numeral being the sum of pulses of a first polarity minus the sum of pulses of the reverse polarity.

4,031,361
ELECTROMECHANICAL COUNTER

Eberhard Moll, Magstadt, Germany, and Lee M. Walch, Jr., Pittsburgh, Pa., assignors to Rockwell International Corporation, Pittsburgh, Pa.

Filed Jan. 14, 1976, Ser. No. 648,855
Int. Cl.² G06M 1/06, 3/12
U.S. Cl. 235—92 C **5 Claims**

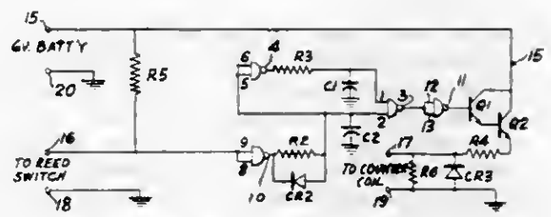


1. An electrically operated counting mechanism comprising a counter, a clapper mounted for pivotal movement about a first axis, means to induce pivotal movement of said clapper about said first axis in response to an electric signal, a verge mounted for pivotal movement about a second axis parallel to and spaced from said first axis, means drive connecting said verge to said counter to operate said counter in response to pivotal movement of said verge about said second axis, means interconnecting said clapper and said verge at a point intermediate said first and second axes whereby pivotal movement of said clapper in one direction will cause pivotal movement of said verge in the opposite direction, the centers of gravity of said clapper and said verge being in substantially the same plane as the plane containing said first and second axes.

4,031,362
ELECTRONIC REMOTE READING SYSTEM FOR A METER

Richard D. Brugger, and Joseph A. Barna, both of Erie, Pa., assignors to Zurn Industries, Inc., Erie, Pa.

Filed Sept. 17, 1975, Ser. No. 614,192
Int. Cl.² G06M 3/12
U.S. Cl. 235—92 FL **14 Claims**



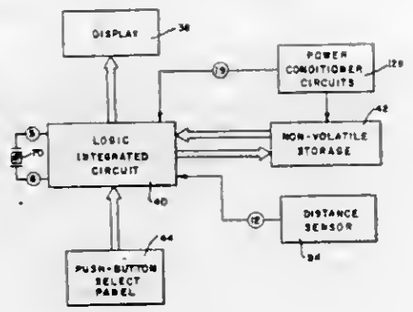
1. A remote reading system for measuring the flow of a product comprising,
an instrument having shaft means moveable in proportion to the flow of said product, contact means,
actuating means on said shaft means adapted to close and open said contact means in response to movement of said shaft,
an electrical circuit connected to said contact means and connected to a counter means for counting the number of times said contact is closed,

said electrical circuit having a power source connected thereto,
said circuit having means comprising an electronic valve connecting said power source to said counter means,
a control element on said electronic valve,
and electronic pulse forming means connected to said control element causing said contact means and to said control element causing said electronic vaive to respond to said closing of said contact and put out a pulse of relatively short duration to said counter when said contact goes from open to closed position and put out no pulse when said contact moves from closed to open position, whereby energy flows from said power source through said electronic valve into said counter during the time of said pulse only.

4,031,363
DISPLAY APPARATUS FOR AUTOMOTIVE VEHICLES

John D. Freeman, Westport, Conn.; Ralph C. Robinson, and Kenneth D. Swonger, both of Charlotte, N.C., assignors to General Time Corporation, Thomaston, Conn.

Filed May 17, 1976, Ser. No. 686,826
Int. Cl.² G06F *15/20*
U.S. Cl. 235—150.2 23 Claims

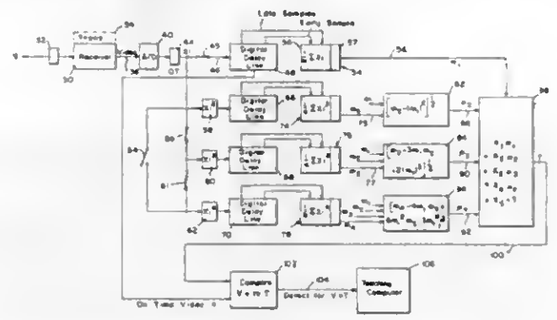


1. A system for automotive vehicles adapted both for providing automatically at least a display representing a time function in minutes and hours and upon manual activation a different display to advise the operator of said automotive vehicle of the state of a selected one of a plurality of other functions which periodically are changing, said system comprising:
a. circuit means including
1. a source of a first input frequency,
2. first divider means connected to said source providing an output which is of a frequency comprising a division of said first input frequency,
3. second divider means having an output of a frequency comprising a further division of said first input frequency,
4. means connecting said first and second divider means whereby said output of said first divider means comprises the input of said second divider means, and
5. a time register also connected to said output of said first divider means, said time register being continuously updated during operation of said system;
b. storage means comprising at least a first storage network, said first storage network connected to said second divider means thereby both to receive said output of said second divider means and store information so that said first storage network continually represents the then present condition of one of said plurality of other functions;
c. a display adapted normally to display said time function and upon command to discontinue said normal display and to display said selected one of said plurality of other functions;
d. means connecting each of said storage means and time register to said display, said connecting means including
1. control means included between said display and storage means for gating said selected one of said plurality of other functions to said display and isolating all other functions from said display;
e. means for activating said control means; and
f. power means for energizing each of said circuit means, storage means and display.

4,031,364
MULTIPLE MOMENT VIDEO DETECTOR

Richard D. Wilmot, Buena Park, Calif., assignor to Hughes Aircraft Company, Culver City, Calif.

Filed Nov. 10, 1975, Ser. No. 630,592
Int. Cl.² G06F *7/38*; G01S *9/02*
U.S. Cl. 235—151.3 18 Claims



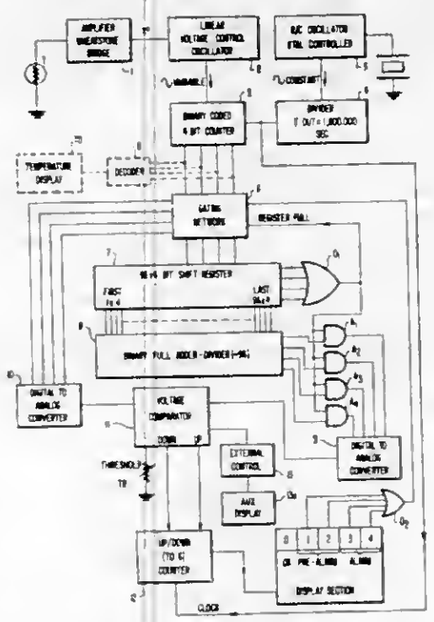
1. A detector system responsive to a source of signals of a statistically varying frequency of occurrence distribution comprising:
first means responsive to said source of signals for generating in parallel a plurality of r moments of said varying distribution; and
second means coupled to said first means for multiplying each moment by a selected constant and combining said moments to develop a threshold signal.

4,031,365
TEMPERATURE MONITORING AND DISPLAY SYSTEM

Guglielmo Raggiotti, and Domenico Colonnelli, both of Perugia, Italy, assignors to Itus Patent Holding (IPH) N.V., Willemstad, Netherlands Antilles

Filed Oct. 14, 1975, Ser. No. 621,915
Claims priority, application Italy, Aug. 21, 1975, 51020/75
Int. Cl.² G01V *1/28*; G01K *7/00*
U.S. Cl. 235—151.3 12 Claims

1. A monitoring system for monitoring the temperature levels of the body of a patient for extended periods, said system comprising:
transducer means for sensing the temperature of the body of the patient under observation and for producing an output voltage in accordance therewith,
a voltage controlled oscillator for producing an output whose frequency varies in accordance with the output voltage of said transducer means,
an n-bit binary coded counter connected to said voltage controlled oscillator for producing an n-bit binary coded output representative of the temperature sensed,
gating means,
a shift register controlled by said gating means for storing the n-bit binary coded output of said counter over N cycles, said N cycles being repeated and said counter producing an N + 1 output following the Nth output thereof,
an adder-divider circuit connected to the outputs of said register for summing N outputs stored thereby and for dividing the resultant sum by N to produce a digital signal representative of the arithmetic average of said N outputs,
comparator means for comparing the output of said adder-divider circuit with the N + 1 output of said counter and for producing a first "normal" output when the difference between said outputs is less than a positive threshold level

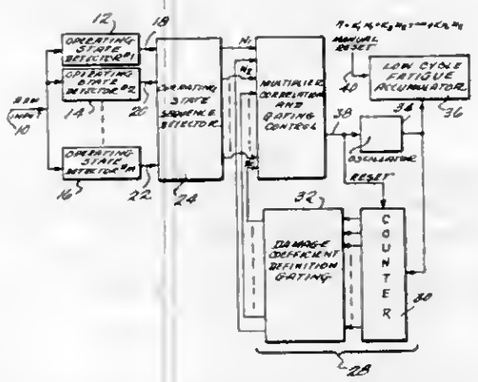


and for producing a second "abnormal" output when said difference exceeds said threshold level, and
display means connected to the output of said comparator means.

4,031,366
LOW CYCLE FATIGUE DAMAGE COUNTER

Robert L. Hartung, Fort Worth, Tex., assignor to Howell Instruments, Inc., Fort Worth, Tex.

Filed Oct. 30, 1975, Ser. No. 627,458
Int. Cl.² G01V *1/28*; G01M *7/00*
U.S. Cl. 235—151.3 16 Claims

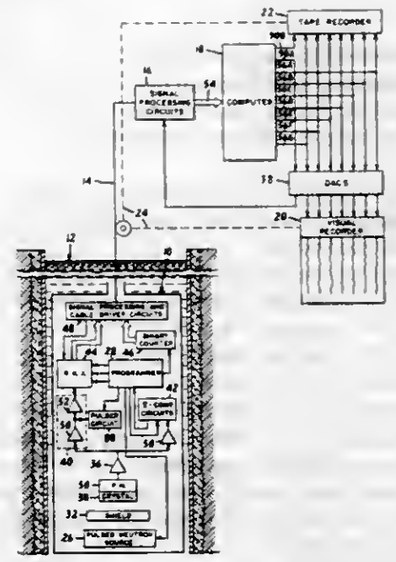


1. Apparatus for detecting and indicating cumulative low cycle fatigue damage done to a rotating member due to the sequential passage of said member through different operating states, said apparatus comprising:
input means for providing an electrical input signal representative of the existing operating state of said rotating member.
classification means connected to receive said input signal for detecting which of a plurality of predetermined operating states is then in occurrence and for producing a respectively corresponding output in response to detection of each different operating state,
sequence detection means for receiving the output from said classification means and for detecting which of a plurality of predetermined sequences of operating states have occurred and for producing a respectively corresponding output in response to detection of each different predetermined sequence of operating states,
damage coefficient determining and correlation means operatively connected to receive the output from said sequence detection means for defining a predetermined constant number of each said predetermined plurality of sequences and for respectively associating each of said constant numbers and said sequences, and
acccumulator means connected to the output of the damage coefficient determining and correlation means for receiving therefrom electrical signals representing the constant number corresponding to the detected predetermined sequence of operating states and to cumulatively add and totalize such constant numbers thereby providing an indication of cumulative low cycle fatigue damage done to the rotating member.

4,031,367
METHODS AND APPARATUS FOR PULSE HEIGHT ANALYZER OFFSET CONTROL

Richard D. Murphy, Ridgefield, Conn., assignor to Schlumberger Technology Corporation, New York, N.Y.

Filed Mar. 31, 1975, Ser. No. 563,510
Int. Cl.² G01V *5/00*
U.S. Cl. 235—151.3 23 Claims



1. Apparatus for generating test pulses useful in controlling offsets in the analog input/digital output relationship of a pulse height analyzer over a certain temperature range, comprising:
switching circuit means responsive to a command signal for generating a first pulse;
means coupled to the switching circuit means for attenuating the first pulse by a predetermined factor which is substantially constant over said temperature range to produce a second pulse;
means coupled to the switching circuit means and to the pulse attenuating means for passing the first and second pulses in a predetermined sequence; and
impedance buffer means, having substantially stable temperature offset characteristics over said certain temperature range, for converting the first and second pulses passed by the pulse passing means into first and second test pulses of a predetermined shape for application to a pulse height analyzer, whereby the amplitude ratio of the first and second test pulses produced by the buffer means is substantially stable over said temperature range.

4,031,368

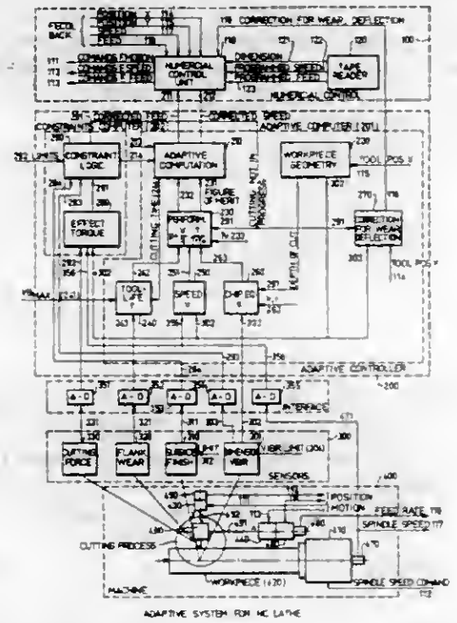
ADAPTIVE CONTROL OF CUTTING MACHINING OPERATIONS

Bertil Coldiog, Stockholm; Arne Novak, Vallingby; Unto Sandstrom, and Goran Jakobsson, both of Stockholm, all of Sweden, assignors to Verkstadsteknik AB, Stockholm, Sweden

Continuation-in-part of Ser. No. 244,607, April 17, 1972, abandoned. This application Feb. 11, 1974, Ser. No. 441,709

Int. Cl.² B23Q *15/00*; **G05B** *13/02*; **G06F** *15/46*

U.S. Cl. 235—151.11 **28 Claims**



1. A method of adaptive control of cutting machine operations to optimize the productivity of cutting machine means including at least one cutting tool and having controllable cutting parameters affecting its cutting tool comprising the steps of:

a. selecting a first set of cutting parameters,

b. performing a machining operation using said first set of cutting parameters,

c. during said machining operation measuring a plurality of times the magnitude of at least one wear-related parameter of the cutting tool,

d. comparing the successive measurements of said at least one wear parameter,

e. calculating the tool life by projecting, based on said comparison step, when said wear parameter will reach a predetermined limiting value,

f. calculating productivity based on said first set of cutting prameters and the tool life calculated in said tool life calculating step,

g. optimizing productivity by selecting further sets of said cutting parameters, and calculating for each set the corresponding tool life, and the productivity resulting from said further sets of cutting parameters and said corresponding tool life,

h. selecting from the optimized productivity value the desired set of cutting parameters.

4,031,369

INTERPOLATION AND CONTROL APPARATUS AND METHOD FOR A NUMERICAL CONTROL SYSTEM

James Patrick Heaman, Westland, Mich., and James Anthony Michaud, Bellbrook, Ohio, assignors to The Bendix Corporation, Southfield, Mich.

Filed Aug. 12, 1975, Ser. No. 603,986

Int. Cl.² G05B *19/30*; **G06F** *15/46*

U.S. Cl. 235—151.11 **7 Claims**

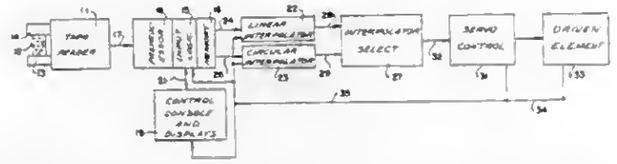
1. A numerical control system for controllably moving an element along a motion path of arbitrary configuration; said system including means for receiving data numerically defining said motion path from a storage medium, system logic for preprocessing and interpolating said data, and means for receiving said data from said system logic and moving said element along said path, said system logic including:

preprocessor means for receiving said data and providing linear interpolating data and circular interpolating data;

said linear interpolating data defining the movement of said element as a straight line segment lying between a start point and an end point at an arbitrary angle with respect to at least two mutually perpendicular axes;

said preprocessor means including means for generating a plurality of sample intervals for each of said segments, the number and length of said sample intervals varying for different segments so that each segment includes an integral number of said sample intervals and said end point for each segment is accurately forced;

said circular interpolating data defining the movement of said element as the rotation of the end of a radius through a total angular excursion from a first position to a final position;



said preprocessor means including means for generating a plurality of subangular excursions for each of said angular excursions, the number and extent of said subangular excursions varying for different angular excursions so that each angular excursion includes an integral number of said subangular excursions and said final position for each angular excursion is accurately forced;

linear interpolating means receiving said linear interpolating data for generating linear interpolated data indicative of the end points for each liner sample interval and apply said linear interpolated data to said means for receiving and moving;

circular interpolting means receiving said circular interpolating data for generating circular interpolated data indicative of the end points for each subangular excursion and applying said circular interpolated data to said means for receiving and moving.

GENERATION OF MATHEMATICAL FUNCTIONS

Reginald Catherall, Woking, England, assignor to Bell & Howell Limited, Basingstoke, United Kingdom

Filed Feb. 17, 1976, Ser. No. 658,349

Claims priority, application United Kingdom, Feb. 26, 1975, 8134/75

Int. Cl.² G06F *7/38, 1/02*

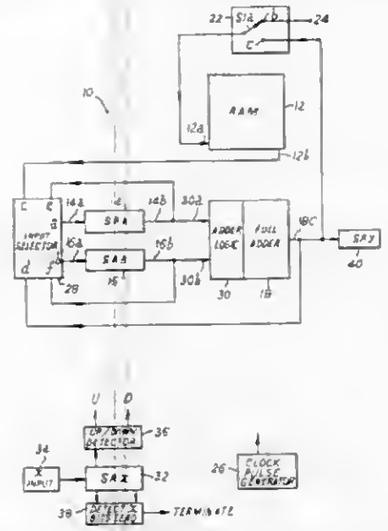
U.S. Cl. 235—152 **29 Claims**

1. A method of interpolating a value of the dependent variable y corresponding to a given value of an independent variable x, wherein y is a function of x and is described by a linear polynomial series of the $2n$th order wherein each term of the series comprises the product of a linear polynomial of x and a coefficient, and the terms of the linear polynomial series containing the $(n+1)$th to the $2n$th polynomials are in the form of an expression which is a product of a common nth order polynomial of x, and the sum of the zero'th to the nth order polynomial each multiplied by its appropriate coefficient, using an nth order polynomial interpolation method to obtain up to a $2n$th order interpolation in 2 iterations of the nth order interpolation method, the method comprising the steps of:

determining the coefficients for each of the terms of the linear polynomial series;

using the determined appropriate coefficients relevant to the $(n+1)$th to the $2n$th polynomials to perform an nth order interpolation to obtain a specific coefficient for the common nth order polynomial at a given value of the independent variable x;

modifying, as required the coefficients relevant to the nth and lower order polynomials of the series to consolidate the term which comprises the common nth order polynomial multiplied by its specific coefficient to provide modified coefficients;



and performing a second nth order interpolation using the modified coefficients at the given value of the independent variable x;

whereby the result of the second interpolation is the value of the dependent variable y for the given value of the independent variable x which would have been obtained by using a higher order interpolation method up to the 2nth order.

4,031,372

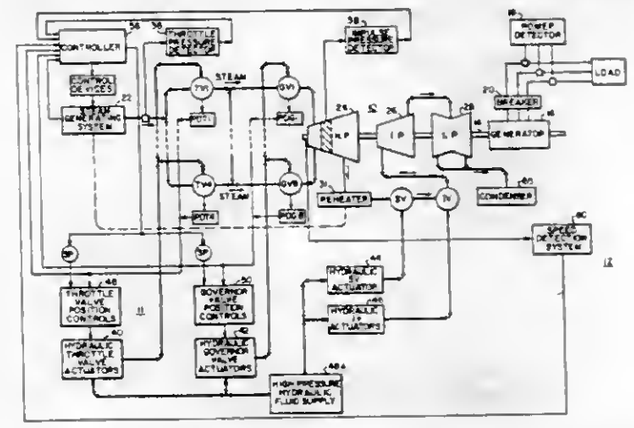
SYSTEM FOR MANUALLY OR AUTOMATICALLY TRANSFERRING CONTROL BETWEEN COMPUTERS WITHOUT POWER GENERATION DISTURBANCE IN AN ELECTRIC POWER PLANT OR STEAM TURBINE OPERATED BY A MULTIPLE COMPUTER CONTROL SYSTEM

Guy E. Davis, Martinez, Calif., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Nov. 6, 1973, Ser. No. 413,278

Int. Cl.² F01D *17/02*; **G05B** *15/00*; **G06F** *15/06*

U.S. Cl. 235—151.21 **84 Claims**



1. A control system for an electric power plant having at least one steam turbine and a steam generator, said control system comprising multiple digital computers including at least a first digital computer and a second digital computer, means for generating input signals representing predetermined process variables associated with said steam generator, means for generating input signals representing predetermined process variables associated with said steam turbine, means for coupling the input signals to both of said computers, each of said computers having means for controlling its sequential programmed operation and including substantially identical control elements which generate control outputs as a function of input signals in various control loops to operate controllable elements of said steam generator and throttle and governor valves of said steam turbine, means for sensing predetermined control system malfunctions, means for coupling the outputs of one of said computers to operate the steam generator controllable elements and turbine valves, means for substantially conforming the structure of the other computer to the structure of said one computer in real time, said conforming means including means for responding to predetermined process input signals to control the operation of at least some of said computer control elements in a tracking mode and generate corresponding control outputs in said other computer substantially equal to those from said one computer, and means for executing a transfer in the control of the steam generator and the turbine from said one computer to said other computer substantially without disturbing the power generation when said sensing means detects a control system malfunction.

4,031,371

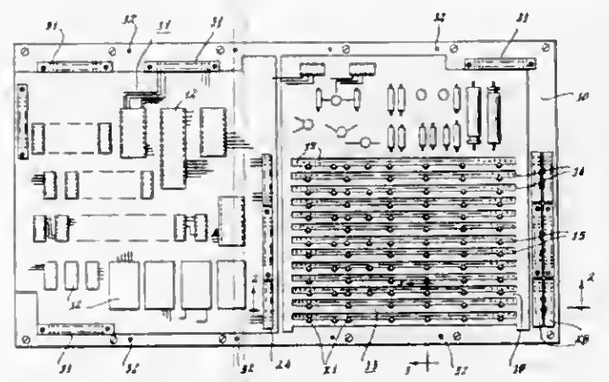
MICROCOMPUTER BOARD HAVING WIRE-WRAP TERMINALS

Hubert G. DeVries, Littleton, Colo., assignor to Monolithic Systems Corporation, Englewood, Colo.

Filed Mar. 8, 1976, Ser. No. 664,815

Int. Cl.² H05K *7/08*

U.S. Cl. 235—152 **11 Claims**



1. A microcomputer board comprising an insulating mounting board, first microcomputer components fixedly mounted to said insulating mounting board in a first area thereof, first and second pluralities of connector means having wire-wrap pins and fixedly mounted to said insulating mounting board, at least a pair of parallel rows of holes in said board in a second area thereof, individual connectors having wire-wrap pins mounted in said holes, and printed circuit means on said insulating mounting board interconnecting said microcomputer components and said first plurality of connector means and not extending directly to said individual connectors and said second connector means.

4,031,373

VELOCITY COMPUTING CHRONOGRAPH

Robert Beckwith, R.R. 1, Box 1058, Marathon, Fla. 33050

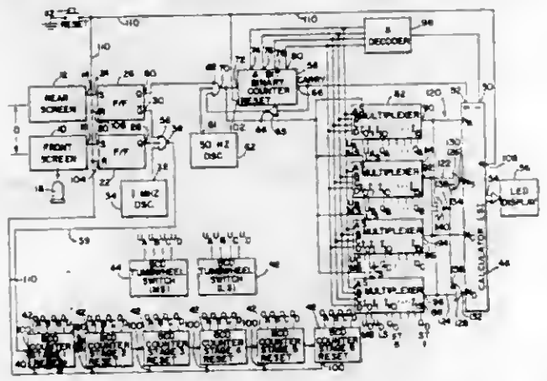
Filed June 1, 1976, Ser. No. 691,327

Int. Cl.² G01N *23/10*; **G06M** *3/06*

U.S. Cl. 235—151.32 **1 Claim**

1. A projectile velocity measuring and computing system having front and rear projectile sensing screens having outputs indicative of the passage of a projectile therethrough the apparatus comprising: a first oscillator; a chain of BCD counter stages; means responsive to the outputs of said screens for coupling said oscillator for clocking said chain of

counters only during the time of flight of said projectile from the front to the rear screen means; a group of BCD coded numerical switches for manual entry of the distance between said pair of screens; an electronic digital display; a digital calculator integrated circuit having data input terminal means for serially receiving BCD digit signals, a divide command input terminal, an equals command input terminal and output means for driving said electronic digital display with the result of computation in said calculator means; means responsive to the output of said rear screen including a second oscillator and a binary counter for deriving a series of binary coded sequential numerical control signals after the flight of said projectile between said front and rear screen means; multiplexer means fed by BCD digit output signals from said BCD counter stages



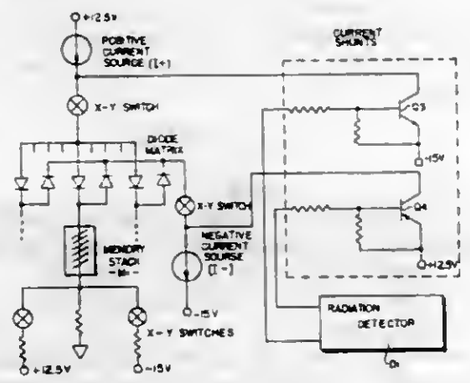
and numerical switches and feeding said data input terminal means of said calculator means for selectively applying different ones of said BCD digit output signals to said data input terminal means in response to the digital state of said numerical control signals, said multiplexer means being organized for serially applying first said BCD digit signals from said numerical switches and then from said BCD counter stages in response to the sequential numerical control signals, there being at east one predetermined numerical control signal state between the application of said BCD digit signals from said BCD coded numerical switches and from said BCD counter stages; means responsive to said predetermined control signal state for driving said divide command input terminal; and means responsive to the occurrence of a last of said numerical control signals for driving said equals command input terminal.

4,031,374

ERROR CORRECTION SYSTEM FOR RANDOM ACCESS MEMORY

Alan I. Grondan, Harrington Park; George F. Schroeder, and H. Lee Treffinger, both of Wayne, all of N.J., assignors to The Singer Company, Little Falls, N.J.

Filed Dec. 24, 1974, Ser. No. 536,142
Int. Cl.² G11C 29/00; G06F 11/10
U.S. Cl. 235—153 AM **16 Claims**



1. A protective system to prevent data word losses in a random access memory in the presence of a radiation pulse from a nuclear radiation event, or the like, which memory includes a multiplicity of individual memory elements and associated selective and read/write circuitry; the combination of:

circumvent circuitry coupled to the selective and read/write circuitry for protecting all unaddressed memory elements in the memory in the event of a radiation pulse;

accessing means coupled to the memory for selectively accessing the data words in the memory at the different memory locations therein; and

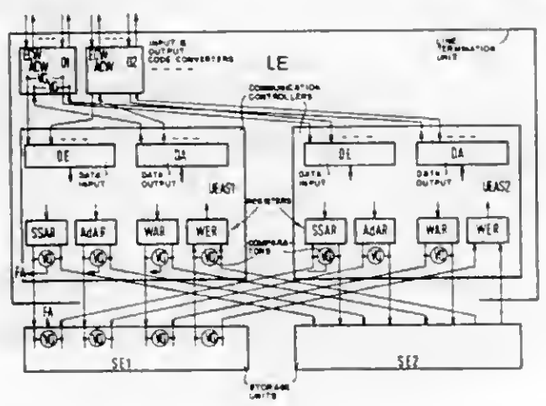
error correction and word recovery logic circuit means coupled to the accessing means for reconstituting the data word being accessed during the radiation pulse so as to replace such data word in the memory with a reconstituted date word.

4,031,375

ARRANGEMENT FOR FAULT DIAGNOSIS IN THE COMMUNICATION CONTROLLER OF A PROGRAM CONTROLLED DATA SWITCHING SYSTEM

Gerhard Jaskulke, Dachau; Alois Schwarz, Munich, and Armin Rutter, Unterpfaffenhofen, all of Germany, assignors to Siemens Aktiengesellschaft, Munich, Germany

Continuation of Ser. No. 501,463, Aug. 28, 1974, abandoned. This application Mar. 15, 1976, Ser. No. 666,583
Claims priority, application Germany, Aug. 29, 1973, 2343586
Int. Cl.² G06F 11/04
U.S. Cl. 235—153 AK **7 Claims**



1. Apparatus for monitoring fault diagnosis operations in a communications controller of a line termination unit in a program controlled data switching center, wherein each said line termination unit includes data input and output devices connecting said line termination unit to transmission lines, word input and output registers for transferring data to and receiving data from a central storage and error detecting means in communication with said central storage for transmitting, responsive to a fault in said communications controller, an error signal to said central storage thereby initiating the operation of a safeguarding routine, comprising:

fault collection means for receiving error signals, registering a fault word describing the error which has occurred and generating first fault signals for communication to said communications controller and second fault signals for communication to said central storage,

diagnostic routine means in said communication controller and including a first decoding means coupled to a said word input register for receiving diagnosis commands issued responsive to said safeguarding routine and for generating, responsive thereto, first control signals and including second decoding means for operating responsive to said first control signal for decoding said diagnosis commands and producing corresponding second control signals,

intermediate buffer storage means in said communication controller,

first means for connecting, responsive to said first control signals, to said input word register, said fault word register and said intermediate buffer storage means to said word output register, and

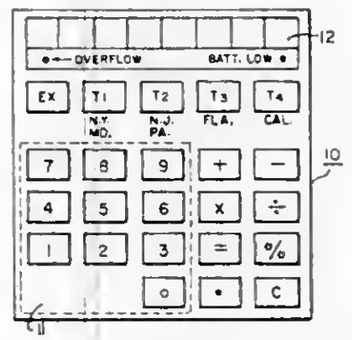
second means for connecting, responsive to said second control signals, components of said communication controller individually to a said word input register for accepting further instructions and to a said word output register for transferring information to said central storage.

4,031,376

CALCULATING METHOD AND APPARATUS FOR HANDICAPPING THOROUGHBRED RACES AND THE LIKE

Samuel Corkin, Jr., 339 Davis Ave., Kearny, N.J. 07032

Filed June 30, 1975, Ser. No. 579,942
Int. Cl.² G06F 7/38
U.S. Cl. 235—156 **14 Claims**



1. A calculator of the digital type particularly adapted for indicating a rating of an entry in a racing contest by operating on the past performance of said entry as regarding past wins (W), past seconds (S) and past thirds (T) and total monies earned by said entry in said past performances, comprising:

a. a keyboard for keying in a code having a given number of digits of a predetermined length indicative of past wins (W), past seconds (S) and past thirds (T),

b. means responsive to said code for multiplying said keyed digits associated with said wins W, said seconds S and said thirds T each by a separate corresponding factor, to provide a separate product for W. S. and T,

c. means responsive to said products for adding the same to provide a total sum,

d. means responsive to said total sum for dividing the same into unity to produce at an output, a class factor,

e. means responsive to said class factor for multiplying the same by said total monies earned to obtain a rating number, and

f. means for displaying said rating number.

4,031,377

FAST MULTIPLIER CIRCUIT EMPLOYING SHIFT CIRCUITRY RESPONSIVE TO TWO BINARY NUMBERS THE SUM OF WHICH APPROXIMATELY EQUALS THE MANTISSA OF THE MULTIPLIER

Ralph Deutsch, Sherman Oaks, and Glen R. Griffith, Westminster, both of Calif., assignors to Nippon Gakki Seizo Kabushiki Kaisha, Hamamatsu, Japan

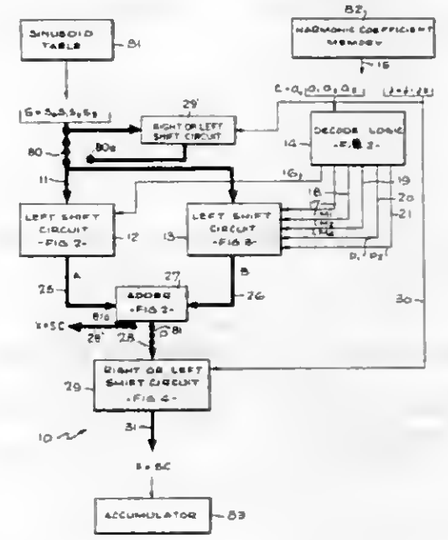
Filed Aug. 25, 1975, Ser. No. 607,141
Int. Cl.² G06F 7/54
U.S. Cl. 235—164 **11 Claims**

1. A multiplier circuit for multiplying a binary fixed point multiplicand by a binary floating point multiplier, comprising:

decode logic means, connected to receive the mantissa of said floating point multiplier, for providing control signals indicative of two binary numbers the sum of which is approximately equal to the value of said mantissa, each of said two numbers being a power of two,

a first left shift circuit means connected to said decode logic means and responsive to one of the control signals therefrom, for left shifting said multiplicand by a number of places corresponding to the first of said two numbers,

a second left shift circuit connected to said decode logic means and responsive to other of the control signals therefrom, for left shifting said multiplicand by a number of places corresponding to the second of said two numbers,



an adder, connected to both said first and second left shift circuits, for adding together the shift products thereof, and

another shift circuit for shifting a binary number by a number of places corresponding to the power of said floating point multiplier, said shifting being to the right for a negative power and to the left for a positive power, said other shift circuit being connected to said adder for shifting the sum received from said adder, the shifted output of said other shift circuit being the multiplication product.

4,031,378

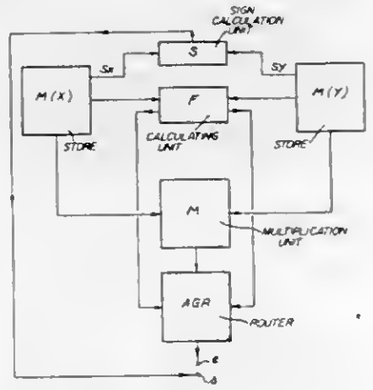
METHOD AND APPARATUS FOR FAST MULTIPLICATION INCLUDING CONVERSION OF OPERAND FORMAT

Michel L. Le Comte, Longjumeau, France, assignor to Jeumont-Schneider, Puteaux, France

Filed June 26, 1975, Ser. No. 590,509
Claims priority, application France, June 28, 1974, 74.22575
Int. Cl.² G06F 7/52
U.S. Cl. 235—164 **22 Claims**

1. A fast-multiplication digital system comprising at least one multiplier for multiplying two binary numbers each number comprised of a plurality of digits having differing significance and weights, each multiplier comprising means for converting each of the two binary numbers into a first amplitude number having a sign, each of said first amplitude numbers comprising the most significant digits of said binary number, the first digit being the most significant non-zero digit of said binary number, and into a second shift number having an amplitude indicative of a weight shift of the binary number before and after conversion to a predetermined format and a sign indicative of a direction of said weight shift, the system further comprising means for multiplying the first amplitude numbers of the two binary numbers and for producing a first resultant number corresponding to the multiplication of said first amplitude numbers, means for algebraically adding the second shift numbers of the two binary numbers and for pro-

ducing a second resultant number corresponding to the addition of said second shift numbers, and means for shifting said



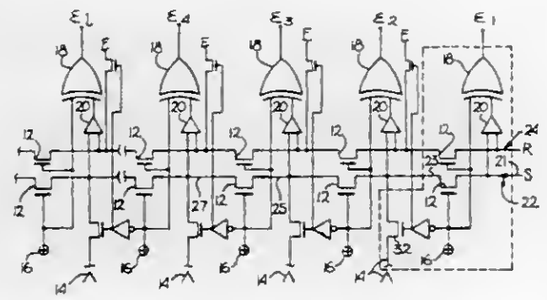
first resultant number in response to said second resultant number.

4,031,379

PROPAGATION LINE ADDER AND METHOD FOR BINARY ADDITION

Samuel Schwartz, Saratoga, Calif., assignor to Intel Corporation, Santa Clara, Calif.

Filed Feb. 23, 1976, Ser. No. 660,693
Int. Cl.² G06F 7/50
U.S. Cl. 235—175 21 Claims



1. A binary adder for adding at least two multiple bit binary numbers comprising:

a conductive reference propagation path having a plurality of segments;

a conductive sense propagation path having a plurality of segments;

a plurality of gating means in series with said reference and sense propagation paths, said gating means for selectively coupling said segments of said reference propagation path together and for selectively coupling said segments of said sense propagation path together;

a plurality of product circuit means corresponding to a plurality of orders of bits of said multiple bit binary numbers, each product circuit means for generating a product signal of a corresponding order of bits of said multiple bit binary numbers and for coupling said product signal to that segment of said sense propagation path corresponding to the next higher order of bits;

a plurality of summing circuit means corresponding to a plurality of orders of bits of said multiple bit binary numbers, each summing circuit means for generating a sum signal of a corresponding order of bits of said multiple bit binary numbers and for coupling said summing signal to selected ones of said plurality of gating means; and

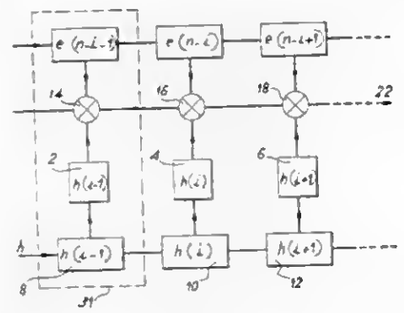
a plurality of output circuit means, each output circuit means coupled to one of said summing circuit means and coupled with selected segments of said sense propagation path, each of said output circuit means for generating an output signal in response to said sum signal and charged state of a corresponding segment of sense propagation path.

4,031,380

METHOD AND DEVICE FOR THE INTEGRATION OF ANALOG SIGNALS

Luc Audaire, St.-Nizier-du-Moucherotte; Joseph Borel, Echirolles; Vincent Le Goascoz, Claix, and Robert Poujois, Grenoble, all of France, assignors to Commissariat a l'Energie Atomique, Paris, France

Division of Ser. No. 464,879, April 29, 1974, Pat. No. 3,956,624. This application Sept. 15, 1975, Ser. No. 613,373
Claims priority, application France, May 4, 1973, 73.16246
Int. Cl.² G06G 7/18
U.S. Cl. 235—183 3 Claims



1. A method of integration of an analog signal in integrated circuit memory elements, wherein the memory elements are constituted by field-effect transistors having a number of layers of different dielectrics between the gate and the doped semiconductor substrate of the transistor, comprising the steps of performing a discrete sampling of the analog signal at N points, storing the N amplitudes corresponding to the N points in the form of threshold voltages in N of said transistors, then storing the amplitudes corresponding to N points of successive sampling of the analog signal in one transistor by successively adding those amplitudes to the threshold voltage of said one transistor, and reading the resultant threshold voltage of said one transistor as the result of the integration.

4,031,381

ILLUMINATABLE UMBRELLA

Phyllis Carver, 1815 Allison Road, Vancouver 8, British Columbia, Canada

Filed Mar. 8, 1976, Ser. No. 664,932
Int. Cl.² F21V 33/00
U.S. Cl. 240—6.42 4 Claims

1. An illuminatable umbrella comprising:

a hollow tubular shaft;

a hub slidably mounted on said shaft and having electrical conductor means on an inner portion thereof, said hub pivotably carrying a plurality of rib elements which support an umbrella hood;

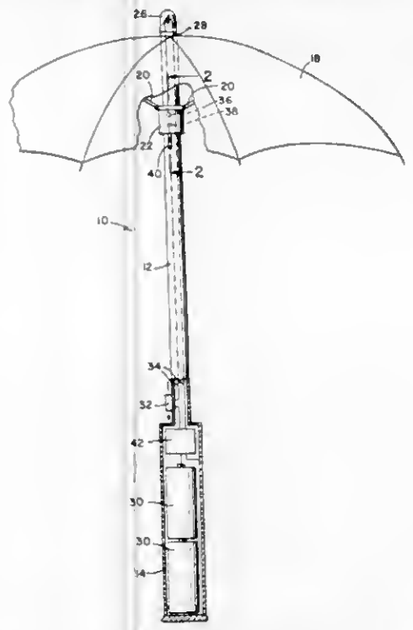
means for mounting an electric bulb at one end of said shaft;

at least one battery mounted within said hollow shaft;

a manually operable electric switch carried by said shaft;

electrical conductor elements positioned within said shaft connecting said switch, batteries and bulb in a series circuit;

and a pair of electrical contacts interposed in said series circuit adjacent the external surface of said shaft cooperable with said electrical conductor means on said hub, whereby upon engagement of said contacts by said elec-



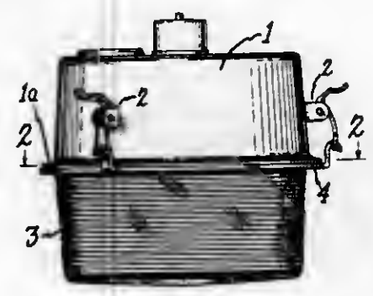
trical conductor means said switch can be manipulated to selectively energize said bulb.

4,031,382

LUMINAIRE ASSEMBLY

Clifford M. Laughter, Hendersonville, N.C., assignor to General Electric Company, New York, N.Y.

Filed June 24, 1976, Ser. No. 699,737
Int. Cl.² F21S 1/10, 3/10, 13/10
U.S. Cl. 240—25 9 Claims



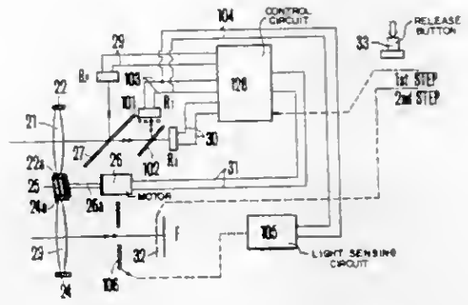
1. A luminaire comprising, in combination, a housing having an open bottom, a plurality of circumferentially spaced latches secured to said housing, a globe having an open top arranged closing the open bottom of said housing, said globe having an outwardly projecting rim extending around its open top, a ring member extending around said globe engaging the underside of said rim, said ring member having a plurality of circumferentially spaced hooks respectively detachably engaged by said latches, and means associated with one of said hooks for retaining the latch in engagement with said one hook whereby the latter hook with associated latch captively hingedly secures said globe to said housing.

4,031,383

METHOD FOR DETECTING VISIBILITY OF IMAGE OF AN OBJECT AND A DEVICE THEREFOR

Kazuya Hosoe; Hiroshi Aizawa, both of Machida; Seiichi Matsumoto, Yokohama, and Hideo Yokota, Tokyo, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

Filed Oct. 15, 1974, Ser. No. 515,015
Claims priority, application Japan, Oct. 19, 1973, 48-117552; Oct. 19, 1973, 48-117553; Oct. 19, 1973, 48-117554; Oct. 19, 1973, 48-117555; Oct. 23, 1973, 48-119280; Oct. 26, 1973, 48-120553; Oct. 26, 1973, 48-120554
Int. Cl.² G01J 1/20; G03B 7/08
U.S. Cl. 250—201 32 Claims



1. A system for detecting the sharpness of an object image, comprising:

an image forming optical system forming an image of an object;

first photoelectric transducing means which receives the object image formed by said optical system and presents an electrical output which corresponds to the sharpness of the image, said first transducing means placed at a position capable of receiving the object image formed by said optical image and having:

a first photosensitive element of a slender strip shape, and

a first pair of electrodes connected to short sides of said element;

second photoelectric transducing means which receives the object image formed by said optical system and presents an electrical output which corresponds to the sharpness of the image, said second transducing means being placed at a position capable of receiving the object image formed by said optical system and having:

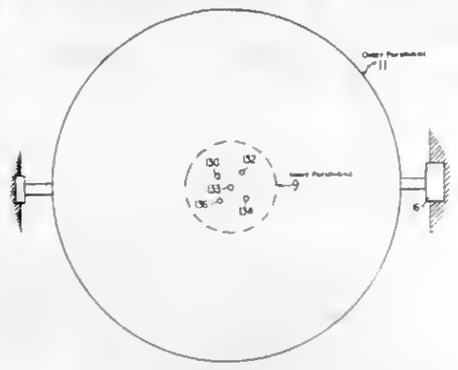
a second photosensitive element of a slender strip shape, and

a second pair of electrodes connected to long sides of said second element;

electrical circuit means to electrically process the output of said first and second transducing means and output image sharpness information based on the output of said first and second transducing means; and

correcting means to eliminate from said circuit means noise outputs of said first and second transducing means having no relationship with image sharpness, said correcting means being electrically coupled to said circuit means to supply an electrical signal thereto based on the brightness of the object, thereby the noise output of said first and second transducing means having no relationship with image sharpness is eliminated and detection of image sharpness may be performed while eliminating noise signals having no relationship with image sharpness.

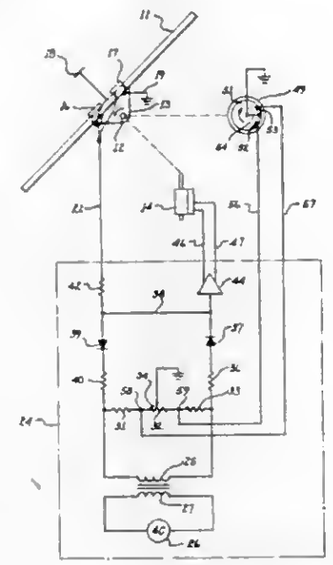
4,031,384
CATOPTRIC SYSTEM FOR SIMULTANEOUS CONCENTRATION OF LIGHT, LASER, AND OTHER TYPE PARAXIAL RAYS INTO BEAMS
Benjamin F. Sherman, Jr., 6329 Mori St., McLean, Va. 22101
Division of Ser. No. 352,466, April 18, 1973, Pat. No. 3,892,476. This application Jan. 24, 1975, Ser. No. 543,925
Int. Cl.² G02B 5/10; G01J 1/20
U.S. Cl. 250—203 R **15 Claims**



1. A concentrator of a wide spectrum of reflectable emissions including limiting rays, such as of light rays, laser rays, infra-red rays, ultra-violet rays, sound waves, electrons and other types of radiant energy emissions from a remote source spaced rearwardly therefrom including a source moving relative thereto, such as planetary bodies, artificial wave sources, a light house, a ship, a signal-transmitting station and a communication sender, comprising:
at least portions of two symmetrically warped truncated shells;
an outer concave shell, provided with at least one inner reflecting surface and
an inner convex shell of a diameter, smaller than that of said outer shell provided at least at its vertex with at least one outer reflecting surface;
means to mount said shells on their central axis, the extremities of said shells being aligned on a conical surface and being defined by an imaginary cone whose surface is traversed by the limiting rays and whose vertex is at the common focal point of the said shells, and whose axis coincides with the central axis,
the reflecting surfaces of the shells being mounted spaced from each other and substantially facing each other at angles and at distances providing at least two successive reflections from each surface for said rays impinging upon them;
at least one of said surfaces including at least one paraboloidal reflector surface, and
means moving at least one of said warped surfaces in response to the changeable location of the said source relative to the said concentrator.

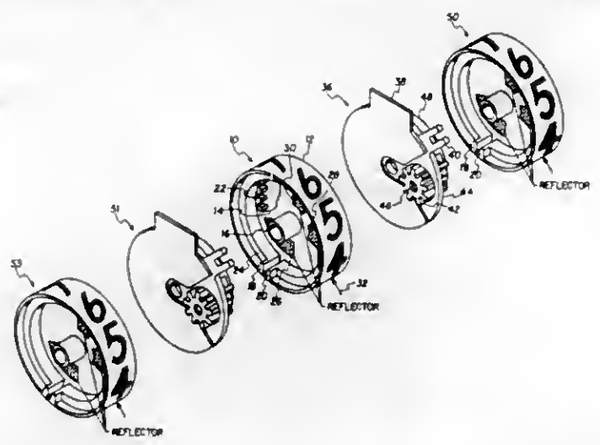
4,031,385
SOLAR TRACKING DEVICE
Gene A. Zerlaut, Phoenix, and Robert F. Heiskell, Glendale, both of Ariz., assignors to Desert Sunshine Exposure Tests, Inc., Phoenix, Ariz.
Filed Apr. 5, 1976, Ser. No. 673,484
Int. Cl.² G01J 1/20
U.S. Cl. 250—203 R **6 Claims**

2. Apparatus for controlling the orientation of a device to track the changing location of the sun in the sky, said apparatus comprising, in combination:
a. means for producing electrical signals corresponding to the position of the device relative to the brightest spot in the sky;
b. orientation means for positioning the device in response to the electrical signals to orient the device perpendicular to the brightest spot in the sky;
c. means for overriding said orientation means whenever the position of the brightest spot in the sky deviates more than a predetermined amount from the position of the sun in the sky;



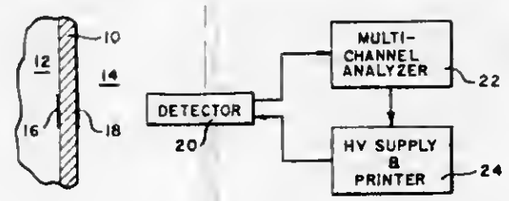
d. means for generating clock responsive signals representing the approximate position of the sun in the sky; and
e. means for locating the device in response to the clock responsive signals whenever said orientation means are overridden, thereby orienting the device approximately perpendicular to the position of the sun in the sky.

4,031,386
OPTICAL TRANSDUCER ENCODING APPARATUS
Gary B. Recker, Cedar Rapids, Iowa, assignor to Rockwell International Corporation, El Segundo, Calif.
Filed June 15, 1976, Ser. No. 696,240
Int. Cl.² G01D 5/36; G06K 7/10
U.S. Cl. 250—230 **5 Claims**



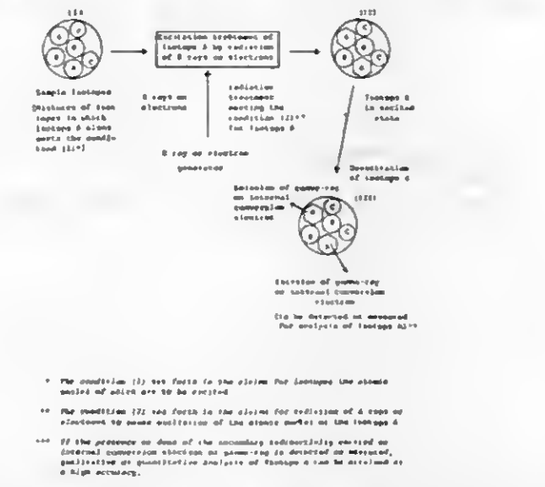
1. Conversion apparatus for providing a visual and binary coded electrical output indication of the number of revolutions of a geared mechanical input wherein an indicating section includes:
a plurality of wheels each having a hub, a connecting web and a felly with indicia on an outer surface, a continuous set of gear teeth on an inner surface on one side of the web and a partial set of gear teeth on the inner surface on the other side of the web to drive further conversion sections, and
a plurality of stationary members, one for each wheel and mounted intermediate said wheels, cooperating with said wheel to provide a bearing surface for a gear operable to mesh with the partial set of gear teeth of the present section and the continuous set of gear teeth of an adjacent further section, the improvement comprising:
a plurality of reflective surfaces situated on said web, each of said surfaces being located at the same radial distance, and
a plurality of optical transducers, including light sources, in said stationary member for detecting and outputting encoded binary digital signals indicate of individual ones of several possible rotational positions of said wheel relative to said stationary member.

4,031,387
METHOD OF DETERMINING WHETHER RADIOACTIVE CONTAMINANTS ARE INSIDE OR OUTSIDE A STRUCTURE
Kenneth R. Lattin, Richland, Wash., assignor to The United States of America as represented by the United States Energy Research and Development Administration, Washington, D.C.
Filed Aug. 5, 1976, Ser. No. 711,926
Int. Cl.² G01D 18/00; G01N 23/00
U.S. Cl. 250—252 **4 Claims**



1. A method of determining the amount of radioactive material inside a test structure compared to the amount outside the structure comprising the steps of:
a. disposing a first quantity of the radioactive material inside a dummy structure having the same shape and made of the same material as the test structure;
b. obtaining an inside spectrum of radiation from the first quantity of material inside the dummy structure by detecting radiation outside the dummy structure over a test range of energies that includes a Compton window where Compton scattering is caused by the material and that also includes a region of the spectrum where Compton scattering is negligible;
c. removing the first quantity;
d. disposing a second quantity of the radioactive material outside the dummy structure;
e. obtaining an outside spectrum of radiation from the second quantity by detecting radiation outside the dummy structure over the test range of energies;
f. obtaining a test spectrum from the test structure by detecting radiation outside the test structure over the test range of energies;
g. obtaining from the inside spectrum and outside spectrum ratios of counts of radioactive disintegrations per unit time in the Compton window to counts of radioactive disintegrations per unit time in the region where Compton scattering is negligible;
h. obtaining from the test spectrum a test ratio of counts of radioactive disintegrations per unit time in the Compton window to counts of radioactive disintegrations per unit time in the region where Compton scattering is negligible;
i. comparing the test ratio linearly with the ratio from the inside spectrum and the ratio from the outside spectrum to obtain a proportional measure,
which proportional measure is a measure of the amount of the radioactive material inside the test structure compared to the amount outside.

4,031,388
METHOD FOR THE ANALYSIS OF ISOTOPES
Masato Morita; Reiko Morita, both of Seita, and Kiyoteru Otozai, Toyonaka, all of Japan, assignors to International Nuclear Fuel Co., Ltd., Toyonaka, Japan
Filed Sept. 6, 1974, Ser. No. 503,693
Claims priority, application Japan, Sept. 8, 1973, 48-101488
Int. Cl.² G01N 23/20
U.S. Cl. 250—272 **4 Claims**



1. A method for the analysis of isotopes which comprises bombarding a substance with X-rays or electrons of a previously determined dose and energy for analyzing an isotope in the substance, to produce an excited state of the atomic nuclei of the isotope and thereafter detecting the gamma rays or internal conversion electrons emitted from the substance when the atomic nuclei is deactivated from the excited state to the ground state, wherein the bombardment of the substance with X-rays or electrons is carried out under such conditions that (1) in the atoms selected to be produced in the excited state of their nuclei, (a) the difference between the nuclear excitation energy and the difference between the binding energies of adequatly selected two electron orbits is small enough to introduce the nuclear excitation by electron transition, and (b) the system of the nucleus and the electrons in the case of ionizing an orbital electron in said atoms should satisfy the spin and parity conservation laws, and (12) the energy of the bombarding X-rays or electrons should be larger than the binding of one of the said two electron orbits which is located at a shorter distance from the atomic nucleus.

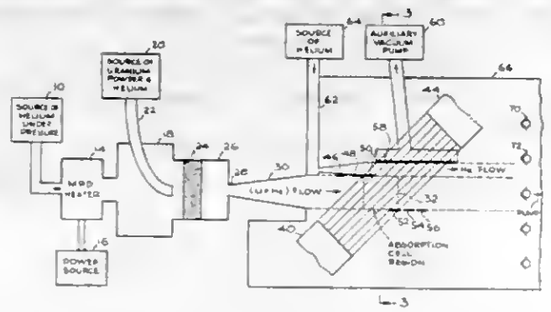
ISOTOPE SEPARATION USING METALLIC VAPOR LASERS
Gary R. Russell; Che Jen Chen, both of Sierra Madre, and Kenneth G. Harstad, Pasadena, all of Calif., assignors to The United States of America as represented by the Administrator of the National Aeronautics and Space Administration, Washington, D.C.
Filed June 26, 1974, Ser. No. 483,301
Int. Cl.² H01J 39/34
U.S. Cl. 250—283 **16 Claims**

1. A method of separating a first isotope from a mixture of a first and second isotope comprising
heating a mixture of said first and second isotopes to a temperature at which they are vaporized and some free electrons are produced,
passing said vaporized isotopes with free electrons therein at a supersonic speed through an expansion nozzle to expand into a supersaturated vapor,
applying laser light having a predetermining frequency to

said supersaturated vapor to selectively elevate the energy level of said first isotope to an energy level at which



said first isotope atoms are ionized by said free electrons, and

directing said ionized atoms to a collection plate.

4,031,390

METHOD OF OPERATING A PARTICLE-BEAM APPARATUS

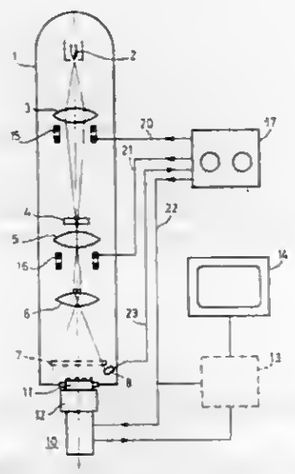
Karl-Heinz Müller; Volker Rindfleisch; Moriz V. Rauch, and Dieter Wilasch, all of Berlin, Germany, assignors to Siemens Aktiengesellschaft, Munich, Germany

Filed Aug. 29, 1973, Ser. No. 392,526

Claims priority, application Germany, Sept. 7, 1972, 2344441

Int. Cl.² G01N *23/04*

U.S. Cl. 250—307 **4 Claims**



1. A method of operating a particle-beam apparatus such as an electron microscope equipped with a controlled deflection system arranged at the beam path, the method comprising adjusting the excitation of the deflection system to direct the particle-beam for a selectable time period onto a location of an object whereat the object is to be investigated; and, again adjusting the excitation of the deflection system to direct the particle-beam in the remaining time to another location of the object whereat the particle-beam passes through the object, the last-mentioned location being disposed laterally of the first mentioned location, said particle-beam apparatus being equipped with a second deflection system, the method comprising the ancillary step of adjusting the excitation of the second deflection system so as to cause the particle-beam to image the region of the object irradiated by the same.

4,031,391

ELECTRON MICROSCOPE INCLUDING IMPROVED MEANS FOR DETERMINING AND CORRECTING IMAGE DRIFT

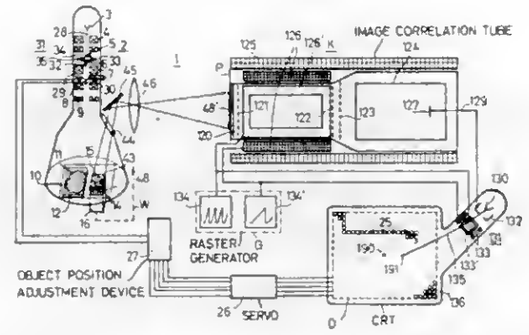
Walter Hoppe, Martinsried near Munich, Germany, assignor to Max-Planck-Gesellschaft zur Forderung der Wissenschaften e.V., Gottingen, Germany

Filed June 21, 1976, Ser. No. 698,082

Claims priority, application Germany, July 1, 1975, 2529735

Int. Cl.² H01J *37/26*

U.S. Cl. 250—311 **15 Claims**



1. In a corpuscular beam microscope including means for adjusting the position of the object image in the microscope and means, coupled to said adjusting means, for determining and correcting drift of the object image by means of a control signal which controls said adjusting means and is derived from a convolution of an actual object image with a stored reference object image, the improvement comprising said means for determining and correcting including means for deriving said convolution by imaging said actual object image directly on said reference object image.

4,031,392

METHOD AND DEVICES FOR COUNTING EVENTS, PARTICULARLY RADIOACTIVE DISINTEGRATION EVENTS

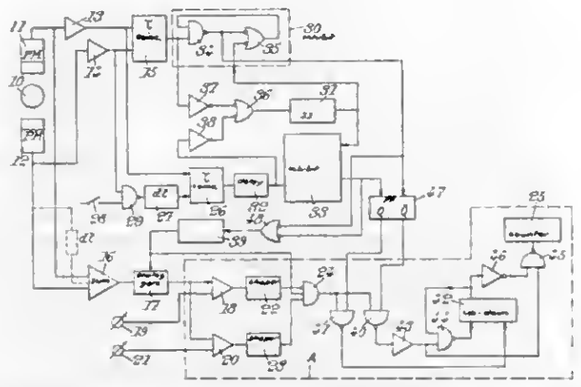
Pierre Giraud, Paris; Conrad Palais, Parly II Le Chesnay, both of France, and Edward Rapkin, Short Hills, N.J., assignors to Intertechnique S.A., Plaisir, France

Filed Mar. 31, 1976, Ser. No. 672,287

Claims priority, application France, Nov. 17, 1975, 75.35085

Int. Cl.² G01T *1/20*

U.S. Cl. 250—328 **8 Claims**



1. A device for counting specific events of a predetermined nature occuring in a sample in the presence of background noise due to events of another nature in said sample, comprising:

a first detector and a second detector operatively associated with a sample receiving location for the first detector and

the second detector to deliver respective signal pulses in time coincidence responsive to each said specific event, while one of said detectors at most delivers a signal pulse responsive to each said event of another nature,

first circuit means connected to receive said signal pulses from said first and second detectors and to deliver a first output signal responsive to each prompt coincidence between the signals received from the first and second detectors,

time delay circuit means connected to receive the signal pulses delivered by the first detector and in response thereto deliver a signal pulse delayed by a predetermined time duration *dt*,

second circuit means connected to receive the signal pulses delivered by the second detector and by the time delay circuit and to deliver a second output signal responsiveto each time coincidence,

and counting means controlled by said first and second circuit means for counting in real time the excess of the coincidences detected by the first circuit means over the coincidences detected by the second circuit means.

4,031,393

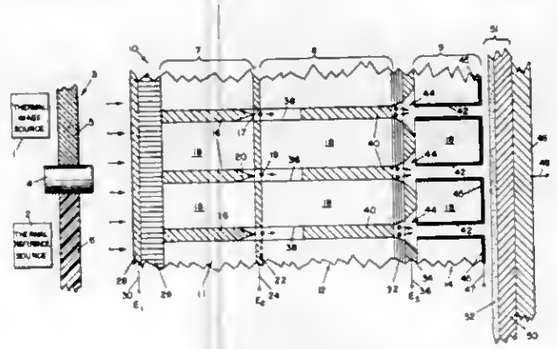
THERMAL IMAGE CAMERA

Charles M. Redman, Las Cruces, N. Mex., assignor to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Filed Mar. 18, 1976, Ser. No. 667,936

Int. Cl.² H01J *31/49*

U.S. Cl. 250—332 **10 Claims**



1. A thermal image camera comprising:

pyroelectric means for detecting a thermal image;

cathode means connected to the pyroelectric means for converting the thermal image to an electron image;

vacuum means communicating with the cathode means for guiding the passage of the electron image in a preselected location;

emitting means communicating with the vacuum means, in spaced relation with the cathode means, for storing and integrating the electron image;

means communicating with the emitting means for amplifying the density and kinetic energy of the electron image delivered from the emitting means; and

recording means positioned adjacent the outward end of the amplifying means for receiving an amplified electron image thereagainst.

4,031,394

CAMERA DEVICE WITH RESISTIVE TARGET

Pierre Felix; Philippe Gamot; Guy Moiroud, and Serge Veron, all of Paris, France, assignors to Thomson-CSF, Paris Cedex, France

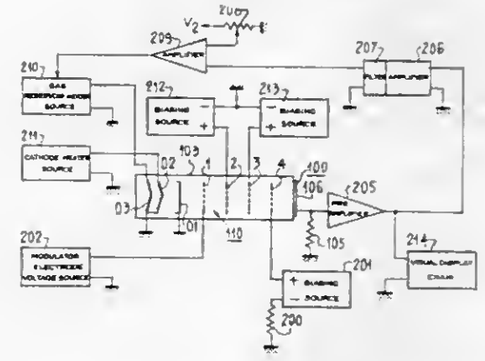
Filed June 21, 1976, Ser. No. 697,750

Claims priority, application France, June 27, 1975, 75.20397

Int. Cl.² H01J *31/49*

U.S. Cl. 250—333 **8 Claims**

1. A camera device with a resistive target comprising a camera tube having a target which in operation receives the energy emanating from the subject on one of its surfaces and which has the property of showing at each point between its two surfaces a dielectric polarisation governed by the energy absorbed by that point, means for generating inside said tube a beam of electrons issuing from a cathode and scanning point by point the other surface of said target so as to bring these points to the potential of said cathode and associated means for reading the signal current of flow of electrons desposited at each point of the target by said beam to obtain this potential, said tube comprising in its interior a first grid arranged in the vicinity of said cathode controlling the intensity of said beam,



a heated ionisable gas reservoir made of a material of which the absorption capacity for said gas and hence the pressure of said gas in the tube is governed by its temperature, ions being generated in said tube by collision between the electrons of said beam and the molecules of said gas, and another grid arranged in the vicinity of said target and brought to a positive d.c. potential which is fixed in relation thereto, said camera device being characterised in that it comprises means for controlling the generation of said ions in the tube in dependence upon the average value of the target currents over a given period.

4,031,395

RADIOGRAPHY

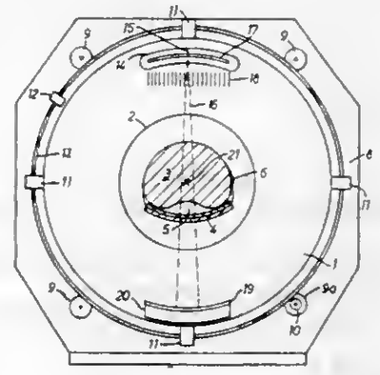
Christopher Archibald Gordon LeMay, Osterley, England, assignor to EMI Limited, Middlesex, England

Filed Mar. 19, 1976, Ser. No. 668,518

Claims priority, application United Kingdom, Mar. 20, 1975, 7366/75; June 21, 1975, 26485/75; Mar. 20, 1975, 11553/75

Int. Cl.² A61B *6/02*; G01N *23/08*; H05G *1/30*

U.S. Cl. 250—360 **10 Claims**



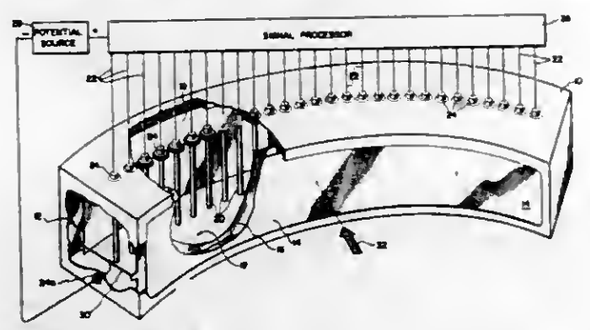
1. An apparatus for examining a body by means of penetrating radiation including a source means arranged to irradate the body with a planar spread of said radiation, detector means arranged to detect the radiation to provide output signals, relating to absorption of the radiation by the body, for processing to provide a representation of the distribution of absorption in a substantially planar section of the body and

means adapted to scan the planar spread of radiation in relation to the body so as to irradiate said section along a plurality of beam paths passing through the body from a plurality of direction, wherein said detector means comprises a plurality of detector devices of which a predetermined number are irradiated by said spread at any time and wherein the scanning means is arranged to traverse the spread of X-rays along the detector devices so as to change the irradiated devices progressively.

4,031,396
X-RAY DETECTOR

Nathan Rey Whetten, Burnt Hills, and John M. Houston, Schenectady, both of N.Y., assignors to General Electric Company, Schenectady, N.Y.

Continuation-in-part of Ser. No. 554,171, Feb. 28, 1975, abandoned. This application Sept. 26, 1975, Ser. No. 616,930
Int. Cl.² G01T *1/18*
U.S. Cl. 250—385 **19 Claims**



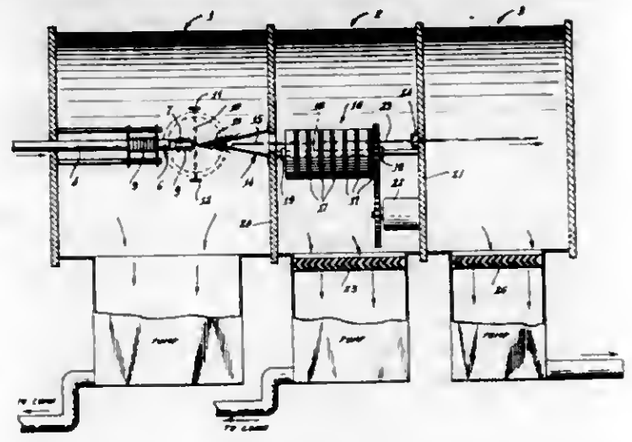
1. An x-ray detector comprising:
a gaseous medium of the type characterized as being substantially opaque to electromagnetic radiation at x-ray frequencies;
a plurality of substantially planar sheet anodes, comprising material which is characterized as being substantially opaque to electromagnetic radiation at x-ray frequencies, disposed in said gaseous medium;
a plurality of substantially planar sheet cathodes, comprising material which is characterized as being substantially opaque to electromagnetic radiation at x-ray frequencies, disposed in said gaseous medium, each of said cathodes lying approximately equi-distant between two of said anodes;
means for applying direct current electric potential between said cathodes and said anodes;
means for separately measuring the electric current flow from each of said anodes connected in series between said anodes and means for applying said potential; and
a beam of x-ray photons disposed and directed to impinge on said gaseous medium in directions substantially parallel to the planes of adjacent said anode sheets and said cathode sheets.

4,031,397
METHOD AND APPARATUS FOR SEPARATING ISOTOPES

Mark J. Cardillo, Somerset, N.J., assignor to Massachusetts Institute of Technology, Cambridge, Mass.

Filed Aug. 25, 1975, Ser. No. 607,393
Int. Cl.² H01J *39/34*
U.S. Cl. 250—423 P **8 Claims**

1. A process for separating isotopes from a gaseous mixture thereof which comprises expanding said mixture to form a molecular beam of the mixture in a carrier gas, the molecules of the carrier gas having a mass either less than or greater than the mass of all the molecules containing the isotopes, exposing the gaseous mixture to a laser light having a radiation frequency that causes excitation of the rotational energy of the isotope molecules having the lowest mass without exciting the rotational energy of the other isotope molecules in said mixture, passing said molecular beam through a means for separating the mixture of isotopes on the basis of differences in velocity profiles of each of the isotopes, controlling the time period between the initial expansion of the gas and subsequent

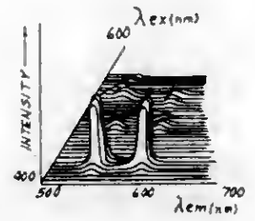


separation of the molecular beam to permit conversion of at least a portion of laser-induced rotational energy to translational energy by secondary collision of the excited isotope molecules with molecules of said carrier gas but without substantially complete conversion of said induced rotational energy to translational energy.

4,031,398
VIDEO FLUOROMETER

James B. Callis, and Ernest R. Davidson, both of Seattle, Wash., assignors to Research Corporation, New York, N.Y.

Filed Mar. 23, 1976, Ser. No. 669,493
Int. Cl.² F21K *2/02*; G01T *1/00*
U.S. Cl. 250—458 **19 Claims**



1. Apparatus for fluorescence spectroscopy comprising:
a. means for holding a sample of fluorescent material;
b. means for simultaneously directing a spatially distributed spectrum of exciting energies onto said sample distributed along its length; and
c. means for simultaneously analyzing the set of fluorescence emissions given off by said sample along its length by producing a fluorescence intensity matrix of the excitation and emission spectra.

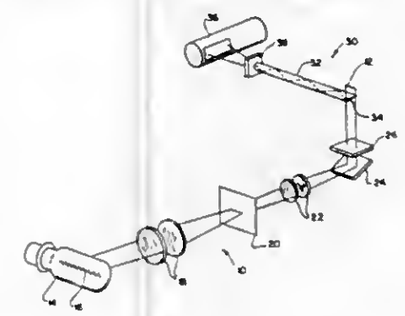
4,031,399
FLUOROMETER

Gerald Lee Klein, Orange, and Richard C. Meyer, La Habra, both of Calif., assignors to Beckman Instruments, Inc., Fullerton, Calif.

Filed Feb. 24, 1975, Ser. No. 552,653
Int. Cl.² G01M *21/38*
U.S. Cl. 250—461 B **4 Claims**

1. A fluorometer comprising:
means for generating a small area of light of a first bandwidth in a plane of a sample to be analyzed, said sample emitting radiation of a second bandwidth in response to said light striking said sample;

transfer means on a side of said plane receiving said light and immediately adjacent said sample for collecting radiation emitted from said sample and for transmitting said radiation to the exclusion of said light to a detector remote from said sample for analysis, said transfer means comprising an opaque light shield including a port immediately adjacent said sample and including a longitudinal axis defining an acute angle with said plane and being

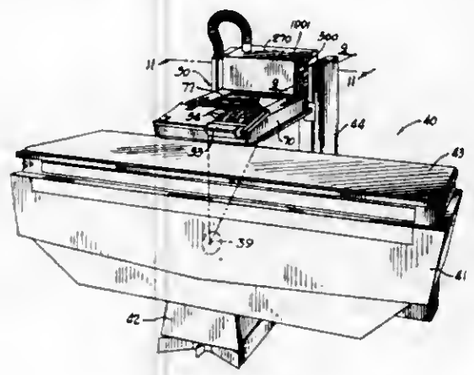


dimensioned to receive and collect a sector of the radiation emitted from said sample, and a light pipe mounted in said shield with an acutely angled end in said port to intersect said longitudinal axis and an opposite end remote from said sample and facing said detector; and
a radiation filter for only passing radiation of said second bandwidth, said filter being located at said opposite end of said light pipe and adjacent said detector.

4,031,400
X-RAY SOFT FILMER

Robert P. Hunt, Chesterland, and Robert J. Steffek, Wickliffe, both of Ohio, assignors to Picker Corporation, Cleveland, Ohio

Filed Oct. 7, 1974, Ser. No. 512,998
Int. Cl.² B65H *5/22*; G11B *1/00*
U.S. Cl. 250—468 **43 Claims**

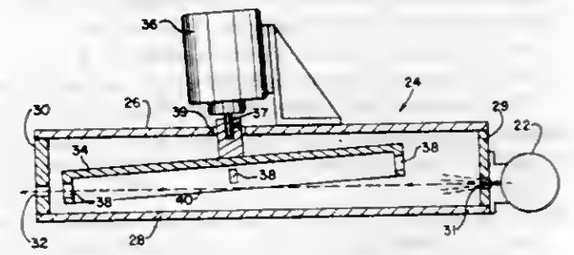


17. An X-ray spot filmer, comprising:
a. a housing structure defining a chamber and having an opening formed therethrough communicating with said chamber;
b. a film positioning assembly movably supported within said chamber for movement between a loading position and an exposure station;
c. drive means carried within said chamber for moving said film positioning assembly between said loading position and said exposure station;
d. film feed means for feeding a sheet of film along a feed path into said assembly and for feeding a sheet of film out of said assembly when said assembly is in said loading position; and,
e. support means supporting said film feed means for movement as a unit through said opening for insertion into and withdrawal from said housing structure.

4,031,401
RADIANT ENERGY IMAGING SCANNING

Daniel Jacob, Allston, Mass., assignor to American Science & Engineering, Inc., Cambridge, Mass.

Filed Mar. 14, 1975, Ser. No. 558,426
Int. Cl.² G01J *1/00*
U.S. Cl. 250—503 **5 Claims**

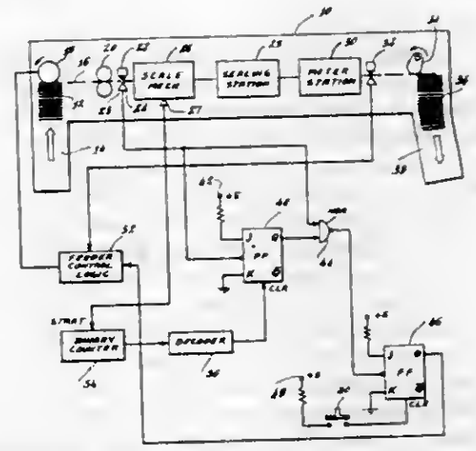


1. Radiant energy image scanning apparatus comprising,
a source of radiant energy that may not be focused by conventional lenses in accordance with the principles of geometric optics,
first means opaque to said radiant energy formed with an exit slit for providing therefrom a pencil beam of radiant energy that scans along the length of said slit.
second means opaque to said radiant energy in the form of an annular rim formed with at least one slit that is generally parallel to the rim axis and generally perpendicular to the length of said exit slit.
and means for rotatably supporting said second means for rotation about said axis with the projection of the at least one slit therein traversing said exit slit as said annular rim rotates oriented so that one surface of said annular rim intercepts said radiant energy while the portion of the annular rim diametrically opposite the intercepting portion is offset from a line joining said source and said exit slit whereby said slit in said second means transmits said radiant energy to said exit slit as said second means is angularly displaced about its axis to coact with said exit slit to provide said scanning pencil beam,
said source of radiant energy being outside said annular rim and spaced from said exit slit by a distance greater than the diameter of said annular rim.

4,031,402
STREAM FEED DETECTOR FOR DETECTING DOCUMENT SPACING

Daniel F. Dlugos, Huntington, and Flavio M. Manduley, Seymour, both of Conn., assignors to Pitney-Bowes, Inc., Stamford, Conn.

Filed Mar. 23, 1976, Ser. No. 669,530
Int. Cl.² G06K *7/015*, *15/00*
U.S. Cl. 250—557 **8 Claims**



1. For use in a object handling device wherein objects are

fed in seriatim along a predetermined path, a stream feed detector for detecting inadequate separation of successive objects, said stream feed detector including:

an object detecting means located on the path at a predetermined point for generating a first level of signal when an object is present and a second level of signal when no object is present;

a bistable device connected to said object detecting means, said bistable device being driven to one state upon a change from the second level to the first level of signal;

counting means for clearing said bistable device to a second state at the end of a predetermined period of time;

means for initiating operation of said timing means when an object is at a second predetermined point on the path; and

logic means having inputs from said object detecting means and said bistable device for generating an inadequate separation signal if the output of said object detecting means returns to the first level before said bistable device is cleared to the second state.

4,031,403

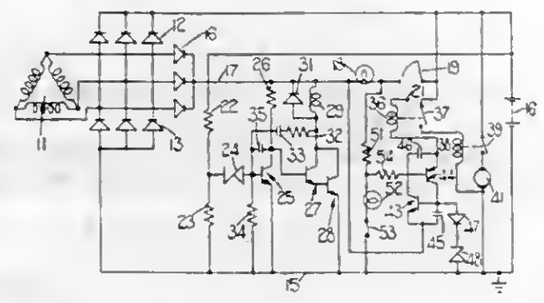
ROAD VEHICLE ELECTRICAL SYSTEMS

William Frank Hill, Stafford, England, assignor to The Lucas Electrical Company Limited, Birmingham, England

Continuation of Ser. No. 385,561, Aug. 3, 1973. This application Sept. 22, 1975, Ser. No. 615,806

Int. Cl.² F02N *11/00*

U.S. Cl. 290—38 R **8 Claims**



1. A road vehicle electrical system comprising an alternator, first and second supply lines, a rectifier connecting the alternator to the first and second supply lines, a vehicle battery connected between the first and second supply lines, at least one additional diode connecting the alternator to a third supply line which when the alternator is operating will reach substantially the same potential as the first line, a warning lamp connected in series with the vehicle ignition switch between the the third and first supply lines, a voltage regulator connected between the third and second supply lines, a starter motor, a control device for the starter motor which when energised energises the starter motor, circuit means connecting said control device between the first and third supply lines so that the control device is energised by way of the voltage regulator, but is de-energised when the alternator energises the third supply line, and switching means operated by the engine of the vehicle independently of the alternator for preventing the control device from being re-energised while the engine is running.

4,031,404

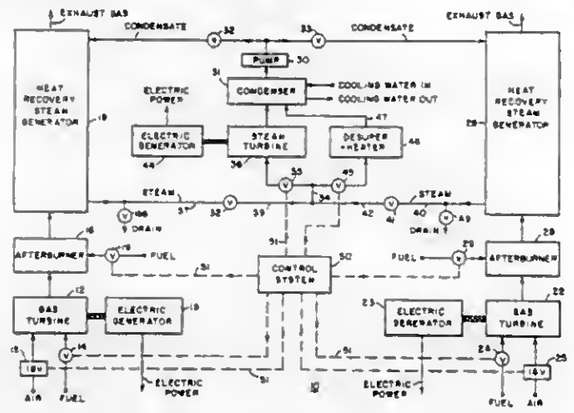
COMBINED CYCLE ELECTRIC POWER PLANT AND A HEAT RECOVERY STEAM GENERATOR HAVING IMPROVED TEMPERATURE CONTROL OF THE STEAM GENERATED

Lyle F. Martz, Verona, Pa., and Richard J. Plotnick, Cherry Hill, N.J., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Aug. 8, 1974, Ser. No. 495,723

Int. Cl.² F01K *23/00*

U.S. Cl. 290—40 R **32 Claims**



1. A combined cycle electric power plant comprising:

a. at least one gas turbine including an exit through which heated exhaust gases pass;

b. means for generating steam coupled to said gas turbine exit for transferring heat from the exhaust gases to a fluid passing through said steam generating means;

c. a steam turbine coupled to said steam generating means and driven by the steam supplied thereby;

d. means for generating electric power by the driving power of said turbines;

e. an afterburner for supplying additional heat to the exhaust gases passing from said gas turbine to said steam generating means;

f. valve means for controlling the flow of fuel to said afterburner;

g. condenser means for receiving and converting the spent system from said steam turbine into condensate;

h. temperature measuring means disposed to measure the temperature of the exhaust gases heated by said afterburner, for providing an output indicative thereof; and

i. means for controlling the operation of said turbines and said steam generating means, comprising steam temperature control means responsive to the output of said temperature measuring means for regulating the opening of said afterburner valve means, whereby the temperature of the superheated steam supplied to said steam turbine is controlled.

4,031,405

WINDMILL WITH SHROUD ADJUSTING MEANS

Paul Asperger, 4225 Cheryl Drive, Flint, Mich. 48506

Filed Aug. 4, 1975, Ser. No. 601,464

Int. Cl.² F03D *9/02*

U.S. Cl. 290—55 **6 Claims**

1. A windmill comprising:

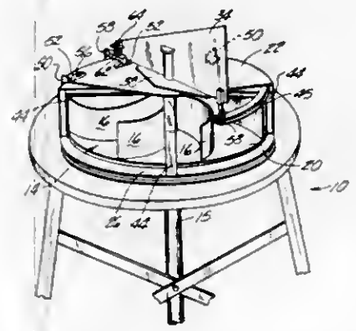
a vane assembly and means rotatably mounting said vane assembly about a vertical axis;

a shroud disposed over a portion of said vane assembly and means mounting said shroud to be rotatable with respect to said vane assembly whereby said shroud can be rotated to cover different portions of said vane assembly;

a directional vane movable by the wind to face the direction of the wind and means rotatably mounting said directional vane independently of said assembly;

means selectively attaching said directional vane to said shroud at different positions on said shroud whereby said shroud is moved by said directional vane to a position with respect to said vane assembly depending upon the position at which said directional vane is attached to said shroud;

said vane assembly mounting means comprising a first shaft and said directional vane mounting means comprising a second shaft, said first shaft and said second shaft being independent of each other, said first shaft being mounted



in a fixed position and said second shaft being fixed to said vane to be rotatable therewith;

said shroud mounting means including means rotatably mounting said shroud to said first shaft;

said attaching means comprising a plurality of stop members disposed on said shroud and spaced within an arc of substantially 90° with respect to the axis of rotation of said shroud and means carried by said directional vane for selective attachment to said stop means.

4,031,406

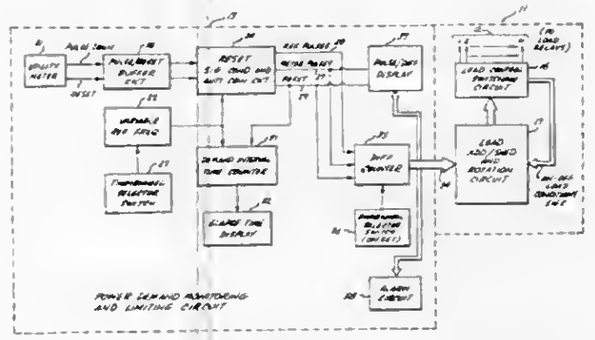
METHOD AND APPARATUS FOR CONTROLLING ELECTRICAL LOADS

Warren L. Leyde, Seattle, and Delbert E. Marker, Issaquah, both of Wash., assignors to Pacific Technology, Inc., Renton, Wash.

Filed June 16, 1975, Ser. No. 587,150

Int. Cl.² H02J *13/00*

U.S. Cl. 307—41 **13 Claims**



1. In an electrical system including a load controller having a plurality of load controlling outputs each capable of assuming either a load-on condition or a load-off condition, said outputs being adapted for individually controlling the connections of a corresponding plurality of electrical loads to a power source, and a load regulating means connected to said controller for regulating the collective status of said load-on and load-off conditions at said outputs, said regulating means assuming an add mode when the number of said outputs that are in said load-on condition is to be increased and assuming a shed mode when the number of said outputs that are in said load-on condition is to be decreased, the improvement in said controller comprising:

switching means connected to said outputs and having input means responsive to said regulating means for successively switching said outputs from said load-off conditions to said load-on conditions when the regulating means is in the add mode and for successively switching said outputs from said load-on conditions to said load-off conditions when said regulating means is in the shed mode, said switching means including means for establishing a plurality of different orders of succession in which said outputs are successively switched;

rotation circuit means for changing said switching means from one of said orders of succession to another of said orders of succession; and,

means for sensing a predetermined collective status of said conditions at said outputs, said rotation circuit means being operative in response to said means for sensing so as to change said switching means from one of said orders of succession to another of said orders of succession when said conditions at said outputs assume said predetermined collective status.

4,031,407

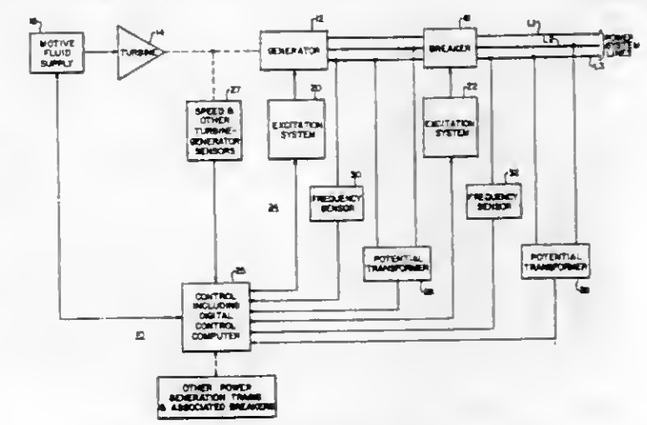
SYSTEM AND METHOD EMPLOYING A DIGITAL COMPUTER WITH IMPROVED PROGRAMMED OPERATION FOR AUTOMATICALLY SYNCHRONIZING A GAS TURBINE OR OTHER ELECTRIC POWER PLANT GENERATOR WITH A POWER SYSTEM

Terry J. Reed, Latrobe, Pa., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa.

Continuation of Ser. No. 99,493, Dec. 18, 1970, abandoned. This application July 31, 1972, Ser. No. 276,343

Int. Cl.² H01J *3/00*

U.S. Cl. 307—87 **32 Claims**



1. A system for operating an electric power plant comprising an electric generator, a prime mover for driving said generator, a circuit breaker for connecting the electric output of said generator to an external power system, a plant control system including means for controlling prime mover motive fluid flow, said control system including a digital control computer, means for detecting the generator speed and the external system frequency, means for determining a computer representation of the magnitude and rate of change of generator output and external system phase difference as a function of time, means for generating a first electric signal representative of the phase difference between the generator and system waveforms, the last named determining means finely determining said phase difference representation in accordance with a computer representation of said phase difference signal after the slip frequency is reduced below a predetermined value, the last named determining means roughly determining said phase difference representation in accordance with representations of the generator speed and external system frequency until the slip frequency is reduced below said predetermined value, said control system providing a loop for controlling prime mover speed in response to a speed reference means for operating said computer within said speed control loop at least to generate said speed reference representation at least during startup operations, means for operating said computer to modify said speed reference representation as a func-

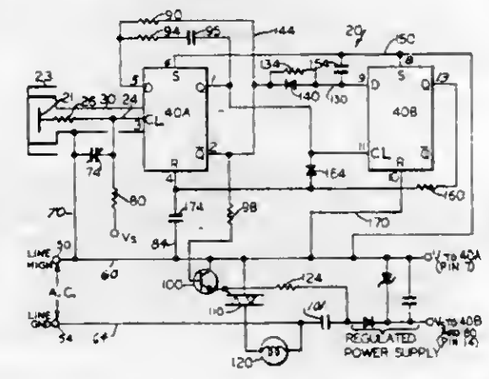
tion of said phase difference representation, means for operating said computer to generate a breaker closure command when said phase difference representation reaches a predetermined condition, and means for operating said breaker in response to said closure command.

4,031,408

PROXIMITY SWITCHING SYSTEM

George Ernest Holz, 97 Grandview Ave., N. Plainfield, N.J. 07060

Filed Oct. 3, 1975, Ser. No. 619,306
Int. Cl.² H05B *37/00*
U.S. Cl. 307—116 16 Claims



1. A control system for operating a utilization device comprising

an A.C. power line including a high side and a ground side connected to ground,

a circuit adapted to produce an output signal when it receives an input signal and having input terminal means and output terminal means,

said utilization device being coupled to the output terminal means of said circuit, and

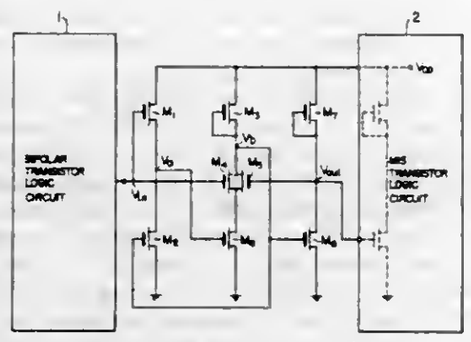
capacitive input signal means coupled by a lead to said input terminal means and comprising a sensor electrode and a conductive shield surrounding said sensor electrode and said lead to shield said sensor from spurious signals, the high side of said A.C. power line being connected to said shield, said sensor electrode being accessible for capacitive coupling to a human body positioned adjacent thereto for generating input signals for said circuit.

4,031,409

SIGNAL CONVERTER CIRCUIT

Shunji Shimada, Kodaira, and Harumi Wakimoto, Hino, both of Japan, assignors to Hitachi, Ltd., Japan

Filed May 26, 1976, Ser. No. 689,966
Claims priority, application Japan, May 28, 1975, 50-62897
Int. Cl.² H03K *3/353*, *19/08*
U.S. Cl. 307—208 3 Claims



1. A signal converter circuit comprising:

a first stage including a source follower circuit having a MIS FET and a first load connected to the source of the MIS FET, the gate of said MIS FET being arranged for reception of an input to the signal converter cicuit;

a second stage including a pair of MIS FETs having their drains connected to each other and their sources connected to each other, a switching MIS FET having its drain connected to the sources of said pair of MIS FETs and its gate connected to the output of said source follower circuit, and a second load connected to the drains of said pair of MIS FETs; and

a third stage including an inverter circuit having a MIS FET and a third load connected to the drain of the MIS FET, the gate of the MIS FET in said third stage being connected to the drains of said pair of MIS FETs in said second stage;

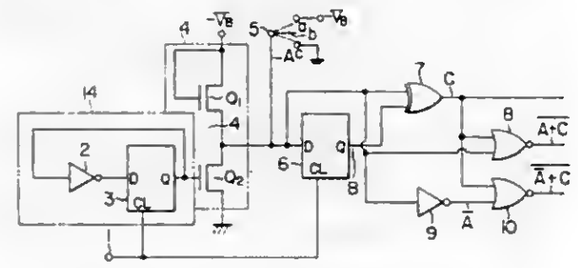
the gate of one of said pair of MIS FETs in said second stage being connected to the gate of the MIS FET in said first stage while the gate of the other of said pair of MIS FETs being connected to the drain of the MIS FET in said third stage.

4,031,410

THREE-STATE DISCERNMENT CIRCUIT

Tadao Kikuchi, Tokyo, Japan, assignor to Hitachi, Ltd., Japan

Filed June 22, 1976, Ser. No. 698,788
Claims priority, application Japan, June 23, 1975, 50-75566
Int. Cl.² H03K *19/08*, *17/02*
U.S. Cl. 307—209 2 Claims



1. A three-state discernment circuit comprising:

first signal generating means for generating a binary signal including logic 0 and 1 levels, said logic 0 and 1 levels being alternately generated in synchronism with a clock signal;

means for applying said binary signal from said first signal generating means to one predetermined terminal through circuit means having a high output impedance, said predetermined terminal being adapted to be selectively connected to power source and ground potentials and opened therefrom;

second signal generating means for receiving a first signal from said predetermined terminal to generate a second signal synchronous with said clock signal but delayed by one bit relative to said first signal;

first logic means for receiving said first and second signals to produce a first logic output representative of an EXCLUSIVE OR combination thereof;

second logic means for receiving said first logic output and one of said first and second signals to produce a second logic output representative of a NOR combination thereof; and

third logic means for receiving said first logic output and an inversion of one of said first and second signals to produce a third logic output representative of a NOR combination thereof;

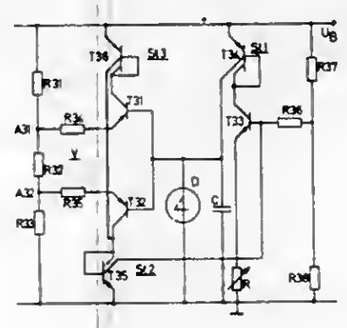
whereby a desired signal is obtained from one of said first, second and third logic means in accordance with one of the condition that said predetermined terminal is connected to the power source potential, the condition that the predetermined terminal is connected to the ground potential and the condition that the predetermined terminal is opened from the power source and ground potentials.

4,031,411

MONOLITHIC INTEGRATED CIRCUIT FOR THE DISTORTION OF A SAW-TOOTH SIGNAL

Hermannus Schat, Freiburg, and Laurin Clemens Freyberger, Endingen, both of Germany, assignors to ITT Industries, Inc., New York, N.Y.

Filed Aug. 4, 1975, Ser. No. 601,759
Claims priority, application Germany, Aug. 16, 1974, 2439343
Int. Cl.² H03K *17/00*
U.S. Cl. 307—228 6 Claims



1. A monolithic integrated circuit for distorting a linear saw-tooth signal without using RC-networks, preferably for the tangent correction of the saw-tooth shaped vertical deflecting current of television picture tubes, which saw-tooth is generated by the charging of a capacitor, comprising:

a regulating circuit which influences the charging current of said capacitor in dependence upon the amplitude of the saw-tooth generator output signal, said regulating circuit comprising:

a voltage comparator (V) having applied thereto the capacitor voltage;

a coupling transistor (T33) having a base electrode coupled to the output of said voltage comparator; an emitter electrode coupled to a reference and

a first current transformer (St1), the collector current of said coupling transistor being coupled to the charging current of said capacitor via said first current transformer.

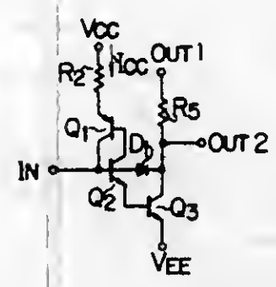
MEMORY CIRCUIT

Ichiro Ohhinata, Yokohama, and Shinzi Okuhara, Fujisawa, both of Japan, assignors to Hitachi, Ltd., Japan

Filed Dec. 23, 1975, Ser. No. 643,757
Claims priority, application Japan, Dec. 27, 1974, 50-148637
Int. Cl.² H03K *17/00*; G11C *11/40*
U.S. Cl. 307—238 10 Claims



1. A memory circuit comprising:

a semiconductor element circuit having equivalently a PNPN four-layer structure including a P-type emitter, an N-type base, a P-type base and an N-type emitter; and

at least an NPN transistor and a diode; and wherein

said N-type emitter of said semiconductor element circuit is connected to the base of said NPN transistor, said P-type base of said semiconductor element circuit is connected to the anode of said diode, the cathode of said diode being connected to the collector of said NPN transistor, said collector being used for a current absorbing terminal,

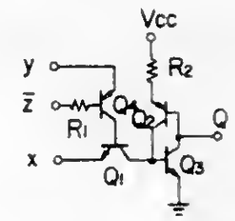
whereby the NPN transistor is adapted to be set to a controlled saturation state by feeding current externally to the collector of said NPN transistor to thereby maintain the memory circuit in the ON state.

4,031,413

MEMORY CIRCUIT

Ichiro Ohhinata, Yokohama; Shinzi Okuhara, Fujisawa, and Tetsuo Takeshita, Yokohama, all of Japan, assignors to Hitachi, Ltd., Japan

Filed Jan. 2, 1976, Ser. No. 646,045
Claims priority, application Japan, Jan. 10, 1975, 50-4938; May 14, 1975, 50-56072
Int. Cl.² G11C *15/04*, *11/40*
U.S. Cl. 307—238 6 Claims



1. A memory circuit under the logical control of three inputs, comprising a semiconductor element circuit corresponding to a four layer PNPN structure and having a control gate; at least a PNP transistor and an NPN transistor, the PNP transistor being connected at its collector to the base of the NPN transistor, the NPN transistor being connected at its collector to the control gate of the semiconductor element circuit, whereby the emitter and base of the PNP transistor and the emitter of the NPN transistor function as logical input terminals, respectively.

4,031,414

CIRCUIT ARRANGEMENT FOR PRODUCING HIGH CURRENT PULSES

Thomas Clyde Giles, Downers Grove; Otto James Kobout, Addison, and Gerald Michael Rinaldi, Mundelein, all of Ill., assignors to GTE Automatic Electric Laboratories Incorporated, Northlake, Ill.

Filed June 10, 1976, Ser. No. 694,751
Int. Cl.² H03K *17/00*
U.S. Cl. 307—270 8 Claims

1. A pulse generating circuit for supplying high current pulses to a load comprising:

a first selectively controlled constant current source;

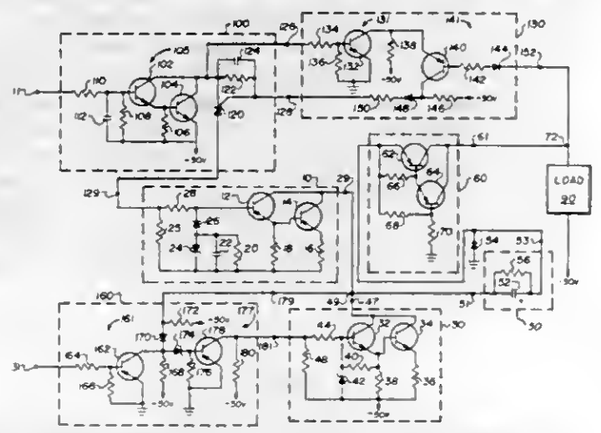
capacitor means connected to said first constant current source;

a second selectively controlled constant current source connected to said capacitor means for charging said capacitor means to a first predetermined voltage level;

first means for establishing a first electrical path for charging said capacitor means when said second constant current source is operated;

second means for limiting the voltage at the output of said first constant current source to a first predetermined value when said first constant current source is operated; and

third means for isolating said load from said capacitor



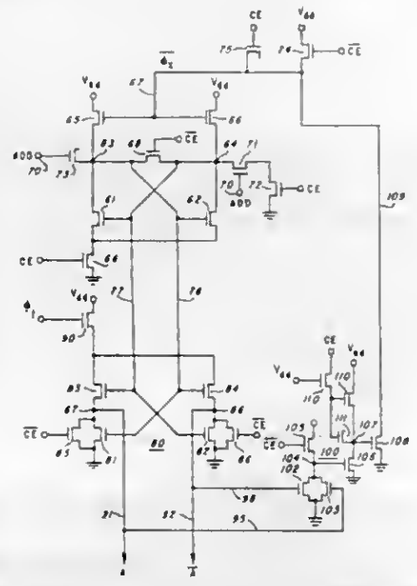
means when said second constant current source is operated.

4,031,415

ADDRESS BUFFER CIRCUIT FOR SEMICONDUCTOR MEMORY

Donald J. Redwine, and Norishisa Kitagawa, both of Houston, Tex., assignors to Texas Instruments Incorporated, Dallas, Tex.

Filed Oct. 22, 1975, Ser. No. 624,813
Int. Cl.² H03K *3/286, 3/353;* **G11C** *11/40;* **H03K** *5/20*
U.S. Cl. 307—279 **21 Claims**



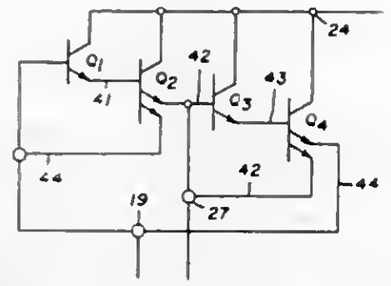
1. An input buffer circuit for an address input of a semiconductor memory device, comprising:
a pair of driver transistors substantially unbalanced in size and characteristic, each driver transistor having a control electrode and two output electrodes, the driver transistors being cross coupled by connection of the control electrode of each to an output electrode of the other,
a pair of load transistors, one for each of the driver transistors, the load transistors being substantially balanced in size and characteristic, each of the load transistors being connected in series with one of the driver transistors and a supply voltage,
means connected to turn on the pair of load transistors at a given time and to turn off the load transistors after a preselected period;
means to short output electrodes of the pair of cross coupled driver transistors together to equalize the voltages on such output electrodes prior to said given time;
means connected to one of the output electrodes of one of said pair of cross-coupled driver transistors to couple said one of the output electrodes to a reference potential when said address input is present during said preselected period; and
a pair of address signal output circuits, each of which has an input connected to an output electrode of a different one of the pair of cross-coupled driver transistors and responsive to the voltage level thereof during said preselected period but delayed by a specified period after said given time, one of the pair of address signal output circuits producing an address signal and the other producing the complement of the address signal during a period of time beginning after said specified period.

4,031,416

SEMICONDUCTOR AMPLIFICATION MEANS COMBINING TWO CASCADED TRANSISTOR AMPLIFIERS OF HIGH INVERSE IMPEDANCES

William Pell, North Syracuse, N.Y., assignor to General Electric Company, Syracuse, N.Y.

Filed Mar. 8, 1976, Ser. No. 664,509
Int. Cl.² H03K *3/26*
U.S. Cl. 307—299 A **6 Claims**



1. Semiconductor amplification means comprising:
a. four transistors of like conductivity type wherein
1. the emitter of the first transistor (Q1) is coupled to the base of the second transistor (Q2),
2. the transistor Q2 has a first and a second emitter, said first emitter of Q2 being coupled to the base of the third transistor (Q3), and the second emitter of Q2 being coupled to the base of Q1 to insure turn off of Q2 when Q1 is turned off,
3. the emitter of Q3 is coupled to the base of the fourth transistor (Q4),
4. the transistor Q4 has a first and a second emitter, said first emitter of Q4 being coupled to the base of Q1, and said second emitter of Q3 being coupled to the base of Q3 to insure turn off of Q4 when Q3 is turned off, and
b. a first terminal for connection to a d.c. source coupled to the collectors of Q1, Q2, Q3, Q4.

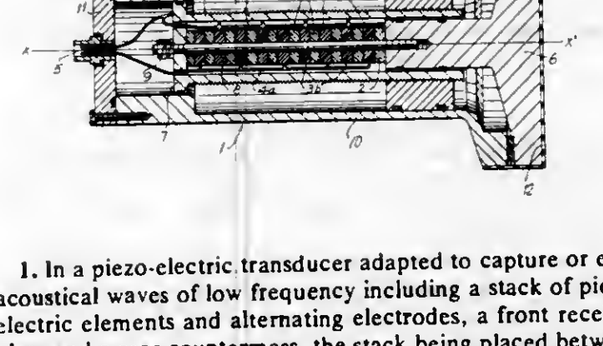
4,031,417

APPARATUS FOR COUPLING A DIGITAL DATA GENERATOR TO A DIGITAL DATA READOUT DEVICE WITH ELECTRICAL ISOLATION THEREBETWEEN

Charles R. Wesner, Crozet, Va., assignor to Sperry Rand Corporation, New York, N.Y.

Filed May 10, 1976, Ser. No. 684,991
Int. Cl.² H03K *17/60, 03/42*
U.S. Cl. 307—311 **6 Claims**

1. An apparatus for coupling a digital data generator to a digital data readout device and for providing electrical isolation therebetween, said apparatus comprising:
means for providing a control signal in response to a data signal coupled from said digital data generator;
means coupled to said control means for switching from a first state to a second state when said control signal achieves a first predetermined level and from said second state to said first state when said control signal achieves a second predetermined level, said switching means including
a first transistor having its collector coupled to said control means and its base coupled to said control means;
a second transistor having its collector coupled to said base of said first transistor, its base coupled to the emitter of said first transistor and the emitter coupled to ground; and
a third transistor having its base coupled to ground and to said collector of said first transistor and its emitter coupled to ground and to said base of said transistor; and



means for providing electrical isolation between said switch means and said digital data readout device and for coupling a signal, in response to said state of said switch means, to said digital data readout device, said coupled signal being representative of said data signal generated by said digital data generator, said isolation means having a first input terminal coupled to the base of said first transistor of said switch means and a second input terminal coupled to the collector of said third transistor of said switch means and having first and second output terminals coupled to said digital data readout device.

4,031,418

LOW FREQUENCY ACOUSTICAL PIEZO-ELECTRIC TRANSDUCER

Philippe Cluzel; Michel Quivy, both of Six-les-Fours-les Plages, and Bernard Tocquet, Sanary, Mer, all of France, assignors to Etat Francais, Paris, France

Filed Sept. 3, 1975, Ser. No. 610,076
Claims priority, application France, Sept. 9, 1974, 74.30415
Int. Cl.² H01L *41/04*
U.S. Cl. 310—8.2 **8 Claims**

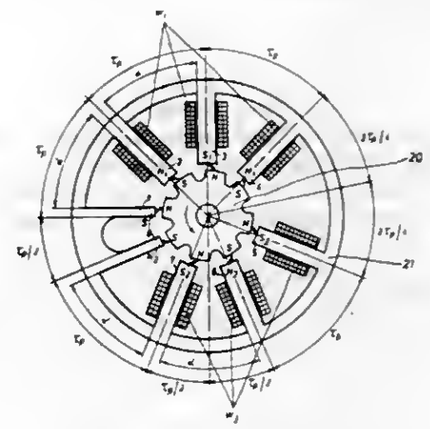
1. In a piezo-electric transducer adapted to capture or emit acoustical waves of low frequency including a stack of piezo-electric elements and alternating electrodes, a front receiver plate and a rear countermass, the stack being placed between the front plate and the rear countermass, an improvement wherein said counter mass is placed at least in part at the front of the rear extremity of the stack and therearound, and comprises a rigid annular block mounted around the stack, a rear plate at the rear extremity of the stack, and elastic connection means between said block and said rear plate, said elastic connection means including a tube, the stack being in the interior of said tube.

4,031,419

SELF-STARTING SYNCHRONOUS AND STEPPING MOTOR HAVING A PERMANENT MAGNET ROTOR

August Spiesberger, Lahr, and Claus Schäffer, Heiligenzell, both of Germany, assignors to Gerhard Berger, Fabrik Elektrischer Messgerate, Lahr, Germany

Filed July 28, 1975, Ser. No. 599,765
Claims priority, application Germany, July 31, 1974, 2436886
Int. Cl.² H02K *37/00*
U.S. Cl. 310—49 R **10 Claims**



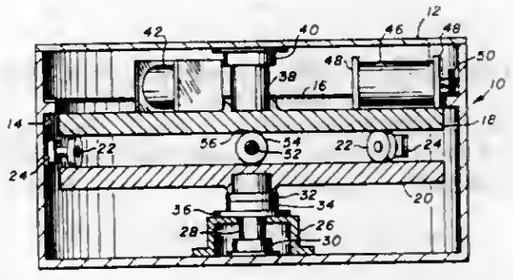
1. In a self-starting synchronous motor of the type having $m \geq$ two phases, a permanent magnet-type rotor with a plurality of alternately polarized poles, a stator including individually excited and inwardly facing main stator poles, both said stator and rotor having an interpole center-to-center angular distance of τ_p, said stator poles being combined in u groups of alternate polarity per phase which groups are spatially displaced from each other by an angle $\tau_p/m = \delta = 180°/m \cdot p$, where p is the number of pole pairs of the rotor, the improvement comprising that at least one windingless auxiliary stator pole of approximately one-half of the width of the main stator poles is provided per group and per phase in addition to the main stator poles, the total number of stator poles being at least equal to the number of rotor poles.

4,031,420

FLYWHEEL DRIVE SYSTEM

Eugene P. Carini, 800 28th Ave., Vero Beach, Fla. 32960

Filed Apr. 22, 1976, Ser. No. 679,193
Int. Cl.² H02K *7/02*
U.S. Cl. 310—74 **12 Claims**



1. Rotary motion producing apparatus comprising:
a housing;
first flywheel means, said first flywheel means including a

first flywheel supported in said housing for rotation about an axis;

second flywheel means, said second flywheel means including a second flywheel supported in said housing for rotation about said axis;

drive means for causing said first flywheel to rotate about said axis, said drive means including at least a first electric motor;

means drivingly coupling said first flywheel to said second flywheel whereby said first and second flywheels rotate about said axis in opposite directions;

power take-off means, said power take-off means including a rotatable output shaft oriented transversely to said axis; and

means coupling said first and second flywheel means to said power take-off means whereby the motion of said flywheels is transmitted to said power take-off means output shaft.

4,031,421

ELECTRIC GENERATOR

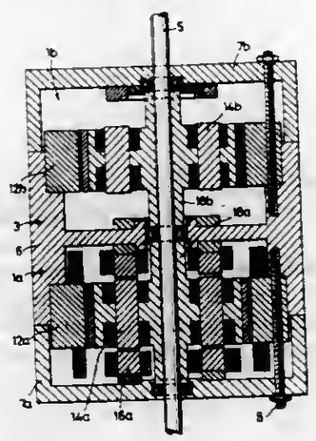
Otto Geiger, Schwabach, Germany, assignor to GeSig Energietechnik GmbH, Schwabach, Germany

Filed Sept. 24, 1975, Ser. No. 616,349

Claims priority, application Germany, Sept. 25, 1974, 2445765

Int. Cl.² H02K *19/34*

U.S. Cl. 310—112 **12 Claims**



1. An electric generator comprising, in combination, a rotor with a shaft, a stator, both carrying respective, peripherally successive poles with a substantially uniform angular distance therebetween, and at least one pair of electrically identical but separate axially aligned generator sections, the latter including pole cores that occupy substantially the same sectors as gaps therebetween, and wheren the angular position of said shaft, in which position said rotor poles overlap between the rotor and the stator of the same generator section, is offset from both generator sections by half the angular distance between said rotor poles.

4,031,422

GAS COOLED FLUX SHIELD FOR DYNAMOELECTRIC MACHINE

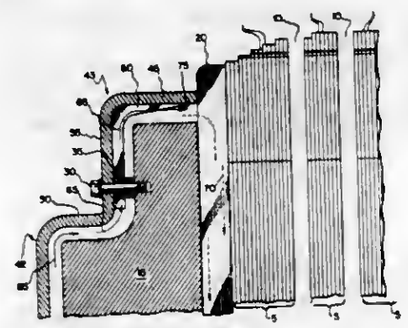
Aathony F. Armor; Madabushi V. K. Chari; Henry W. Kudlacik, all of Schenectady, N.Y., and Paul Reece, Pittsfield, Mass., assignors to General Electric Company, Schenectady, N.Y.

Filed Sept. 2, 1975, Ser. No. 609,390

Int. Cl.² H02K *1/12*

U.S. Cl. 310—256 **6 Claims**

1. A dynamoelectric machine of the type including a gas cooled stator core comprising a plurality of laminations held in assembled relationship by end flanges applying a compressive loading thereto and an annular flux shield for reducing the eddy current losses in the end flanges and the stator cores, the flux shield including an inner rim disposed adjacent to and spaced from a respective end flange for providing a passage for the flow of cooling gas therebetween and including the improvement comprising:



means for circulating cooling gas radially through the passage between said flux shield and said end flange, and

means disposed adjacent the inner rim of said flux shield for increasing the amount of heat transfer surface area between said flux shield and said cooling gas.

4,031,423

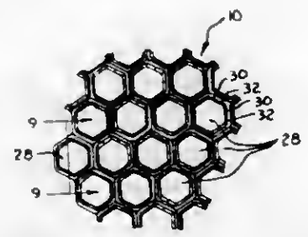
CHANNEL STRUCTURE FOR MULTI-CHANNEL ELECTRON MULTIPLIERS AND METHOD OF MAKING SAME

Walter P. Siegmund, Woodstock, Conn., assignor to American Optical Corporation, Southbridge, Mass.

Filed Apr. 30, 1969, Ser. No. 823,245

Int. Cl.² H01J *43/00*

U.S. Cl. 313—105 CM **4 Claims**



1. An electron multiplier component comprising a glass plate having a multiplicity of juxtapositioned channels extending from one face through the plate to an opposite face thereof, the inner wall of each channel being formed of a plurality of contiguous strips of glass extending along substantially the full length of the channel, said strips being alternately one of a glass having high electrical conductivity and another of a glass having high electron emissive properties and a matrix glass surrounding said strips.

4,031,424

ELECTRODE TYPE GLOW DISCHARGE APPARATUS

Alan S. Penfold, Playa del Rey, and John A. Thornton, Los Angeles, both of Calif., assignors to Telic Corporation, Santa Monica, Calif.

Division of Ser. No. 178,240, Sept. 7, 1971, Pat. No. 3,484,239. This application Mar. 3, 1975, Ser. No. 554,485

Int. Cl.² H01J *1/02, 1/44, 1/52, 21/22*

U.S. Cl. 313—146 **3 Claims**

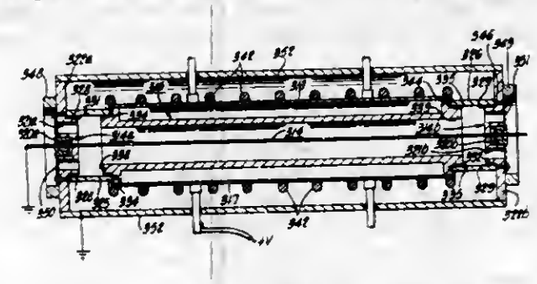
1. Electrode-type glow discharge apparatus comprising:

a low pressure gaseous environment;

anode means and cathode means within said low pressure gaseous environment and adapted to be coupled to a power supply;

said cathode means including a central cathode and a pair of electrically conductive end flanges physically and electrically coupled with said cathode,

said cathode comprising an elongated member and said flanges comprising outwardly extending flanges electrically coupled with said elongated member, said elongated member being movable from outside said gaseous environment into said gaseous environment through and with respect to said flanges along the longitudinal axis of said flanges.



4,031,425

DISPENSER CATHODE FOR A GRID-CONTROLLED ELECTRON TUBE AND METHOD OF MANUFACTURING SAME

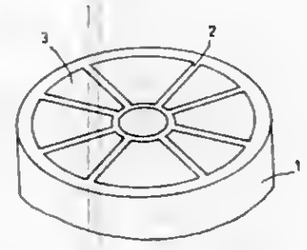
Reinhard Ziegler, and Horst Seifert, both of Hamburg, Germany, assignors to U.S. Philips Corporation, New York, N.Y.

Filed Oct. 2, 1975, Ser. No. 619,061

Claims priority, application Germany, Oct. 19, 1974, 2449796

Int. Cl.² H01J *1/14, 19/06*; H01K *1/04*

U.S. Cl. 313—346 R **8 Claims**



1. A sintered dispenser cathode for a grid-controlled electron tube in which the emission of regions of the emissive surface of the cathode immediately opposite to the control grid is reduced, said cathode having projections above the emissive surface of fused pore-closed portions of reduced emission which have a focusing effect.

4,031,426

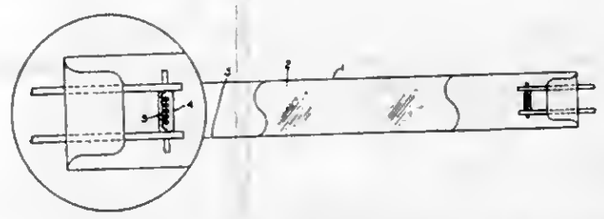
EMISSIVE COATING FOR ELECTRODES

Edmund R. Kern, Hampton, N.H., assignor to International Telephone and Telegraph Corporation, Nutley, N.J.

Division of Ser. No. 487,409, July 10, 1974, Pat. No. 3,953,376. This application Dec. 15, 1975, Ser. No. 641,192

Int. Cl.² H01J *1/14*; D02G *3/00*

U.S. Cl. 313—346 R **2 Claims**



1. A cathode for electrical gas discharge devices comprising a tungsten coil and an electron emissive coating thereon said coil, said coating comprising barium tantalate having the composition five parts BaO to one part Ta_2O_5.

4,031,427

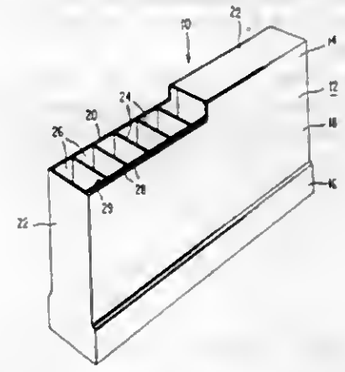
FLAT CATHODE RAY TUBE

Thomas Osborne Stanley, Princeton, N.J., assignor to RCA Corporation, New York, N.Y.

Filed Aug. 25, 1975, Ser. No. 607,492

Int. Cl.² H01J *29/08, 31/00*

U.S. Cl. 313—422 **9 Claims**



1. An electron beam addressed device comprising:

an evacuated envelope having mutually spaced, substantially parallel, front and back walls,

a target adjacent to and substantially co-extensive with the front wall,

means for generating and directing electrons along at least one path extending between said front and back walls and substantially parallel to said target,

guide means disposed along the entire length of said path for creating electrostatic forces which confine the electrons in a beam which is spaced from the walls of the envelope,

means for deflecting said beam toward said target at selected points along said path, and

openings in said guide means through which the beam can pass when it is deflected toward said target.

4,031,428

DISCHARGE TUBE HAVING MULTIPLE ELECTRODES ARRANGED IN TANDEM

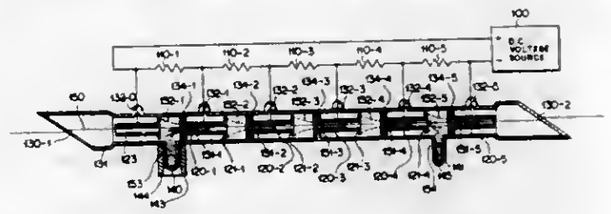
Katsumi Tokudome, Iruma, and Shuzo Hattori, Nagoya, both of Japan, assignors to Kimmon Electric Co., Ltd., Tokyo, Japan

Filed Mar. 15, 1976, Ser. No. 666,907

Claims priority, application Japan, Mar. 13, 1975, 50-30331

Int. Cl.² H01S *3/22*

U.S. Cl. 315—111 **7 Claims**



1. A discharge tube comprising:

a vessel containing rare gas;

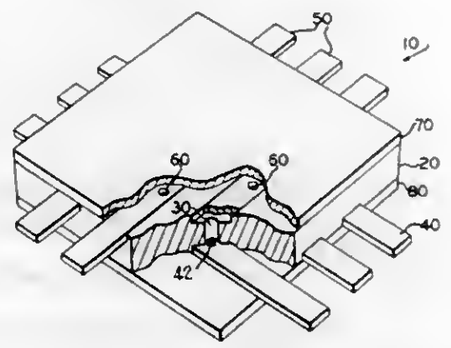
a plurality of electrodes having a cathodic part and anodic part therein and so arranged tandem in said vessel that a glow discharge is kept in a discharge gap between each said cathodic part and said anodic part of the preceding electrode, and that an optical path is provided to let

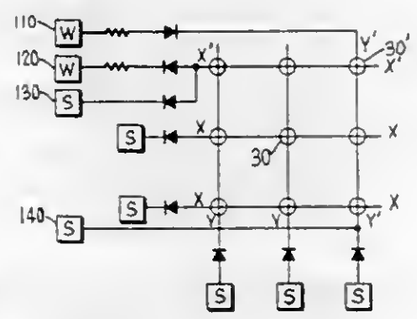
through each negative glow part of said glow discharge adjacent to said cathodic part;
means to apply a dc voltage across every said discharge gap in series; and
means to supply metal vapor to one of said glow discharge at the most low potential end of said means to apply dc voltage, whereby metal ions formed in said one of said glow discharge are carried down throughout said vessel.

4,031,429
INFORMATION DISPLAY AND METHOD OF OPERATING WITH STORAGE

George E. Holz, North Plainfield, and James A. Ogle, Neshanic Station, both of N.J., assignors to Burroughs Corporation, Detroit, Mich.

Continuation of Ser. No. 83,200, Oct. 22, 1970, abandoned, which is a continuation of Ser. No. 780,099, Nov. 29, 1968, abandoned. This application May 12, 1976, Ser. No. 685,550
Int. Cl.² H05B 41/16
U.S. Cl. 315—169 TV 44 Claims



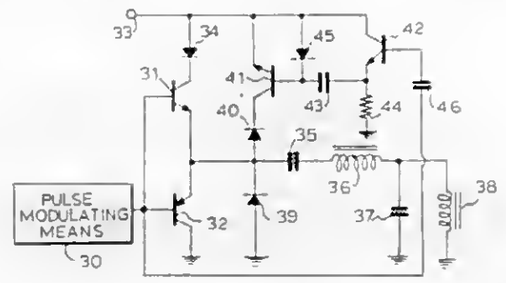


1. An information display system including
a glow discharge device comprising an envelope containing a gaseous atmosphere at a pressure capable of sustaining a glow discharge;
at least one anode electrode and one cathode electrode in operative relation with the gas disposed in said envelope,
the combination of said gas and said anode electrode and cathode electrode having a characteristic firing voltage;
means for applying a write voltage between said electrodes to produce a glow discharge in the gas between said electrodes, said write voltage having an amplitude greater than that of said characteristic firing voltage and permissibly as much as about twice the amplitude of said firing voltage, said glow discharge generating excited particles in said gaseous atmosphere; and
means for applying short duration sustaining pulses between said electrodes starting after the termination of said write voltage and continuing at spaced intervals thereafter but while excited particles still present;
said sustaining pulses being of shorter duration than said write voltage but of sufficient duration to sustain said glow discharge while excited particles are still present; said sustaining pulses having an amplitude greater than that of said firing voltage and a duration and repetition rate sufficient to sustain said glow discharge at a favorable level of light output, current flow, and power dissipation but insufficient to cause arcing; the amplitude, duration, and repetition rate of said sustaining pulses being insufficient to produce said glow discharge if said write voltage has not been applied and excited particles are not present.

4,031,430
VERTICAL DEFLECTION CIRCUIT

Shigeru Enomoto, Kyoto, Japan, assignor to Matsushita Electric Industrial Co., Ltd., Osaka, Japan

Filed Nov. 12, 1975, Ser. No. 631,460
Claims priority, application Japan, Nov. 13, 1974, 49-131489; Dec. 5, 1974, 49-140277; Feb. 13, 1975, 50-18520
Int. Cl.² H01J 29/70, 29/76
U.S. Cl. 315—403 5 Claims



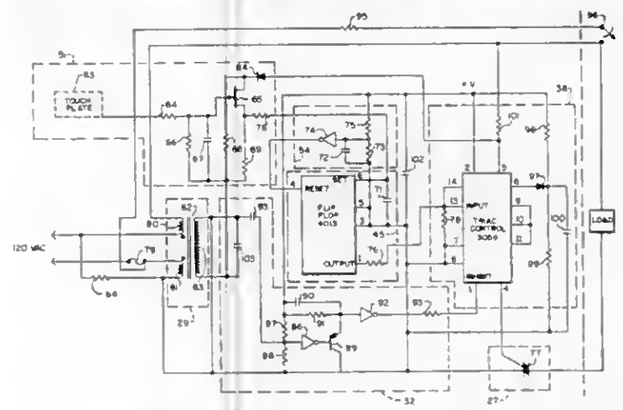
1. A vertical deflection circuit employing a class D amplifier comprising:
modulating means for converting a sawtooth waveform signal having a field frequency to a width modulated pulse train;
a pulse amplifier coupled to said modulating means for amplifying said width modulated pulse train, said pulse amplifier comprising an output circuit having a pair of switching devices which are connected in series and also connected for making one of them conductive while the other is nonconductive, two damping diodes each being connected in parallel with a corresponding switching device and reversely with respect to current flow through the switching devices, switching means connected in series with one of said damping diodes and which is nonconductive during a retrace period in said field frequency, and a forwardly biased diode coupled between one of said switching devices and a voltage supply source;
demodulating means for demodulating said width modulated pulse train to said sawtooth waveform, said demodulating means being composed of a filtering choke, a decoupling capacitor, one end of said choke being coupled to the connection between said switching devices through said decoupling capacitor, and a further capacitor coupled between the other end of the filtering choke and ground; and
a deflection yoke winding coupled between the connecting point between the filtering choke and said further capacitor, and ground.

4,031,431
GROUND FAULT CIRCUIT INTERRUPTER

Thomas A. O. Gross, Lincoln, Mass., assignor to The Gillette Company, Boston, Mass.

Filed Oct. 1, 1975, Ser. No. 618,567
Int. Cl.² H02H 3/28
U.S. Cl. 307—326 18 Claims

1. In a circuit for protecting the operator of a portable apparatus having an electrical load from an alternating current source having line and neutral conductor sides, circuit means capable of being electrically coupled between the alternating current source and the electrical load for sensing a current imbalance in the line and neutral conductor sides and developing an output signal in response to the current imbalance, switching means for interrupting the current in the line conductor side in response to said output signal, the improvement comprising:
polarity sensing means for indicating if said switching means

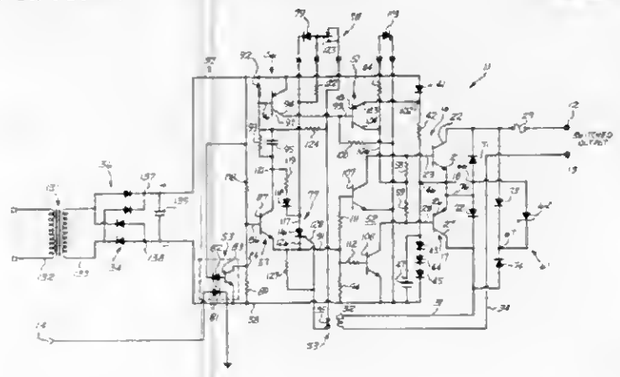


is electrically connected in series in the line conductor side when said circuit means is electrically connected to the alternating current source and means for permanently connecting the electrical load in series in a completed circuit with the switching means wherein the switching means is a solid state switch adapted to self-destruct prior to a lethal voltage developing across said permanently connected electrical load.

4,031,432
SOLID STATE SWITCHING CIRCUIT AND METHOD FOR SIMULATING A RELAY

Daryl F. Proctor, Redmond, Wash., assignor to Proctor and Associates Company, Redmond, Wash.

Filed Nov. 5, 1975, Ser. No. 629,127
Int. Cl.² H02H 7/20
U.S. Cl. 361—7 16 Claims

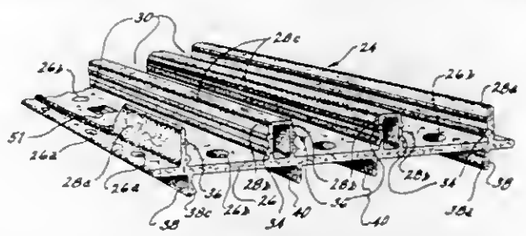


1. A solid state switch comprising:
a pair of output terminals adapted to be connected in a circuit path which is to be switched between closed and open conditions;
a pair of like polarity transistors having their emitters connected in common and having their collectors individually connected to a separate one of said output terminals;
switching signal source means having an output producing a switching signal at selected, non-periodic times; and
drive circuit means jointly connected to said emitters and to the bases of said pair of transistors, and said drive circuit means being connected and responsive to said output of said switching signal source means to drive the base emitter junctions of said pair of transistors between a forward biased condition in which said pair of output terminals connected to said collectors assume a relatively low impedance closed switch condition and a reverse biased condition in which said output terminals connected to said collectors assume a relatively high impedance open switch condition.

4,031,433
INSULATIVE MODULAR MOUNTING PANELS FOR ELECTRICAL SWITCHBOARDS

William Francis Olashaw, Plainville, Conn., assignor to General Electric Company, New York, N.Y.

Continuation of Ser. No. 474,761, May 30, 1974. This application Oct. 3, 1975, Ser. No. 619,241
Int. Cl.² H02B 1/20
U.S. Cl. 361—338 1 Claim

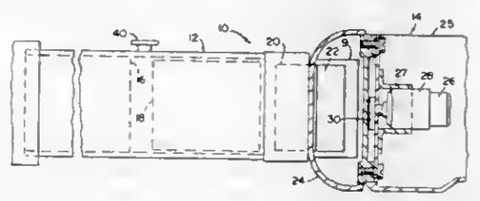


1. For use in an electrical switchboard having vertical busbars for distributing electrical power to a load via an electrical device accommodated in a switchboard compartment, a modular insulative mounting panel comprising:
A. a base plate having opposed marginal side portions for mounting attachment to the switchboard;
B. a plurality of spaced parallel ribs outstanding from one side of said base plate to define three open, longitudinally elongated, parallel channel sections, said rib plurality including two pairs of contiguous inboard ribs separating adjacent channel sections said contiguous inboard ribs of each pair interconnected adjacent their free edges by an integrally formed, coextensive bridging segment spanning the space between adjacent channel sections, said contiguous rib pairs and bridging segments serving to increase the oversurface clearance between adjacent channel sections;
C. busbar mounting means formed in said channel sections;
D. means forming two longitudinally spaced sets of transversely aligned apertures in said base plate, the apertures of at least one set individually located in each said channel section; and
E. coextensive spacer ridges integrally formed on the surfaces of those of said ribs constituting sidewalls for adjacent channel sections.

4,031,434
KEYHOLE-LESS ELECTRONIC LOCK

Robert Richard Perron, Beverly, and John E. Trombly, Winchester, both of Mass., assignors to The Eastern Company, Naugatuck, Conn.

Filed Dec. 29, 1975, Ser. No. 644,947
Int. Cl.² E05B 47/00
U.S. Cl. 361—172 6 Claims



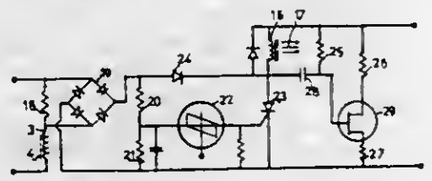
1. An electronic lock system comprising, in combination: key means including generating means for generating a plurality of binary frequency modulated carrier waves, first inductor means electrically connected to said generating means; lock means including lock inductor means positioned to induc-

tively couple with said key inductor means when said key means is in predetermined spatial relation to said lock means, signal distinguishing means electrically connected in circuit of said lock means and disposed to receive signals from said generating means whereby a predetermined sequence of binary signals is compared with the sequence of binary signals contained within the carrier from said generating means, motor means electrically connected in driven relation to said signal distinguishing means so that upon a corresponding comparison of said signal distinguishing means said motor means is activated, lock lug means connected in movable, driven relation to said motor means, whereby activation of said motor means causes movement of said lock lug means between a locked and unlocked position.

4,031,435
SWITCHING DEVICE

Dov Zioni, and Levi Y. Halperin, both of Jerusalem, Israel, assignors to Shaare Zedek Hospital, Jerusalem, Israel

Filed Apr. 8, 1976, Ser. No. 674,863
Int. Cl.² H01H 47/32
U.S. Cl. 361—186 **9 Claims**



1. An indirectly activated electrical switching device comprising an inductor adapted to be periodically pulse-energized, an armature movable mounted with respect to said inductor so as to assume a first and a second position relative to said inductor thereby causing a distinct variation of current flow in said inductor when energized by said periodically applied pulse, a manipulative armature positioning means and an associated electrical circuit responsive to current flowing in said inductor and adapted to selectively actuate and external system only when said armature assumes one of said positions and a periodic energizing pulse has reached the inductor.

4,031,436
ELECTROLYTE CAPACITORS

Robert S. Alwitt, Longmeadow, Mass., assignor to United Chemi-Con, Inc., Syracuse, N.Y.

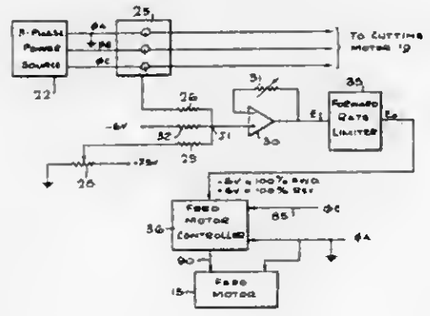
Filed May 9, 1975, Ser. No. 576,089
Int. Cl.³ H01G 9/02
U.S. Cl. 361—301 **9 Claims**

1. A capacitor comprising aluminum anode and cathode members separated by an insulating spacer impregnated with an electrolyte consisting essentially of a solute of a salt of a heteropoly acid of the class consisting of silicotungstic acid and silicomolybdic acid in a polar organic solvent, said salt being selected from the group consisting of alkali metal, ammonium, quaternary ammonium and amine salts, and said electrolyte having a pH of about 5 to about 7.2, said acid containing 1 silicon atom per 12 atoms of tungsten or molybdenum.

4,031,437
WORK AND FEED CONTROL SYSTEM FOR CUTTING MACHINES

Edward Justin Dempsey, Huntington Beach, and David Earl Kent, La Mirada, both of Calif., assignors to Concrete Cutting Equipment Inc., Hawthorne, Calif.

Filed July 10, 1975, Ser. No. 594,584
Int. Cl.² G05B 19/24
U.S. Cl. 318—39 **16 Claims**



1. In a machine for cutting material an arrangement comprising;

a cutting tool;

a cutting motor to which said cutting tool is coupled for producing a cutting motion of said tool at a rate proportional to the level of current supplies to said cutting motor, which level is in turn proportional to the load level of said cutting motor which is related to the load of said cutting tool;

a bidirectional variable speed feed motor for producing relative motion in a forward direction between said cutting tool and material to be cut, thereby feeding material to said cutting tool, and for producing relative motion in a reverse direction, which is opposite said forward direction, between said cutting tool and said material;

first means for continuously detecting said level of current to said cutting motor for providing a first signal proportional to the cutting motor load level;

second means responsive to said first signal and to a selected second signal or providing a load level signal which is indicative of the cutting motor load level with respect to a desired cutting load level; and

third means responsive to said load level signal for controlling said feed motor to produce relative motion in the forward direction at a controlled rate of increase when the cutting motor load level is less than said desired cutting load level, for controlling said feed motor to maintian the relative motion in the forward direction at a substantially constant level when the cutting motor load level is substantially equal to said desired load level, for controlling said feed motor to decrease the relative motion in the forward direction at a rate substantially equal to the rate of increase of the cutting motor load level from said desired level toward a threshold load level, for controlling said feed motor to produce relative motion in the reverse direction at rates related to the rates of change of the cutting motor load level when the latter exceeds said threshold load level, and for controlling said feed motor to produce relative motion in the forward direction, when said cutting motor load level decreases below said threshold load level, at an increasing rate which is substantially equal to either the rate of decrease of the cutting motor load level below said threshold load level or at a controlled rate of increase, whichever rate is smaller.

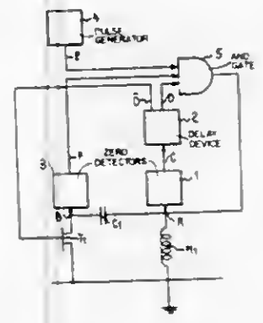
CONTROL DEVICE FOR THE ROTARY MOTOR OF A WATCH

Jean-Claude Berney, Lausanne, Switzerland, assignor to Ebauches S.A., Neuchatel, Switzerland

Filed Jan. 20, 1976, Ser. No. 650,737
Claims priority, application Switzerland, Feb. 11, 1975, 1631/75
Int. Cl.² G05B 5/00
U.S. Cl. 318—331 **2 Claims**

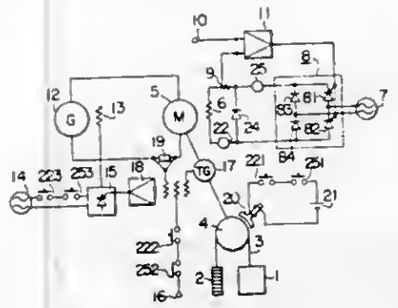


1. A control device for the rotary motor of a watch, comprising: a first zero detector, an input of which is connected to a coil of the motor and the output of which is connected to a delay device; a second zero detector, the input of which is connected to the coil of the motor via a capacitor, which may be short-circuited by a switch controlled by the output of the delay device; and a logic circuit, delivering driving pulses to the coil during the time in which the second detector and the delay device simultaneously deliver an output signal.

4,031,439
OVER-SPEED PREVENTING APPARATUS FOR DC MOTOR

Yoshio Sakai, and Toshiaki Kurosawa, both of Katsuta, Japan, assignors to Hitachi, Ltd., Japan

Filed July 11, 1975, Ser. No. 595,365
Claims priority, application Japan, July 19, 1974, 49-82215
Int. Cl.² H02P 7/06
U.S. Cl. 318—338 **8 Claims**

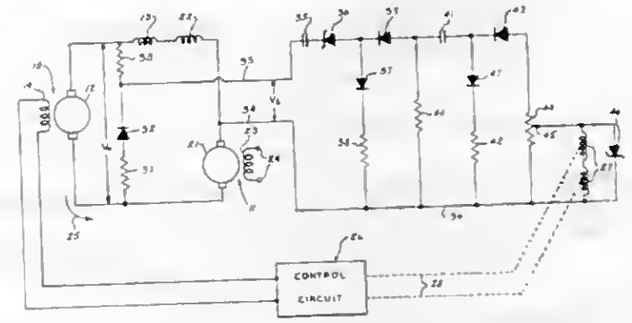


1. An over-speed preventing apparatus for a DC motor comprising a DC motor having a field winding and rectifier means including a rectifier circuit for supplying power to separately excite the field winding of said DC motor; said apparatus further comprising a unidirectional current conducting element connected in parallel to said field winding, current reduction detecting means connected in series between said parallel circuit, formed by said unidirectional current conducting element and said field winding, and said rectifier circuit for detecting reduction of the current therethrough to below a prescribed level, and protecting means responsive to said current reduction detecting means for preventing over-speed operation of said DC motor.

4,031,440
TRANSIENT LOAD DAMPING CIRCUIT FOR EXCAVATOR

Edward H. Christian, Brookfield; Donald M. Mains, Greendale, and James H. Treiber, Milwaukee, all of Wis., assignors to Bucyrus-Erie Company, South Milwaukee, Wis.

Filed May 20, 1976, Ser. No. 688,488
Int. Cl.² H02P 7/00
U.S. Cl. 318—432 **14 Claims**



5. In an excavator drive system the combination comprising:

a drive motor having an armature, and a field winding connected in series with the armature;

a generator having an armature connected to said motor armature to form a loop which includes said motor and generator armatures and said motor field winding;

a voltage divider connected across said generator armature and including a pair of series connected resistors;

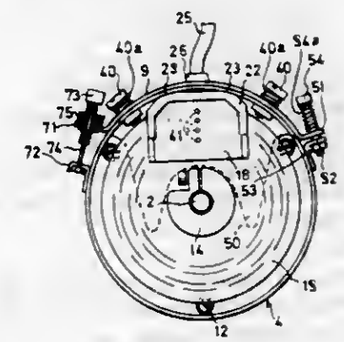
a feedback circuit having one input lead connected to the juncture of said voltage divider resistors and a second input lead connected to the juncture of said motor armature and its associated field winding, said feedback circuit including means for generating a feeback signal proportional to the second derivative of the signal applied to said input leads; and

a control circuit connected to effect the operation of said generator and connected to receive said feedback signal, said control circuit being responsive to said feedback signal to alter the operation of the generator.

4,031,441
OPTICAL ENCODER

David Aubrey Garrett, Sutton, England, assignor to Vactric Control Equipment Limited, England

Filed June 6, 1975, Ser. No. 584,385
Claims priority, application United Kingdom, June 7, 1974, 25445/74
Int. Cl.² G01D 5/36
U.S. Cl. 318—480 **9 Claims**



1. An optical encoder comprising

a housing capable of being secured to the end wall of a motor or rotating component about its shaft, said housing having a peripheral aperture and also an opening for receiving an end portion of said shaft;

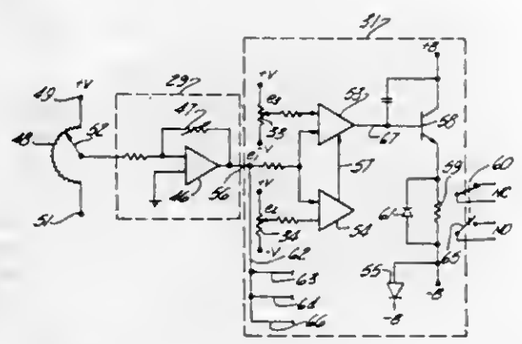
a fixture for mounting an optical encoding disc rigidly on said shaft end portion,
a removable closure for said peripheral aperture of said housing,
a caliper assembly supported by said closure within said housing, said caliper assembly having opposite arms overlying opposite sides of said encoding disc, said arms carrying light-generating and light-sensitive elements, respectively, so that an electrical signal provided by said light-sensitive element is a function of the rotational movement of said disc, and
means for adjusting said caliper assembly through limited arcuate movement about the shaft axis.

4,031,442

ELECTRONIC POSITION AND VELOCITY CONTROL SYSTEM

Joseph C. Poppelreiter, II, Sterling Heights, Mich., assignor to Kubik Hydradrives, Inc., Troy, Mich.

Continuation of Ser. No. 423,805, Dec. 11, 1973, abandoned. This application May 12, 1975, Ser. No. 576,743
Int. Cl.² G05B *13/00*
U.S. Cl. 318—561 **1 Claim**



1. A system for controlling the extent of movement of a movable member with respect to a fixed member and for effecting velocity changes at arbitrarily selected locations along the path of movement comprising:
means for providing a variable voltage, said variable voltage varying in direct relationship with the position of said movable member;
first means for providing a first reference voltage, said first reference voltage providing a level representative of a first arbitrarily selected location along said path of movement where a first change in velocity occurs, said first arbitraily selected location being readily changeable over a widely variable range by changing said first reference voltage;
first voltage comparison means receiving said variable voltage and said first referene voltage and generating a comparison signal when said variable voltage and said first reference voltage are substantially equal;
second means for providing a second reference voltage, said second reference voltage providing a level representative of a second arbitrarily selected location along said path of movement where a second change in velocity occurs, said second arbitrarily selected location being readily changeable over a widely variable range by changing said second reference voltage;
second voltage comparison means receiving said variable voltage and said second reference voltage, said second voltage means being responsive to said comparison signal to provide an actuation signal, said second comparison means ceasing the provision of said actuation signal when said variable voltage substantially equals said second reference voltage;
utilization means responsive to said actuation signal, said utilization means changing the velocity of movement of said movable member when said first comparison means yields said comparison signal and stopping said movement when said second comparison means ceases provision of said actuation signal;
said motion being reciprocal between preselected start and stop points and wherein said second reference voltage means establishes the stop point for motion in one direction and the start point for motion in the order direction and further including:
third means for providing a third reference voltage having a level indicative of an arbitrarily selected third position for a velocity change during motion in the opposite direction;
third voltage comparison means receiving said variable voltage and said third reference signal and generating a second comparison signal when said variable voltage and said third reference voltage are equal;
fourth means for providing a fourth reference voltage for establishing a second change in velocity at a fourth arbitrarily selected position during motion in the opposite direction;
fourth voltage comparison means receiving said variable voltage and said fourth reference voltage, said fourth voltage means being responsive to said second comparison signal to provide a second actuation signal, said fourth comparison means ceasing the provision of said second actuation signal when said variable voltage substantially equals said fourth reference voltage; and

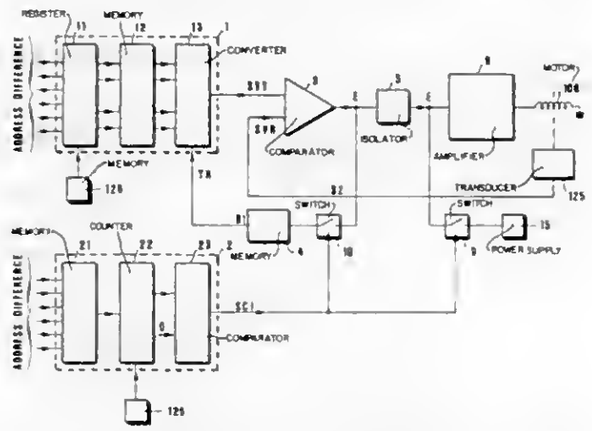
4,031,443

APPARATUS FOR POSITIONALLY CONTROLLING A MOVABLE HEAD ASSEMBLY

Jacques Pierre Léon Droux, Paris, and René Jean Rodier, Bobigny, both of France, assignors to Compagnie Honeywell Bull (Societe Anonyme), Paris, France

Filed May 22, 1975, Ser. No. 579,862
Int. Cl.² G05B *13/00*; G11B *21/08*
U.S. Cl. 318—561 **7 Claims**



1. An apparatus for positionally controlling a movable head assembly, said apparatus having an acceleration and deceleration state, comprising, in combination:
a motor drivingly connected to said movable head assembly;
transducer means for producing a velocity signal representing the speed of said movable head assembly;
a first and second switch;
an isolator
a power supply connected to said motor through said first switch;
first memory means for setting a series of theoretical velocities for said movable head assembly, said first memory means producing a series of theoretical velocity signals representing said theoretical velocities, said first memory means defining a series of arbitrary velocity signals;
means for comparing said theoretical velocity signals and said velocity signal to produce an error signal, said comparing means including a pair of inputs connected to said first memory means and said transducer means, respectively, and an output connected to said motor through said isolator;
second memory means for producing a reference signal in response to said error signal, said second memory means being connected to said output of said comparing means through said second switch, said first memory means being connected to said second memory means for receipt of said reference signal, said theoretical velocity signals being the product of said arbitrary velocity signals and said reference signal; and
means for controlling inversion between said acceleration and deceleration states, said first and second switches being connected and responsive to said controlling means, said controlling means closing said first and second switches is said acceleration state, whereby said second memory means continually receives said error signal, said motor is connected to said power supply to drive said movable head assembly under substantially free conditions, and said isolator isolates said comparing means from said power supply, said controlling means opening said first and second switches in said deceleration state, whereby said second memory means stores said error signal at inversion, said reference signal becomes constant, and said motor is connected to said output of said comparing means to drive said movable head assembly in response to said error signal, whereby said velocity signal tracks said theoretical velocity signals.

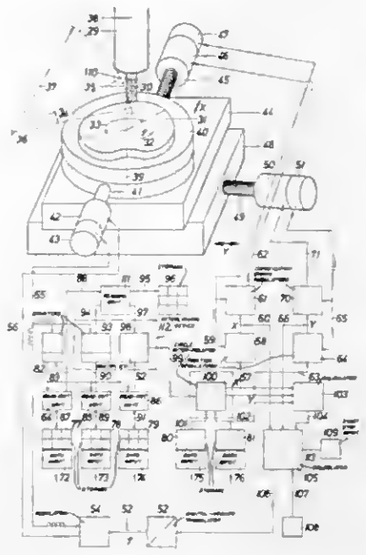
CONTROL ARRANGEMENT FOR A CAM PRODUCTION MACHINE

Alfred Schmermund, 62, Kornerstrasse, 5820 Gevelsberg, Germany

Filed Aug. 21, 1975, Ser. No. 606,827
Claims priority, application Germany, Aug. 26, 1974, 2440775
Int. Cl.² G05B *19/42*
U.S. Cl. 318—568 **7 Claims**



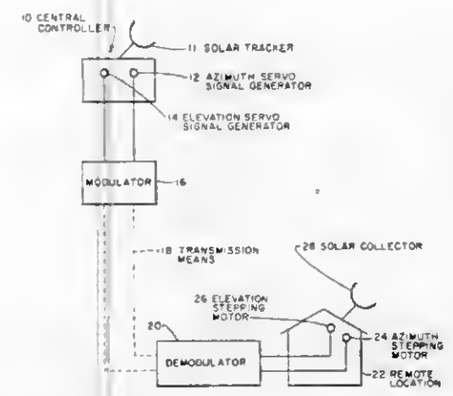
1. An automatic milling or grinding machine comprising in combination:
a frame;
tool support means supported on said frame;
workpiece support means mounted on said frame to be rotationally and rectilinearly displaceable relative thereto;
rotational drive means to rotate said workpiece support means;
first drive means to rectilinearly displace said workpiece support means in a first co-ordinate direction in a plane perpendicular to the axis of rotation of said workpiece support means;
second drive means to rectilinearly displace said workpiece support means in a second co-ordinate direction in said plane and perpendicular to said first co-ordinate direction;
first storage means to store information relating to a law of a camming surface to be formed on said workpiece by said machine;
second storage means to store information relating to workpiece-dependent parameters for determining dimensional characteristics of given portions of said camming surface;
co-ordinator means to operatively associate with one another related items of information derived from each of said first and second storage means thereby to generate a succession of angle information signals, said succession defining a circular arc corresponding to one on which the axis of rotation of a roller follower of given dimensions would move on following said camming surface; and
command signal generator means connected to said co-ordinator means and responsive to said angle information signals to apply respective command signals to each of said first and second rectilinear drive means thereby to cause said workpiece to be displaced relative to said tool along said circular arc.

4,031,444

SOLAR COLLECTOR CONTROL SYSTEM

Earl J. Beck, Jr., Ventura, Calif., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Oct. 20, 1975, Ser. No. 624,148
Int. Cl.² G05B *11/32*
U.S. Cl. 318—562 **7 Claims**



1. A solar collector control system comprising:
a. means for tracking the sun as it traverses in an arc across the sky;
b. servo means for producing two sets of intermittent stepping signals representative of azimuth and elevation of said means for tracking;
c. means for multiplexing said signals for transmission to remote locations;
d. means for demultiplexing said signals at said remote locations; and
e. stepping means for controlling the azimuth and elevation of solar collectors at said remote location in response to said signals.

4,031,446

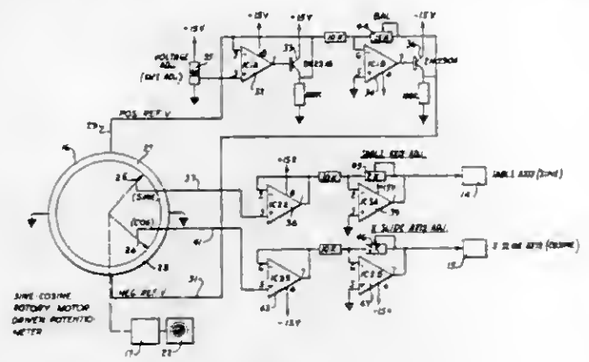
MACHINE TOOL

Arthur Francis St. André, Marlboro; Joseph David LeBlanc, Holden, and Edward George Robillard, Cherry Valley, all of Mass., assignors to Cincinnati Milacron-Heald Corporation, Worcester, Mass.

Continuation of Ser. No. 395,917, Sept. 10, 1973, abandoned. This application July 31, 1975, Ser. No. 600,903

Int. Cl.² G05B *1/06*

U.S. Cl. 318—665 **5 Claims**



1. A machine tool, comprising

a. a base,

b. a workhead mounted on the base,

c. a toolhead mounted on the base,

d. a first means for producing relative movement in a first direction between the workhead and the toolhead, said first means including a constant-torque motor,

e. a second means for producing relative movement between the workhead and the toolhead in a second direction perpendicular to the first direction, said second means including a constant-torque motor, the first means and the second means each including an electrical servo motor receiving a signal from one of the said portions and operating through a ball-screw mechanism to produce the said respective relative movement between the workhead and the toolhead,

f. a first and second potentiometer portion, at least one portion having non-linear resistance and a contactor associated with each portion, the portions of the potentiometer being circular and concentric with a shaft for driving the contactors, the electrical signal developed by one portion of the potentiometer varying as the sine of the angle of the shaft, while the electrical signal developed by the other portion varies as the cosine of the angle, and

g. a motor driving the contactors together at the same constant and predetermined speed, thus causing the potentiometers to develop two separate and continuous electrical signals, each signal varying in accordance with the nature of its respective portion, one signal controlling the speed of one motor and the other signal controlling the speed of the other motor, each motor bringing about the said relative movement at a velocity proportional to the voltage developed by its portion of the potentiometer.

4,031,447

IMPROVED CONTROL SYSTEM FOR ENERGIZING A STEPPING MOTOR

Masaaki Togo, Kawasaki; Masao Shima, Shinagawa, and Kiyoshi Mochizuki, Kamakura, all of Japan, assignors to Yamatake-Honeywell Company Limited, Tokyo, Japan

Filed June 27, 1975, Ser. No. 591,117

Claims priority, application Japan, July 2, 1974, 49-75004

Int. Cl.² H02K *37/00*

U.S. Cl. 318—685 **7 Claims**

1. A control system for energizing a stepping motor for bidirectional rotational comprising in combination:

a comparactor circuit with two input means and and output means;

an input signal and a feedback signal;

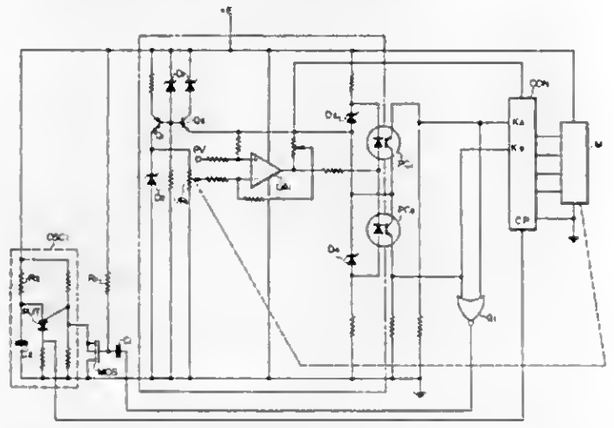
means for coupling the input signal to said one of said input means and the feedback signal to the other of said input means;

a stepping motor;

means for energizing said stepping motor;

means responsive to an output of said comparator for periodically coupling said energizing means to said stepping motor;

said responsive coupling means including a clock pulse generator, the pulse width of which determines the energy coupled to said motor is stepping;



said coupling means coupling said energizing means to said motor to cause rotation in one direction in response to an output of said comparator at one level;

said coupling means coupling said energizing means to said motor to cause rotation in the opposite direction in response to an output of said comparator at another level;

said coupling means for decoupling said energizing means from said motor in response to an output of said comparator which is between said levels; and

means for increasing the width of said clock pulses for a predetermined period in response to the output of said comparator initially reaching said one level.

4,031,448

MOTOR DRIVING SYSTEM AND CIRCUIT THEREFOR

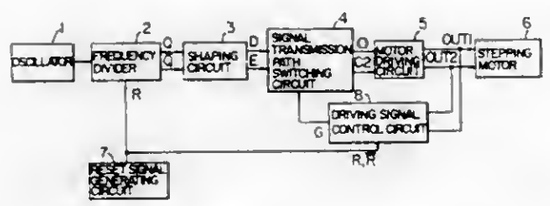
Yoshio Adachi, Kodaira, Japan, assignor to Hitachi, Ltd., Japan

Filed Feb. 11, 1976, Ser. No. 657,235

Claims priority, application Japan, Sept. 26, 1975, 50-115633

Int. Cl.² G05B *19/40*

U.S. Cl. 318—696 **17 Claims**



1. A motor driving system comprising:

a reference signal generating circuit for generating a pair of reference signals of different phase from each other;

a motor driving circuit responsive to said pair of reference signals for producing a pair of motor driving signals for causing drive currents of opposite polarity to each other to be alternately fed to a motor;

a signal transmission path switching circuit connected between said reference signal generating circuit and said motor driving circuit for switching the paths which transmit said reference signals to said motor driving circuit;

a control circuit for receiving said motor driving signals at an input thereof and supplying an output thereof as a control signal to said signal transmission path switching circuit, and

a reset circuit connected to said reference signal generating circuit and said control circuit for generating a reset signal which deactuates said reference signal generating circuit and causes said control circuit to produce and maintain an output signal corresponding to the status of the motor driving signals,

whereby the signal transmission path corresponding to the status of the motor driving signal at the time of the reset is selected and the reference signal is transmitted to the motor driving circuit through the selected signal transmission path at the release of the reset.

4,031,449

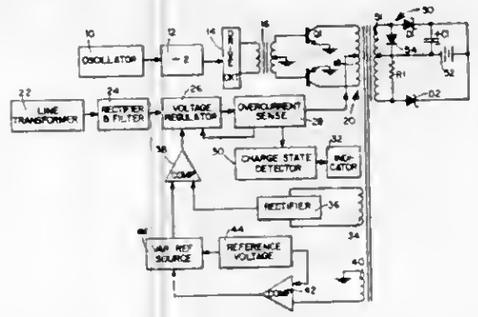
ELECTROMAGNETICALLY COUPLED BATTERY CHARGER

John E. Trombly, Winchester, Mass., assignor to Arthur D. Little, Inc., Cambridge, Mass.

Filed Nov. 20, 1975, Ser. No. 633,987

Int. Cl.² H02J *7/04*

U.S. Cl. 320—2 **14 Claims**



1. A battery charger comprising:

a first electromagnetic assembly having a drive winding and a sense winding;

a charging circuit operative to energize said drive winding to provide a predetermined alternating field;

a control circuit connected to said sense winding and to said charging circuit and operative in response to a signal from said sense winding to control the charging level of said charging circuit;

an electromagnetic receiver assembly connectable to a battery to be charged and adapted for electromagnetic coupling to said assembly; and

means operative in response to the presence of said receiver assembly in coupling relationship with said first assembly to enable full power operation of said charging circuitry, including:

a proximity winding operative to provide a signal upon coupling of said receiver assembly and said first assembly; and

means operative in response to said proximity winding signal to provide an enabling signal to cause full power operation of said charging circuit.

4,031,450

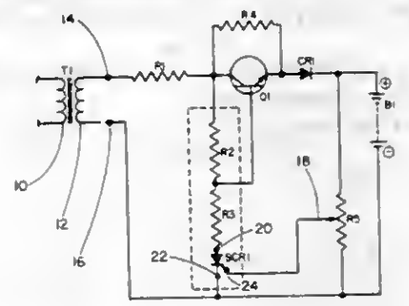
TWO STEP SOLID STATE BATTERY CHARGER

Ronald O. Hammel, Denver; Charles N. Kuykendall, Boulder, and William A. Fischer, Denver, all of Colo., assignors to The Gates Rubber Company, Denver, Colo.

Filed Mar. 26, 1971, Ser. No. 128,430

Int. Cl.² H02J *7/10*

U.S. Cl. 320—23 **17 Claims**



1. Charging means for delivering current to a battery comprising:

a. a power source connected to first and second charging terminals;

b. a charging path including a semiconductor switching means connected between said first charging terminal and one side of said battery, said switching means having a control terminal;

c. a shunt path between said first and second charging terminals including a resistor in series with a controlled rectifier having a gate electrode, a cathode connected to said second charging terminal, and an anode connected to said resistor and forming a juncture therebetween, said juncture connected to said control terminal of said switching means;

d. a voltage divider connected across said battery, said gate electrode connected to said voltage divider at a preselected dividing point;

e. said second charging terminal connected to the other side of said battery;

f. whereupon charging, current is supplied to the battery through the charging path, and when the battery reaches its pre-selected end of the charge voltage, sufficient potential is impressed across the gate-cathode junction to the controlled rectifier to render it conductive and thereby shunt current away from the battery;

g. said controlled rectifier provided with means other than or in addition to self-heating for increasing its temperature during conduction to lower the gate-cathode potential required to render the controlled rectifier conductive, and thereby latching said switching means into non-conduction and reducing the battery voltage to a safe limit to prevent overcharging.

15. In a method of charging a battery of one or more electrochemical cells utilizing circuitry comprising a power source provided with input terminals, a semiconductor switching means connected between the power source and battery, a shunt path connected across said power source and including a resistive element and controlled rectifier having a control terminal, and a voltage divider connected across said battery and having a juncture point connected to said control terminal, the improvement comprising:

substantially freely heating said controlled rectifier below its destruction point, commencing heating only when the battery has attained a nearly fully charged state corresponding to a given end of charge voltage exhibited by the battery, said heating of the controlled rectifier being provided by placing said resistive element in thermal conductive relationship with said controlled rectifier;

reducing the battery voltage below said end of charge voltage; and thereafter

continuously maintaining the battery voltage level below

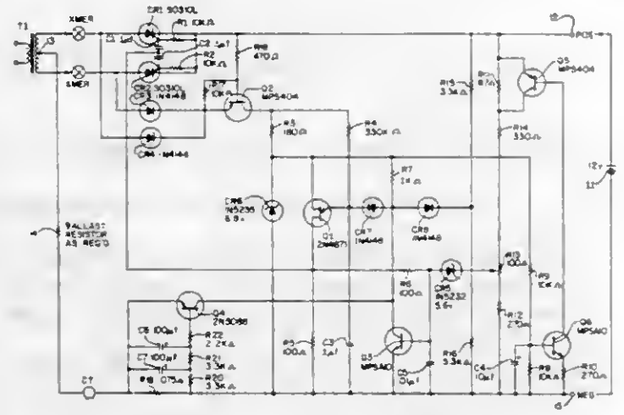
said end of charge voltage to prevent overcharging the battery while simultaneously tapering charging current to safety bring the battery to its fully charged state.

4,031,451

CHARGING CIRCUIT WITH SCR'S TRIGGERED BY PEDESTAL AND COSINE MODIFIED RAMP UNIJUNCTION CIRCUIT HAVING MEANS FOR CURRENT LIMITING BY CONTROLLING PEDESTAL LEVEL

Peter H. Gordon, Framingham, Mass., assignor to Alkon Laboratories, Inc., Newton, Mass.

Filed Feb. 23, 1976, Ser. No. 660,764
Int. Cl.² H02J *7/10*
U.S. Cl. 320—23 **9 Claims**



1. Electrical battery charging apparatus comprising,
input terminal means for receiving A.C. energy,
output terminal means for receiving a potential from a battery to be charged,
gated rectifier means intercoupling said input and output terminal means for converting said A.C. energy into D.C. energy for charging said battery,
a pedestal and cosine modified ramp unijunction trigger circuit having a unijunction transistor with an emitter connected to an emitter capacitor and means for charging said capacitor to a predetermined pedestal level for controlling the time when said unijunction trigger circuit provides trigger pulses, and circuit means for controlling said pedestal voltage
said circuit means including means responsive to the charging current delivered by said output terminal means for limiting said charging current to less than a predetermined value,
wherein said circuit means for controlling said pedestal voltage furthur includes means responsive to a discharged condition of a battery connected to said output terminal means and/or a high voltage upon said input terminal means for establishing said pedestal voltage at a level which prevents triggering of said gated rectifier means until the potential then on said input terminal means is decreasing from its peak value during that cycle to a value low enough so that the peak current through said gated rectifier means is always less than a predetermined value.

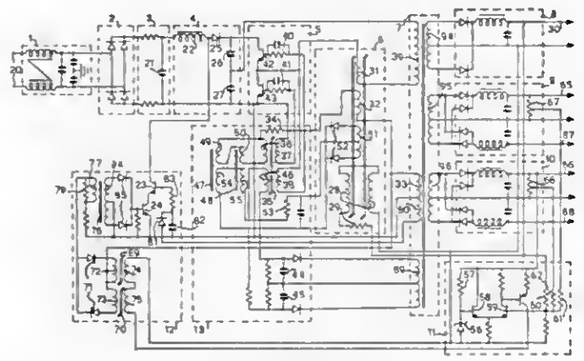
4,031,452

STABILIZED POWER SUPPLY

Pier Luigi Longa, Pavone Canavese (Turin), and Piero Gamba, Banchette (Turin) both of Italy, assigoors to Ing. C. Ollvetti & C., S.p.A., Ivrea (Turin), Italy

Filed Oct. 6, 1975, Ser. No. 620,129
Claims priority, application Italy, Oct. 29, 1974, 70201/74
Int. Cl.² H02M *7/04*
U.S. Cl. 321—2 **4 Claims**

1. A switching power supply coupled to AC mains for supplying a stabilized DC output voltage to an electronic apparatus, comprising:
a rectifying circuit having an input connected directly to said AC mains;
a voltage stabilizing circuit including a storage inductor, and an arrangement of a diode and a capacitor in series with said inductor for generating a DC stabilizing voltage;
said rectifying circuit having an output connected to said inductor;
a frequency generating means for generating a frequency higher than the AC mains frequency;
an interrupter circuit, having a switching cycle of constant repetition rate controlled by said frequency generating means, connected in parallel with said diode and said capacitor whereby said inductor is caused to store mag-



netic energy during a charging interval of said switching cycle corresponding to closing of said interrupter circuit, and whereby the magnetic energy stored in said inductor is transferred to said capacitor through said diode during a discharging interval of said switching cycle corresponding to opening of the said interrupter circuit;
means responsive to the deviation of said stabilized DC output voltage with respect to a reference voltage for conditioning said interrupter circuit to alter a time ratio of charging and discharging of said inductor within said switching cycle; and
a limiting circuit, having an overload detecting means for detecting an overload of said power supply, connected to the output of said stabilizing circuit to shorten the repetition cycle of said stabilizing circuit to limit dissipation of power in the power supply during said overload.

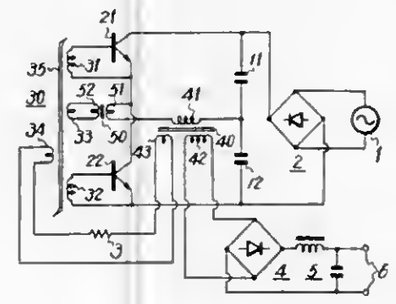
TRANSISTOR INVERTER

Tadao Suzuki; Tadao Yoshida, and Shigeaki Wachi, all of Tokyo, Japan, assignors to Sony Corporation, Tokyo, Japan

Filed June 1, 1976, Ser. No. 691,827
Claims priority, application Japan, June 6, 1975, 50-68708
Int. Cl.² H02M *3/335*
U.S. Cl. 321—2 **8 Claims**



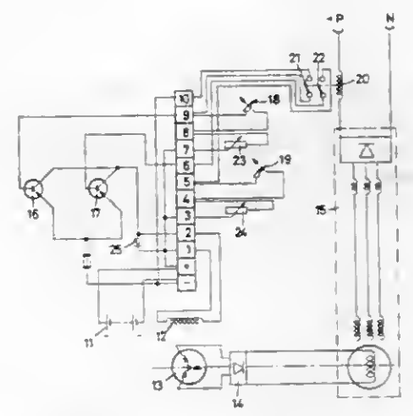
1. A transistor inverter comprising:
a. a DC voltage source having first, second and third terminals;
b. an output transformer having primary and secondary windings;
c. a pair of first and second transistors each having base, emitter and collector electrodes, each of the collector and emitter electrodes of said first and second transistors being connected between the first and second terminals of said DC voltage source and between the second and third terminals of said DC voltage source through the primary winding of said output transformer, respectively;
d. an input transformer having a voltage feedback winding, a pair of voltage control windings and a saturable core;
e. circuit means for coupling the voltage across said primary winding of said output transformer to said voltage feedback winding and connecting each of the voltage control windings of said input transformer between the base and emitter electrodes of said first and second transistors, respectively;
f. DC voltage output means connected to the secondary winding of said output transformer, and
g. means for feeding back one part of the primary current flowing through the primary winding of said output transformer to said input transformer, the last mentioned means further including means for producing a predetermined desired amount of said current feedback.

4,031,455

EXCITATION CIRCUIT FOR BRUSHLESS SYNCHRONOUS WELDING GENERATORS

Dieter Beck, Etzenrod, Germany, assignor to Firma A. van Kaick "AvK" Generatoren- und Motorenwerke, Neu-Isenburg, Germany

Filed Nov. 25, 1975, Ser. No. 635,096
Claims priority, application Germany, Nov. 25, 1974, 2455643
Int. Cl.² H02P *9/10, 9/38*
U.S. Cl. 322—27 **5 Claims**



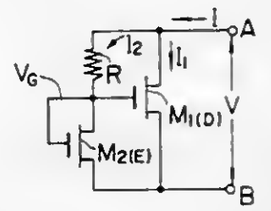
1. In a brushless synchronous welding generator having a three-phase exterior-pole exciter machine including a stator-mounted excitation winding supplied from a separate d. c. voltage source and a three-phase rotor winding connected to a rectifier, an excitation control circuit comprising:
two power transistors arranged in parallel between said voltage source and the excitation winding, one being operative in the idling mode, the other in the welding mode of the machine;
switching means for alternatingly activating one transistor and blocking the other in response to the flow or absence of flow of welding current in the welding generator in the welding and idling modes, respectively; and
means for independently adjusting the base potential of each transistor.

4,031,456

CONSTANT-CURRENT CIRCUIT

Shunji Shimada, Kodaira; Yoshikazu Hatsukano, Hachioji, and Osamu Yamashiro, Kodaira, all of Japan, assignors to Hitachi, Ltd., Japan

Filed Aug. 28, 1975, Ser. No. 608,731
Claims priority, application Japan, Sept. 4, 1974, 49-100916
Int. Cl.² G05F *3/08*
U.S. Cl. 323—4 **4 Claims**



1. A constant-current circuit wherein a depletion type FET M_1, and a series circuit consisting of impedance means and an enhancement type FET M_2 are connected between two terminals A and B and wherein gate electrodes of the respective FET's M_1 and M_2 are connected to a juncture between said impedance means and said FET M_2, characterized in that a current I_1 which flows through said FET M_1 is set to be suffi-

ciently large in comparison with a current I_2 which flows through said series circuit, and that a voltage across said FET M_2 is made substantially equal to a threshold voltage of this FET M_2.

4,031,457

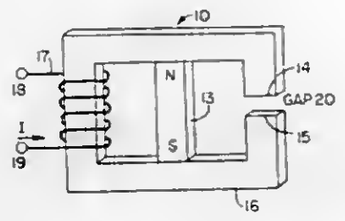
SATURABLE REACTOR CURRENT LIMITER

George A. Oberbeck, Belmont, Mass., assignor to The Charles Stark Draper Laboratory, Inc., Cambridge, Mass.

Continuation-in-part of Ser. No. 614,773, Sept. 19, 1975, abandoned. This application Nov. 28, 1975, Ser. No. 635,895

Int. Cl.² G05F 1/32, 1/70

U.S. Cl. 323—92 21 Claims



1. A device for limiting current in an electric circuit comprising:

A. at least three magnetic circuit branch elements extending between two nodes:

i. the first of said branch elements being characterized by a permeance P_1,

ii. the second of said branch elements being characterized by a non-linear permeance P_2 and having saturated and non-saturated states, wherein P_2 is greater when said second element is in said non-saturated state than when in said saturated state, and wherein the magnetic flux density of said second element is equal to a saturation flux density which is relatively invariant with respect to magneto-motive force applied across said second element when in said saturated state, and said magnetic flux density is less than said saturated flux density otherwise,

iii. the third of said branch elements is characterized by a permeance P_3 and includes a magneto-motive force (mmf) bias means for establishing a substantially constant magnetic flux density in said third element,

B. an input coil including means for electrically coupling said device to said electric circuit so that said current passes therethrough, said coil having a plurality of windings extending about said second element so that magnetic flux is induced in said second element in response to said current,

wherein said elements are magnetically coupled at said nodes, and P_1 is relatively high with respect to the medium external to said device, P_2 is greater than P_1 and is relatively high with respect to the medium external to said device when said second element is non-saturated, and P_3 is relatively low with respect to P_1 and P_2 when said second element is non-saturated, and

wherein further the net magnetic flux density in said second element is equal to the saturation flux density for said second element when said current is below a predetermined threshold, and said net flux density is below said saturation flux density when said current is in a predetermined range above and extending from said threshold.

A.C. VOLTAGE REGULATOR EMPLOYING THYRISTOR

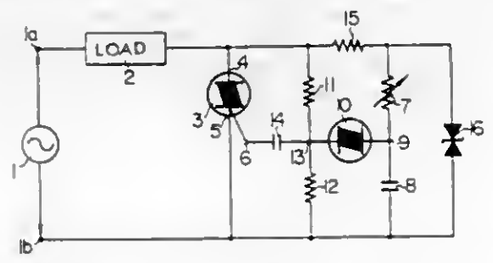
Kazuo Ichikawa, Minowa, Japan, assignor to Olympus Optical Co., Ltd., Tokyo, Japan

Filed Mar. 12, 1976, Ser. No. 666,335

Claims priority, application Japan, Mar. 20, 1975, 50-33725

Int. Cl.³ G05F 1/44

U.S. Cl. 323—36 2 Claims



1. A phase controlled a.c. voltage regulator for regulating the voltage applied to a load connected in series with an a.c. source, said voltage regulator comprising:

a bilateral thyristor having first and second anodes and a gate, said first and second anodes being connected to first and second terminals across which a load and an a.c. source may be connected;

a voltage divider comprising first and second resistive elements connected in series across said first and second terminals;

a timing circuit including a thrid resistive element, a variable resistor, and a capacitor connected in series across said first and second terminals and a bilateral constant voltage diode connected across said variable resistor and said capacitor to insure that the rate of charge of said capacitor is not affected by minor fluctuations in the magnitude of the voltage generated by said a.c. source;

a bilateral diode connected between the junction between said capacitor and said variable resistor and the junction between said first and second resistive elements;

a capacitor coupled between the junction between said first and second resistive elements and said gate whereby the conductive period of said thyristor increases or decreases as an inverse function of an increasing or decreasing power supply voltage so as to apply a substantially constant effective voltage to said load.

4,031,459

INDUCTIVE VOLTAGE TRANSFORMER FOR A HIGH-VOLTAGE METAL-CLAD SWITCH-GEAR INSTALLATION

Jurgen Moeller, Memmelsdorf; Werner Mitrach, Bamberg; Helmut Krauss, Geisfeld, and Hubert Schulte, Bischberg, all of Germany, assignors to Messwandler-Bau GmbH, Germany

Filed Oct. 30, 1975, Ser. No. 627,272

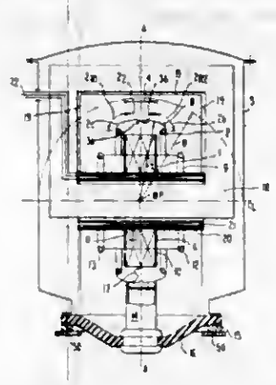
Claims priority, application Germany, Nov. 2, 1974, 2452056

Int. Cl.³ H01F 15/04

U.S. Cl. 323—60 45 Claims

1. An inductive voltage transformer insulated by an insulating gas and including a pressure vessel means and a high-voltage winding means which is surrounded by a high-voltage electrode means, the insulating gas within the pressure vessel means forming the high-voltage insulation, characterized in that the high-voltage electrode means is axially drawn over the winding end faces of at least a part of the high-voltage winding means, said high-voltage electrode means including a central portion surrounding the winding cross section of the high-voltage winding means as well as edge portions axially projecting over the high-voltage winding means, said central portion and said edge portions being so curved that the outer surfaces

thereof together with adjacent wall portions of the pressure vessel means form at least approximately a Rogowski-profile projected on a cylinder area, said central portion of said high-voltage electrode means and the adjacent wall portions of the



pressure vessel means representing in cross section concentric partial circles having at least approximately a common center point of curvature with said edge portions of said high-voltage electrode means having smaller radii of curvature than said central portion so as to form a Rogowski-profile.

4,031,460

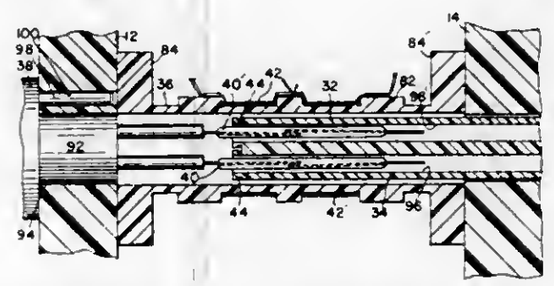
DEVICE FOR MEASURING THE MAGNETIC FLUX DISTRIBUTION ALONG THE LENGTH OF ELONGATED MAGNETIZED ELEMENT

Khaja M. Jameel, Glen Ellyn; Von W. Mueller, Elk Grove Village, and Ronald A. Foerster, Carol Stream, all of Ill., assignors to GTE Automatic Electric Laboratories Incorporated, Northlake, Ill.

Filed Oct. 31, 1975, Ser. No. 627,634

Int. Cl.² G01R 33/12

U.S. Cl. 324—34 R 14 Claims



1. An apparatus for use in the measuring magnetic flux distribution along a magnetic member which is in the form of an elongate rod of relatively small cross sectional diameter, said apparatus comprising a support frame having a plurality of upstanding post forming support members spaced along a linear path, an elongate rod member constituting a thrust arm supported by said post members for reciprocating movement along said linear path between extended and retracted positions, drive means for reciprocating said thrust arm, said thrust arm having a hollow end portion of a length and cross section which will accommodate in telescoped relation therein said magnetic rod member, means for supporting said magnetic rod member in axial alignment with said hollow end portion of said thrust arm so as to be telescoped within said hollow end portion when said thrust arm is extended, bobbin forming means having a hollow tubular core portion of a cross section which will receive in telescoped relation said hollow end portion of said thrust arm and mounted in telescoping relation to said magnetic member, said bobbin forming means adapted to have wound thereon an energizing coil for said magnetic member, a search coil having an axial dimension only a small fraction of the length of the magnetic member, mounted on the hollow end portion of said thrust arm so as to sweep along the length of said magnetic member upon retractive member of said thrust arm, and means associated with said search coil and said thrust arm for sensing and recording magnetic flux values at discrete points along the length of the magnetic member and the position of said search coil along said magnetic member as said thrust arm is reciprocated and correlating the two measurements.

4,031,461

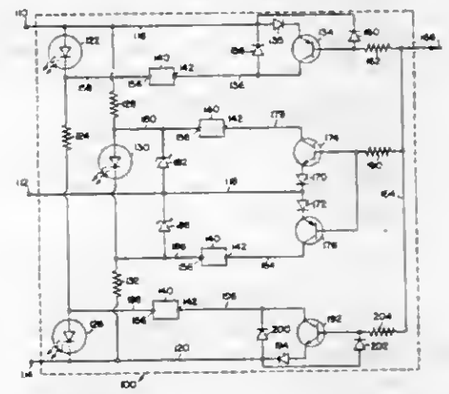
SOURCE RELATED POTENTIAL INDICATING CONTINUITY TESTER

Carl Casper Reiner, Moline, Ill., assignor to Deere & Company, Moline, Ill.

Filed Jan. 23, 1976, Ser. No. 651,808

Int. Cl.² G01R 31/02

U.S. Cl. 324—51 48 Claims



1. A detector for determining continuity in an electrical circuit between a selected point in the circuit and an electrical source in the circuit, said source having first and second source potentials, comprising: probe means adapted to be placed in contact with the selected point; first and second connector means adapted to be connected respectively to the first and second source potentials; first indicator means connected to the probe and first connector means responsive to the potentials thereat to provide a first digital, off-on indication when the potentials are approximately equal thereby indicating continuity in the circuit between the point and first source potential; and second indicator means connected to the probe and second connector means responsive to the potentials thereat to provide a second digital, off-on indication when the potentials are approximately equal thereby indicating continuity in the circuit between the point and second source potential.

4,031,462

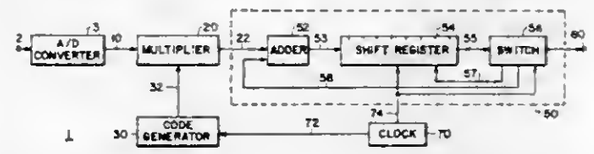
FREQUENCY SPECTRUM ANALYZER

David William Bouvier; William Geary Green, both of Tempe, and Randolph Gaylon Moore, Phoenix, all of Ariz., assignors to Motorola, Inc., Schaumburg, Ill.

Filed July 7, 1975, Ser. No. 593,830

Int. Cl.² G01R 23/16

U.S. Cl. 324—77 B 18 Claims

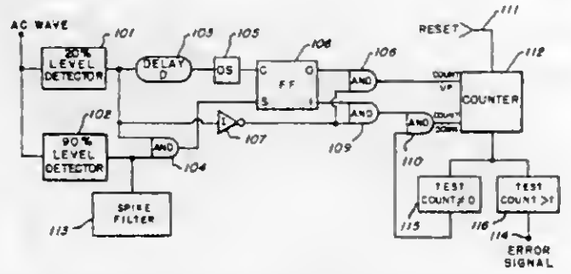


1. An apparatus for analyzing in real time the frequency spectrum of an incoming signal of unknown frequency characteristics which has been separated into two quadrature components, comprising:

means for receiving and limiting the amplitude of each quadrature component;

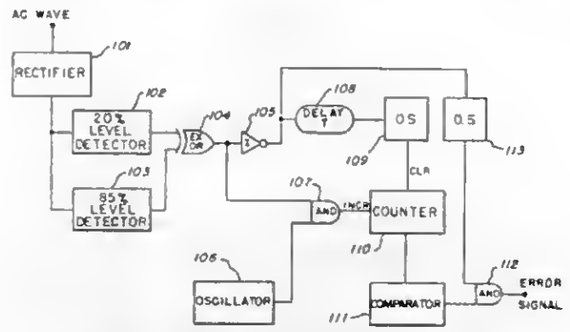
means for generating a timing signal;
means responsive to the timing signal for generating first and second trains of sampling pulses in repetitive frames, wherein each frame of said first and said second trains of sampling pulses represents a series of cross-correlation functions in terms of a predetermined number of sampling intervals and a predetermined number of harmonics;
first means for multiplying said first train of sampling pulses with said first quadrature signal component to generate a first train of discrete sampled outputs;
second means for multiplying said second train of sampling pulses with said second quadrature signal component to generate a second train of discrete sampled outputs;
means for separating said first and said second train of discrete sampled outputs into two completely separated upper and lower channel sampled output signals;
first means responsive to the timing signal for accumulating said upper channel sampled outputs and generating an upper sideband frequency domain output signal for each frame of sampling pulses; and
second means responsive to the timing signal for accumulating said lower channel sampled outputs and generating a lower sideband frequency domain output signal for each frame of sampling pulses.

4,031,463
POWER BROWN-OUT DETECTOR
Gayle Russell Norberg, Columbia Heights, Minn., assignor to Control Data Corporation, Minneapolis, Minn.
Filed Mar. 1, 1976, Ser. No. 662,315
Int. Cl.² G01R *23/16*
U.S. Cl. 324—77 A **11 Claims**



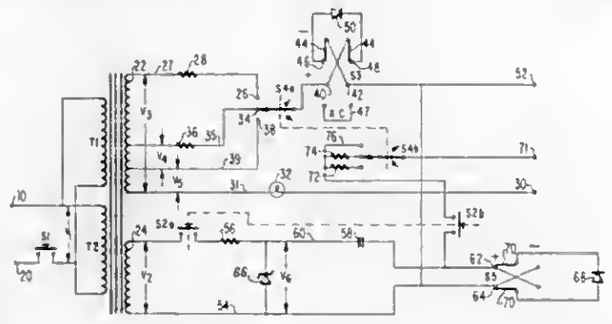
1. Apparatus for providing a brownout signal indicating low power in an AC wave having a nominal peak voltage, and comprising
a. voltage detecting means receiving the AC wave, for providing a low half-cycle signal each time the maximum AC wave excursion from 0 falls between a first predetermined voltage level and a second predetermined voltage level greater in magnitude than the first, and a normal half-cycle signal each time the maximum AC wave excursion is at least as great in magnitude as the second predetermined voltage level; and
b. an accumulator receiving the low and normal half-cycle signals, comprising
i. means responsive to an externally supplied reset signal, for setting the accumulator contents to a first preselected value,
ii. means responsive to each low half-cycle signal, for changing the accumulator contents to decrease the difference between the accumulator contents and a second preselected value by a third preselected value,
iii. means responsive to each normal half-cycle signal, for changing the accumulator contents to increase the difference between the accumulator contents and the second preselected value by a fourth preselected value whenever the accumulator contents are exclusively between the first and second preselected values, and
iv. means for issuing the brownout signal whenever the difference between the second and first preselected values is exceeded by the difference between the accumulator contents and the first preselected value.

4,031,464
LINE POWER DISTORTION DETECTOR
Gayle Russell Norberg, Columbia Heights, Minn., assigoor to Control Data Corporation, Minneapolis, Minn.
Filed Mar. 1, 1976, Ser. No. 662,318
Int. Cl.² G01R *23/02*
U.S. Cl. 324—78 Z **7 Claims**



1. Apparatus for detecting distortion in a phase of an AC power wave of predetermined nominal frequency and peak amplitude, comprising
a. voltage detecting means receiving the AC wave for providing a first signal when the AC wave reaches a preselected first percentage of nominal peak amplitude and a second signal when the AC wave reaches a preselected second percentage of nominal peak amplitude, said second percentage being greater than the first;
b. timing means receiving the voltage detecting means' first and second signals and providing a timing signal encoding the time between the start of adjacent first and second signals in a preselected half cycle of the AC wave; and
c. comparison means for comparing the difference between the time encoded in the timing signal and the time elapsed between adjacent first and second peak amplitude percentages of a sine wave of the same predetermined nominal frequency and amplitude as the AC wave, and supplying an error signal if different by more than a predetermined amount.

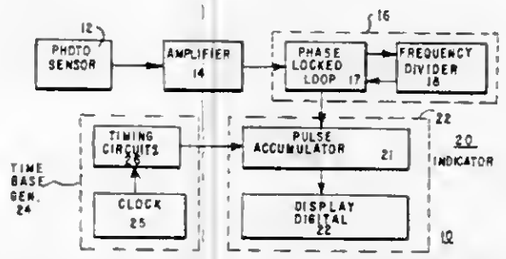
4,031,465
SCR, DIODE, DIAC, AND TRIAC TESTER
John Franklin Sterner, Piscataway, N.J., assignor to RCA Corporation, New York, N.Y.
Filed Dec. 23, 1974, Ser. No. 535,812
Int. Cl.² G01R *31/22*
U.S. Cl. 324—158 SC **7 Claims**



1. A tester for thyristor semiconductor devices having two main electrodes and a control electrode, comprising,
first, second, third terminals adapted to be connected respectively to said main electrodes and said control electrode,
a power source,

means including first switch means connected between said source and one of said first and second terminals for selectively providing direct current or alternating current and for setting the voltage value of electrical energy provided from said source to said first and second terminals, conductor means connecting the power source to the other of said first and second terminals,
pulse source means,
second switch means connecting said pulse source means to said third terminal for selectively (i) setting the pulse current direction and (ii) generating a trigger pulse of electrical energy to said third terminal, said selectively generated trigger pulse having a substantially instantaneous rise time and an exponential fall time based on time constant τ such that $\tau << T$, where T is the pulse period, and
indicating means connected in the path of the power source to indicate the presence of current flow between said first and second terminals according to the acceptable operating parameters of the particular device under test.

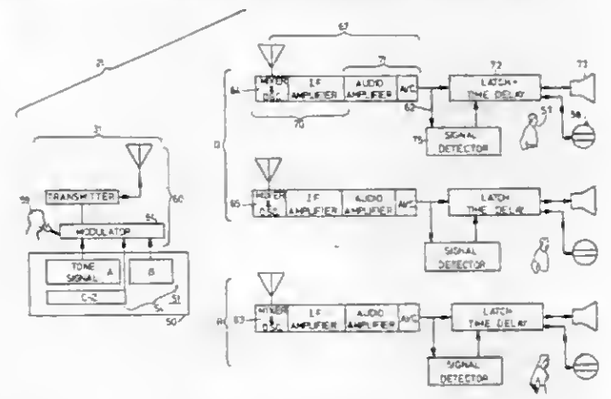
4,031,466
DIGITAL PHOTO-OPTICAL TACHOMETER
Ernest Harry Krause, Addison; Wesley Arthur Seaman, River Grove, and Peter Gregory Angelopoulos, Elmhurst, all of Ill., assignors to The Pioneer Electric and Research Corporation, Forest Park, Ill.
Filed May 5, 1975, Ser. No. 574,252
Int. Cl.² G01P *3/36*; **G01R** *25/00*
U.S. Cl. 324—175 **15 Claims**



1. In a tachometer for measuring the rotational or reciprocating speed of a moving object, the combination comprising sensing means for deriving an input signal related in frequency to the speed of the object, frequency detecting means including phase comparator means for comparing said input signal with a reference signal of a predetermined frequency and for providing a series of output pulses having a frequency which is an integral multiple of the frequency of the input signal, timing means, and output means controlled by said timing means to be responsive to the number of output pulses provided within a predetermined time duration to provide an indication of the speed of said object.

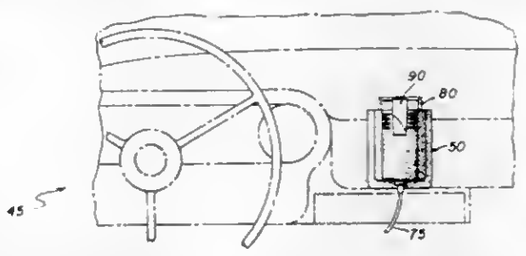
4,031,467
ALERTING PROCESS AND SYSTEM OF APPARATUS THEREFOR
Lewis Singleton, Jr., 422 Ramada, Amarillo, Tex. 79108, and James M. Whitney, 3403 Paramount, Amarillo, Tex. 79109
Filed Sept. 19, 1975, Ser. No. 614,918
Int. Cl.² H04J *3/00*
U.S. Cl. 325—54 **12 Claims**

8. A localized area warning process comprising, in a large geographic area, continuously operating a radio frequency transmitter at and broadcasting a fixed radio frequency signal characteristic with audio modulation and a plurality of distinct emergency modulating audio signals each of fixed frequency in range of 20 to 3,000 Hz, carried by said radio frequency signals for a predetermined time and, in one of several separate smaller geographic area portions within said one large area, at each of a plurality of radio frequency receiving circuits tuned to said fixed radio frequency signal and comprising a audio detector circuit and a loudspeaker circuit not operatively connected to said detector circuit, continuously actuating said audio detector circuit by said modulated frequency signals and an electrical power source and, in an emergency situation, selectively actuating a selective audio signal frequency receiving circuit by one of said distinct emergency modulating audio signals carried by said radio frequency signal and characteristic of that one smaller geographic area portion only, and timing said period of actuation and



after a predetermined period of time of such actuation operatively connecting said audio detector to a loudspeaker and then maintaining operative connection therebetween for only a predetermined period of time while
an audio frequency signal is passed from said radio frequency transmitter to said loudspeakers and an audible verbal message produced by said loudspeaker.

4,031,468
RECEIVER MOUNT
Donald O. Ziebell, and James M. Longly, both of Lexington, Nebr., assignors to Reach Electronics, Inc., Lexington, Nebr.
Filed May 4, 1976, Ser. No. 682,843
Int. Cl.² H04B *1/08*
U.S. Cl. 325—312 **13 Claims**



1. A mount for a portable RF receiver, said receiver having a current conducting clip constituting the receiver input for RF signals, said clip adapted to be connected to an antenna, said mount comprising a holder for said receiver, a terminal on said holder for connection to an antenna, and means on said holder electrically coupled to said terminal and placed into electrical contact with said clip when said receiver is positioned in said holder.

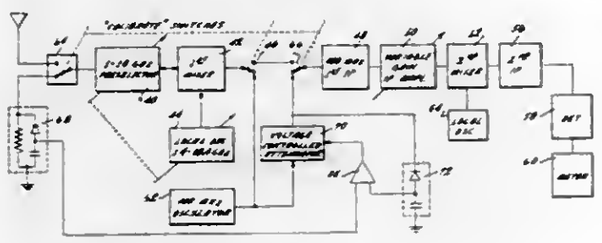
4,031,469
RECEIVER GAIN CALIBRATION
Edgar A. Johnson, Tujunga, Calif., assignor to The Singer Company, New York, N.Y.
Continuation of Ser. No. 612,057, Sept. 10, 1975, abandoned.
This application May 26, 1976, Ser. No. 690,345
Int. Cl.² H04B *17/00*
U.S. Cl. 325—363 **6 Claims**

1. A method for gain calibrating superheterodyne receivers having a bilateral RF and converter portion at the input

thereof, and IF portion, and a detector portion near the output thereof; said method compriaing the steps of:

injecting into the output of said RF and converter portion a calibration signal of known amplitude and at the RF and converter portion a calibration signal of known amplitude and at the IF frequency of said receiver;

measuring the level of said calibration signal appearing at the RF input of said receiver to determine the gain of said bilateral RF and converter portion;



injecting said known calibration signal into the portion of said receiver following said bilateral RF and converter portion;

measuring the level of the signal produced at the output of said receiver to determine the gain of said receiver portion following said RF and converter portion; and

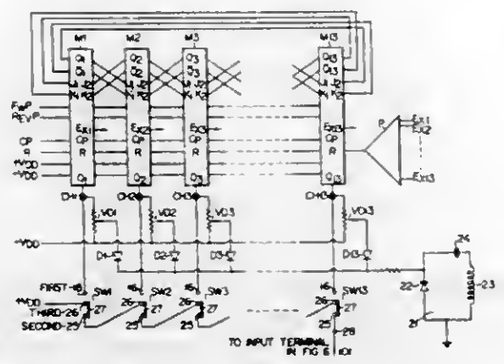
algebraically adding said RF and converter gain with said gain of said receiver portion following said RF and converter portion to obtain the overall gain of the receiver at the frequency to which it is tuned.

4,031,470

OPERATION PROGRAM-PRESETTING SYSTEM

Naoyuki Kukado, Tokyo, and Shinichi Makino, Fujisawa, both of Japan, assignors to Tokyo Shibaura Electric Co., Ltd., Tokyo, Japan

Filed Apr. 15, 1975, Ser. No. 568,204
Claims priority, application Japan, Apr. 19, 1974, 49-43465
Int. Cl.² H04B 1/16; H01H 43/00
U.S. Cl. 325—396 8 Claims



1. An operation program-presetting system comprising:

a. input means including a plurality of switches each providing both time and control data;

b. means for generating coded signals corresponding to the operation of each of said switches;

c. means responsive to the order in which said coded signals are generated for allotting said coded signals into sets of information, each set comprising both time data and control data;

d. means for storing said sets of information;

e. means for generating a time signal;

f. means for generating a coincident signal when said time signal coincides with any one of said time data in a stored set of information; and

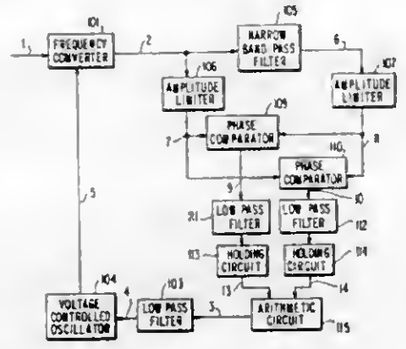
g. means for controlling at least one external appliance responsive to both said coincident signal and said control data included in said one set of information having time data in coincidence with said time signal.

4,031,471

AUTOMATIC FREQUENCY CONTROL CIRCUIT

Toshitake Noguchi, Tokyo, Japan, assignor to Nippon Electric Co., Ltd., Tokyo, Japan

Filed Dec. 17, 1975, Ser. No. 641,709
Claims priority, application Japan, Dec. 18, 1974, 49-145156
Int. Cl.² H04B 1/16
U.S. Cl. 325—423 6 Claims



1. An automatic frequency control circuit for use in a time-division multiplex communication system including a frequency converter for receiving an input signal and a local oscillator signal and producing an output signal which is the sum or difference of said input and local oscillator signals, and a voltage-controlled oscillator for generating said local oscillator signal in response to a control voltage, said automatic frequency control circuit comprising:

a band-pass filter connected to the output of said frequency converter,

first and second phase comparator means each having a first input connected to the output of said frequency converter and a second input connected to the output of said band-pass filter for comparing the phases of the input and output signals of said band-pass filter, said first and second phase comparator means having different output characteristics,

first and second holding circuits for holding the maximum voltages of output signals of said first and second phase comparators, respectively, and

an arithmetic circuit for calculating the average value of the output signals of said first and second holding circuits to develop said control voltage.

4,031,472

MIXER CIRCUIT

Keiro Shinkawa; Chiukhi Sodeyama, both of Yokohama; Yoichi Kaneko, Tokorozawa, and Katsuhiro Kimura, Tokyo, all of Japan, assignors to Hitachi, Ltd., Japan

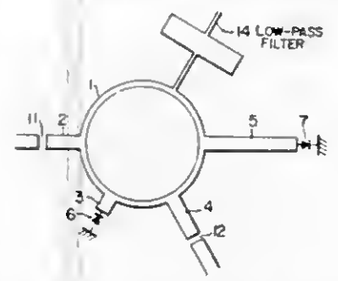
Filed Sept. 3, 1975, Ser. No. 609,920
Claims priority, application Japan, Sept. 6, 1974, 49-102671
Int. Cl.² H04B 1/26
U.S. Cl. 325—446 8 Claims

1. A mixer circuit for converting a high frequency signal into an intermediate frequency signal comprising:

a rat-race including a first transmission line forming a circular closed loop having an overall circumferential length corresponding to three halves the wavelength of the high frequency signal, a second transmission line connected to said first transmission line and having an impedance which is $1/\sqrt{2}$ times the impedance of said first transmission line, and a third, a fourth and a fifth transmission line connected to said first transmission line in such a relationship that they are successively spaced apart from

the connection point of said second transmission in the above order along said first transmission line by an arcuate distance corresponding to one quarter the wavelength of the high frequency signal, said third, fourth and fifth transmission lines having an impedance equal to that of said second transmission line;

means for supplying said high frequency signal to be subject to the frequency conversion to one of said second and fourth transmission lines in said rat-race and supplying a local oscillation signal to the other of said second and fourth transmission lines connected to said rat-race;



a pair of diodes grounded at one terminal thereof and connected at the other terminal thereof to the other end of said third and fifth transmission lines respectively; and

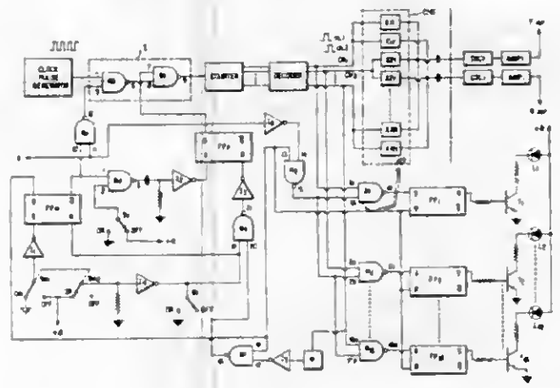
output means connected to said first transmission line at a position forming a straight line passing through the connection of one of said third and fourth transmission lines to said first transmission line relative to the center of said circular closed loop formed by said first transmission line in said rat-race being on said straight line, for delivering an output signal having a frequency component representing the frequency difference between said high frequency signal and said local oscillation signal.

4,031,473

STATION SELECTING DEVICE HAVING IMPROVED MONITOR

Kaoru Mitarai, Tokyo, Japan, assignor to Trio Electronics Incorporated, Tokyo, Japan

Filed Nov. 14, 1974, Ser. No. 523,860
Claims priority, application Japan, Apr. 3, 1974, 49-37642
Int. Cl.² H04B 1/06
U.S. Cl. 325—455 5 Claims



1. A station selecting device for use in a multi-channel communication system, said device comprising

information signal receiving means for receiving information signals over at least one of a plurality of channels;

means for generating a train of clock pulses of predetermined width and period;

sensing signal generating means responsive to said information signals for generating a sensing signal for each of said channels whenever an information signal corresponding to one of said channels is present;

scanning signal generating means responsive to said clock pulses for sequentially generating a plurlity of scanning signals respectively corresponding to the sensing signals of said plurality of channels of said information signal receiving means;

a plurality of display means respectively corresponding to said channels; and

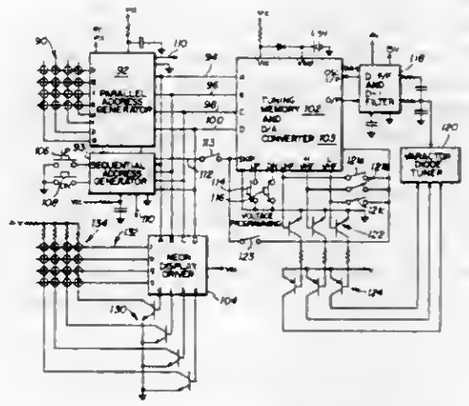
control means responsive to said scanning signal generating means and said sensing signals for actuating those display means corresponding to the channels for which sensing signals are generated so that said last mentioned channels can be readily determined from the actuated display means, said control means including means for maintaining the generation of said scanning signals by said scanning signal generating means even though an information signal is sensed in one of said channels by said sensing means until a predetermined number of said scanning signals have been generated so that all channels having sensing signals can be displayed by said display means.

4,031,474

SOLID STATE TELEVISION CHANNEL SELECTION SYSTEM

George John Ehni, III, and Horst Leuschner, both of Dallas, Tex., assignors to Texas Instruments Incorporated, Dallas, Tex.

Continuation of Ser. No. 508,969, Sept. 25, 1974, abandoned. This application Apr. 7, 1976, Ser. No. 674,458
Int. Cl.² H04B 1/26
U.S. Cl. 325—455 27 Claims



1. A television channel tuning system comprising:

switch means operable to produce a signal indicative of a desired television channel,

an address generator responsive to said signal produced by said switch means for generating a unique binary address corresponding to the desired channel,

memory means for storing a plurality of digital tuning words each representative of a different television channel and selectively outputting one of said tuning words upon reception of one of said unique binary addresses,

converter means for receiving and converting said tuning words into analog tuning levels,

manually controllable means operable to selectively change any of the digital tuning words stored in said memory means,

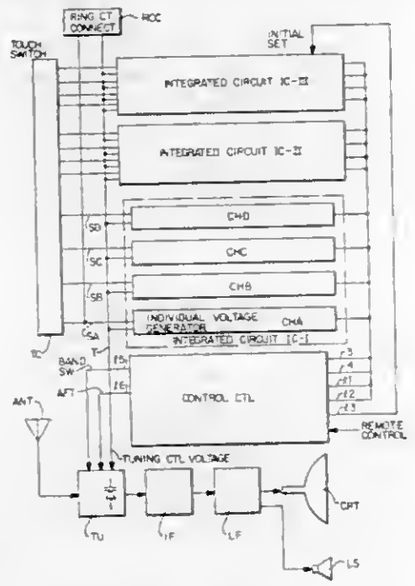
means operable in connection with said switch means to produce sequential access tuning of said system by causing said address generator to produce progressively changing binary addresses, and

skip means in said memory means for causing selective ones of the digital tuning words stored in said memory means to be skipped during sequential access tuning of said system.

4,031,475
ELECTRONIC CHANNEL SELECTING APPARATUS

Takeshi Arai, Higashiosaka, Japan, assignor to Sanyo Electric Co., Ltd., Japan

Filed Apr. 5, 1976, Ser. No. 673,941
Claims priority, application Japan, Apr. 3, 1975, 50-41029
Int. Cl.² H04B 1/26
U.S. Cl. 325—455 **16 Claims**

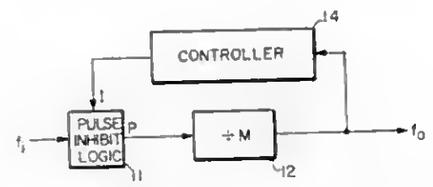


1. An electronic channel selecting apparatus, comprising:
means for selectively providing a plurality of individual channel selecting signals for selecting the corresponding one of a plurality of broadcasting channels,
tuning means comprising tuning circuit means including a voltage controlled variable reactance device the reactance of which is variable as a function of a tuning control voltage applied thereto, said variable reactance device determining a tuning frequency of said tuning means,
a plurality of tuning control voltage providing means, each responsive to the corresponding one of said individual channel selecting signals for providing a different tuning control voltage to said voltage controlled variable reactance device of said tuning means for selecting the corresponding one of said plurality of broadcasting channels,
each said tuning control voltage providing means comprising
gate means responsive to a gating signal for allowing the corresponding individual channel selecting signal to pass therethrough,
store means responsive to said corresponding individual channel selecting signal, as gated by said gate means, for assuming an active state and responsive to a disabling signal for assuming an inactive state,
preset voltage providing means for providing a predetermined voltage for selecting the corresponding one of said plurality of broadcasting channels when said predetermined voltage is applied to said variable reactance device, and
switching means responsive to the active state output from said store means for allowing said predetermined voltage to pass therethrough to said voltage controlled variable reactance device of said tuning means, said apparatus further comprising
means responsive to any one of said plurality of store means being in an active state and an individual channel selecting signal being received in any one of said plurality of tuning control voltage providing means for providing said gating and disabling signals to said gate means and store means, respectively for causing said one store means to assume an inactive state and for causing the store means of said one tuning control voltage providing means to assume an active state, whereby the broadcasting channel corresponding to said one tuning control voltage providing means is selected.

4,031,476
NON-INTEGER FREQUENCY DIVIDER HAVING CONTROLLABLE ERROR

Edwin Allen Goldberg, Princeton, N.J., assignor to RCA Corporation, New York, N.Y.

Filed May 12, 1976, Ser. No. 685,549
Int. Cl.² H03K 27/00, 23/00
U.S. Cl. 328—39 **4 Claims**

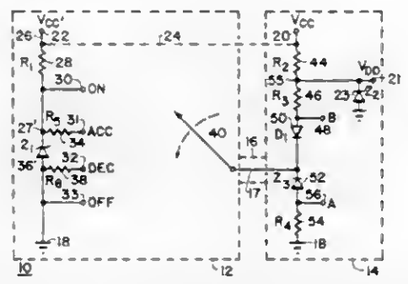


1. A circuit, producing from a signal at a first frequency a signal at a second frequency, said first and second frequencies being related by a non-integral ratio, comprising the combination of:
gating means receptive of said first frequency signal for producing pulses in response thereto when enabled by an enabling signal;
divider means responsive to said pulses for producing said second frequency signal; and
control means responsive to said second frequency signal for enabling said gating means said control means comprising:
means for accumulating a known error value associated with said second frequency signal; and
means responsive to said means for accumulating for producing said enabling signal and supplying it to said gating means while the accumulated error value is less than a predetermined value.

4,031,477
SYSTEM FOR TRANSFERRING FOUR COMMANDS OVER A SINGLE CONDUCTOR UTILIZING DUAL THRESHOLD LOGIC GATES

Mark Layne Shaw, Austin, Tex., assignor to Motorola, Inc., Schaumburg, Ill.

Filed Apr. 26, 1976, Ser. No. 679,964
Int. Cl.² H03K 3/02
U.S. Cl. 328—70 **9 Claims**



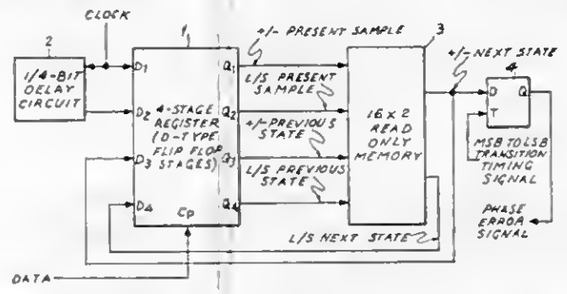
1. A system for transmitting a selected one of a plurality of commands along a conductor comprising:
selection means for selecting one of said plurality of commands;
transmitting means coupled to said conductor and said selection means for generating a signal on said conductor representative of said selected command;
receiving means coupled to said conductor for receiving said signal and generating a pair of ternary signals which represent said selected command;

digital means coupled to said receiving means and to a plurality of output conductors for generating a binary output signal representative of said selected command at one of said plurality of output conductors.

4,031,478
DIGITAL PHASE/FREQUENCY COMPARATOR

James Monroe Clark, Cedar Grove, N.J., assignor to International Telephone and Telegraph Corporation, Nutley, N.J.

Filed June 29, 1976, Ser. No. 700,931
Int. Cl.² H03B 3/04
U.S. Cl. 328—134 **10 Claims**

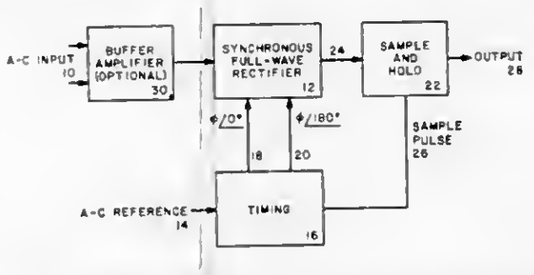


1. A digital phase/frequency comparator comprising:
a first source of clock;
a second source of digital data;
first means coupled to said first and second sources to produce a first signal indicating a plus/minus phase error of a present sample of said data and a second signal indicating a large/small phase error of said present sample of said data;
second means to provide a third signal indicating a plus/minus phase error of a previous state of said data and a fourth signal indicating a large/small phase error of said previous state of said data; and
third means coupled to said first and second means responsive to said first, second, third and fourth signals following a given set of rules determined by a predetermined logic to produce a phase error signal,
said first, second and third means cooperating to provide negative frequency errors for a clockwise change of phase states of said data and positive frequency errors for counter-clockwise changes of phase states of said data.

4,031,479
PEAK DETECTING DEMODULATOR

Virgil E. Thomas, Jr., China Lake, and Donald G. Quist, Ridgecrest, both of Calif., assignors to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Feb. 23, 1976, Ser. No. 660,585
Int. Cl.² G05B 21/02; H03D 1/00
U.S. Cl. 329—50 **5 Claims**



1. A demodulator for converting varying amplitude alternating current (a.c.) signals into direct current (d.c.) format representative of the information contained therein, comprising:
first and second a.c. signals of identical frequency, wherein said first signal is the input of said demodulator containing said information and said second signal is a reference signal;
rectifying means for full-wave rectifying said input and providing an output of either all positive value pulses or all negative value pulses;
gated means for sampling and holding the value of said pulses when said gated means is gated; and
timing means coupled to said reference signal for gating said gated means at only the peak values of said pulses,
such that the value held by said gated means is the demodulator's output, which is a d.c. format representative of at least part of the information contained in said a.c. signal.

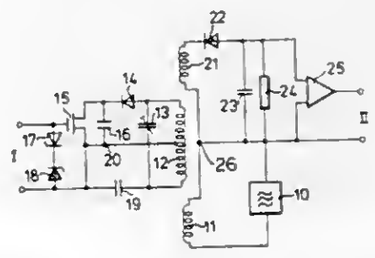
CIRCUIT ARRANGEMENT FOR THE UNGROUNDED TRANSMISSION OF SIGNALS THROUGH TESTING POINTS IN COMMUNICATION SYSTEMS

Josef Huellwegen, Altenbeken, Germany, assignor to Nixdorf Computer AG, Paderborn, Germany

Filed Feb. 3, 1976, Ser. No. 654,759
Claims priority, application Germany, Feb. 5, 1975, 2504785
Int. Cl.² H03F 3/38
U.S. Cl. 330—10 **8 Claims**



1. In a circuit arrangement for the ungrounded transmission of signals through testing points in communication systems with the aid of high-frequency oscillations which are signal controlled on one side of a testing point and rectified on the other side of the testing point and utilized to reproduce the signals, said circuit arrangement having input terminal means and output terminal means, the improvement comprising a resonant circuit, a high-frequency generator powered independently of said circuit arrangement, first inductive coupling means for inductively coupling the output from said high-frequency generator to said resonant circuit, said resonant circuit being tuned to the high-frequency oscillations of said high-frequency generator, a modulation circuit connected between and to said input terminal means and said resonant circuit, a demodulaton circuit and second inductive coupling means for inductively coupling the input to said demodulation circuit to said resonant circuit, the output to said demodulation circuit being connected to said output terminal means.

TRANSISTOR AMPLIFIER

Tadao Yoshida, Tokyo, Japan, assignor to Sony Corporation, Tokyo, Japan

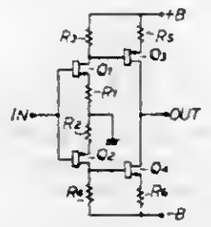
Filed May 16, 1975, Ser. No. 578,195
Claims priority, application Japan, May 23, 1974, 49-59292[U]
Int. Cl.² H03F 3/16
U.S. Cl. 330—35 **6 Claims**

1. A transistor amplifier comprising:
power supply means having a pair of terminals for providing operating potentials;
first and second field effect transistors each having triode-type dynamic characteristics, the gate electrodes of said first and second field effect transistors being supplied with an input signal to be amplified and the source and drain electrodes of said first and second field effect tran-

sistors being connected in a series circuit between said pair of terminals, the source electrodes of said field effect transistors being connected to each other, and said first and second field effect transistors operating as a common source class-A amplifier;

a first connection point connected to one of said source and drain electrodes of said first transistor;

a second connection point connected to one of said source and drain electrodes of said second transistor and having a different DC voltage level than said first connection point; and



third and fourth field effect transistors each having triode-type dynamic characteristics, the gate electrode of said third field effect transistor being directly connected to the drain of said first field effect transistor, and the gate electrode of said fourth field effect transistor being directly connected to the drain of said second field effect transistor, said third and fourth field effect transistors being connected in push-pull amplifier configuration, and the drains of said third and fourth field effect transistors being connected to an output terminal and having their source electrodes connected to said pair of terminals.

BIAS CIRCUIT FOR FET

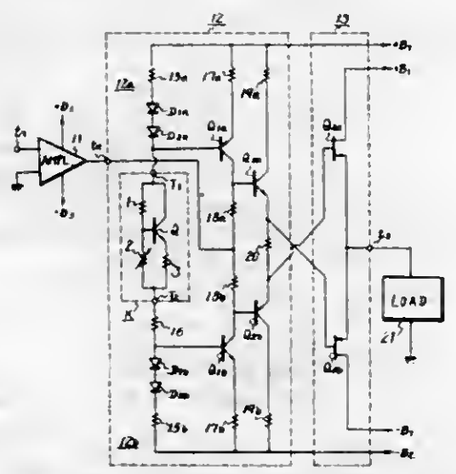
Katsuaki Tsurushima, Kawasaki, Japan, assignor to Sony Corporation, Tokyo, Japan

Filed Nov. 10, 1975, Ser. No. 630,331

Claims priority, application Japan, Nov. 14, 1974, 49-131276; Nov. 12, 1974, 49-130125

Int. Cl.² H03F *3/16*

U.S. Cl. 330—35 **12 Claims**



1. A bias circuit for use with a field effect transistor comprising: means for supplying an operating voltage susceptible to voltage fluctuations; a field effect transistor having triode-type dynamic characteristics and including gate, source and drain electrodes; means for applying said operating voltage across said drain and source electrodes through a load; input circuit means for applying an input signal to said gate electrode; bias voltage generating means for generating a bias voltage and applying same to said gate electrode of said field effect transistor, said bias voltage generating means including compensating means coupled to said operating voltage supply means and responsive to voltage fluctuations in said operating voltage to correspondingly vary said bias voltage applied to said gate electrode so as to stabilize the DC drain bias current of said field effect transistor in spite of the voltage fluctuations in the operating voltage; and voltage-controlled impedance means having a pair of terminals at least one of which being coupled to said compensating means and supplied with said operating voltage, said impedance means including biased semiconductor means connected to said pair of terminals having an impedance thereacross which varies with said operating voltage fluctuations in a hyperbolic relation that is substantially the same as the relationship between the amplification constant (μ) and the pinch off voltage (Vp) characteristics of said field effect transistor so as to adjust the DC gate bias voltage applied to said field effect transistor even though the pinch-off voltage (Vp) and the amplification constant (μ) may deviate from one field effect transistor to another.

4,031,483

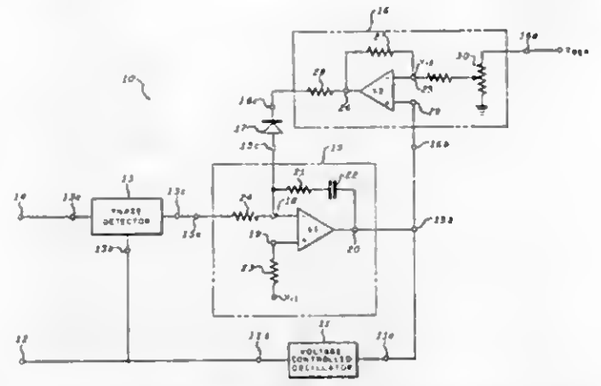
LIMITER CIRCUIT FOR SERVOSYSTEMS

Richard B. Formeister, Phoenix, Ariz., assignor to Sperry Rand Corporation, New York, N.Y.

Filed Jan. 15, 1976, Ser. No. 649,307

Int. Cl.² G05B *11/06, 23/02*; H03B *3/04*

U.S. Cl. 331—17 **11 Claims**



1. In a servomechanism of the type including a feedback loop having an error detecting means with first and second input terminals and an output terminal, for detecting and providing at said output terminal, an crror signal consistent with a signal coupled to said first input terminal from an output terminal of said servomechanism and a signal coupled to said second input terminal; means, having an input terminal coupled to said output terminal of said error detecting means and an output terminal and containing means for storing electrical energy, for providing a filtered error signal at said output terminal; and means, coupled between said second input terminal of said error detecting means and said output terminal of said filter means for providing a signal representative of said filtered error signal, the combination with said filter means of means, coupled to said filter means, for limiting said error signal at said output terminal of said filter means to a predetermined signal level, in the absence of a signal at said input terminal to said servomechanism, that is within predetermined upper and lower bounds, said limiting to said predetermined signal level achieved in a manner that substantially maintains energy stored in said energy storage means, contained in said filter means, at a level that said storage means would have attained for a signal at said output terminal of said filter means equal to said predetermined signal level without said limiting.

9. A method for observing the transient response of a servosystem containing a filter means which comprises:

coupling a limiter circuit containing a variable reference source to said filter means;

adjusting said reference source to establish a reference signal at said limiter circuit, said reference signal establishing a level to which the output signal of said filter means is servoed, in the absence of an input signal within a predetermined frequency range to said servosystem, such that energy storage devices contained within said filter means exhibit an energy storage that is consistent with said output signal of said filter means;

applying an input signal to said servosystem; and

observing the output signal of said servosystem from the time said input signal is applied to the time marking the completion of said transient.

10. A limiter, in combination with a filter means having an input and an output terminal and containing a storage element therein, comprising:

means for receiving a reference signal;

a differential operational amplifier having a first input terminal coupled to said reference signal receiver means, a second input terminal coupled to said output terminal of said filter means and an output terminal;

a first resistor coupled between said first input terminal and said output terminal of said differential operational amplifier; and

a second resistor having a first terminal coupled to said output terminal of said operational amplifier and a second terminal;

a unidirectional current conductive device coupled between said second terminal of said second resistor and said filter means and poled to be operative when a signal at said input terminal of said filter means exceeds a specified value so that a signal at said output terminal of said operational amplifier servoes to a predetermined level thereby accomplishing said limiting in a manner that maintains a charge on said storage element at a value consistent with said predetermined signal level.

4,031,484

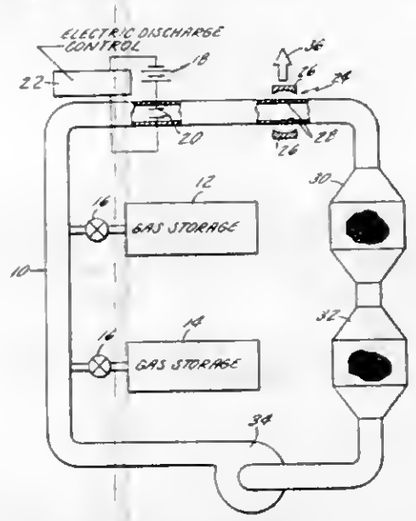
PORTABLE CHEMICAL LASER WITH GAS RECIRCULATION

Robert J. Freiberg, South Windsor; David W. Fradin, Manchester; Peter P. Cheausky, West Hartford, and Frank R. Biancardi, South Windsor, all of Conn., assignors to United Technologies Corporation, Hartford, Conn.

Filed Nov. 11, 1975, Ser. No. 630,828

Int. Cl.² H01S *3/00*

U.S. Cl. 331—94.5 G **14 Claims**



1. A portable laser system comprising:

a closed loop circuit through which a gaseous medium may be repeatedly circulated;

a vessel for the containment of a first gas and a second gas, said vessel being connected to the conduit in a manner which allows these gases to be controllably admitted into the conduit;

means for causing dissociation of the first gas in the conduit to form a species of atomic gas, such means being downstream of the position at which the first and second gases are admitted into the conduit;

a reaction region in which the atomic gas and the second gas combine chemically to form an excited species from which laser radiation can be extracted;

optical means adjacent to the reaction region for extracting laser radiation from the active species;

scrubber means for removing undesired constituents in the gaseous working medium passed therethrough, the scrubber being positioned in the conduit downstream of the optical means; and

recirculation means for continuously pumping the working medium around the fluid circuit described by the conduit.

4,031,485

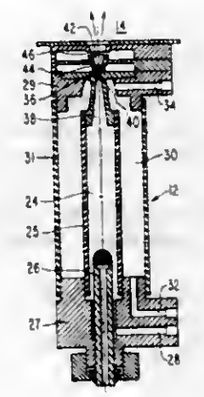
METHOD FOR ACHIEVING GAS DYNAMIC LASING

Robert Anthony Crane, Beaconsfield, and Asoke Kumar Ghosh, Dollard des Ormeaux, both of Canada, assignors to RCA Corporation, New York, N.Y.

Filed Jan. 7, 1976, Ser. No. 647,005

Int. Cl.² H01S *3/095, 3/22*

U.S. Cl. 331—94.5 P **10 Claims**



1. A method for achieving dynamic laser emission comprising:

dissociating molecules of a multi-atomic molecular first gas into atoms;

recombining the dissociated atoms into molecules in a metastable energy state;

mixing a second gas with the recombined molecules to form an active laser gas mixture having a population inversion; and

injecting the gas mixture into an optical laser cavity.

4,031,486

MEDIUM Q HIGH POWER DUAL CAVITY OSCILLATOR

Richard Calvin Havens, Scottsdale, Ariz., assignor to Motorola, Inc., Schaumberg, Ill.

Filed May 26, 1976, Ser. No. 690,215

Int. Cl.² H03B *9/12*

U.S. Cl. 331—96 **4 Claims**

1. A microwave oscillator comprising:

a first resonator:

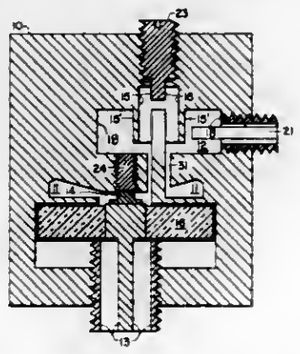
a second resonator electromagnetically coupled to the first resonator;

negative resistance means electromagnetically coupled to the first resonator;

means for supplying energy to said negative resistance means to provide RF energy;

means for coupling the output of the second resonator electromagnetically to a load wherein said first and said second resonators form a circuit with the characteristics of a parallel resonant circuit at a first frequency and wherein said negative resistance means and said first and

second resonators form a circuit with the characteristics of a series resonant circuit when the oscillator is operated



at a second frequency which is within 20% below said first frequency.

4,031,487

RECIPROCAL MICROWAVE JUNCTION DEVICE

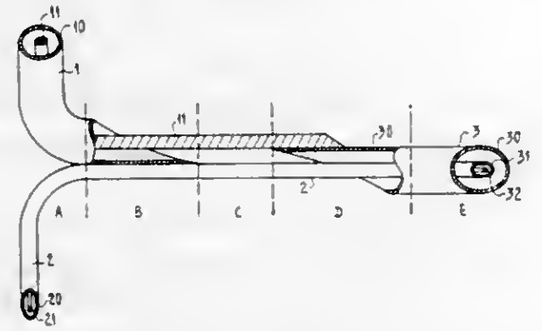
Jean Rannou, Paris, France, assignor to Thomson-CSF, Paris, France

Filed Jan. 28, 1976, Ser. No. 653,022

Claims priority, application France, Jan. 31, 1975, 75.03101

Int. Cl.² H01P *5/00, 3/06*

U.S. Cl. 333—1 **4 Claims**



1. A reciprocal microwave junction device between a system of concentric coaxial lines having an external conductor and an internal coaxial line, and a first and a second independent coaxial line each having an internal conductor and an external conductor, said junction device comprising:

a section of two parallel wires transmission line having a first wire formed of a common section of the first independent coaxial line and the internal coaxial line of the concentric coaxial line system, and a second wire formed of an extension of the internal conductor of the second independent coaxial line,

said first and second coaxial line being located adjoining and parallel to one another at one end of said device, the external conductor of said second independent coaxial line terminating at said end and making electrical contact with said first line external conductor,

said concentric coaxial line system being located at the other end of said device in prolongation of the first coaxial line, the external conductor of said concentric coaxial line system terminating at said other end and making electrical contact with said second line internal conductor.

4,031,488

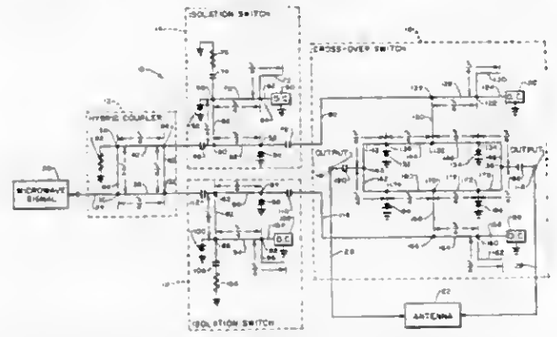
MULTIPLE POLARIZATION SWITCH

Lawrence A. Beno, Camarillo, Calif., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Apr. 5, 1976, Ser. No. 673,557

Int. Cl.² H01P *1/16, 1/15, 1/18*

U.S. Cl. 333—21 A **45 Claims**



1. A multiple polarization switch for providing horizontal, vertical, right-hand circular and left-hand circular polarization from a single microwave source comprising:

a. a hybrid coupler having an input coupled to receive a microwave signal from a microwave source and a first and second output having first and second respective signals appearing thereon, said first signal being substantially 90° out of phase with said second signal;

b. a first isolation switch connected to receive said first signal from said hybrid coupler first output at an input port, said first switch passing said first signal to an output port when on and terminating the passage of said first signal to said output port when off;

c. a second isolation switch connected to receive said second signal from said hybrid coupler second output, said second switch passing said second signal to an output when on and terminating the passage of said second signal to said output port when off;

d. a cross-over switch having first and second input ports connected, respectively, to receive said first

and second signals from said first isolation switch output and said second isolation switch output, said cross-over switch having a first and second mode, when in said first mode said cross-over switch connecting said first input to a first output and said second input to a second output, when in said second mode said cross-over switch connecting said first input to said second output and said second input to said first output.

4,031,489

VHF HIGH-POWER BROADBAND ISOLATORS

Nicolle Bernard, and Gerard Forterre, both of Paris, France, assignors to Societe Ligoes Telegraphiques et Telephoniques, Paris, France

Filed June 29, 1976, Ser. No. 700,916

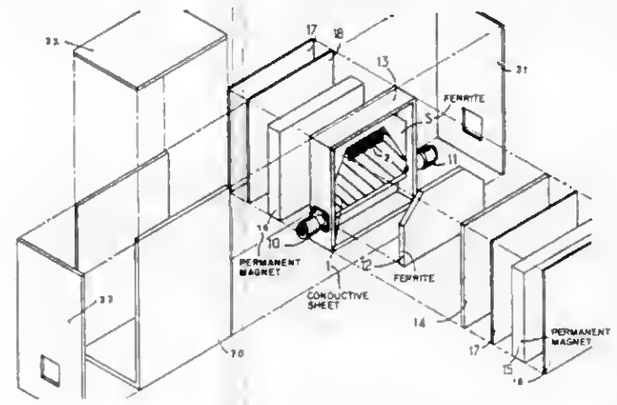
Claims priority, application France, July 15, 1975, 75.22036

Int. Cl.² H01P *1/36*

U.S. Cl. 333—24.2 **6 Claims**

1. A broadband high level VHF isolator having two terminals operating in a wide temperature range comprising two gyromagnetic material slabs on both sides of a substantially trapezoidal metal sheet connected respectively to the two terminals, radiating slots defining teeth cut from said sheet along at least one edge parallel to the propagation direction, the distance between the bottom of said teeth and the nearest edge of gyromagnetic slabs material equal to a quarter wavelength within the gyromagnetic material at a frequency in the operating frequency band, means to encase said slab, means to establish a non uniform d.c. magnetic field within said slabs reaching the gyromagnetic valve in the vicinity of said teeth

and of lower value elsewhere, means to compensate for the variations of permeability of the gyromagnetic material and



the d.c. establishing means with temperature, and means to close the d.c. magnetic field.

4,031,490

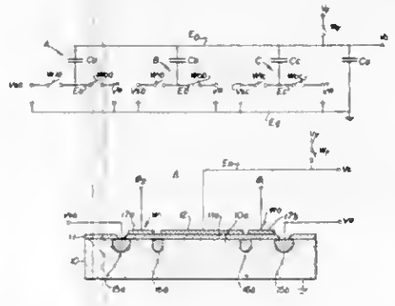
ANALOG SIGNAL PROCESSOR

Miles Alexander Copeland, Ottawa, Canada, assignor to Northern Electric Company Limited, Montreal, Canada

Filed Jan. 29, 1976, Ser. No. 653,293

Int. Cl.² H03H *7/28;* **G06G** *7/19;* **H01L** *29/78, 29/50*

U.S. Cl. 333—70 T **3 Claims**



1. A signal processor comprising:

a plurality of charge storage elements each having an input signal electrode and an output sensing electrode, the input signal electrodes being separated from each other and the output sensing electrodes being connected to each other;

a common electrode;

a control means for initially coupling the input signal electrodes to a first reference potential source and the output sensing electrodes to a second reference potential source to set the electrodes to a fixed potential with respect to the common electrode;

the control means thereafter disconnects the second reference potential source from the output sensing electrodes, selectively disconnects the first reference potential source from preselected input signal electrodes, and connects sampled analog signal potential sources to said preselected input signal electrodes to alter the voltage on the storage elements so as to derive an output signal voltage on the output sensing electrodes which is a function of the magnitude of the sampled analog signal potentials and of the preselected connections of the sources to the input signal electrodes.

4,031,491

TUNING APPARATUS USING A VOLTAGE-DEPENDENT REACTANCE ELEMENT

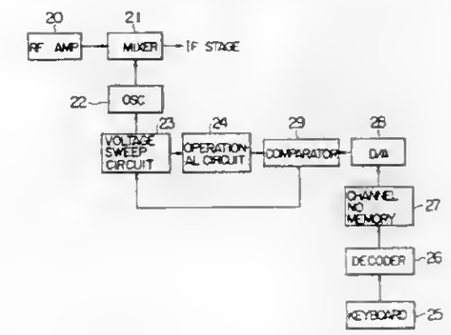
Yoichi Sakamoto, Takatsuki, Japan, assignor to Matsushita Electric Industrial Co., Ltd., Kadoma, Japan

Filed Feb. 20, 1975, Ser. No. 551,383

Claims priority, application Japan, Feb. 25, 1974, 49-22636; Feb. 25, 1974, 49-22637; Mar. 4, 1974, 49-25448

Int. Cl.² H03H *5/12;* **H03J** *3/06, 5/04*

U.S. Cl. 334—15 **9 Claims**



1. A tuning apparatus comprising:

a tuning circuit including means for generating tuning frequencies having a voltage dependent reactance element as a tuning element;

a voltage sweep circuit coupled to said tuning circuit for producing a D.C. sweep tuning voltage, said D.C. sweep tuning voltage being applied to said voltage dependent reactance element to control the generation of said tuning frequencies;

an operational circuit including a logarithm converter circuit coupled to said voltage sweep circuit for converting said D.C, tuning voltage to a D.C. reference voltage which varies in linear proportion to said tuning frequencies;

a standard voltage generating circuit for selectively producing a D.C. standard voltage;

voltage comparator means coupled to said operational circuit for comparing said D.C. reference voltage with said D.C. standard voltage; and

means coupling said comparator means to said voltage sweep circuit for controlling the sweep of said voltage sweep circuit in response to the output of said comparator means to produce a predetermined tuning frequency in said tuning circuit.

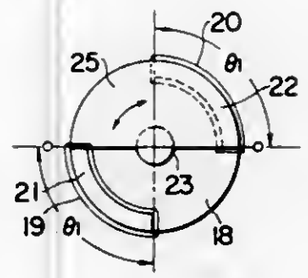
VARIABLE INDUCTOR
Hideo Fujiwara, Tachikawa; Yukio Ichinose, Kokubunji; Satoshi Taniguchi, Tokorozawa; Tsutomu Kobayashi; Kazuo Ichino, both of Tokyo; Michiyasu Itoh, Kodaira; Yasutaro Uesaka, Hachioji; Fumiyuki Inose, Kokubonji, and Sadayasu Ueno, Katsuta, all of Japan, assignors to Hitachi, Ltd., Japan
Filed July 3, 1974, Ser. No. 485,626
Claims priority, application Japan, July 6, 1973, 48-76808; July 6, 1973, 48-76809; July 6, 1973, 48-76811
Int. Cl.² H01F 21/06
U.S. Cl. 336—135 **11 Claims**

1. A variable inductor comprising
movable magnetic core means;
first fixed magnetic core means forming with said movable magnetic core means a first closed magnetic path;

second fixed magnetic core means forming with said movable magnetic core means a second closed magnetic path;
first coil means wound around a portion of said first closed magnetic path;
second coil means wound around a portion of said second closed magnetic path;
whereby the inductance of said first coil means varies in a complementary manner with the inductance of said second coil means such that the sum of said inductance of said first coil means and said inductance of said second coil means remains constant when said movable magnetic core means is removed relative to said first and second fixed magnetic core means, and
magnetic core member means for joining said first fixed magnetic core means with said second fixed magnetic core means, said magnetic core member means having center columnar means projecting between said first and second fixed magnetic core means and providing a common magnetic path portion of said first and second closed magnetic paths,
said movable magnetic core means being rotatably supported relative to said first and second fixed magnetic core means joined by said magnetic core member means



about the longitudinal axis of said columnar means opposite parallel surfaces of said first and second fixed magnetic core means, and said movable magnetic core means being supported with respective constant gap portions from said opposite parallel surfaces of said first and second fixed magnetic core means,
wherein as said movable magnetic core means is rotated about said longitudinal axis of said columnar means, the sum of the areas of the surfaces of said first and second fixed magnetic core means which face said movable magnetic core means remains constant and wherein said movable magnetic core means is magnetically coupled more closely at said center columnar means than at said gap portions;
wherein said magnetic core member means is disc-shaped, said first and second fixed magnetic core means are of arcuate shape and project axially of said magnetic core member means at respective edge portions thereof toward said movable magnetic core means and said movable magnetic core means is rotatably mounted parallel to said magnetic core member means; and
wherein said movable magnetic core means comprises
a substantially semi-circular shaped disc piece parallel to said magnetic core member means,
wherein the longitudinal axes of said magnetic core member means and said columnar means coincide with the axis of rotation of said movable magnetic core means.

POSITION MEASURING DEVICE

Guy Parent, Le Plessis-Robinson, France, assignor to Compagnie Industrielle des Telecommunications Cit-Alcatel SA, Paris, France

Filed Feb. 11, 1976, Ser. No. 657,330

Claims priority, application France, Feb. 27, 1975, 75.06083

Int. Cl.² G01S 5/18

U.S. Cl. 340—6 R **11 Claims**

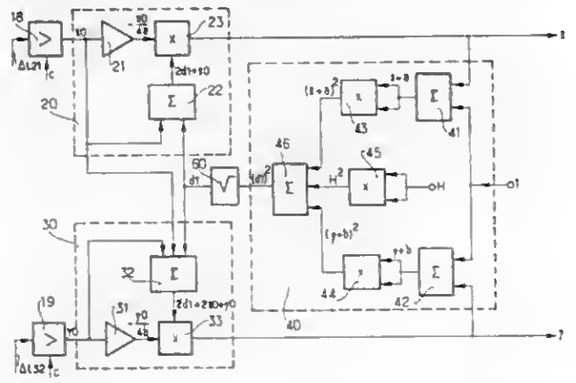
1. In a position measuring device, making it possible to calculate the position of a vessel which can move on water in relation to a fixed point O situated on the sea bed from which are emitted sound waves, and comprising: at least three detectors D1, D2, D3 fixed to the bottom of the vessel and arranged at the apexes of a right-angled triangle, the distance between the detectors D1, D2 being $2a$, the distance between the detectors D2, D3 being $2b$, the distance between the point O and the detector D1 being d_1, the distance between the point O and the detector D2 being d_2, the distance between the point O and the detector D3 being d_3;

Means for calculating the depth H of the water below the vessel;

Means for calculating the difference in travel time Δt_{21} of the sound waves between O and D2 on the one hand and O and D1 on the other hand;

Means for calculating the difference in travel time Δt_{32} of the sound waves between O and D3 on the one hand and O and D2 on the other hand; the improvement comprising:

First means (**18, 19**) supplying, from the difference in travel time Δt_{21}, by multiplication by a coefficient depending on the propagation speed c of sound waves in water, a signal xo equal to the difference between d_2 and d_1 and, from the



difference in travel, by multiplication by a coefficient depending on c, a signal yo equal to the difference between d_3 and d_2;

Second means (**20, 20'**) supplying, by algebraic multiplications and additions of signals xo and d_1, a signal equal to kx, x being the distance of the point O in relation to the mid plane of D1 D2;

Third means (**30, 30'**) supplying, by algebraic multiplications and additions of signals xo, yo and d_1, a signal ky, y being equal to the distance of O in relation to the mid plane of D2 D3;

Fourth means (**40, 40'**) supplying, by algebraic multiplications and additions of signals kx, ky and H, a signal equal to $k^2d_1^2$ which, after application to a square root extractor (**60, 60'**), is applied to the second and third means (**20, 20'**) (**30, 30'**).

4,031,501

APPARATUS FOR ELECTRONICALLY LOCATING ANALOG SIGNALS

Frank Caruso, W. Long Branch, N.J., assignor to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Continuation-in-part of Ser. No. 546,957, Feb. 4, 1975, abandoned. This application Apr. 5, 1976, Ser. No. 673,321

Int. Cl.² G01S 3/80

U.S. Cl. 340—6 R **7 Claims**

1. Apparatus for electronically locating the source of an acoustic or seismic planar wave comprising:

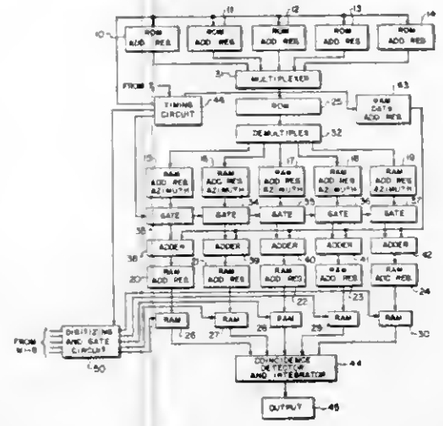
a plurality of signal transducers physically positioned in a predetermined array for detecting an analog acoustic or seismic planar wave and producing an analog electrical signal indicative of said wave;

transducer sampling means electrically coupled to each signal transducer for sampling the detected analog signal at a first sampling rate consistent with the dimensions of the array and the frequency characteristic of the analog signal;

digitizing means, electrically coupled to the output of the transducer sampling means for digitizing each analog electrical signal;

a first plurality of memory means electrically coupled to said digitizing means for storing the digitized signals associated with each transducer in real time;

programmed sampling means electrically coupled to the first plurality of memory means for repeatedly, selectively sampling the partial contents of each of the first plurality of memory means at a second sampling rate in predetermined patterns, each sample pattern corresponding to the expected positions of the digitized signals in the plurality



of memory means for a known azimuth position of the source of said planar wave; detection and summation means electrically coupled to the output of the first plurality of memory means for detecting the sampled contents of each of the first plurality of memory means and selectively summing the sampled contents so as to discount the effects of random noise;

output means coupled to the output of the detection and summation means for displaying the summations.

HYDROPHONE WITH ACOUSTIC REFLECTOR

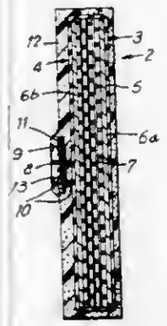
Francnis L. M. Lefaudeux, Le Relecq-Kerhaun, and Michel Georges Quivy, Six Fnurs Les Plages, both nf France, assignors to Etat Francais, Paris, France

Filed Apr. 7, 1976, Ser. No. 674,605

Claims priority, application France, Apr. 11, 1975, 75.11305

Int. Cl.² H04B 13/00

U.S. Cl. 340—10 **6 Claims**



1. A hydrophone comprising an acoustical reflector, at least one transducer disposed adjacent said reflector, and a common envelope for said transducer and reflector;

said reflector comprising a flexible sealed container, two rigid parallel plates disposed in said container and sheets of interlaced filaments disposed between said plates,

said transducer being a piezoelectric transducer comprising a thin flexible blade in the form of a disc, at least one piezoelectric disc fixed to a surface of said blade, and a rigid annular ring to which said blade is fixed at the periphery thereof,

said reflector and transducer being entirely embedded in said common envelope with said flexible blade in immediate proximity to said reflector.

4,031,503

ANTI-CORROSION ULTRASONIC TRANSDUCER

Hiroshi Minami, Kawasaki, Japan, assignor to Hokushin Electric Works, Ltd., Tokyo, Japan

Filed Aug. 19, 1975, Ser. No. 605,808

Claims priority, application Japan, Aug. 30, 1974, 49-105078

Int. Cl.² G01V 1/00

U.S. Cl. 340—11 **4 Claims**

1. An ultrasonic transducer comprising:

A. a cylindrical case provided at one end with an opening;

B. an ultrasonic unit disposed within said case, said unit consisting essentially of a disc-shaped electrostriction element having an inherent resonance frequency, and a relatively thick rigid body affixed thereto which reduces the natural frequency of the element to a degree axially shifting the vibratory nodal point thereof into said body, means suspending said unit from said nodal point to occupy a position within said case in which it is spaced from the inner surface of the case and from said opening;

C. an electrically non-conductive elastomeric material filling the free-space within said case and embedding the unit therein to permit ultrasonic energy to be emitted by said unit or received thereby through said opening, said energy being conveyed by said filling material which otherwise serves to isolate said unit from the environment in which the transducer is installed.

4,031,504

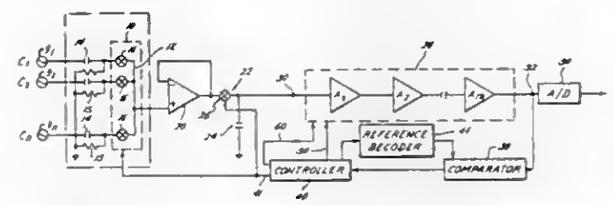
GAIN RANGING AMPLIFIER SYSTEM

George T. Mioduski, Houston, Tex., assignor to Western Geophysical Company of America, Houston, Tex.

Filed Mar. 8, 1976, Ser. No. 664,616

Int. Cl.² G01V 1/24

U.S. Cl. 340—15.5 GC **13 Claims**



12. A gain ranging amplifier system having input and output terminals comprising:

a plurality of amplifiers having inputs and outputs connected in cascade between said terminals, each said amplifier having at least two different gain states, one gain state being unity, the amplification ratio between said gain states being unique to each said amplifier;

controller means for defining the gain states of said amplifiers;

voltage reference means for selectively providing discrete reference voltages corresponding to the amplification ratios unique to each said amplifier, the amplifier having the highest amplification ratio being associated with the lowest reference voltage;

means for comparing the signal voltage at the output of said system with said first reference voltage; and

means for transmitting the result of the comparison to the controller.

4,031,505
SEISMIC SYSTEM WITH SIGNAL-TO-NOISE DETERMINATION

Gary D. Owens, Bellaire, Tex., assignor to Texaco Inc., New York, N.Y.

Filed Mar. 24, 1976, Ser. No. 669,774
Int. Cl.² G01V 1/28
U.S. Cl. 340—15.5 DP 10 Claims

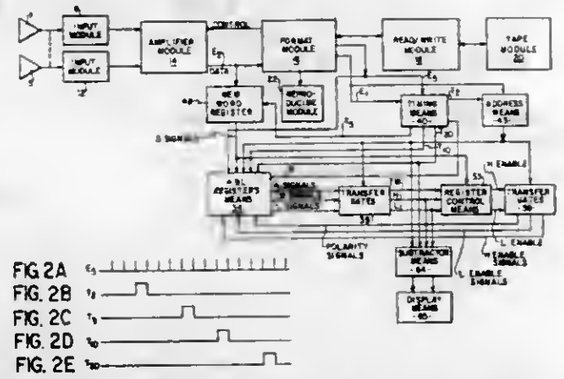


FIG. 2A
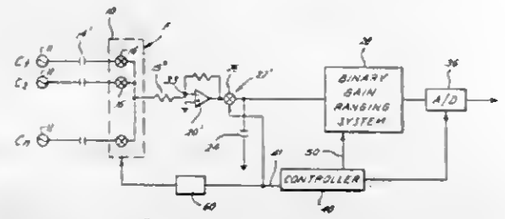
FIG. 2B
FIG. 2C
FIG. 2D
FIG. 2E

1. An improvement to a seismic system, which provides a data word having digital signals corresponding to sensed vibrations in an earth formation or to noise occurring in the seismic system, for determining the signal-to-noise ratio of the seismic system when the digital signals correspond to the noise, the data word digital signals including a sign bit corresponding to a positive or a negative polarity of the data word while the remaining data word digital signals correspond to the absolute value of the sensed vibrations or the noise, said improvement comprising sampling means connected to the seismic system for periodically sampling the data word provided by the seismic system to provide a new word for each sampling; means connected to the sampling means for storing the most positive new word, with respect to the new words provided by the sampling means, as an H word, and the most negative new word, with respect to the new words provided by the sampling means, as an L word; and means connected to the storing means for providing a digital output corresponding to the absolute difference between the H word and the L word.

4,031,506
MULTIPLEXER COMMUTATED HIGH PASS FILTER

Lee E. Siems, Houston, Tex., assignor to Western Geophysical Company of America, Houston, Tex.

Filed Mar. 8, 1976, Ser. No. 664,614
Int. Cl.² G01V 1/22; H03K 17/56; H04Q 11/04
U.S. Cl. 340—15.5 GC 7 Claims

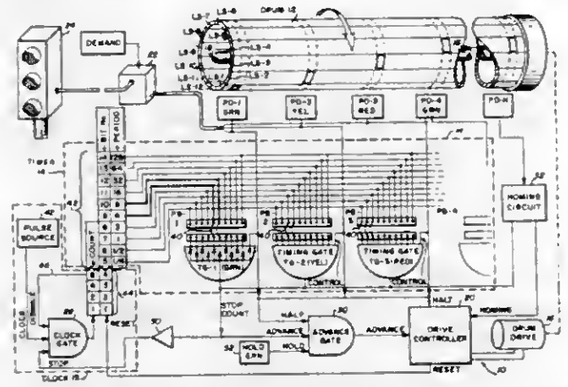


1. A multiplexer commutated high pass filter having a plurality of analog input terminals and an output terminal comprising:
- a multiplexer having a plurality of input terminals and a common output bus;
- a capacitor connected between each analog input terminal to the filter and the corresponding input terminals of the multiplexer;
- a resistor connected to said common output bus;
- seismic sensor units connected respectively to said input terminals; and
- control means connected to said multiplexer for sequentially connecting each capacitor to said resistor, said control means including means for varying the ratio of the dwell with respect to the channel-off time of said multiplexer to vary the cut-off frequency, where the dwell is the time period during which one of said seismic sensor units is connected to said resistor and the remainder of the time required to complete a scan cycle is the channel-off time.

4,031,507
TRAFFIC CONTROLLER, ELECTROMECHANICAL SEQUENCER FOR A TRAFFIC CONTROLLER

Ronald P. Johnson, San Jose, and Reynold W. Bell, Santa Clara, both of Calif., assignors to The Singer Company, Binghamton, N.Y.

Continuation of Ser. No. 485,074, July 2, 1974, abandoned.
This application Aug. 2, 1976, Ser. No. 711,013
Int. Cl.² G08G 1/00
U.S. Cl. 340—41 R 15 Claims

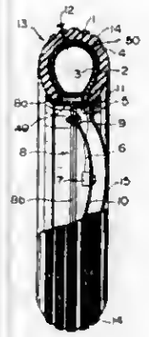


1. A traffic controller sequencer for establishing the order and duration of traffic light events in a traffic light cycle, the sequencer comprising:
- a sequence means having prepositioned structures thereon corresponding to the traffic light events;
- reading means responsive to the prepositioned structures;
- drive means for providing relative motion and periods of nonmotion between the sequence means and the reading means,, permitting the reading means to sequentially read the prepositioned structures on the sequence means for establishing the sequence of traffic light events;
- binary counter means having a sequential series of stages, each of which is periodically activated on a time base which doubles in duration with each subsequent stage causing each stage of the series to have a time base which is a power of two multiple of the first stage of the series;
- a plurality of separately adjustable timer means, one associated with each traffic light event for independently establishing the length of the period of nonmotion for that traffic light event, each timer means having a series of inputs corresponding to at least some stages in sequence in the series of sequential stages, selected stages of the series of sequential stages being electrically connected to the corresponding input in the series of timer inputs for each timer means for establishing the period of nonmotion for that timer means which is equal to the sum of the time bases of the selected stages; and
- drive controller means responsive to the plurality of timer means for initiating the relative motion, and responsive to the reading means for terminating the relative motion when a prepositioned structure is read.

4,031,508
PUNCTURE ALARM DEVICE FOR A TIRE

Seita Omori, 1109-6 Oaza Sho, Tadotsu-cho, Nakatado, Kagawa, Japan

Filed Dec. 15, 1975, Ser. No. 640,436
Int. Cl.² B60C 23/00
U.S. Cl. 340—58 8 Claims

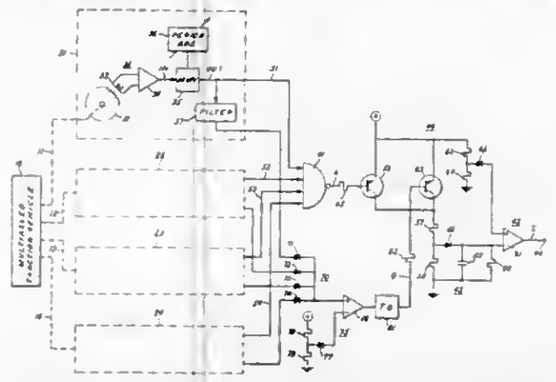


1. In a puncture alarm for a tire, including sensor means disposed within said tire, said sensor means for providing a change in electrical characteristic in response to the puncturing of said tire by a conductive object, and including an alarm and detection circuit means for producing an output signal in response to said sensor means to activate said alarm, said detection circuit means coupled to said sensor means and alarm, and comprising:
- a power supply;
- gate means coupled to said alarm for producing said output signal; and
- compensation means coupled to said power supply, sensor means and gate means for biasing said gate means such that said output signal is produced only when said electrical caracteristic assumes a value outside of a preselected range, said compensation means for allowing a predetermined magnitude of degradation of said electrical characteristic without causing a false alarm.

4,031,509
LOCKED AXLE DETECTOR FOR A MULTI-AXLED TRACTION VEHICLE

E. S. Matulevich, Erie, Pa., assignor to General Electric Company, Erie, Pa.

Filed June 27, 1975, Ser. No. 590,982
Int. Cl.² G08B 21/00; B60T 8/04
U.S. Cl. 340—62 6 Claims



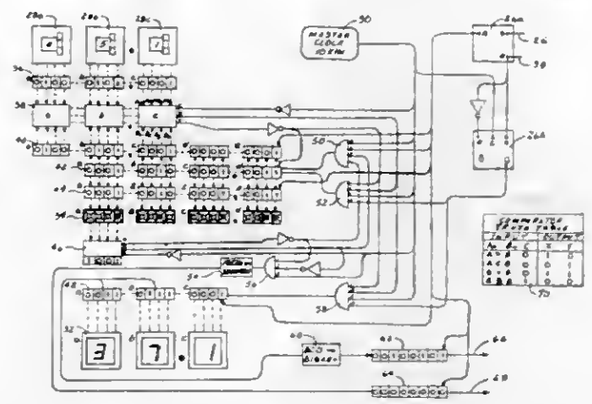
1. For detecting a predetermined speed differential among a plurality of axles of a traction vehicle equipped with speed detectors that provide a corresponding plurality of input signals indicative of the speeds at which the respective axles are rotating, the improvement comprising:
- a. a corresponding plurality of signal conditioning means adapted to receive said input signals from said speed detectors, each of said signal conditioning means being operative to generate a train of discrete output pulses having an average value representative of the axle speed indicated by the associated input signal as that speed varies between nearly zero and a predetermined magnitude, and each of said signal conditioning means also including an electric filter energized in accordance with the corresponding output pulse train whose average value determines the magnitude of an analog output signal of said electric filter;
- b. control means coupled to said signal conditioning means and supplied with the output pulse trains respectively generated thereby, said control means being operative to produce a predetermined control signal in response to any one of said pulse trains having an average value indicating that the rotational speed of the associated axle is lower than a predetermined first threshold level, and
- c. disabling means comprising:
  - i. an OR logic circuit coupled to the said signal conditioning means for receiving the respective analog output signals therefrom, and
  - ii. level detecting means connected between said control means and said OR logic circuit for preventing the production of said control signal except when at least one of said analog signals exceeds a magnitude corresponding to a predetermined second threshold level of rotational speed of the associated axle, said second threshold level being higher than said first threshold level,

whereby the production of said control signal indicates that the speed of at least one axle is lower than said first threshold level while the speed of another axle is higher than said second threshold level, said predetermined magnitude of axle speed being at least as high as said second threshold level.

4,031,510
SPEED DETECTION SYSTEM FOR AUTOMOBILES AND OTHER MOTOR-DRIVEN OBJECTS

Frederick N. King, 5068 Franklin Ave., Los Angeles, Calif. 90027

Filed Dec. 19, 1975, Ser. No. 642,332
Int. Cl.² B60Q 1/54
U.S. Cl. 340—62 11 Claims



1. An adjustable speed detection system for accurately recording the speed of moving objects between a pair of detection locations comprising:
- start timing sensor at the first detection location of said two locations responsive to an object for commencing a time interval;
- stop timing sensor at the second detection location of said two locations responsive to said object for terminating said time interval;
- speed calculation means coupled to said sensors and responsive to said time interval to determine speed of said object;
- compensation means included in said speed calculation means to adjust said uncompensated calculated object

speed for inaccuracies due to reaction time of said sensors; and

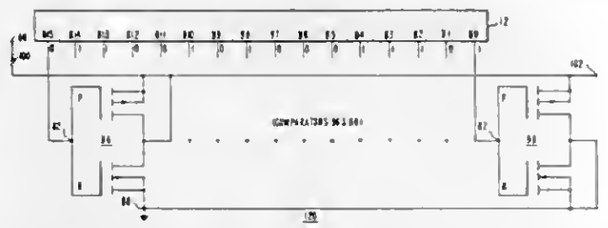
a decimal display matrix coupled to said speed calculation means for visually indicating said object speed.

4,031,511

CMOS COMPARATOR

James S. Britton, Raleigh, N.C., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Apr. 27, 1976, Ser. No. 680,655
Int. Cl.² G06F *7/04;* **H03K** *5/20*
U.S. Cl. 340—146.2 **14 Claims**



1. A single bit comparator for comparing a variable word with a fixed word, comprising:

a pair of complementary MOS devices including a p-channel MOS and an n-channel MOS having their gates connected in common and their drains connected in common,

said drains being connected to the source of a selected one of the MOS devices, with the selected MOS device being responsive to the logic level of the fixed word,

a power supply having first and second terminals,

a load resistor,

the source of said p-channel MOS being connected to the first terminal of said power supply via said load resistor,

the source of said n-channel device being connected to the second terminal of said power supply,

an input terminal for receiving the variable word, said input terminal being connected to said gates, and

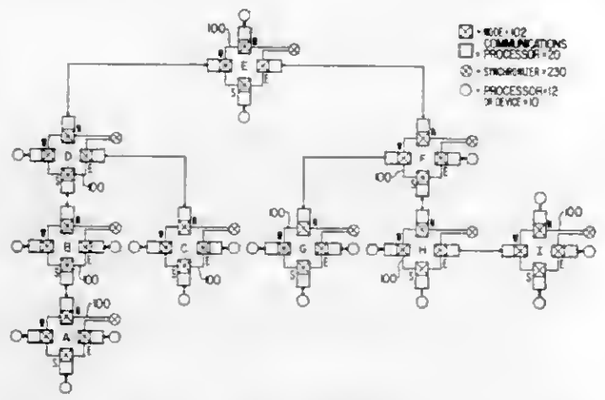
an output terminal for indicating when the variable word is equal to the fixed word, said output terminal being connected to the source of said p-channel MOS device.

4,031,512

COMMUNICATIONS NETWORK FOR GENERAL PURPOSE DATA COMMUNICATIONS IN A HETEROGENEOUS ENVIRONMENT

Ulbe Faber, Honeybrook, Pa., assignor to Burroughs Corporation, Detroit, Mich.

Filed May 29, 1975, Ser. No. 581,938
Int. Cl.² H04Q *9/00*
U.S. Cl. 340—147 R **16 Claims**



1. A method of communicating data between a plurality of information handling units arranged in a series loop configuration comprising the steps of:

generating a plurality of undedicated information limited slots for carrying signals;

organizing said plurality of undedicated information limited slots into a continuous sequence of undedicated information carrying slots;

conveying said organized continuous sequence of undedicated information carrying slots onto said series loop configuration;

dedicating on demand at each of said plurality of information handling units the first available undedicated information carrying slot for receiving information signals to be communicated from said respective information handling unit; and

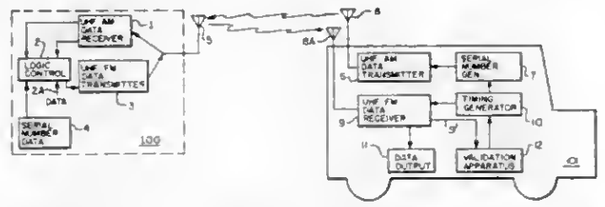
undedicating on demand at each of said designated ones of said information handling units said dedicated information carrying slots when delivering said received information signals.

4,031,513

RF DATA EXCHANGE SYSTEM

Walter Simclak, Longwood, Fla., assignor to Northern Illinois Gas Company, Aurora, Ill.

Filed Nov. 8, 1974, Ser. No. 522,019
Int. Cl.² H04Q *9/00*
U.S. Cl. 340—152 T **12 Claims**



1. In a remote meter reading system having an individual transponder for each of a plurality of remotely located meters and interrogate means for energizing, requesting and receiving information from a selected one of said transponders, said interrogate means including interrogate transmitter means for transmitting electromagnetic signals over a UHF AM radio channel to initiate the readout of the information from said selected one of said plurality of remotely located meters, each of said transponders including data receiver means for receiving the UHF AM signals and data transmitter means responsive to said data receiver means for retransmitting UHF FM radio signals comprised of a carrier signal modulated by signals of predetermined frequencies for representing the information requested by said interrogate transmitter means, said interrogate means further including interrogate receiver means for receiving the UHF FM radio signals and validation means responsive to said interrogate receiver means to provide a control output for enabling said interrogate transmitter means to continue the readout of information from the selected meter whenever the UHF FM radio signals received by said interrogate receiver means are modulated at said predetermined frequencies.

4,031,514

ADDRESSING SYSTEM IN AN INFORMATION PROCESSOR

Toshimasa Kihara, Kunitachi, Japan, assignor to Hitachi, Ltd., Japan

Filed Sept. 2, 1975, Ser. No. 609,605
Claims priority, application Japan, Sept. 4, 1974, 49-100924
Int. Cl.² G06F *9/20*
U.S. Cl. 364—200 **4 Claims**

1. An addressing system for an information processor comprising:

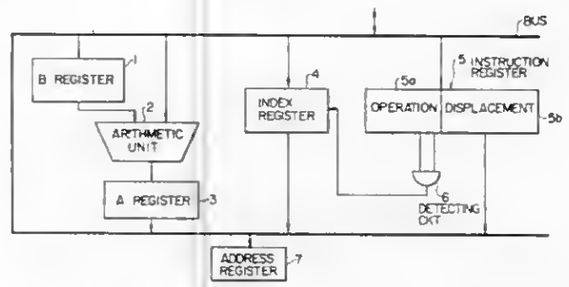
a data bus by way of which data is transmitted within the system;

an index register having an input and an output coupled to said data bus;

an address register having an input coupled to said data bus;

an instruction register, including an operation part and an address part and havng an input coupled to said data bus, said address part having an output coupled to said data bus;

an adder, having a first input coupled to receive the contents of said index register and a second input coupled to



rceive the contents of the address part of said instruction register, for adding said respective contents to each other to provide a summation output;

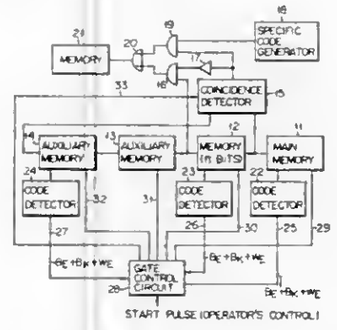
detection means, responsive to the state of selected bits of the operation part of said instruction register, for causing the summation output of said adder to be supplied to said index register and stored in said address register upon the state of said selected bits being a preselected state, and for otherwise preventing the summation output of said adder from being supplied to said index register.

4,031,515

APPARATUS FOR TRANSMITTING CHANGEABLE LENGTH RECORDS HAVING VARIABLE LENGTH WORDS WITH INTERSPERSED RECORD AND WORD POSITIONING CODES

Toshio Kashio, Tokyo, Japan, assignor to Casio Computer Co., Ltd., Tokyo, Japan

Filed Apr. 29, 1975, Ser. No. 572,871
Claims priority, application Japan, May 1, 1974, 49-48289; May 2, 1974, 49-49494
Int. Cl.² G06F *5/02, 7/34*
U.S. Cl. 364—200 **13 Claims**



1. A system for transmitting data to an output means, comprising:

a source of a plurality of records serially arranged with record positioning codes interposed therebetween, said records including a plurality of words serially arranged with word positioning codes interposed therebetween;

main memory means coupled to said source for temporarily storing said serially arranged records and record positioning codes;

auxiliary memory means coupled to said main memory means for temporarily storing a record including words of different lengths read out from said main memory means based on said record and word positioning codes;

comparator means coupled to said main and auxiliary memory means for comparing any one of the words of a record read out from said auxiliary memory means with the corresponding word of said record read out from said main memory means immediately after said record which was read out from said auxiliary memory means; and

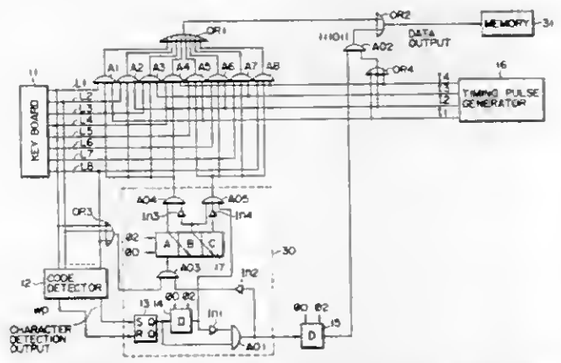
control circuit means coupled to said main memory means and to said comparator means for transmitting to the output means the record read out from the main memory means immediately after said record which was read out from said auxiliary memory means, in the original form, whenthe corresponding words are detected by said comparator means not to be identical and for transmitting the record to the output means with the corresponding word omitted when the corresponding words are detected by said comparator means to be identical.

4,031,516

TRANSMISSION DATA PROCESSING DEVICE

Toshio Kashio, Tokyo, Japan, assignor to Casio Computer Co., Ltd., Tokyo, Japan

Filed June 4, 1975, Ser. No. 583,845
Claims priority, application Japan, June 7, 1974, 49-63932
Int. Cl.² G06F *13/00*
U.S. Cl. 364—200 **12 Claims**



1. A transmission data processing device for serially transmitting records each constituted by data word of variable length which have word positioning codes (*wp*) interposed among them and each of which includes a spontaneous number of binary-coded characters, said device comprising:

a memory means (**31**) for storing as a series transmission data a record comprised of predominantly numeric data characters coded in *n* bits, of data characters including at least one characeter and coded in *m* bits and of specific function codes (α) of *n* bits and inserted immediately before at least said data characters and contained in each data word, where *n* is smaller than *m;*

means (**AO 6**) coupled to said memory means (**31**) for detecting said function codes (α) read out from said memory means (**31**);

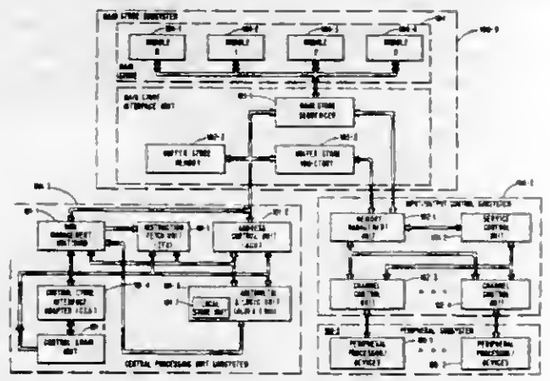
bit configuration designating means (**OR 5,** delay **23 AND AO 8**) having an input coupled to said detecting means (**AO 6**) for reading in *m*-bit configuration the data characters from said memory means (**31**) after said detection means produces a detection output; and

means (**AO 5,** 1*n* **9**) coupled to said memory means (**31**) and to said designating means (**OR 5,** delay **23,** AND **AO 8**) for releasing the *m*-bit configuration designating mode of said designating means upon detection of an *n* bit word positioning code.

4,031,517
EMULATION OF TARGET SYSTEM INTERRUPTS THROUGH THE USE OF COUNTERS

Allen C. Hirtle, Needham, Mass., assignor to Honeywell Information Systems, Inc., Waltham, Mass.

Filed Apr. 24, 1974, Ser. No. 463,700
Int. Cl.² G06F 9/18
U.S. Cl. 364—200 26 Claims



1. A data processing system for handling interrupts received from a peripheral subsystem coupled to said data processing system during the execution of a target system program from a plurality of target system peripheral control means which in the target system being emulated couple to a plurality of peripheral devices, and connect in common to share the common interrupt hardware facilities of said target system said data processing system including:

a main store having a plurality of storage locations;

a first group of said storage locations coded to store instructions of said target system program, said instructions including at least one input/output instruction involving the processing of interrupts generated during execution of said target system program by any one of said peripheral control means connected in common to share the common interruption facilities of said target system;

a second group of said storage locations, each location coded to store signals representative of said interrupts received from said peripheral subsystem and corresponding to the interrupt status indications for a different one of said plurality of peripheral control means of said target system being emulated;

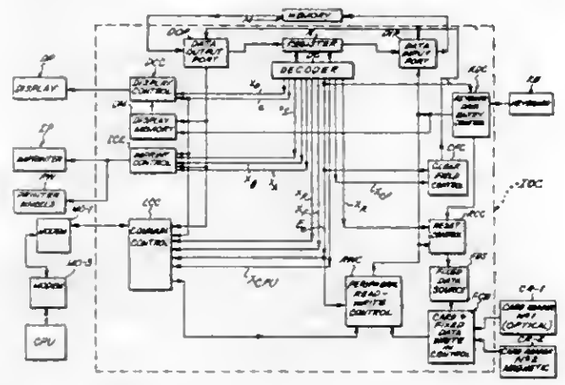
a third group of said storage locations coded for indicating the interrupt status of said emulated target system, at least one of said locations storing an interrupt count representing the number of said peripheral control means of said emulated target system having interrupt conditions; and,

microprogram control means for storing sequences of microinstructions for conditioning said system for processing instructions in at least first and second modes, said control means including branch means, said branch means when said control means is operated in a first mode during the execution of a target system input/output instruction coded to specify the altering of the interrupt status signals of a specified one of said plurality of target systems peripheral control means is caused by said instructions to reference a predetermined one of said sequences, said microprogram control means further including decode means, said decode means being conditioned by microinstructions of said one sequence to generate signals for conditioning said data processing system to switch one of said second group of said locations storing signals corresponding to interrupt status indicators of said specified peripheral control means to a predetermined state and generate signals for modifying the interrupt count contents of said one location of said third group for indicating said interrupt status of all of said plurality of peripheral control means.

4,031,518
DATA CAPTURE TERMINAL

Thomas Patrick Holloran, Aurora; Arthur Buell Braden, Mentor; Jerrold Stokes Foley, Stow; James Lucian Maynard, Northfield; John Patrick Klosky, Mentor; Gerald Anthony Dissauer, South Euclid; Terreoce Miller Adams, Kirtland, and Allan Alfred Lorenz, Mentor, all of Ohio, assignors to Addressograph Multigraph Corporation, Cleveland, Ohio

Filed June 26, 1973, Ser. No. 373,884
Int. Cl.² G06F 3/00, 13/02
U.S. Cl. 364—200 16 Claims



1. A data capture terminal for use in a data communication system, wherein data including output peripheral commands and associated messages are received from a remote device, comprising:

memory means for receiving data for storage therein;

means for entering all output peripheral data from a remote device, including output peripheral commands having associated messages, into said memory means for storage thereby;

communication means, including for receiving data from said remote device and supplying said output peripheral data to said data entering means for entry into said memory means;

means for periodically and non-destructively outputting said data from said memory means;

a plurality of output peripheral means;

a corresponding plurality of actuatable output peripheral control means, each coupled to said outputting means and exposed to all said data outputted therefrom, and each being associated with a different one of said output peripheral means; and

a corresponding plurality of actuating means, each similarly associated with a different one of said output peripheral control means and coupled to said outputting means, for actuating its associated peripheral control means whenever the outputted data includes a command intended for its associated output peripheral means, so that thereby all communication from said remote device to a particular output peripheral means is conducted only through said memory means;

wherein each of said actuable output peripheral control means, when actuated by its corresponding actuating means, commands the associated peripheral means to perform a function in accordance with said associated output peripheral command upon the particular message associated therewith.

4,031,519
PRINTER

Gerald I. Findley, Morgan Hill, Calif., assignor to IBM Corporation, Armonk, N.Y.

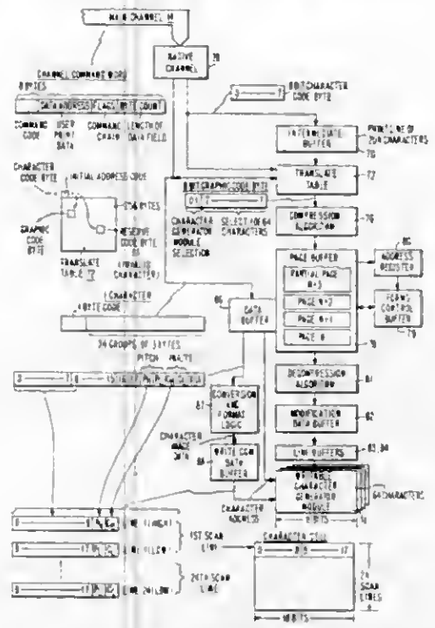
Filed Nov. 11, 1974, Ser. No. 522,998
Int. Cl.² G06F 3/12, 7/34, 13/00; G06K 15/02
U.S. Cl. 364—900 36 Claims

1. A system for printing characters in response to coded data comprising:

means for storing a plurality of different sets of graphical data, each set of graphical data being identified by a particular address and defining the portions of a grid pattern which a particular character comprises;

means responsive to receipt of the coded data by the system for assembling the data into a group representing a plurality of characters to be printed;

means responsive to assembly of the coded data into a group for translating each portion of the coded data representing a character into a corresponding address, the means for translating including means for storing



addresses in a plurality of different storage locations and means responsive to the value of each portion of the coded data representing a character for selecting a storage location to provide the address stored therein;

means responsive to each address from the means for translating for selecting the corresponding set of graphical data from the means for storing sets of graphical data corresponding to the address;

grid pattern scanning print means; and

means responsive to each selected set of graphical data for modulating the scanning print means in accordance with the graphical data to print a character.

4,031,520
MULTISTAGE SORTER HAVING PUSHDOWN STACKS WITH CONCURRENT ACCESS TO INTERSTAGE BUFFER MEMORIES FOR ARRANGING AN INPUT LIST INTO NUMERICAL ORDER

Michel Alexandre Rohner, San Jose, Calif., assignor to The Singer Company, Binghamton, N.Y.

Filed Dec. 22, 1975, Ser. No. 642,849
Int. Cl.² G06F 7/24
U.S. Cl. 364—200 15 Claims

1. An M stage sorter for arranging input members into a numerical order, comprising:

means for grouping the input numbers into groups;

a first stage for ordering the input numbers within each of the groups, and formed by:

first stage input means for sequentially receiving all of the input numbers within each of the groups;

first stage means for comparing each currently received input number to the previously received numbers from the same group; and

first stage storage means for inserting each currently received input number into proper numerical order among the numbers previously received from the same group;

M-1 subsequent sequential stages for progressively forming fewer groups of more numbers each, the last stage of which provides all of the input numbers in numerical order, each stage formed by:

interstage storage means for storing the ordered groups from the preceding stage;

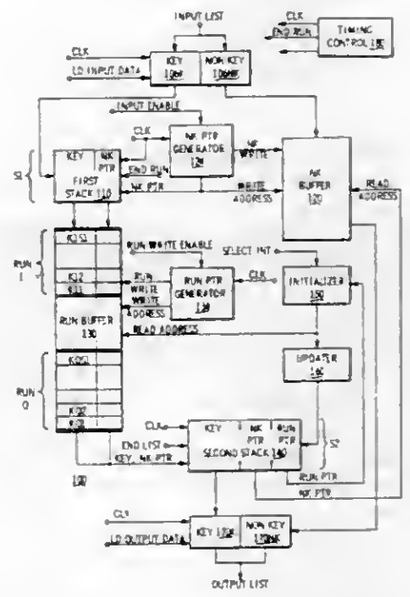
stack input means for sequentially receiving each of the numbers stored in the interstage storage means;

stack comparing means for comparing each currrently received number to the previously received numbers currently in the sorting stack;

stack pushdown storage means for inserting each currently received number into proper numerical order among the previously inserted numbers, which pushdown stormeans progressively fills up from a first-filled position to a last-filled position as each currently received number is inserted;

interstage output means for advancing the current number in the last filled position to the next stage;

replacement means for holding a replacement number from the interstage storage means for insertion into the stack pushdown storage means via the stack input means and stack comparing means as each current output number is advanced from the last filled position of the pushdown storage means to the interstage output means;



candidate pointer means for providing a candidate pointer for a next replacement number candidate for each replacement number from the interstage storage means prior to entering the replacement means for identifying candidates for the next replacement number;

first access means for permitting the candidate pointer for the current replacement number in the replacement means to access a first candidate for the next replacement number from the interstage storage means;

second access means for permitting the candidate pointer for the current number in the last filled position of the pushdown storage means to access a second candidate for the next replacement number from the interstage storage means; and

a candidate comparing means for selecting the next replacement number from the two candidates for entry into the replacement means as the current replacement number is inserted into the stack pushdown storage means; and

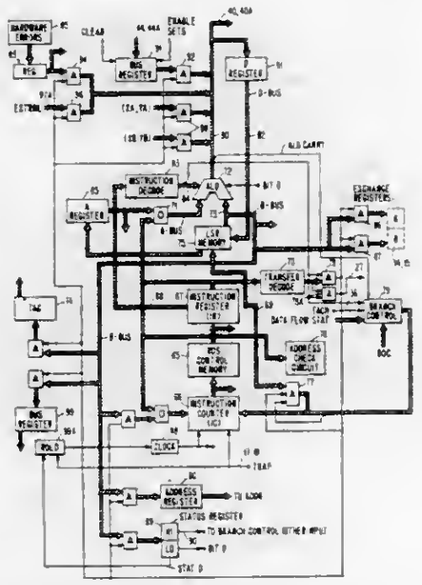
output means for receiving the numbers in numerical order from the last of the M sequential stages.

4,031,521

MULTIMODE PROGRAMMABLE MACHINES

Phil H. Hall, and John W. Irwin, both of Longmont, Colo., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Oct. 15, 1971, Ser. No. 189,576
Int. Cl.² G06F 9/16
U.S. Cl. 364—200 8 Claims



1. A multimode programmable machine,
a microprocessing portion having a plurality of program step means,
a multimode cyclable program loop including a predetermined number of control program step means,
means establishing first and second modes of operation in said machine,
means having first sequences of machine operation cooperating with a first group of said control program step means being branch-on-condition steps and which first sequences are operative during said first mode to interrupt said cyclable program loop to selectively execute said first sequences upon certain events occurring in the machine,
means having second sequences of machine operation cooperating with said first group of said step means and operative during said second mode to supply first timed control signals of momentary duration in accordance with a continuous recycling of said program loop for indicating elapsed time, and
said machine having circuit means responsive to said control signals to perform predetermined machine functions in accordance therewith.

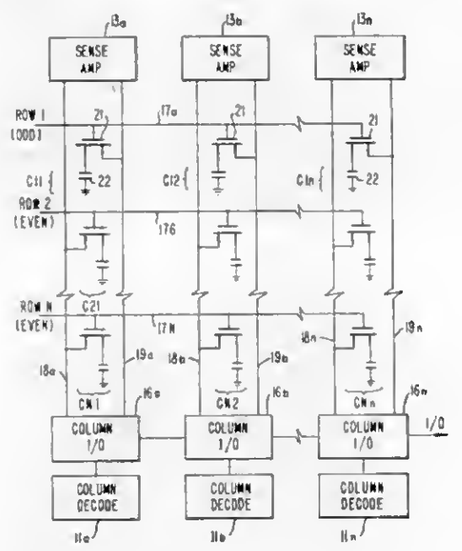
4,031,522

ULTRA HIGH SENSITIVITY SENSE AMPLIFIER FOR MEMORIES EMPLOYING SINGLE TRANSISTOR CELLS

John Anthony Reed, Los Altos, and Joel Allen Karp, Palo Alto, both of Calif., assignors to Burroughs Corporation, Detroit, Mich.

Filed July 10, 1975, Ser. No. 594,579
Int. Cl.² G11C 11/40
U.S. Cl. 340—173 R 10 Claims

1. A differential sense amplifier and restore circuitry comprising:
a pair of sense conductors;
a pair of transistors cross-coupled to form a latch to sense a difference in voltage potential between said sense conductors, said latch having a pair of output leads and a pair of input leads;
a pair of source followers, each coupled between one of said sense conductors and one of said input leads to receive an input signal from one or the other of said sense conductors; and



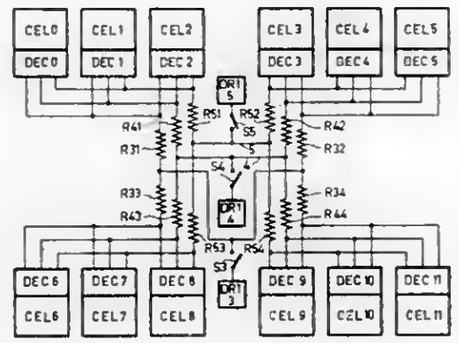
a pair of write-back transistors, each coupled between one of said output leads and one of said sense conductors to supply a restore signal to the sense conductor from which an input signal was received.

4,031,523

INTEGRATED STORAGE SYSTEM WITH PARALLEL CONNECTION LINES CONTAINING A RESISTOR

Johannes Bernardus Horsten, Eindhoven, Netherlands, assignor to U.S. Philips Corporation, New York, N.Y.

Continuation of Ser. No. 500,951, Aug. 27, 1974, abandoned.
This application Oct. 7, 1975, Ser. No. 620,301
Claims priority, application Netherlands, Sept. 11, 1973, 7312487
Int. Cl.² G11C 5/06, 7/00
U.S. Cl. 340—173 R 6 Claims



6. A memory system comprising
a plurality of bit-organized storage cells, each cell storing a plurality of bits;
a first network of first connecting lines connecting said storage cells, each one of said lines including a first junction point with at least another one of said lines, and a resistor connected in series with said one line;
a plurality of drive units for supplying signals to said storage cells; and
a second network of second connecting lines for connecting each of said drive units with at least one second junction point, said at least one second point being connected with said resistor of each respective one of said first connecting lines connected to said at least one second junction point; and
a plurality of capacitors connected between each respective one of said first connection line and ground; whereby said

first network forms an integrating RC network with a minimal integration time for each first connection line.

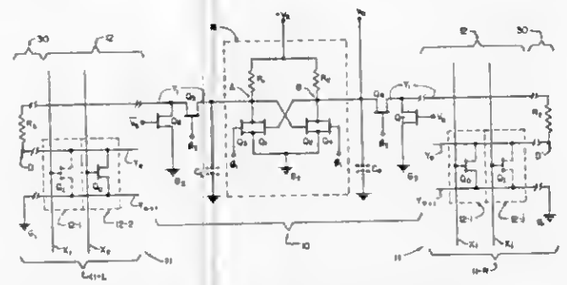
READ-ONLV MEMORIES, AND READOUT CIRCUITS THEREFOR

Richard H. Heeren, Palatine, Ill., assignor to Teletype Corporation, Skokie, Ill.

Filed Oct. 17, 1975, Ser. No. 623,870
Int. Cl.² G11C 11/40, 17/00
U.S. Cl. 340—173 R 26 Claims



1. An improved readout circuit for a read-only memory bank of the type having an array of memory cells and means for accessing each individual cell, each cell including a memory device programmed to have either a high impedance or a low impedance, representing stored data, the improved readout circuit being characterized by:
a. a sense amplifier having a pair of input nodes;
b. means for connecting the memory bank, including the selected cell impedance, between a first one of the amplifier nodes and a circuit reference node, the total impedance of the memory bank, including that of the selected cell, having a first, "ON" value if the memory device in the selected cell is in the low-impedance state, and a second, "OFF" value if the memory device is in the high-impedance state; and
c. means for connecting a reference impedance between the other amplifier node and the reference node, the reference impedance having a value between the ON bank impedance and the OFF bank impedance;
d. the sense amplifier including means for sensing a difference in the impedance connected to the two amplifier nodes and for generating a binary output signal in response to the sensed difference, representing the data stored in the selected memory cell.

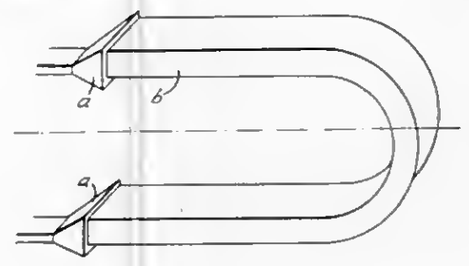
PROCESS FOR RECORDING AND REPRODUCTION OF INFORMATION IN ELECTROMAGNETIC FORM

Horst Volz; Reinhard Straubel, and Arnulf Hager, all of Berlin, Germany, assignors to VEB Kabelwerk Oberspree (KWO), Berlin-Oberschoeneweide, Germany

Filed Apr. 8, 1974, Ser. No. 458,933
Int. Cl.² G11C 13/00
U.S. Cl. 340—174 MS 23 Claims



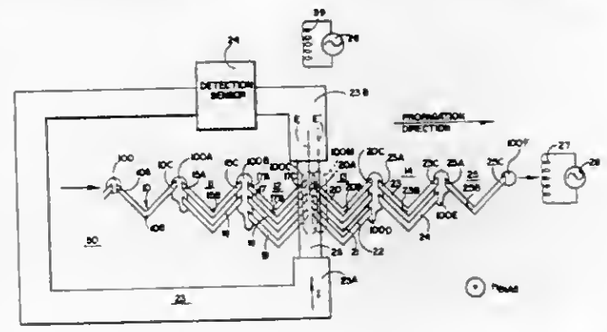
1. A process for the storage and readout of information in electromagnetic form which comprises:
a. modulating an information carrier with an information signal, within the range of the reversible permeability or reversible dielectric constant of said information carrier, wherein the information carrier is comprised of a material selected from a group consisting of ferromagnetic, ferrimagnetic, antiferrimagnetic, ferroelectric and antiferroelectric, metamagnetic, materials, said modulating comprising propagating said signal along a conductor,
b. forming an image of said information signal along the propagation path of the information carrier in the form of values of residual magnetism and/or residual dielectric polarization by short term high frequency pre-magnetization and/or short term high frequency dielectric pre-polarization of said information carrier, comprising applying an alternating electromagnetic field to said carrier, and
c. reading out the stored information by a short term magnetization step and/or short term dielectric polarization step comprising applying an alternating electromagnetic field to said carrier.

4,031,526

MAGNETIC BUBBLE DOMAIN DETECTION DEVICE

John L. Archer, Orange; Leonard R. Tocci, Laguna Niguel, and Jeffrey L. Williams, Corona, all of Calif., assignors to Rockwell International Corporation, El Segundo, Calif.

Continuation of Ser. No. 290,607, Sept. 20, 1972, abandoned.
This application May 24, 1976, Ser. No. 689,435
Int. Cl.² G11C 19/08
U.S. Cl. 340—174 TF 6 Claims

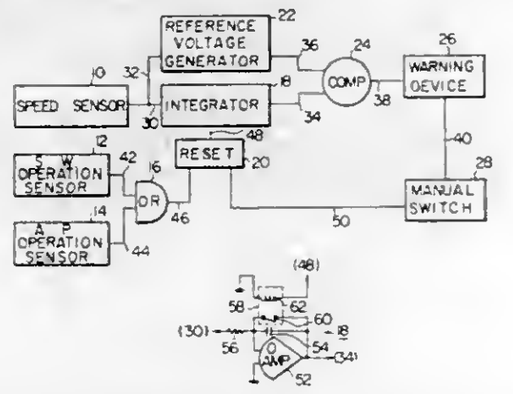


1. A magnetic device comprising,
a magnetic film capable of maintaining isolated domains therein wherein said domains have different magnetic polarization than said film,
a plurality of magnetizable areas on said magnetic film for controlling the position of said isolated domains in said film,
at least some of said plurality of magnetizable areas arranged adjacent to each other for expanding said isolated domains in a direction different from the direction of motion of said domains through said magnetic film, and
detector means adjacent to said magnetizable areas for detecting the presence of an expanded isolated domain at said magnetizable areas,
said detector means including a single magnetoresistive element the resistance of which varies as a function of the proximity of said expanded isolated domain,
said magnetizable areas disposed on said magnetic film under said detector means.

4,031,527
ELECTRONIC ALERTING SYSTEM FOR A VEHICLE DRIVER

Takayuki Yanagishima, and Naohiko Inoue, both of Yokohama, Japan, assignors to Nissan Motor Co., Ltd., Yokohama, Japan

Filed July 3, 1975, Ser. No. 592,983
Claims priority, application Japan, July 8, 1974, 49-77315
Int. Cl.² G08B *21/00*; B60K *28/00*; B60T *7/19*
U.S. Cl. 340—279 **3 Claims**

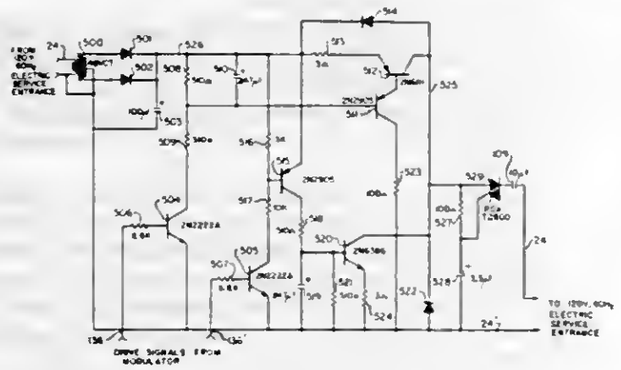


1. A safety system for alerting a driver when said driver becomes drowsy while operating a motor vehicle, comprising a steering wheel operation sensor for producing a first signal when a steering wheel of said motor vehicle rotates through an angle larger than a predetermined angle; an accelerator operation sensor for producing a second signal when an accelerator pedal of said motor vehicle is displaced through a distance larger than a predetermined distance; signal generating means including a speed sensor for producing a third signal representing the speed of said motor vehicle, and an integrator for integrating said third signal into a voltage signal representing the distance travelled by said vehicle until it is reset, into its initial state, by at least one of said first and second signals; a reference voltage generator for producing a reference voltage, the magnitude of which is variable in accordance with said third signal; a comparator for producing a fourth signal when the magnitude of said voltage signal exceeds said reference voltage; and a warning device for giving a warning to said driver when it receives said fourth signal.

4,031,528
TRANSMITTING OVER POWER LINES

David C. Harrison, Arlington, Mass., assignor to General Public Utilities Corporation, New York, N.Y.

Continuation-in-part of Ser. No. 551,356, Feb. 20, 1975, abandoned. This application July 26, 1976, Ser. No. 708,394
Int. Cl.² H04M *11/04*
U.S. Cl. 340—310 R **7 Claims**

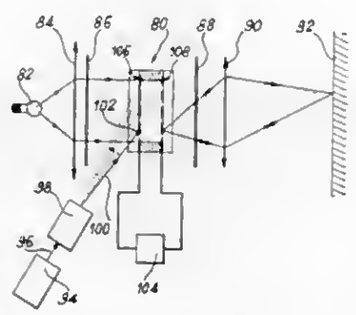


1. Apparatus for transmitting over power lines comprising,
a source of a unipolar potential derived from electrical power on said power lines,
a source of a modulating signal of carrier frequency for interrupting said unipolar potential at a rate corresponding to said carrier frequency,
and means for coupling the interrupted unipolar potential to said power lines to provide a carrier signal of said carrier frequency on said power lines,
said means for coupling comprising gated semiconductor switching means having gate electrode means and input and output electrode means in series with one of said power lines,
gate resistive means connected between said input and gate electrode means,
gate capacitive means connected between said gate electrode means and the other of said power lines,
output transistor switching means connected to said input electrode means for selectively exchanging current with said gate capacitive means through said gate resistive means,
input capacitive means coupled to said output transistor switching means for carrying a potential for slowly switching the latter amplifying means on,
first and second input switching means responsive to said modulating signal coupled to said input capacitive means and rendered conductive during alternating contiguous time intervals at said carrier signal frequency for alternately charging and discharging said input capacitive means and thereby slowly switching on said switching off said transistor switching means whereby said gated semiconductor switching means delivers to said power line a slowly rising and falling current provided by said transistor switching means.

4,031,529
THERMAL METHOD FOR CONTROLLING THE OPTICAL PROPERTIES OF A LIQUID CRYSTAL AND DEVICES FOR THE APPLICATION OF SAID METHOD

Joseph Borel, Echirolles, and Jacques Robert, St-Egreve, both of France, assignors to Commissariat a l'Energie Atomique, Paris, France

Filed Dec. 22, 1975, Ser. No. 643,144
Claims priority, application France, Dec. 24, 1974, 74.42766
Int. Cl.² G02F *1/13*
U.S. Cl. 340—324 R **17 Claims**

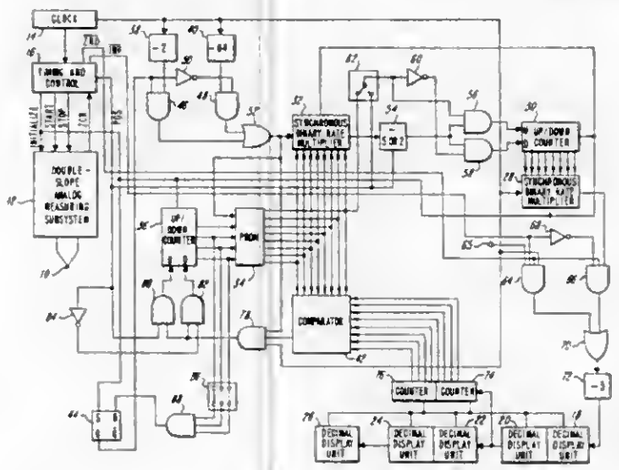


1. A method for controlling the optical properties of a liquid crystal film in which the value of dielectric anisotropy of the liquid crystal molecules is modified in order to control the optical state of said crystal, wherein:
there is chosen a liquid crystal in which said anisotropy depends on the temperature within a range in which the liquid crystal retains the same phase,
an electric field of predetermined frequency is applied to the liquid crystal film,
the temperature of the liquid crystal film is brought to a value located within said range, the dielectric anisotropy then assumes a predetermined value in respect of the value of said frequency and the liquid crystal film then assumes a predetermined optical state.

4,031,530
DIGITAL SECOND-ORDER CLOCK LINEARIZER

Nicholas E. Aneshansley, Centerville, Ohio, assignor to Instrulab Incorporated, Dayton, Ohio

Filed Oct. 22, 1975, Ser. No. 624,598
Int. Cl.² H03K *13/02, 13/20*
U.S. Cl. 340—347 NT **13 Claims**

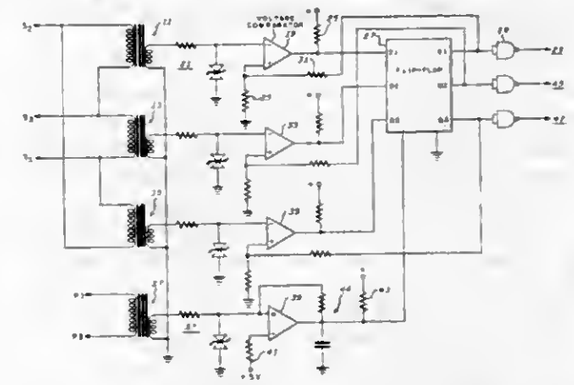


1. A linearizer for processing a non-linear signal comprising:
A. a first source of timing pulses;
B. a first synchronous binary rate multiplier, said first binary rate multiplier having a signal input terminal, a signal output terminal, and a plurality of rate control input terminals;
C. means coupling timing pulses from said first source to said signal input terminal of said first synchronous binary rate multiplier;
D. a second source of timing pulses, the pulses from said second source occurring at a lower frequency than the pulses from said first source;
E. a second synchronous binary rate multiplier, said second binary rate multiplier having a signal input terminal, a signal output terminal, and a plurality of rate control input terminals;
F. means coupling timing pulses from said second source to said signal input terminal of said second synchronous binary rate multiplier;
G. a first counter, said first counter having an increment input terminal and a plurality of output terminals which issue output signals representative of the instantaneous count held therein;
H. means coupling said signal output terminal of said second synchronous binary rate multiplier to said increment input terminal;
I. means individually coupling said output terminals from said first counter to said rate control input terminals of said first binary rate multiplier;
J. means for developing a binary representation of the second order of the correction factor instantaneously required to effect linearization of the non-linear signal; and
K. means coupling the binary representation to said control input terminals of said second binary rate multiplier whereby the binary representation of the second order of the correction factor controls the fractional multiplication which said second binary rate multiplier applies to the timing pulses from said second source, and the resultant pulses applied to said increment input to said first counter alter the count therein, thereby correspondingly altering the rate multiplication applied to the timing pulses from said first source by said first binary rate multiplier, the linearized pulses issuing from said output terminal of said first binary rate multiplier therefore being linearized in accordance with the instantaneously desired correction factor.

4,031,531
SYNCHRO-TO-DIGITAL CONVERTER

Jeffrey C. Rice, McLean, and Terry A. Tucker, Charlottesville, both of Va., assignors to Sperry Rand Corporation, New York, N.Y.

Filed Jan. 12, 1976, Ser. No. 648,073
Int. Cl.² H03K *13/02*
U.S. Cl. 340—347 SV **3 Claims**



1. A synchro-to-digital converter comprising individual transformer means to receive the three stator output voltages and a sample of the rotor excitation voltage from an external synchro, individual channels coupled to said transformer means for processing each stator voltage, and means to produce a clock pulse at a predetermined point in each cycle of the rotor excitation voltage; each of said channels including voltage comparator means having a first input terminal coupled to receive a stator output voltage from the associated transformer means and a second input terminal for applying a threshold potential to the comparator so that the comparator produces a switching signal when and only when the associated stator output voltage exceeds the threshold potential, bistable switching means coupled to receive switching signals from the comparator in the same channel, said bistable means being constructed and arranged to switch to first or second bistable states in response to a clock pulse occurring in the presence or absence, respectively, of a switching signal, said second input terminal being coupled to ground potential through a resistance element and to the output of said bistable switching means through a feedback loop so that said threshold potential is at ground level in the absence of a switching signal but is depressed to a lower level at the inception of a switching pulse, output means on each switching means for producing steady output signals indicative of the bistable state of the switching means in the corresponding channel, the output means in the three channels being arranged to provide simultaneous binary-valued output signals in a known digital code format.

4,031,532
VOLTAGE TO FREQUENCY CONVERTER

David J. First, c/o D. J. Instruments Inc., 11 Esquire Road, North Billerica, Mass. 01862

Filed Dec. 29, 1975, Ser. No. 644,879
Int. Cl.² H03K *13/02*
U.S. Cl. 340—347 NT **6 Claims**

1. A voltage to frequency converter comprising:
A. integrating means having an input connected to receive an input signal and an output;
B. level detecting means responsive to the output of said integrating means for producing an output at a first level responsive to the integrating means output being greater than a predetermined level and an output at a second level responsive to the integrating means output being less than said predetermined level;
C. clock means for generating a clock signal including periodic clock pulses;
D. logic means having an input connected to receive the output of said level detecting means, an input connected

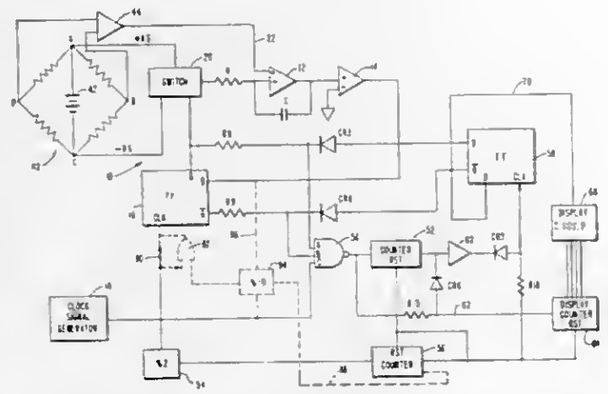
to receive the clock pulses from said clock means and an output for producing an output at a first level responsive to the receipt of a clock pulse and the output of said level detecting means being at the first level and for producing an output at a second level responsive to the receipt of a clock pulse and the output of said level detecting means being at the second level;

E. reference signal source means for producing first and second reference signals of equal magnitude but opposite polarity;

F. switch means having an input connected to receive the output of said logic means, an input connected to receive the first and second reference signals from said reference signal source means, and an output connected to the input of said integrating means for applying the first reference signal to said integrating means when

G. output means for coupling the output of said logic means as a pulsed output signal of said converter, said output signal having a pulse frequency corresponding to the voltage of the input signal and a pulse duty cycle corresponding to the polarity of the input signal;

H. gating means selectively passing the clock pulses from said clock means to its output during the time period in which the output of said logic means is at one of the first or second levels; and



I. counting means connected to the output of said gating means for establishing a digital count corresponding to the voltage of the input signal,

said counting means comprising

1. a first counter connected to receive the output of said gating means:
2. dividing means having an input for receiving clock pulses from said clock means for producing an output having a frequency equal to one half the frequency of the clock pulses from said clock means;
3. a second counter connected to receive the output of said dividing means;
4. a third counter coupled to the output of said gating means;
5. means responsive to said first counter attaining a selected count for passing the clock pulses passed by said gating means to said third counter; and
6. means responsive to said second counter attaining said selected count for resetting said first and second counters, the count into said third counter corresponding to the net voltage of the input signal over the time period required for said second counter to attain said selected count.

4,031,533

DIFFERENTIAL FLOATING DUAL SLOPE CONVERTER

Leopold Neumann, Lexington, Mass., assignor to Analogic Corporation, Wakefield, Mass.

Filed Oct. 2, 1975, Ser. No. 618,783
Int. Cl.² H03K *13/00*
U.S. Cl. 340—347 NT **13 Claims**

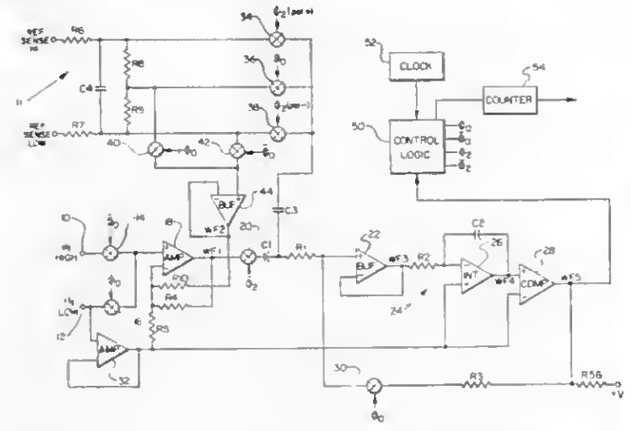
1. For use with a transducer providing a low level differential analog signal representative of a sensed condition, said signal providing a first, lower voltage level and a second, higher voltage level relative to each other, a ratiometric analog-to-digital converter comprising:

an autozeroed dual slope analog-to-digital converter circuit operative to provide a digital representation of said differential analog signal;

the dual slope analog-to-digital converter being of the type which performs an autozero calibration during a first interval, integrates at a rate determined by an input signal during a second interval, and integrates at a rate determined by a reference signal during a third interval;

a differential preamplifier;

differential input switch means for coupling the first and



second levels of said differential analog signal respectively during the first and second intervals to one input of said preamplifier;

first means for selectively capacitively coupling the output of said preamplifier to the input of said converter circuit during said first and second intervals;

reference means operative to differentially sense the excitation of said transducer and provide reference and offset signals to said converter circuit; and

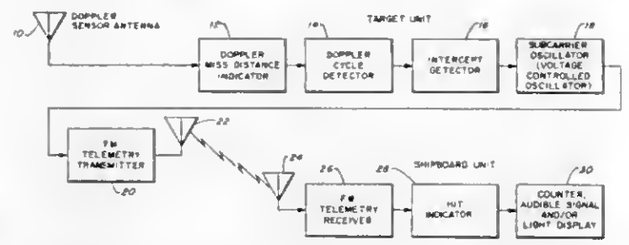
second means for selectively coupling during said first interval said reference means to the input of said converter circuit for analyzing said offset signal thereto, and for coupling during said third interval a reference signal to the input of said converter circuit which reference signal is integrated by said converter circuit.

4,031,534

NOISE RESISTANT ZONE PENETRATION DETECTION SYSTEM

George T. Kallmann, Pacific Palisades, and Theodore P. Waddell, Port Hueneme, both of Calif., assignors to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed June 1, 1976, Ser. No. 691,924
Int. Cl.² G01S *9/04*
U.S. Cl. 343—12 MD **12 Claims**



1. A system for detecting the existence of a projectile within a penetration zone of a target and providing a score indication for each projectile comprising:

a. doppler miss distance indication means for producing a beat frequency signal whenever said projectile is moving within said penetration zone;

b. means for producing a target detection pulse having a predetermined pulse width in response to detection of said beat frequency signal within a predetermined frequency range;

c. means for transmitting from said penetration zone a first FM subcarrier signal having a first predetermined frequency and a second FM subcarrier signal having a second predetermined frequency in response to said target detection pulse;

d. receiving means for detecting said first and second subcarrier signal; and

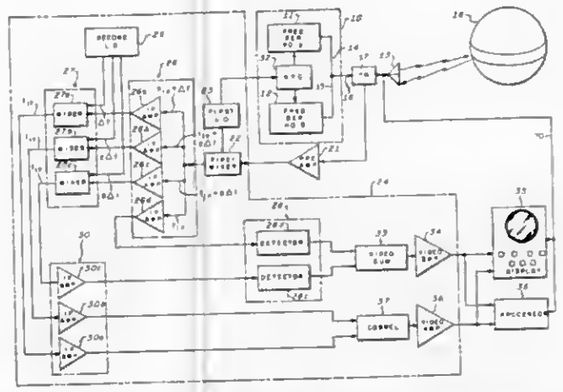
e. display means for providing a score indication for each projectile in response to detection of said second subcarrier signal by said receiving means.

4,031,535

MULTIPLE FREQUENCY NAVIGATION RADAR SYSTEM

Eric J. Isbister, Greenlawn, N.Y., assignor to Sperry Rand Corporation, New York, N.Y.

Filed Nov. 10, 1975, Ser. No. 630,553
Int. Cl.² G01S *9/56;* **H01Q** *15/14*
U.S. Cl. 343—6.5 R **11 Claims**



I. A detection and identification system comprising

transmitter means for producing a multiplicity of signals each having a different frequency with a known frequency separation therebetween;

means coupled to said transmitter means for radiating said multiplicity of signals;

signal generating means for receiving said multiplicity of signals and for producing signals at frequencies that are linear combinations of the frequencies of said multiplicity of signals including signals at frequencies of said multiplicity of radiated signals and re-radiating said produced signals; and

means for receiving said re-radiated signals and producing output signals in response to said re-radiated signals whereby said signal generating means may be identified.

4,031,536

STACKED ARRAYS FOR BROADCASTING ELLIPTICALLY POLARIZED WAVES

Andrew Alford, 120 Cross St., Winchester, Mass. 01890

Filed Nov. 3, 1975, Ser. No. 628,247
Int. Cl.² H01Q *21/24*
U.S. Cl. 343—796 **10 Claims**

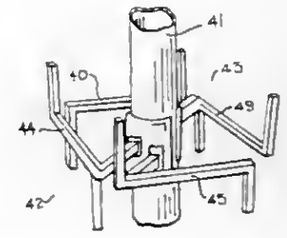
1. A radiating element comprising:

a. Two substantially similar metal conductors each having a central portion and two end portions with the end of the central portion of one conductor located close to the end of the central portion of the other conductor,

b. Said central portions arranged at an angle with each other in substantially the same plane,

c. The end portions of each conductor pointing in opposite directions from the plane containing the central portions,

d. The end portions of the two conductors at the proximate ends of the central portions pointing in opposite directions,



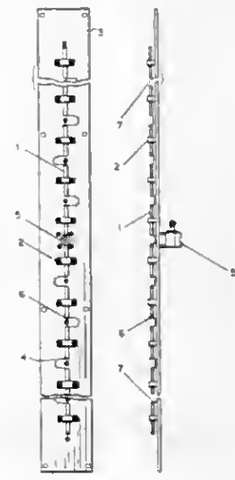
e. Means for energizing the proximate ends of the central portions of the conductors at their proximate ends by radio frequency in opposite phases.

4,031,537

COLLINEAR DIPOLE ARRAY WITH REFLECTOR

Andrew Alford, 120 Cross St., Winchester, Mass. 01890

Filed Oct. 23, 1974, Ser. No. 513,587
Int. Cl.² H01Q *1/02, 9/20*
U.S. Cl. 343—704 **5 Claims**



1. An antenna array comprising a collinear chain of dipoles, a reflecting plate, phasing loops connected between consecutive dipoles and located on the same side of the reflecting plate as the dipoles "said phasing loops having major portions substantially parallel to said reflecting plate", means for spacing the dipoles from the reflecting plate less than a quarter wavelength at the operating frequency, means for spacing the phasing loops at a smaller distance from the plate than the dipoles and means for energizing said chain of dipoles from one end.

4,031,538

ANTENNA WITH ECHO CANCELLING ELEMENTS

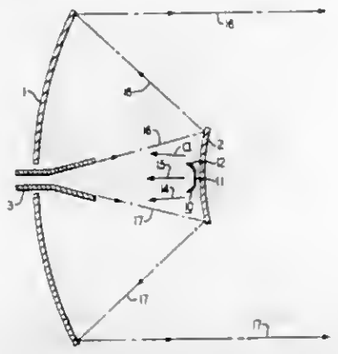
Carl William Lundgren, Jr., Colts Neck, N.J., assignor to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed July 21, 1975, Ser. No. 597,367
Int. Cl.² H01Q *19/14*
U.S. Cl. 343—781 CA **10 Claims**

1. An antenna having a main reflector, a smaller subreflector, and feeding means so arranged that radiation from said feeding means is reflected successively from said subreflector and said main reflector,

wherein the improvement comprises a reflective band located near said subreflector between said subreflector and said feeding means, said band having a significant width aspect and having an inner surface flaring outward toward said feeding means,

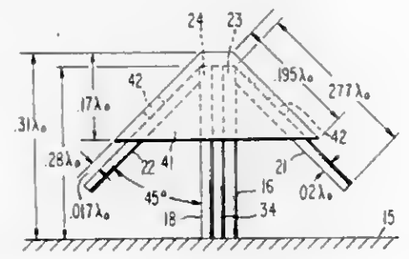
whereby radiation from said feeding means reflected back to said feeding means by said subreflector is substantially cancelled in both a lower and a higher frequency range.



4,031,539
BROADBAND TURNSTILE ANTENNA

Oakley McDonald Woodward, Princeton, N.J., assignor to RCA Corporation, New York, N.Y.

Filed Dec. 11, 1975, Ser. No. 639,761
Int. Cl.² H01Q 21/26
U.S. Cl. 343—797 **7 Claims**



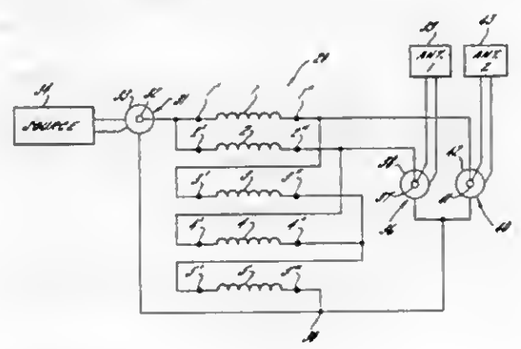
1. A broadband turnstile antenna comprising:
a pair of crossed dipoles mounted forward of a reflective surface,
said dipoles being center fed with the legs of the dipoles fed with equal power in the relative phase rotation of 0°, 90°, 180° and 270°, and
a single member of conductive material closely spaced forward of said dipole legs and separated therefrom with said member overlapping the feed point of said dipoles and a substantial portion of said dipole legs.

4,031,540
IMPEDANCE MATCHING DEVICE

Emil G. Borys, Jr., Rockford, Ill., assignor to Hydrometals, Inc., Chicago, Ill.

Filed Feb. 17, 1976, Ser. No. 658,288
Int. Cl.² H01Q 1/50
U.S. Cl. 343—860 **6 Claims**

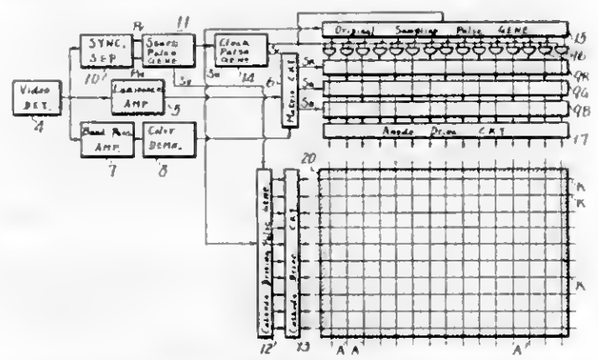
1. An impedance matching device for matching the impedances of a pair of antennas to a single source, said device comprising a bifilar transformer having a toroidal core and five mutually coupled windings thereon, first and second of said windings being connected in series in a first branch, third and fourth of said windings being connected in series in a second branch, said first and second branches being connected in parallel, said fifth winding being connected between said parallel combination and a common connection, means providing a connecting point for a first antenna from the junction between said first and second windings and said common point, means providing a connecting point for said second antenna from the junction between said third and fourth windings and said common point, and means providing a connecting point for said source across said series parallel combination whereby the impedances of said antennas are matched to the impedance of said source.



4,031,541
COLOR VIDEO DISPLAY SYSTEM

Kuniyoshi Arisawa, Higashikurume, and Yoshifumi Amano, Zushi, both of Japan, assignors to Sony Corporation, Tokyo, Japan

Filed May 7, 1975, Ser. No. 575,244
Claims priority, application Japan, May 13, 1974, 49-54090[U]; May 13, 1974, 49-54091[U]
Int. Cl.² H04N 9/12
U.S. Cl. 358—56 **9 Claims**

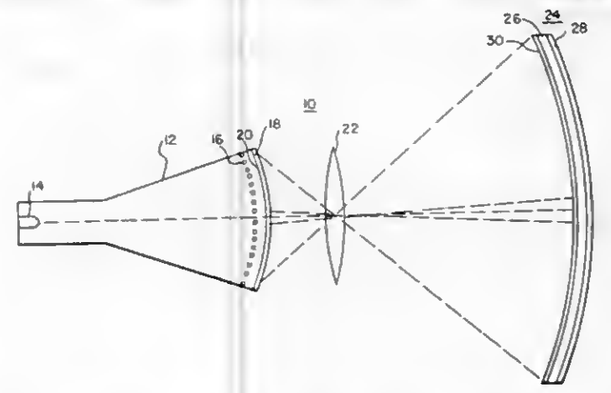


1. A color video display system comprising: a color display panel having a plurality of component color generating means arranged in rows and in columns substantially perpendicular to said rows and arranged to generate a repeating pattern of component colors along selected ones of said rows in a predetermined sequence; means responsive to an input video signal for generating a plurality of component color signals and a synchronizing signal; signal sampling means responsive to said synchonizing signal for sampling said component color signals so that different component color signals are sampled sequentially; means applying the sampled component signals to respective ones of said component color generating means for generating said repeating pattern of component colors along selected ones of said rows; and row selecting means responsive to said synchronizing signal to energize said rows in said predetermined sequence, whereby color pictures are reproduced on said color display panel.

4,031,542
PROJECTION COLOR TELEVISION SYSTEM

Arthur E. Anderson, Murrysville, Pa., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Mar. 8, 1976, Ser. No. 665,132
Int. Cl.² H04N 9/31
U.S. Cl. 358—60 **12 Claims**



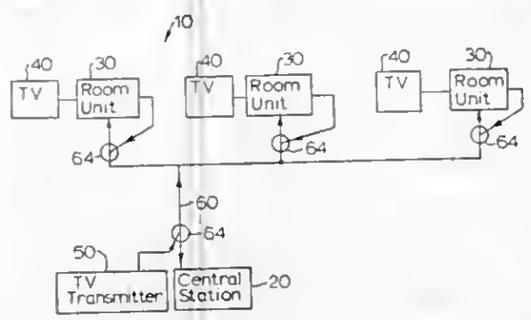
1. A projection color television system comprising:
a. cathode ray tube means for converting electronic color television signals to an optical radiation pattern on a uniform single cathodoluminescent layer phosphor screen of the tube, which optical radiation pattern. is primary color coded;
b. projection optics for coupling the optical radiation pattern produced by the tube to projection screen display means;
c. projection screen display means comprising a support substrate having a plurality of at least one primary color emissive organic phosphor areas disposed thereon, with the primary color emissive organic phosphor areas being opitcally registered via the projection optics to the corresponding primary color coded portion of the optical radiation pattern.

9. A projection color television display screen comprising a support substrate and a plurality of at least two primary color emissive organic phosphor areas, which are absorptive of and excitable by optical radiation, disposed in a regular repeated pattern on the substrate.

4,031,543
COMMUNICATION SYSTEM

George E. Holz, North Plainfield, N.J., assignor to Berkeley Varitronics Systems, Edison, N.J.

Filed Mar. 11, 1974, Ser. No. 450,048
Int. Cl.² H04N 7/16
U.S. Cl. 358—86 **34 Claims**

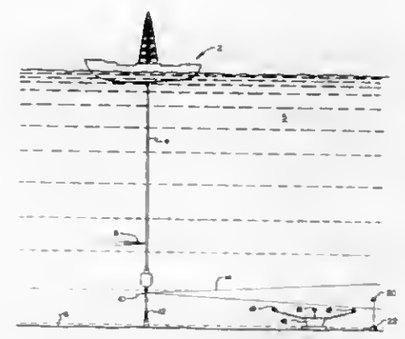


1. A communiction system comprising
a central station and a plurality of remote stations,
a program transmitter at said central station for transmitting program signals representing said programs to all of said remote stations,
second means at each of said remote stations for transmitting information signals to said central station at generally regular but random intervals whereby a relatively large number of remote stations can communicate with a central station without said information signals interfering with each other, said second means including a signal transmitter, switch means for turning on said transmitter at generally regular but slightly random intervals, and a summing amplifier coupled to said switch means,
said summing amplifier being adapted to be charged to a predetermined voltage level at which it operates and switch means, and
a plurality of signal-generating means coupled to said summing amplifier including means for selecting portions of said program signals, a ramp voltage generator, and a random signal generator.

4,031,544
SONAR/TELEVISION SYSTEM FOR USE IN UNDERWATER EXPLORATION

Robert Anthony Lapetina, Salt Lake City, Utah, assignor to Edo Western Corporation, Salt Lake City, Utah

Filed Aug. 11, 1975, Ser. No. 603,696
Int. Cl.² H04N 7/18
U.S. Cl. 358—99 **14 Claims**

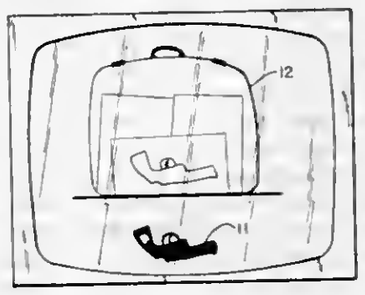


1. A sonar/television system for use with a hollow underwater conductor in locating underwater objects comprising
a first housing having exterior dimensions which enable insertion thereof into the hollow of the underwater conductor,
a television camera disposed within said housing so that the camera is directed downwardly of the housing to record scenes appearing therebelow, and
transducer means carried by said housing for transmitting acoustical signals downwardly of the housing and also generally laterally of the housing through an angle of substantially 360° about the housing and for receiving reflected acoustical signals.

4,031,545
RADIANT ENERGY ALARM SYSTEM

Jay A. Stein, Framingham, and Martin Annis, Newton, both of Mass., assignors to American Science & Engineering, Inc., Cambridge, Mass.

Filed Sept. 8, 1975, Ser. No. 611,230
Int. Cl.² H04N 7/18
U.S. Cl. 358—108 **8 Claims**



1. In a radiant energy imaging system having a scanning

beam of radiant energy that scans a radiant energy detector to provide video signals representative of the opacity of objects intercepting the radiant energy beam alerting apparatus comprising,

a source of a signal of reference level corresponding to a predetermined reference opacity,

means for comparing said video signal with said reference signal to provide a threshold signal when the video signal bears a predetermined relationship to the reference signal,

means for indicating an alarm condition when said threshold signal occurs for a predetermined time interval,

wherein said source of a reference signal comprises a predetermined portion of said video signal produced when said beam is scanning a predetermined reference object of known opacity between said detector and the source of said radiant energy beam.

4,031,546

DISC PLAYER AND STYLUS THEREFOR

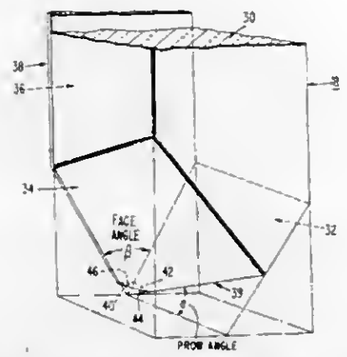
Marvin Allan Leedom, South Brunswick Township, Middlesex County, N.J., assignor to RCA Corporation, New York, N.Y.

Filed June 30, 1975, Ser. No. 591,953

Claims priority, application United Kingdom, Nov. 18, 1974, 49926/74

Int. Cl.² H04N *5/76*

U.S. Cl. 358—128 **7 Claims**



1. In a disc playback system including a turntable for rotating a spiral grooved disc record of the type which contains an information track in the groove thereof, the combination comprising:

1. an elongated stylus tapering to a tip at one end thereof, said tip having:

a. a substantially flat rear face, with a pair of edges converging at said one end and terminating at the ends of a base edge of a generally right triangular shaped bottom surface;

b. a first side disposed orthogonally relative to said rear face and extending from a first edge of said rear face, said first side terminating at said one end at an altitude edge of said triangular shaped bottom surface; a second side disposed at an acute angle to the rear face extending from a second edge of said rear face, said second side terminating at a said one end at a hypotenuse edge of said triangular shaped bottom surface; and

c. an electrode disposed on said rear face; and

2. means for mounting said stylus in a manner permitting stylus reception in a record groove during record playback with an orientation of said stylus tip bottom such that said stylus tip side terminating at said altitude edge of said bottom faces the center of rotation of said turntable, and the direction of movement of said turntable beneath the point of stylus reception extends from said apex toward said base edge.

NOISE REDUCING CIRCUIT FOR VIDEO SIGNALS

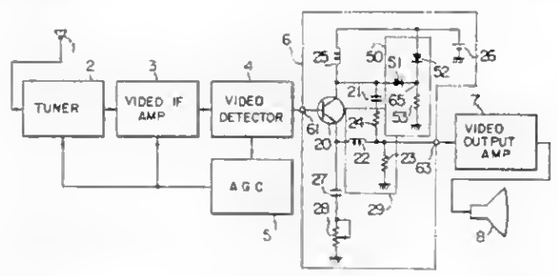
Yukimi Saiki; Masanori Ogino, both of Yokohama, and Shutoku Watanabe, Ashiya, all of Japan, assignors to Hitachi, Ltd., Japan

Filed Nov. 18, 1975, Ser. No. 633,114

Claims priority, application Japan, Nov. 21, 1974, 49-134960

Int. Cl.² H04N *5/14*; **H03K** *5/20*

U.S. Cl. 358—167 **7 Claims**



1. A noise reducing circuit for video signals comprising:

an input circuit including an active element having first, second and third electrodes, said first electrode being for receiving a video signal including high and low frequency components accompanied with noise;

a high-pass filter connected with said second electrode of said active element for deriving the high frequency components of said video signal and a low-pass filter connected with said third electrode of said active element for deriving the low frequency components of said video signal, said high-pass filter and low-pass filter serving as first and second loads on said active element with respect to said high and low frequency components of the received video signal on said first electrode of said active element respectively;

a noise eleminating means including a voltage source and a switching circuit connected between said voltage source and said high-pass filter, the junction point between said switching circuit and said high-pass filter being connected with said second electrode of said active element, whereby said switching circuit is rendered conductive to make the potential on said second electrode substantially constant when the output of said high-pass filter, derivable on said second electrode of said active element, has an amplitude smaller than a predetermined value and is rendered non-conductive when said output derivable on said second electrode has an amplitude not smaller than said predetermined value; and

means for adding the output of said low-pass filter to the output of said high-pass filter under control of said noise eliminating means, thereby reproducing a noise-suppressed video signal.

PLURAL RECEIVING AND RECORDING TELEVISION SYSTEM

Yoshiro Kato, Fujisawa, and Choichi Fujita, Machida, both of Japan, assignors to Sony Corporation, Tokyo, Japan

Filed Sept. 25, 1975, Ser. No. 616,667

Claims priority, application Japan, Sept. 30, 1974, 49-112534

Int. Cl.² H04N *5/44*, *5/76*

U.S. Cl. 358—188 **2 Claims**

1. A television system comprising the combination of:

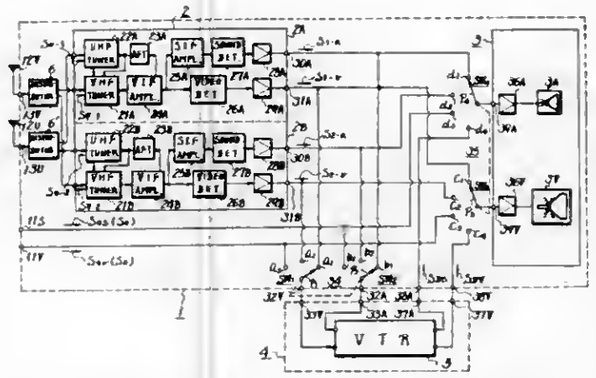
A. signal recording and/or reproducing apparatus having input and output terinals; and

B. a television receiver comprising:

1. a pair of signal selecting and receiving circuitries, each including at least a separately tunable tuner, a video intermediate frequency amplifier, a video detector, and a sound detector,

2. a display stage including sound and video reproducing circuits,

3. first switching means for selectively connecting one of said pair of signal selecting and receiving circuitries to the input terminal of said recording and/or reproducing apparatus, and



4. second switching means for selectively connecting one of said pair of signal selecting and receiving circuitries and the output terminal of said recording and/or reproducing apparatus to said display stage.

4,031,549

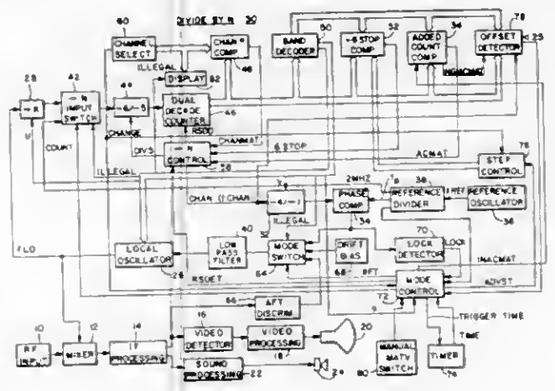
TELEVISION TUNING SYSTEM WITH PROVISIONS FOR RECEIVING RF CARRIER AT NONSTANDARD FREQUENCY

Robert Morgan Rast, Mercerville; Charles Martin Wine, and John Goodchilde Norie Henderson, both of Princeton, all of N.J., assignors to RCA Corporation, New York, N.Y.

Filed May 21, 1976, Ser. No. 688,521

Int. Cl.² H04N *5/50*; **H04B** *1/26*

U.S. Cl. 358—193 **14 Claims**



1. Apparatus for tuning a receiver to a selected channel, comprising:

input means for receiving an information bearing radio frequency carrier;

local oscillator means for generating a local oscillator signal;

mixer means for combining said radio frequency carrier and said local oscillator signal to derive an intermediate frequency information bearing carrier;

first means for tuning the frequency of said local oscillator signal to the nominal local oscillator frequency allocated to said selected channel;

second means for tuning said local oscillator signal to minimize a deviation between the frequency of said intermediate frequency carrier and a nominal intermediate frequency carrier;

control means for selectively coupling either said first means or said second means to said local oscillator, said control means initially coupling said first means to said local oscillator means when said selected channel is selected;

lock detection means for generating a lock signal when said means has substantially tuned the frequency of said local oscillator signal to said nominal local oscillator frequency, said control means coupling said second means to said local oscillator means in response to said lock signal;

offset detection means for generating an offset signal when the frequency of said local oscillator signal is more than a predetermined offset from the frequency of said local oscillator signal generated when said first means was coupled to said local oscillator, said control means coupling said first means to said local oscillator means in response to said offset signal; and

means coupled to said first means for generating a step signal in response to said offset signal, said first means tuning the frequency of said local oscillator signal to a frequency differing by an incremental amount from the frequency of said local oscillator signal during the initial interval in which said local oscillator means is under the control of said first means.

FILM SCANNER

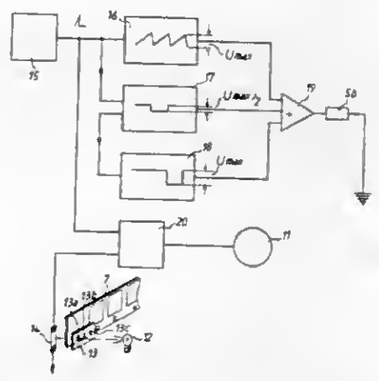
Richard Wick, Munich; Friedrich Bestenreiner, Grunwald; Reinhold Deml, and Josef Helmberger, both of Munich, all of Germany, assignors to AGFA-Gevaert, A.G., Leverkusen, Germany

Continuation of Ser. No. 384,396, Aug. 1, 1973, which is a continuation of Ser. No. 162,373, July 14, 1971, abandoned. This application Feb. 25, 1976, Ser. No. 661,333

Claims priority, application Germany, July 18, 1970, 2035820

Int. Cl.² H04N *3/36*

U.S. Cl. 358—216 **4 Claims**



1. Arrangement for reproducing images recorded on motion picture film at a predetermined frame rate in frames having a predetermined height in the lengthwise direction of said motion picture film, on television receiver means having a vertical scanning rate approximately equal to an integral multiple of said predetermined frame rate, comprising, in combination, moving means for moving said motion picture film continuously along a predetermined path across a predetermined scanning region; scanning means for scanning each of said frames of said film a first, second and third time over said scanning region during said movement of said frames along said predetermined path, thereby furnishing scanning signals constituting a first, second and third scan, said scanning means including a cathode ray tube for furnishing a light beam and a screen, said scanning means further comprising lens means for focussing said screen onto said frames, and photoreceiver means positioned behind said film in the direction of propagation of said light, the height of said screen exceeding the

height of said image of said screen on said frames by one-third; and scan control means connected to said scanning means for deflecting said light over a region corresponding to half of said screen height for each of said scans and for changing the position of said scanning region by one-third of said image height along said predetermined path following completion of said first scan and following completion of said second scan, said scan control means comprising multivibrator means and sawtooth voltage generator means for furnishing voltages deflecting said light from an initial position to a maximum deflection in a first direction during said first scan, deflecting said light to a position corresponding to one-half the maximum deflection in the opposite direction at the start of said second scan, deflecting said light to a position corresponding to one-half of said maximum deflection in said first direction during said second scan, deflecting said light to a value corresponding to said maximum deflection in said opposite direction at the beginning of said third scan and back to said initial position at the end of said third scan; wherein said motion picture film has perforations having a predetermined spatial relationship to each of said frames; further comprising photosensitive means for furnishing location signals in response to light passing through said perforations during movement of said film along said predetermined path; and synchronizing means for furnishing synchronizing signals for synchronizing said scan control means to said moving means at least in part in dependence upon said location signals.

4,031,551

IMAGE PICKUP DEVICE

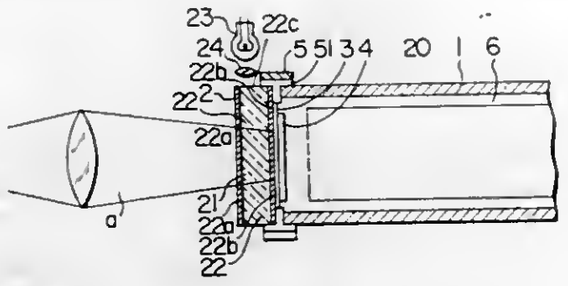
Saburo Nobutoki, Mobara; Chihaya Ogusu, and Masao Sugimoto, both of Tokyo, all of Japan, assignors to Hitachi, Ltd. and Nippon Hoso Kyokai, both of, Japan

Filed Mar. 19, 1976, Ser. No. 668,401

Claims priority, application Japan, Mar. 22, 1975, 50-33541

Int. Cl.² H04N *5/21*

U.S. Cl. 358—223 **10 Claims**



1. An image pickup device having a photoconductive type image pickup tube comprising:

a. a face plate disposed at one end of an envelope and consisting of an effective image pickup region at the central portion thereof and an ineffective image pickup region at the peripheral portion thereof including the edge of the face plate, at least a portion of said ineffective image pickup region being light-dispersive; and

b. means including at least one light source for introducing light solely into said light-dispersive portion of said ineffective image pickup region, said introduced light being dispersed by said portion and projected as bias light into said effective image pickup region.

4,031,552

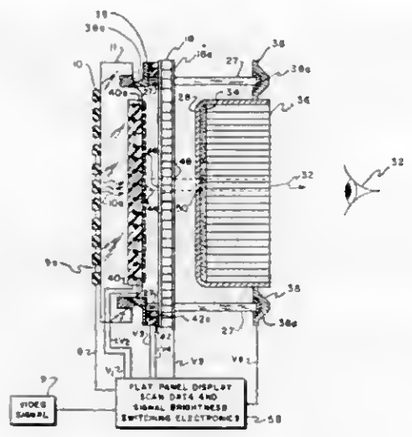
MINIATURE FLAT PANEL PHOTOCATHODE AND MICROCHANNEL PLATE PICTURE ELEMENT ARRAY IMAGE INTENSIFIER TUBE

David A. Bosserman, Alexandria, and Charles F. Freeman, Springfield, both of Va., assignors to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Filed Mar. 5, 1976, Ser. No. 664,325

Int. Cl.² H04N *5/70, 5/66*

U.S. Cl. 358—241 **4 Claims**



1. A miniature flat panel picture element array image intensifier tube comprising:

a video picture signal generator for providing a video signal;

a radiation source, said radiation source being modulated by said video signal for creating a generally uniform flow of photons therefrom with said radiation source mounted on the front of a transparent input faceplate;

a plurality of electrically isolated parallel photocathode array stripes mounted on the inside of said input faceplate;

a microchannel plate electron multiplier having an array of electrically isolated parallel input electrode metallic stripes that are positioned adjacent said photocathode array stripes and are orthogonal thereto, said microchannel plate having a continuous metallic output electrode;

an array switching electronic means for switching bias voltages in some selected scan mode over individual stripes of said photocathode array and over said array of microchannel plate input electrode metallic stripes for selectively providing proximity focus areas between cross-over stripes that have on bias voltages applied thereto and wherein repressive voltages exist on all other cross-over stripes that have off bias voltages applied thereto wherein photoelectrons emitted from said photocathode array stripes conform to a charge pattern swept through the proximity focus areas according to said scan mode; and

a metallized phosphor screen mounted on the inside of a transparent output faceplate wherein said metallized phosphor screen is adjacent said microchannel plate output electrode for converting electrons from said microchannel plate into visible energy on said metallized phosphor screen for producing a visible image of said video signal according to said scan mode.

4,031,553

IMPLOSION-RESISTANT CATHODE RAY TUBE WITH PROTECTIVE ASSEMBLY FOR ITS FACE PLATE

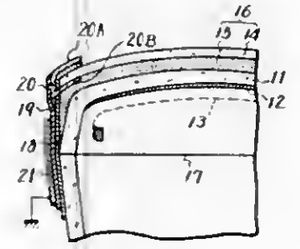
Hiroji Sumiyoshi, Sagamihara, and Tomosuke Chiba, Matsudo, both of Japan, assignors to Sony Corporation, Tokyo, Japan

Filed Nov. 25, 1975, Ser. No. 635,240

Claims priority, application Japan, Dec. 17, 1974, 49-152750[U]

Int. Cl.² H04N *5/65*

U.S. Cl. 358—247 **6 Claims**



1. A cathode ray tube comprising an envelope having a face plate, a conductive reinforcing band girdling said envelope adjacent said face plate, a transparent protective panel covering the outer surface of said face plate and being spaced from the latter, a transparent conductive adhesive resin filling the space between said face plate and said panel to cooperate with the latter in protecting said face plate and adhesively joining said panel to said face plate, and at least one conductive connecting element providing an electrically conductive connection between said conductive material and said band.

4,031,554

MAGNETIC RECORDING AND REPRODUCING APPARATUS

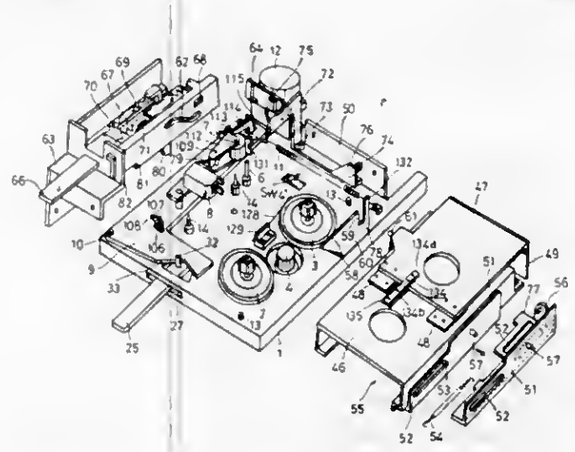
Tomoyoshi Umeda, and Yoshimasa Haraguchi, both of Tokyo, Japan, assignors to Beltek Corporation, Tokyo, Japan

Filed Aug. 19, 1975, Ser. No. 605,924

Claims priority, application Japan, Sept. 13, 1974, 49-105563

Int. Cl.² G11B *5/54, 15/46, 19/24*

U.S. Cl. 360—73 **7 Claims**



1. A magnetic recording and reproducing apparatus comprising:

a substrate;

a tape pack inserting container having a space therein for receiving a tape deck and being supported over said substrate in a manner to be movable between a lower recording or playback position and an upper recording or playback stand-by position;

container actuating mechanism means for moving said container vertically between said upper and lower positions in relation with loading and ejection of said tape pack;

container supporting means for stably supporting both opposite lateral sides of said container in both said lower position and said upper position thereof as well as during movement thereof between said positions;

a head plate supported to be movable between a recording or playback position and a recording or playback stand-by position;

spring member means for constantly biasing said head plate toward said recording or playback position;

head plate actuating means for moving said head plate to said recording or playback position by utilizing the force of said spring member means or to said recording or playback stand-by position against the force of said spring member means, as a function of said container actuating mechanism means and in response to movement of said container to said recording or playback position or said recording or playback stand-by position thereof;

a track scanning head supported by said head plate;

a pair of rotatable reel rest means for taking up a magnetic tape of said tape deck in the forward or reverse directions thereof;

an assembly including a single capstan and a single pinch roller for causing said magnetic tape to travel in both said forward or reverse directions thereof, depending on the direction of rotation of said single capstan and single pinch roller;

a single idler located approximately midway between said pair of reel rest means;

movable support plate means, rotatably and slidably supporting thereon said single idler, for moving said single idler into contact with a selected either one of said reel rest means to transfer the driving force of said single idler to said one reel rest means;

a puller maintained in pressing contact with said single idler to provide said single idler with normal or reverse rotative force around the axis thereof and around said pulley;

a single motor;

means for transferring rotation of said single motor to said single capstan and to said single idler through said pulley; and

a control circuit system comprising a motor constant-speed control circuit for controlling constant-speed drive of said magnetic tape, a motor normal-reverse control circuit for controlling the normal or reverse rotation of said motor, a single switching mechanism for, during constant-speed travel of the magnetic tape, supplying operation signals to said motor constant-speed control circuit to achieve constant-speed travel of said magnetic tape, and for, during fast feed and rewinding of said magnetic tape, actuating said motor normal-reverse control circuit to achieve rapid drive of said motor, and directly controlling the driving of motor through said motor normal-reverse control circuit, thereby causing normal or reverse drive of said motor, and thus enabling fast feed or rewinding operation of magnetic tape.

4,031,555

REEL-TO-REEL TAPE TO TAPE CARTRIDGE ADAPTER

Theodore R. Hughes, 28 S. Kingstoo, Tulsa, Okla. 74112, and Glenn L. McCarty, 6319 S. 45 W. Ave., Tulsa, Okla. 74132

Filed Oct. 20, 1975, Ser. No. 623,820

Int. Cl.² G11B *5/78, 15/66, 23/04*

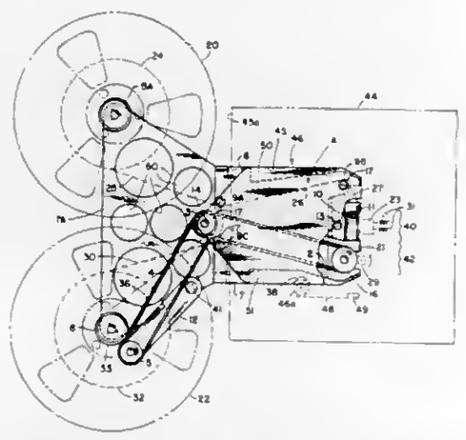
U.S. Cl. 360—94 **4 Claims**

1. In combination with a conventional magnetic tape player adapted to receive and play a tape cartridge carrying magnetic tape, said cartridge having selected physical and geometric characteristics, said player including:

an aperture for receiving said tape cartridge;

means in said player for driving a transport means for said tape in said tape cartridge;

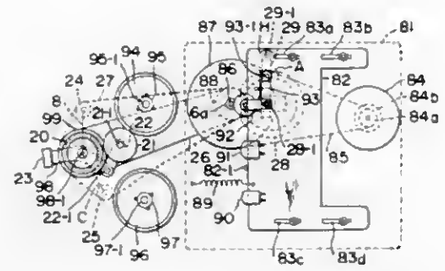
magnetic head means for contacting and interacting with the magnetized surface of said tape in said cartridge;
amplifier and speaker means for utilizing the electrical signals generated in said magnetic head means;
the improvement in apparatus for adapting said player for playing a non-cartridge type reel-to-reel tape of the type wherein the reels are completely independent elements, comprising:
a. frame means having two principal parts;
1. a first frame means having substantially the same exterior characteristics as said tape cartridge; and adapted to be received in said aperture like said tape cartridge;
2. second frame means for indepently supporting a take up reel and a storage reel, said storage reel carrying



a tape to be played in said player, said second frame means adapted to be disposed on the outsideof said player when said first frame means is inserted into said player whereby both of said reels are accessible;
b. means for driving said take up reel, which when said first frame is inserted into said player, is responsive to said means for driving in said player;
c. means in said first frame means for guiding said tape from said storage reel through said first frame means and past a first aperture in the front end of said first frame means similar to the path of the tape and the aperture in said tape cartridge; and then to said take up reel;
whereby when said first frame is inserted into said player, said tape will be in operating relation to said magnetic head means.

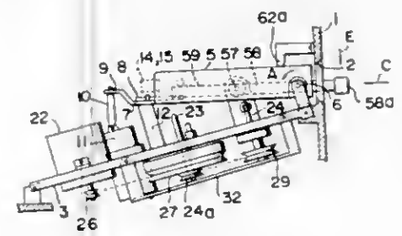
4,031,556
MODE CHANGEOVER APPARATUS FOR RECORDER/PLAYER
Itsuki Ban, 829, Higashioizumi, Nerima, Tokyo, and Kazunori Mochizuki, 6673 Oazahodaka, Hodaka-cho, Minamiazumi, Nagano, both of Japan
Filed Apr. 14, 1976, Ser. No. 676,892
Claims priority, application Japan, Apr. 14, 1975, 50-44270; May 2, 1975, 50-52520; June 26, 1975, 50-78640
Int. Cl.² G11B *15/10, 15/24, 15/44, 23/04*
U.S. Cl. 360—96 **28 Claims**

1. An improvement in a mode changeover apparatus for a magnetic recorder/player of the type which includes means for moving, along a surface of a deck provided in the main body of the recorder/player, a support carrying a magnetic head and the like toward and away from a magnetic tape set in the recorder/player, a spring for elastically biasing said suppot in one direction, reproduction push-botton means for effecting reproducing mode, push-button means for effecting respective modes of stop, fast-feed and rewind, an alternative-selection mechanism for alternatively locking some of said push-button means in position and releaving others of said push-button means from locking engagement when one of said modes is effected, reel driving means for driving, through depression of said fast-feed push-button, a take-up reel-shaft at a high speed, and driving, through depression of said rewind push-button, a supply reel-shaft at a high speed in a reverse direction, and means for shutting off, through depression of said stop push-button, power supply to a motor for capstan power means, the improvement comprising:
a. restraining means for restraining against the elastic force of said spring said support to a reproduction position when said support has been moved near to the magnetic tape;
b. locking means for locking against the elastic force of said spring said support at a non-reproduction position where said support has been moved remotely from the magnetic tape;
c. an eccentric idler rotatably supported by a movable member provided to said deck;
d. spring means for elastically biasing said movable member in a manner that said idler may be rotated by said capstan power means;
e. engaging means for making, in accordance with the movement of said movable member, engagement with said support to move said support to the non-reproduction position;
f. locking member for locking said movable member at a point where a portion of the periphery of said idler having substantially smallest radius with respect to the rotating axis of said idler confronts said capstan power means;



g. means for temporarily relieving, through depression one of said push-buttons for stop, fast-feed and rewind, the locking action of said locking member;
h. means for releasing, through depression of said reproduction push-button, said support from locking engagement with said locking means made at the non-reproduction position;
i. said support, along with taking up of the magnetic tape by the take-up reel-shaft driven through depression of said reproduction push-button, advancing toward the magnetic tape and then being held there by said restraining means;
j. means for holding, upon said advance of said support toward the magnetic tape, said idler apart from said capstan power means with a small gap left between said substantially smallest radius portion of the periphery of said idler and said capstan power means; and
k. whereby said idler, through depression of any one of said push-bottons for stop, fast-feed and rewind, rotating and then being locked by said locking means in a manner that a portion of the periphery of said idler having substantially largest radius with respect to its rotating axis confronts said capstan power means, and the take-up reel-shaft, through depression of said fast-feed push-button, being rotated at a high speed, and the supply reel-shaft, through depression of said rewind push-button, being rotated at a high speed in reverse direction.

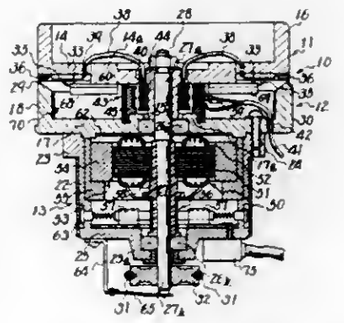
4,031,557
CASETTE LOADING DEVICE FOR USE IN MAGNETIC SOUND RECORDING AND PLAYING BACK APPARATUS
Itsuki Ban, 829, Higashi, Ohizumi, Nerima, Tokyo, and Kazunori Mochizuki, 6673, Ohaza Hodaka, Hodakamachi, Minamiazumi, Nagano, both of Japan
Filed Aug. 4, 1975, Ser. No. 601,437
Claims priority, application Japan, Aug. 2, 1974, 49-87996; Aug. 2, 1974, 49-87995
Int. Cl.² G11B *15/00, 5/54*
U.S. Cl. 360—96 **6 Claims**



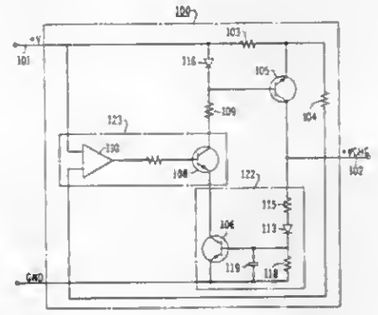
1. A cassette loading device for use in magnetic sound recording and playing back apparatus comprising a chassis mounted on the inner side of the front panel of the holder of the apparatus, said chassis inclining downwardly; a capstan for driving a magnetic tape and reel supporting platforms mounted on said chassis; a cassette holder having a bottom plate and being mounted on said chassis to be rotatable about an axis perpendicular to the direction of insertion of a cassette containing said magnetic tape into said cassette holder, said cassette holder being provided with a cassette insertion opening confronting the cassette insertion opening provided for said front panel; spring means for biasing said cassette holder to rotate downwardly; a cassette detection lever mounted near the inner end of said cassette holder so as to be rotated a predetermined angle by said cassette when it is inserted completely; a stop member mounted on said chassis, the upper surface of said stop member cooperating with said cassette detection lever before completion of the insertion of said cassette thereby maintaining said cassette holder in the horizontal position against the biasing force of said spring means; and an operating lever mounted on the bottom plate of said cassette holder to be slidable in the direction of insertion of said cassette, said operating lever including a portion extending in parallel with the inner edge of said cassette holder, a magnetic head and a pinch roller mounted on said portion, and spring means for biasing said operating lever to pull said portion toward said cassette holder.

4,031,558
HEAD DRUM ASSEMBLY WITH ELECTRICAL NOISE SHIELD
Satoru Kusaka, Kawasaki, Japan, assignor to Sony Corporation, Tokyo, Japan
Filed Aug. 11, 1975, Ser. No. 603,538
Claims priority, application Japan, Aug. 27, 1974, 49-98105
Int. Cl.² G11B *15/60, 5/52, 21/04*
U.S. Cl. 360—130 **11 Claims**

1. A head drum assembly for a video tape transport apparatus, a grounded stationary drum member; a rotary drum member coaxial with said stationary drum member and cooperating with the latter to define a peripheral guide surface for a magnetic tape with a circumferential gap in said guide surface between said stationary and rotary drum members; at least one magnetic head fixed to said rotary drum member and extending into said gap for transducing video signals on a magnetic tape guided by said peripheral guide surface; a D.C. motor disposed coaxially in respect to said stationary and rotary drum members and having a rotary shaft directly coupled to said rotary drum member for effecting rotation of the latter; signal transformer means including nested annular outer stationary and inner rotary cores which are fixed to, and coaxial with said stationary and rotary drum members, respectively, and adjacent stationary and rotary windings mounted on said stationary and rotary cores, respectively; means connecting said magnetic head to said rotary winding; signal conducting means connected to said stationary winding; and shielding means comprising a material of high magnetic permeability extending around said outer surface of said stationary core and having a layer of good electrical conductivity superimposed on said high permeability material and electrically connected to said grounded stationary drum member for shielding said signal transformer means from electrical signals noise generated by said D.C. motor.



4,031,559
FILTER CAPACITOR CHARGING CIRCUIT
Daniel Vern Peters, Naperville, Ill., assignor to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.
Filed Dec. 10, 1975, Ser. No. 639,396
Int. Cl.² H02H *9/04*
U.S. Cl. 361—52 **6 Claims**



1. A circuit for charging an input filter capacitance from a source of potential having a battery terminal and a ground terminal comprising:
an input connected to the battery terminal, and an output for connection to the capacitance;
a first charging circuit comprising two resistors connected in series between said input and said output;
a threshold detecting circuit comprising first semiconductor switching means connected to said ground terminal and having an output terminal and a control terminal, and diode means connected between said output and said control terminal of said first semiconductor switching means;
a second charging circuit comprising second semiconductor switching means connected between the junction of said two resistors and said output and having a control terminal, and diode means interconnecting said battery terminal and said control terminal of said second semiconductor switching means; and
means for coupling said output terminal to said control terminal of said second semiconductor switching means.

4,031,560

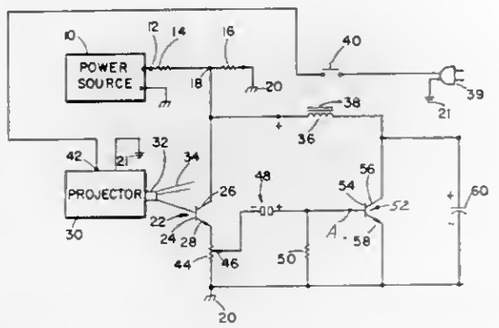
CHOPPED LIGHT RELAY KEYER

Richard L. Maresh, R.R. No. 2, Syracuse, Ind. 46567

Filed Nov. 19, 1975, Ser. No. 633,294

Int. Cl.² H01H *47/24*

U.S. Cl. 361—175 **10 Claims**



9. A protective circuit for a projector having a sequentially framed light energy output comprising a phototransistor having a base, collector, and emitter; said base being subject to the output of the projector and being biased thereby to cause conduction between said emitter and said collector at a rate corresponding to said sequential frame occurence; a transistor having a base, collector, and emitter; a transistor emitter-collector circuit; a relay coil being coupled in said transistor emitter collector circuit; a capacitor being coupled across said transistor emitter and collector; a power source being coupled across said relay and capacitor whereby said power source will charge said capacitor through said relay when said transistor is non-conductive; a differentiating circuit being coupled between said phototransistor emitter and said transistor base whereby a spike signal will be generated and applied to said transistor base when said phototransistor conducts; a power circuit for applying power to the projector; a relay contact switch in said power circuit responsive to current flow in said relay coil to close said power circuit to said projector and responsive to attenuated current flow in said relay coil to open the power circuit to power projector.

4,031,561

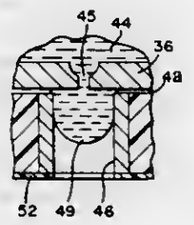
STARTUP APPARATUS AND METHOD FOR JET DROP RECORDING WITH RELATIVELY MOVABLE CHARGE PLATE AND ORIFICE PLATE

Suresh C. Paranjpe, Xenia, Ohio, assignor to The Mead Corporation, Dayton, Ohio

Filed May 3, 1976, Ser. No. 682,363

Int. Cl.² G01D *15/18*

U.S. Cl. 346—1 **22 Claims**



15. In a jet drop recording head having a jet forming nozzle and a circular charging electrode spaced apart from said nozzle, the method of starting a flow of recording liquid through said nozzle comprising the steps of:

placing said electrode in liquid resisting proximity to said nozzle,

after aforesaid placement introducing a flushing liquid into said recording head and forcing it through said nozzle and electrode to form a liquid jet,

introducing recording liquid into said recording head to replace said flushing liquid in said jet, and

retracting said electrode to an operating position spaced apart from said nozzle and surrounding said jet.

4,031,562

DEVICE FOR CREATING A DISPLAY OF A VARIABLE, THE VALUE OF WHICH IS DIGITALLY ENCODED

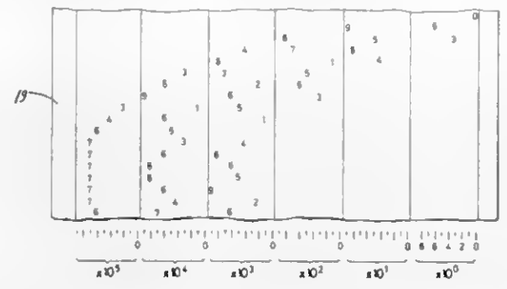
Horst Holzbrecher, Jülich-Bourheim, Germany, assignor to Kernforschungsanlage Julich Gesellschaft mit beschrankter Haftung, Julich, Germany

Filed Nov. 12, 1975, Ser. No. 631,380

Claims priority, application Germany, Nov. 13, 1974, 2453752

Int. Cl.² G01D *9/06*

U.S. Cl. 346—35 **3 Claims**



1. An apparatus for developing a printed display of a variable transformed into a digital voltage or current signal while a digital signal is so coded in a code adapted to a predetermined numerical system and consists of digital individual signals which correspond to groups of a predetermined numerical system which comprises in combination: means for measuring instantaneous values of the variable and for encoding the signals thus developed in a binary code in which individual signals correspond to differently valued groups of a numerical system, and a type printing mechanism including means establishing operative connection with said means for measuring instantaneous values of the variable and for encoding the signals thus developed in the binary code to receive the encoded signals in conformity with the respective group, said mechanism being operable to register and display the values corresponding to the respective groups in adjacent relation in a sequence corresponding to the value of the groups and also corresponding to the values within each group, said printing mechanism comprising a plurality of printing heads, each having numerals thereon distributed circumferentially of the respective head, each head being rotatable individually, and means for rotating the heads in conformity with the value to be printed thereby.

4,031,563

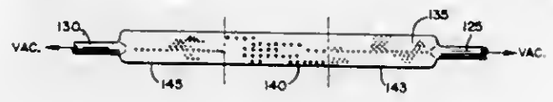
JET DROP RECORDING HEAD HAVING AN IMPROVED POROUS DEFLECTION RIBBON

Suresh C. Paranjpe, Xenia, and Daniel W. Moore, Dayton, both of Ohio, assignors to The Mead Corporation, Dayton, Ohio

Filed Jan. 29, 1976, Ser. No. 653,597

Int. Cl.² G01D *15/16*

U.S. Cl. 346—75 **5 Claims**



1. A self-cleaning deflection ribbon assembly for use in a jet drop recording head having means for generating a plurality of drop streams, each stream consisting of a series of liquid recording drops, means for selectively charging said drops, and a source of drop deflecting potential, comprising:

a porous deflection ribbon having an electrically conductive surface defining a plurality of liquid ingesting pores, the total cross-sectional area of said pores per unit area of said ribbon varying progressively from a smaller value at a point adjacent a first end of said ribbon to larger values at points further removed therefrom,

means for connecting the source of drop deflecting potential to said electrically conductive surface, and

means for applying an evacuating suction of said first end of said ribbon, wherein variations in drop ingesting effectiveness due to variations in evacuating suction along the extent of the ribbon are minimized.

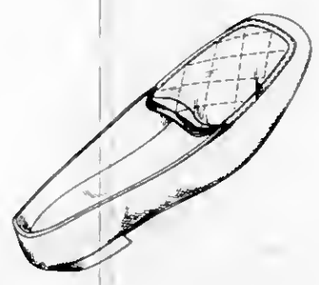
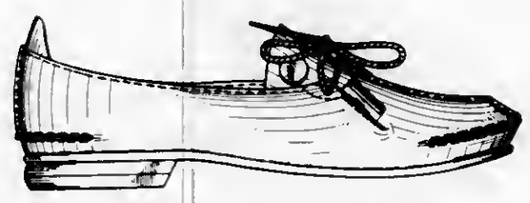
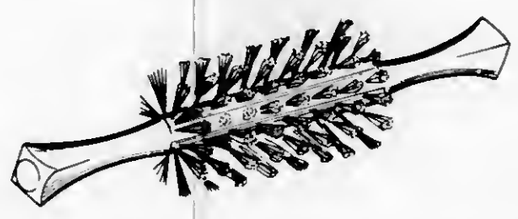
POCKET-TOP SHOE
Marcella M. Katz, 10573 Le Conte Ane., Los Angeles, Calif., 90024
Filed Dec. 31, 1975, Ser. No. 645,542
Term of patent 14 years
Int. Cl. D2—*04*
U.S. Cl. D2—265



244,727
SHOE
Ambrogio Borri, Piazza della Repubblica 21, Milan, Italy
Filed Apr. 16, 1975, Ser. No. 568,512
Claims priority, application Italy, Oct. 16, 1974, 22161/74
Term of patent 3½ years
Int. Cl. D2—*04*
U.S. Cl. D2—287

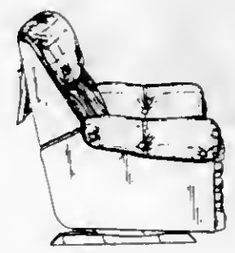


244,728
DUAL HANDLED HAIR BRUSH
Diane I. Kael, 16300 N. Park Drive, Apt. 805, Southfield, Mich. 48075
Filed Apr. 19, 1976, Ser. No. 677,903
Term of patent 14 years
Int. Cl. D4—*02*
U.S. Cl. D4—31

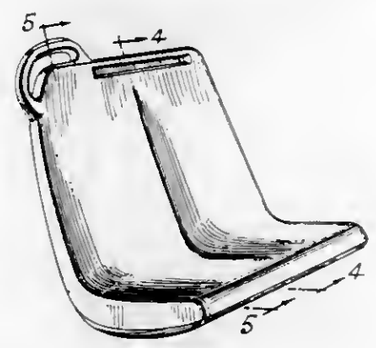


244,729
SWIVEL CHAIR
Randall P. Buhk, Wyoming, Mich., assignor to Steelcase, Inc., Grand Rapids, Mich.
Filed Sept. 5, 1975, Ser. No. 610,834
Term of patent 14 years
Int. Cl. D6—*01*
U.S. Cl. D6—31

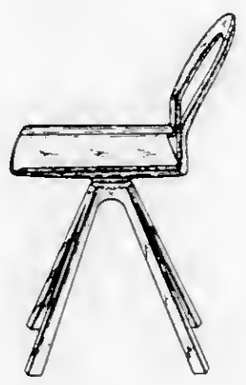
244,730
CHAIR
Stapleton Long, Morristown, Tenn., assignor to The Berkline Corporation, Morristown, Tenn.
Division of Ser. No. 630,321, Nov. 10, 1975, Pat. No. Des.241,695. This application June 10, 1976, Ser. No. 694,777
Term of patent 7 years
Int. Cl. D6—*01*
U.S. Cl. D6—37



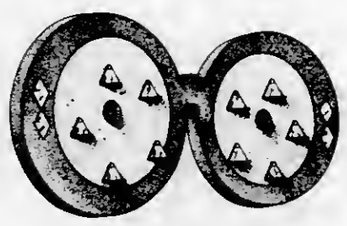
244,731
BUS SEAT
Norman J. James, Bonita; Larry G. Hickey, Chula Vista, and Fred Powers, San Diego, all of Calif., assignors to Rohr Industries, Inc., Chula Vista, Calif.
Filed Mar. 19, 1976, Ser. No. 668,483
Term of patent 14 years
Int. Cl. D6—*01*
U.S. Cl. D6—48



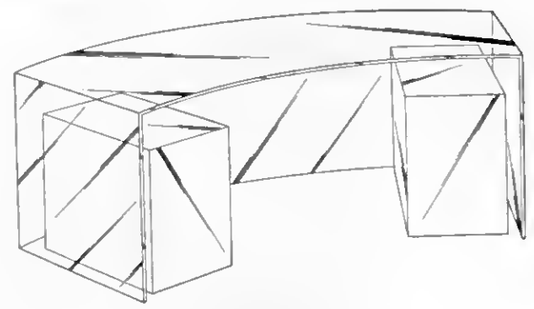
244,732
CHAIR
Vittorio Introini, Gallarate, Italy, assignor to Fratelli Saporiti, Besnate (Varese), Italy
Filed Mar. 18, 1975, Ser. No. 559,447
Claims priority, application Italy, Sept. 20, 1974, 60922/74
Term of patent 14 years
Int. Cl. D6—*01*
U.S. Cl. D6—76



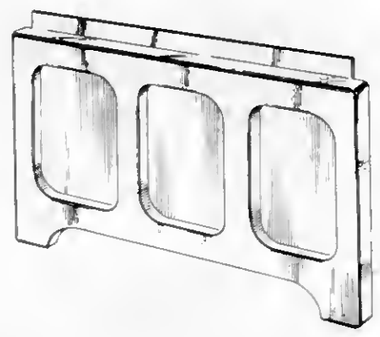
244,733
EYEGLASS DISPLAY RACK INCLUDING ROTARY DISKS
Italo Tammera, 7 Cliff St., West Orange, N.J. 07052
Filed Feb. 20, 1976, Ser. No. 659,593
Term of patent 14 years
Int. Cl. D20—*02*
U.S. Cl. D6—136



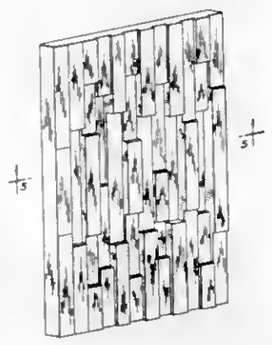
244,734
DESK
Eric Laroye, Koningstraat 14 -Bus 2-, 8400 Oostende, Belgium
Filed June 12, 1975, Ser. No. 586,337
Claims priority, application Belgium, Dec. 20, 1974, 60081
Term of patent 14 years
Int. Cl. D6—*04*
U.S. Cl. D6—175



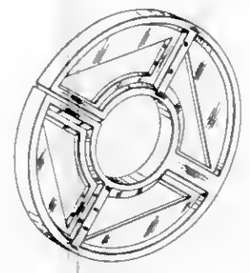
244,735
PANEL FOR USE WITH A MODULAR COUNTER UNIT
Robert J. Kennedy, Jr., and Kendall S. Smith, II, both of West Lafayette, Ind., assignors to Lincoln Manufacturing Company, Inc.
Filed Sept. 17, 1975, Ser. No. 614,337
Term of patent 14 years
Int. Cl. D6—*06*
U.S. Cl. D6—193



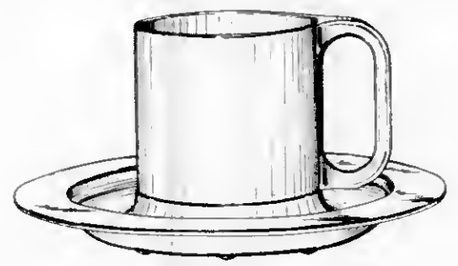
244,736
CABINET DOOR PANEL
James J. Palka, Arlington Heights, Ill., assignor to General Bathroom Products Corporation, Elk Grove Village, Ill.
Filed Mar. 15, 1976, Ser. No. 666,749
Term of patent 14 years
Int. Cl. D6—*06*
U.S. Cl. D6—193



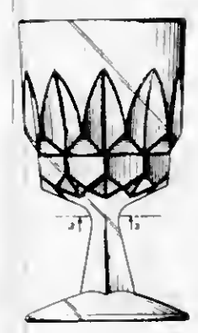
244,737
WARDROBE SYSTEMIZER DEVICE
Franklin H. Henry, 1431 Prentice Drive, Healdsburg, Calif. 95448
Filed Dec. 22, 1975, Ser. No. 642,726
Term of patent 14 years
Int. Cl. D6—*08*
U.S. Cl. D6—257



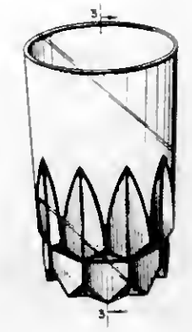
244,738
CUP AND SAUCER COMBINATION
Sven-Eric Juhlin, Ingaro, Sweden, assignor to Aktiebolaget Gustavsbergs Fabriker, Gustavsberg, Sweden
Filed Mar. 9, 1976, Ser. No. 665,303
Claims priority, application Sweden, Sept. 24, 1975, 751871
Term of patent 14 years
Int. Cl. D7—*01*
U.S. Cl. D7—3



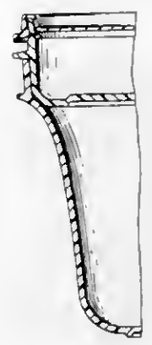
244,739
WINE GLASS OR SIMILAR ARTICLE
Philippe J. Durand, 62510 Arques, LaGarenne, France
Filed Dec. 30, 1975, Ser. No. 645,460
Term of patent 14 years
Int. Cl. D7—*01*
U.S. Cl. D7—13



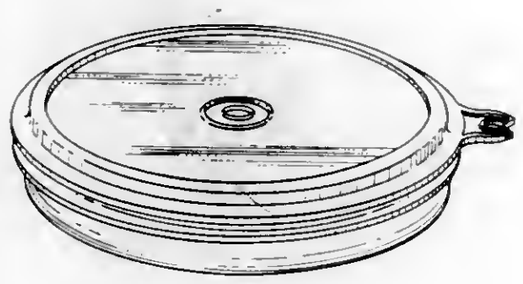
244,740
TUMBLER OR SIMILAR ARTICLE
Phllippe J. Durand, 62510 Arques, LaGarenne, France
Filed Dec. 30, 1975, Ser. No. 645,459
Term of patent 14 years
Int. Cl. D7—*01*
U.S. Cl. D7—14

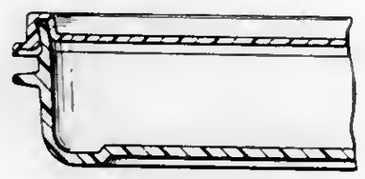


244,741
COVERED COMPARTMENTED BOWL
Robert H. C. M. Daenen, Aalst, Belgium, assignor to Dart Industries Inc., Los Angeles, Calif.
Filed Sept. 10, 1975, Ser. No. 612,154
The portion of the term of this patent subsequent to May 24, 1991, has been disclaimed.
Term of patent 14 years
Int. Cl. D7—*01*
U.S. Cl. D7—17



244,742
COVERED SERVING BOWL OR THE LIKE
Robert H. C. M. Daenen, Aalst, Belgium, assignor to Dart Industries Inc., Los Angeles, Calif.
Filed Jan. 23, 1976, Ser. No. 651,863
The portion of the term of this patent subsequent to Apr. 19, 1991, has been disclaimed.
Term of patent 14 years
Int. Cl. D7—*01*
U.S. Cl. D7—17





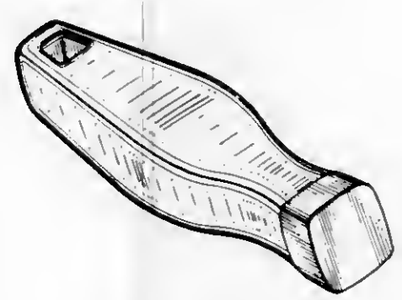
244,743
CANISTER LID
Wendy P. Turner, 3901 E. Garden Lane, Littleton, Colo. 80121
Filed June 4, 1975, Ser. No. 583,840
Term of patent 3½ years
Int. Cl. D7—*01*
U.S. Cl. D7—131

244,744
DETACHABLE GRASS SHEAR HEAD FOR CORDLESS TOOL
Roderick Francis Bunyea, Cockeysville, Md., assignor to The Black and Decker Manufacturing Company
Filed Aug. 19, 1975, Ser. No. 605,859
Term of patent 14 years
Int. Cl. D8—*03*
U.S. Cl. D8—8

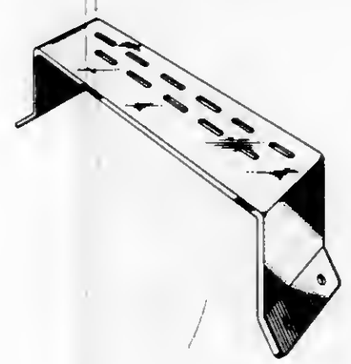
244,745
TORQUE WRENCH
Hiroshi Tsuji, Tokyo, Japan, assignor to Tohnichi Manufacturing Co. Ltd., Japan
Filed Dec. 19, 1975, Ser. No. 642,392
Term of patent 14 years
Int. Cl. D8—*05*
U.S. Cl. D8—24

244,746
JIG FOR CUTTING TILE
Leonard C. Stabb, 10137 Catalina Drive, Indianapolis, Ind. 46236
Filed Mar. 3, 1976, Ser. No. 663,241
Term of patent 14 years
Int. Cl. D8—*99*
U.S. Cl. D8—71

244,747
HANDLE FOR TOOLS
Johannes Josef Solf, Sindelfingen-Eichholz, Germany, assignor to Friedr. Dick G.m.b.H., Esslingen, Germany
Filed Dec. 31, 1975, Ser. No. 645,654
Claims priority, application Germany, July 18, 1975, 831221
Term of patent 14 years
Int. Cl. D8—*04*
U.S. Cl. D8—107

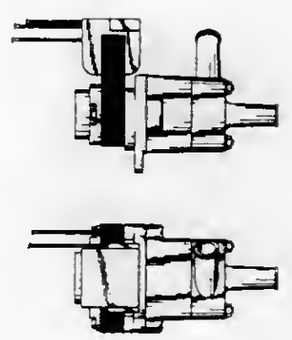


244,748
BRACKET FOR MOUNTING ACCESSORIES OVER THE TRANSMISSION HUMP OF A VEHICLE
Robert W. Canterbury, Addison, Tex., assignor to Holly Enterprises, Addison, Tex.
Filed Feb. 19, 1976, Ser. No. 659,491
Term of patent 14 years
Int. Cl. D8—*08*
U.S. Cl. D8—380

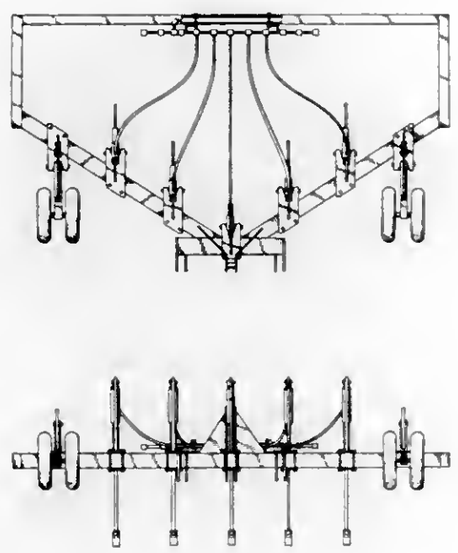


244,749
RIBBON CONTAINER
Dale R. Hodges, 4103 Inwood Road, Dallas, Tex. 75209
Filed July 28, 1975, Ser. No. 599,475
Term of patent 14 years
Int. Cl. D9—*03*
U.S. Cl. D9—238

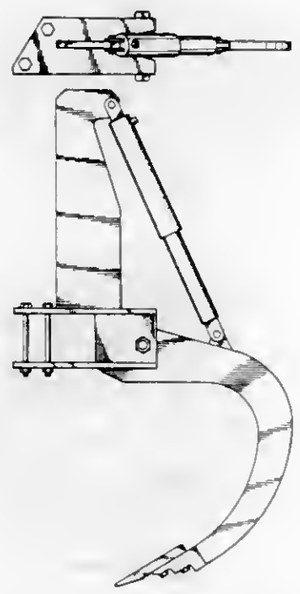
244,750
PUMP
Leo L. Roberts, Moore; Lee W. Davis, Del City, and Jim S. Hollingsworth, Oklahoma City, all of Okla., assignors to Little Giant Corporation, Oklahoma City, Okla.
Filed Oct. 8, 1975, Ser. No. 620,888
Term of patent 14 years
Int. Cl. D15—*02*
U.S. Cl. D15—7



244,751
HYDRAULIC RESET GROUND RIPPER IMPLEMENT
Glen A. Watts, Rte. 1, Box 258, McMinnville, Oreg. 97128
Filed Mar. 8, 1976, Ser. No. 664,491
Term of patent 14 years
Int. Cl. D15—*03*
U.S. Cl. D15—11

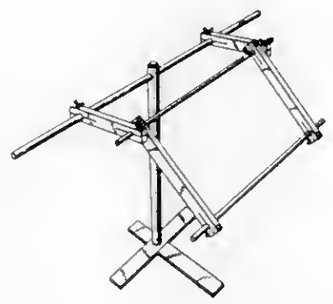


244,752
COMBINED GROUND RIPPER TOOTH AND HYDRAULIC RESET ASSEMBLY
Glen A. Watts, Rte. 1, Box 258, McMinnville, Oreg. 97128
Filed Mar. 8, 1976, Ser. No. 664,492
Term of patent 14 years
Int. Cl. D15—*03*
U.S. Cl. D15—29

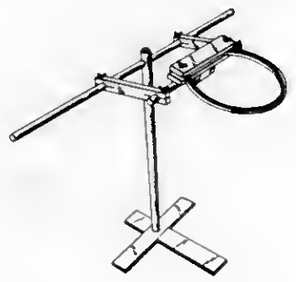


244,753
GROUND RIPPER TOOTH
Glen A. Watts, Rte. 1, Box 258, McMinnville, Oreg. 97128
Filed Mar. 8, 1976, Ser. No. 664,493
Term of patent 14 years
Int. Cl. D15—*03*
U.S. Cl. D15—29

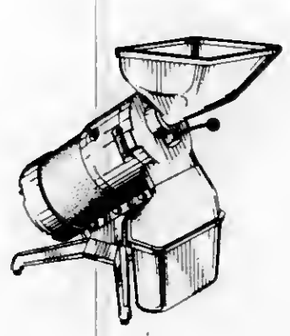
244,754
PORTABLE ADJUSTABLE STAND FOR A NEEDLEWORK FRAME
Donald I. Bard, 7901 College Lane, Annandale, Va. 22003
Filed Mar. 26, 1976, Ser. No. 670,812
Term of patent 14 years
Int. Cl. D15—*06*
U.S. Cl. D15—66



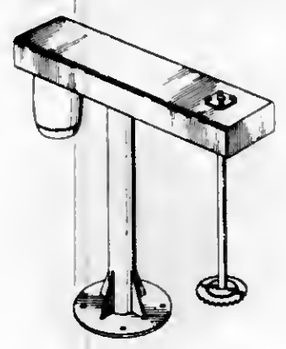
244,755
PORTABLE ADJUSTABLE STAND FOR SUPPORTING AN EMBROIDERY HOOP
Donald I. Bard, 7901 College Lane, Annandale, Va. 22003
Filed Mar. 26, 1976, Ser. No. 670,813
Term of patent 14 years
Int. Cl. D15—*06*
U.S. Cl. D15—66



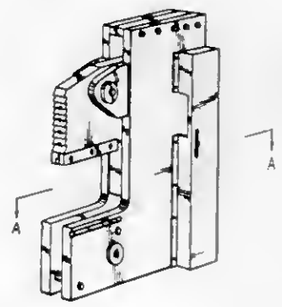
244,756
GRAIN MILL
Clarence E. Granzow, 2516 E. Jackson St., Phoenix, Ariz. 85034
Filed June 28, 1976, Ser. No. 700,592
Term of patent 14 years
Int. Cl. D15—*08*
U.S. Cl. D15—98



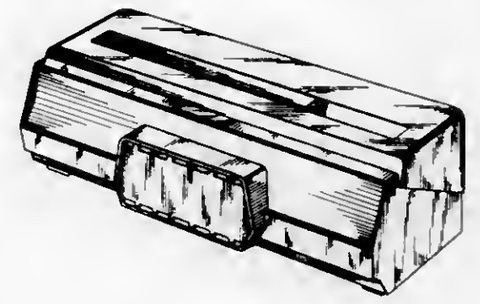
244,757
DISPERSING APPARATUS
Donald M. Schnear, Corona del Mar, Calif., assignor to Morehouse Industries, Inc., Fullerton, Calif.
Division of Ser. No. 515,203, Oct. 16, 1974, Pat. No. Des. 241,675. This application Nov. 17, 1975, Ser. No. 632606
Term of patent 14 years
Int. Cl. D15—*09*
U.S. Cl. D15—122



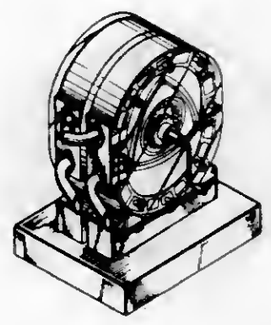
244,758
METAL FORMING PRESS
Dugmore Dennis Slattery, 177 Kestell Street, Potgietersrus, Transvaal Province, South Africa
Filed Mar. 3, 1976, Ser. No. 663,379
Claims priority, application South Africa, Sept. 8, 1975, 75/1298
Term of patent 14 years
Int. Cl. D15—*09*
U.S. Cl. D15—123



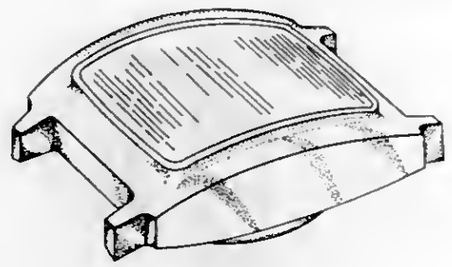
244,759
APPLIANCE FOR CUTTING, SEALING AND MAKING PLASTIC BAGS
William B. Kludred, Allen Park, Mich., assignor to Weigl Co., Inc., New York, N.Y.
Filed July 12, 1976, Ser. No. 704,370
Term of patent 14 years
Int. Cl. D15—*99*
U.S. Cl. D15—146



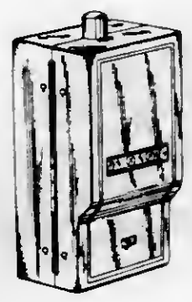
244,760
ROTARY ENGINE MODEL
Ronald L. Phillips, 4633 Dow Ridge, Orchard Lake, Mich. 48033
Filed Mar. 24, 1975, Ser. No. 561,109
Term of patent 14 years
Int. Cl. D19—*07*
U.S. Cl. D19—62



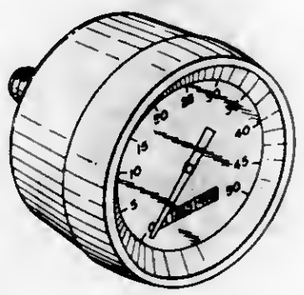
244,761
DIGITAL WRIST WATCH
Eugene Joseph Solek, 3725 Buckboard, Plano, Tex. 75074
Filed Sept. 11, 1975, Ser. No. 612,616
Term of patent 14 years
Int. Cl. D10—*02*
U.S. Cl. D10—38



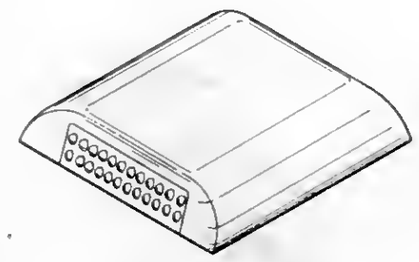
244,762
ELECTRICAL LEAKAGE ANALYZER
Roger K. F. Wasmer, 410 Ridgewood Drive N., Bellevue, Nebr. 68005; David W. McCord, 4811 Florence Blvd., Omaha, Nebr. 68110, and Anthony J. Graziano, 2110 Georgia Ave., Bellevue, Nebr. 68005
Filed June 9, 1975, Ser. No. 584,695
Term of patent 14 years
Int. Cl. D10—*04*
U.S. Cl. D10—75



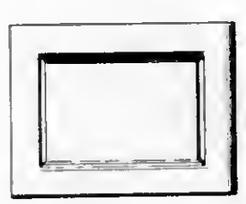
244,763
SPEEDOMETER
Philip S. Stefaniak, Evanston, Ill., assignor to Stewart-Warner Corporation, Chicago, Ill.
Filed Dec. 18, 1975, Ser. No. 641,985
Term of patent 14 years
Int. Cl. D10—*04*
U.S. Cl. D10—98



244,764
ROAD-TRAFFIC STUD
Emil Grubauer, Wattens, Austria, assignor to D. Swarovski & Co., Wattens, Austria
Filed Sept. 12, 1975, Ser. No. 612,672
Claims priority, application Austria, Mar. 18, 1975, 11495/75
Term of patent 14 years
Int. Cl. D10—*06*
U.S. Cl. D10—113

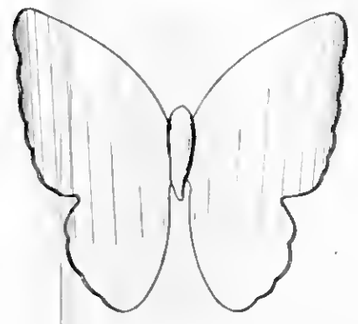


244,765
JEWELRY PIN FOR DISPLAY OF PHOTOGRAPHIC NEGATIVE CONTACT PRINTS
Krystin L. Grenon, 1837 S. Halsted, Chicago, Ill. 60608
Filed Dec. 1, 1975, Ser. No. 636,414
Term of patent 14 years
Int. Cl. D11—*01*
U.S. Cl. D11—40

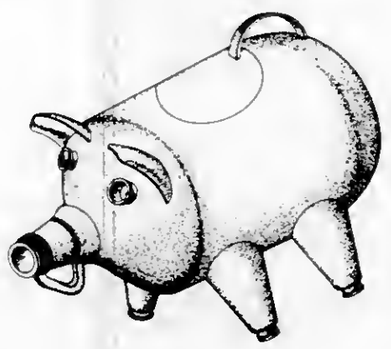


244,766
CROWN FOR A RING
Roy R. Powell, R.D. 1, W. Main Road, North East, Pa. 16428
Filed Dec. 15, 1975, Ser. No. 640,625
Term of patent 14 years
Int. Cl. D11—*01*
U.S. Cl. D11—89

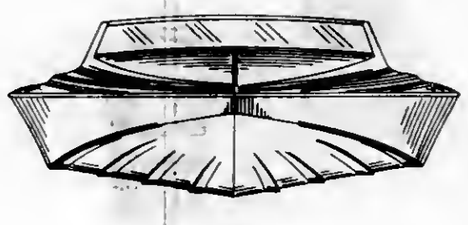
244,767
BUTTERFLY ORNAMENT
Donald R. Ditto, 3129 Maple Leaf Lane, Dallas, Tex. 75233
Filed Jan. 31, 1975, Ser. No. 545,864
Term of patent 14 years
Int. Cl. D11—*02*
U.S. Cl. D11—137



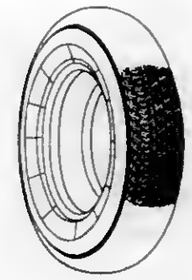
244,768
PLANTER AND A LID THEREFOR
Arthur J. Lacativo, 236 Canyon Drive, Oroville, Calif. 95965
Filed Feb. 27, 1976, Ser. No. 662,188
Term of patent 14 years
Int. Cl. D11—*02*
U.S. Cl. D11—149



244,769
POWER BOAT
Bruce E. Nescher, 1861 Kashlon, LaHabra Heights, Calif. 90631
Filed June 3, 1975, Ser. No. 583,276
Term of patent 14 years
Int. Cl. D12—*06*
U.S. Cl. D12—62



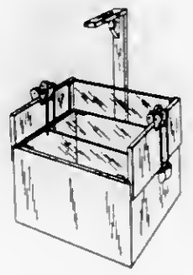
244,770
VEHICLE TIRE
Hiroshi Kojima, Hino; Toshio Hayakawa, Kodaira, and Masafumi Yoshihara, Higashi-Murayama, all of Japan, assignors to Bridgestone Tire Company Limited, Tokyo, Japan
Filed Feb. 4, 1976, Ser. No. 655,261
Claims priority, application Japan, Aug. 8, 1975, 50-32395
Term of patent 14 years
Int. Cl. D12—*15*
U.S. Cl. D12—142



244,771
LICENSE PLATE HOLDER
John A. Bott, 931 Lakeshore Drive, Grosse Pointe Shores, Mich. 48236
Filed Jan. 5, 1976, Ser. No. 646,547
Term of patent 14 years
Int. Cl. D12—*16*
U.S. Cl. D12—193

244,772
DECOY ANCHOR
Floyd E. Zongker, Tulsa, Okla., assignor to Zongker Lead Casting, Inc., (Entire), Tulsa, Okla.
Filed May 20, 1976, Ser. No. 688,485
Term of patent 14 years
Int. Cl. D12—*16*
U.S. Cl. D12—215

244,773
RAT TRAP
Frank S. Curtis, 1009 N. Jenison, Lansing, Mich. 48915
Filed Nov. 17, 1975, Ser. No. 632,266
Term of patent 14 years
Int. Cl. D22—*19*
U.S. Cl. D22—18

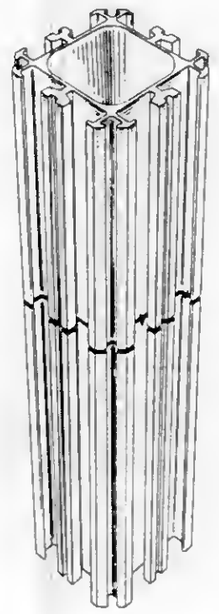


244,774
ANTI-WATER SPLASH SHIELD FOR BATHTUBS
John H. Dose, 4006 Chinaberry Road; River Isles Box 106, Bradenton, Fla. 33505
Filed Nov. 6, 1975, Ser. No. 629,642
Term of patent 14 years
Int. Cl. D23—*02*
U.S. Cl. D23—69

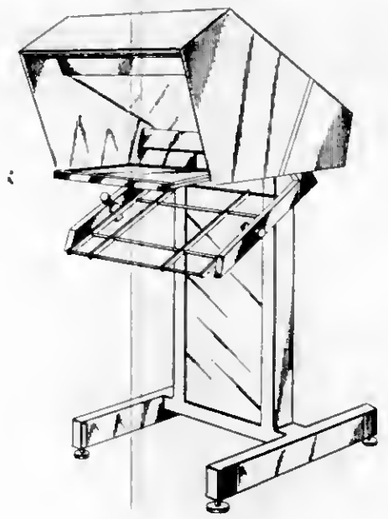
244,775
AIR FRESHENER CONTAINER
Norman E. Wilson, Moscow Mills, Mo., assignor to The Puro Co., Inc.
Filed Dec. 19, 1975, Ser. No. 642,464
Term of patent 14 years
Int. Cl. D23—*99*
U.S. Cl. D23—150

244,776
INFANT NURSING BOTTLE
Paul K. Meeker, 412 Park St., Kent, Ohio 44240
Filed Aug. 16, 1976, Ser. No. 714,529
Term of patent 14 years
Int. Cl. D7—*01*; D9—*01*
U.S. Cl. D24—47

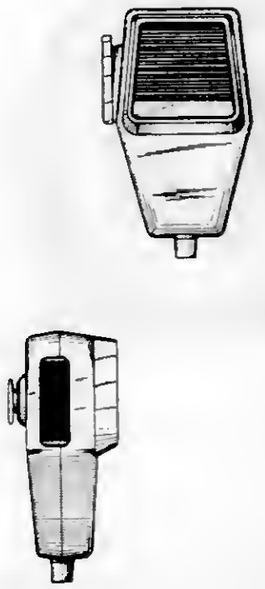
244,777
TUBULAR POST
Bertalan Tamas Bobrovniczky, Don Mills, Canada, assignor to Beautiline Systems Limited
Filed Jan. 7, 1976, Ser. No. 647,165
Term of patent 14 years
Int. Cl. D25—*01*
U.S. Cl. D25—75



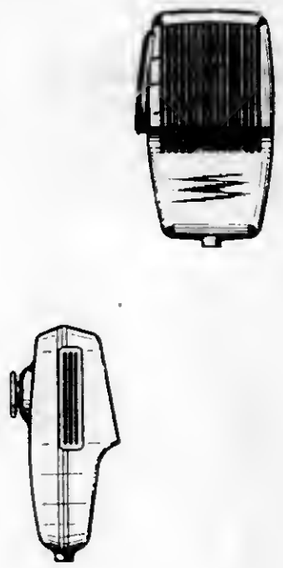
244,778
COMPONENT LOCATER FOR ELECTRONIC PRODUCT ASSEMBLY OPERATIONS
Lewis A. Latanzi, Bethel, Conn., assignor to Contact Systems, Inc., Danbury, Conn.
Filed Oct. 28, 1975, Ser. No. 625,939
Term of patent 14 years
Int. Cl. D14—*02*
U.S. Cl. D14—99



244,779
MICROPHONE
Yoshiaki Kobayasbi, Tokyo, Japan, assignor to Nihon Atsudenki Kabushiki Kaisha, Mitaka, Japan
Filed Aug. 19, 1975, Ser. No. 605,804
Claims priority, application Japan, Feb. 20, 1975, 50-006757
Term of patent 7 years
Int. Cl. D14—*01*
U.S. Cl. D14—12



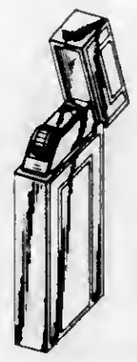
244,780
MICROPHONE
Yoshiaki Kohayashi, Tokyo, Japan, assignor to Nihon Atsudenki Kabushiki Kaisha, Mitaka, Japan
Filed Aug. 19, 1975, Ser. No. 605,801
Claims priority, application Japan, Feb. 25, 1975, 50-7508
Term of patent 7 years
Int. Cl. D14—*01*
U.S. Cl. D14—12



244,781
SPEAKER GRILL
Jack R. Saidel, 1618 Heather-Hill Crescent, Flossmoor, Ill. 60422
Filed Oct. 22, 1976, Ser. No. 734,715
Term of patent 7 years
Int. Cl. D14—*01*, *99*
U.S. Cl. D14—39

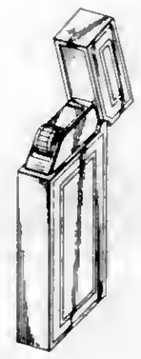
244,782
CIGARETTE LIGHTER
Kenjiro Goto, 4-17-3, Naka-cho, Urawa, Saitama, Japan
Filed Mar. 21, 1975, Ser. No. 560,777
Term of patent 7 years
Int. Cl. D27—*05*
U.S. Cl. D27—36

244,783
CIGARETTE LIGHTER
George O'Brien, New York, N.Y., assignor to Tiffany & Company, New York, N.Y.
Filed July 19, 1976, Ser. No. 706,731
Term of patent 14 years
Int. Cl. D27—*05*
U.S. Cl. D27—36

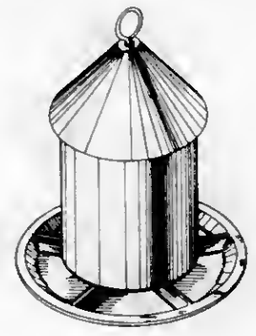


244,784
CIGARETTE LIGHTER
George O'Brien, New York, N.Y., assignor to Tiffany & Company, New York, N.Y.
Filed July 19, 1976, Ser. No. 706,732
Term of patent 14 years
Int. Cl. D27—*05*
U.S. Cl. D27—36

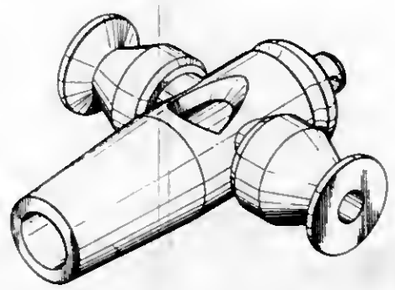
244,785
CIGARETTE LIGHTER
George O'Brien, New York, N.Y., assignor to Tiffany & Company, New York, N.Y.
Filed July 19, 1976, Ser. No. 706,733
Term of patent 14 years
Int. Cl. D27—*05*
U.S. Cl. D27—36



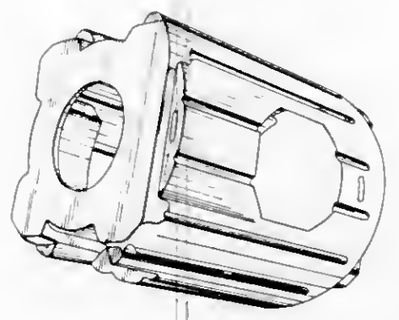
244,786
BIRD FEEDER
Littleton P. Dryden, Westminster, Colo., assignor to Premier Manufacturing Co., Arvada, Colo.
Filed Jan. 12, 1976, Ser. No. 648,330
Term of patent 14 years
Int. Cl. D30—*03*
U.S. Cl. D30—15



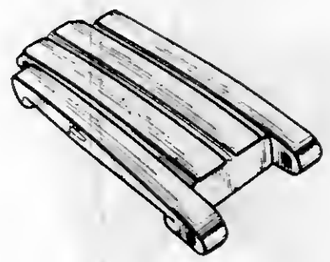
244,787
MUSICAL WHISTLE
Martin B. Cohen, Hillsdale, N.J., assignor to Latin Percussion, Inc.
Filed Aug. 4, 1975, Ser. No. 601,763
Term of patent 14 years
Int. Cl. D21—*01*
U.S. Cl. D34—15 C



244,788
POD MODULE FOR USE AS PLAY EQUIPMENT
Kenneth Peter Burgess, Kew Surrey, and Timothy Sefton Elsdale, London, both of England, assignors to WCB Containers Limited, Stalybridge, England
Filed Aug. 19, 1975, Ser. No. 605,895
Claims priority, application United Kingdom, Feb. 19, 1975, 969950/75
Term of patent 14 years
Int. Cl. D21—*03*
U.S. Cl. D34—5 H



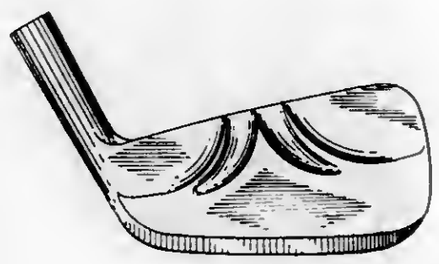
244,789
SLAB MODULE FOR USE AS PLAY EQUIPMENT
Kenneth Peter Burgess, Kew Surrey, and Timothy Sefton Elsdale, London, both of England, assignors to WCB Containers Limited, Stalybridge, England
Filed Aug. 19, 1975, Ser. No. 605,896
Term of patent 14 years
Int. Cl. D21—*03*
U.S. Cl. D34—5 H



244,790
FIELD HOCKEY STICK
Phillip Howard Carlson, Minneapolis, and Lawrence E. Ericksoo, Edina, both of Minn., assignors to International Telephone and Telegraph Corporation, New York, N.Y.
Filed Sept. 16, 1975, Ser. No. 613,968
Term of patent 14 years
Int. Cl. D21—*02*
U.S. Cl. D34—5 BC

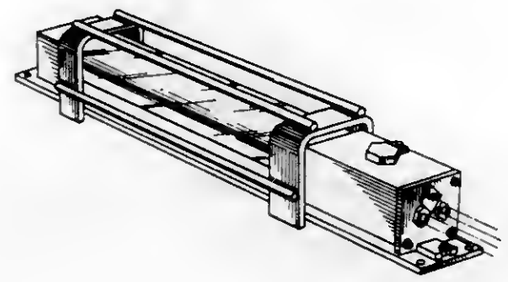
244,791
GOLF STANCE AND SWING PRACTICE DEVICE OR THE LIKE
Edward F. Sullivan, Jr., 6944 Gallardia Road South, Jacksonville, Fla. 32211
Filed Sept. 24, 1975, Ser. No. 616,309
Term of patent 14 years
Int. Cl. D21—*02*
U.S. Cl. D34—5 CB

244,792
DRIVING IRON HEAD
Paul B. Gelinas, 66 Prospect St., Manchester, N.H. 03104
Filed May 12, 1976, Ser. No. 685,807
Term of patent 14 years
Int. Cl. D21—*02*
U.S. Cl. D34—5 GH



244,793
LIGHTING FIXTURE
Alan J. Ruud, West Allis, Wis., assignor to Donald L. Goulet and Alan J. Ruud
Filed July 31, 1975, Ser. No. 600,643
Term of patent 14 years
Int. Cl. D26—*05*
U.S. Cl. D48—20 A

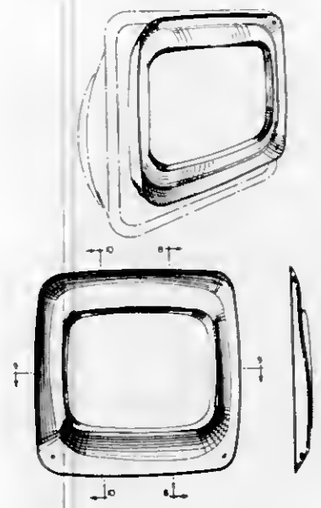
244,794
EXPLOSION PROOF FLUORESCENT LAMP FOR MINES OR THE LIKE
Perfecto Dacal, Beckley, W. Va., assignor to Control Products Inc., Beckley, W. Va.
Filed May 24, 1976, Ser. No. 689,596
Term of patent 14 years
Int. Cl. D26—*05*
U.S. Cl. D48—20 E



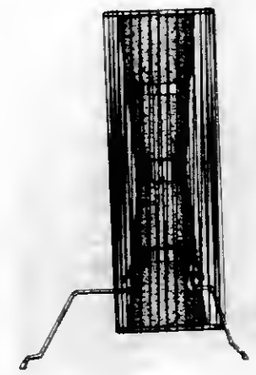
244,795
LIGHTING FIXTURE
Robert M. O'Hara, 1873 Berkley Ave., St. Paul, Minn. 55105
Filed Apr. 11, 1975, Ser. No. 567,398
Term of patent 14 years
Int. Cl. D26—*05*
U.S. Cl. D48—23 R

244,796
PENLIGHT
David E. Staub, Clearwater, Fla., assignor to Concept, Inc., Clearwater, Fla.
Filed Nov. 13, 1975, Ser. No. 631,621
Term of patent 14 years
Int. Cl. D26—*02*
U.S. Cl. D48—24 A

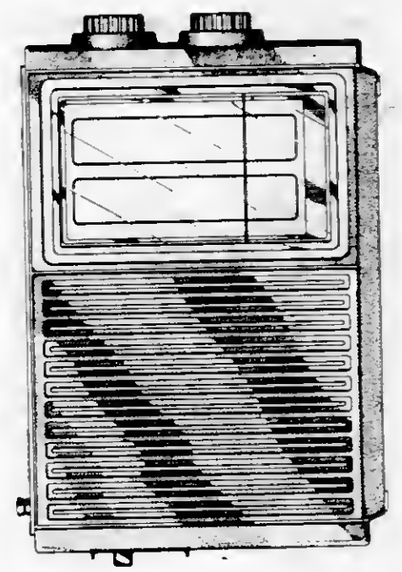
244,797
VEHICLE HEADLAMP BEZEL
William F. Leahy, 624 Edwards, West Dundee, Ill. 60118
Filed Feb. 26, 1976, Ser. No. 661,423
Term of patent 7 years
Int. Cl. D26—*06*
U.S. Cl. D48—32 C



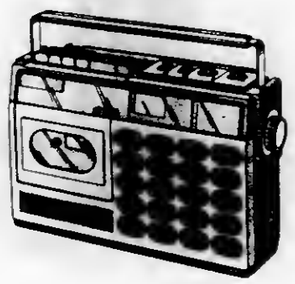
244,798
DRUM
Fred Fleck, 3719 Central Park Circle, Las Vegas, Nev. 89109
Filed Feb. 20, 1975, Ser. No. 551,251
Term of patent 14 years
Int. Cl. D17—*04*
U.S. Cl. D56—1 E



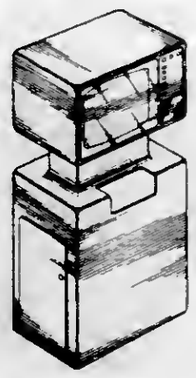
244,799
PORTABLE RADIO
John S. Kolwaite, Dewitt, N.Y., assignor to General Electric Company
Filed June 16, 1975, Ser. No. 587,503
Term of patent 14 years
Int. Cl. D14—*03*
U.S. Cl. D14—75



244,800
COMBINED TAPE RECORDER AND RADIO RECEIVER
Katsutoshi Kido, Toyonaka, and Susumu Yamamoto, Moriguchi, both of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Kadoma, Japan
Filed Oct. 21, 1975, Ser. No. 624,635
Claims priority, application Japan, Apr. 23, 1975, 50-16299
Term of patent 14 years
Int. Cl. D14—*03*
U.S. Cl. D14—5

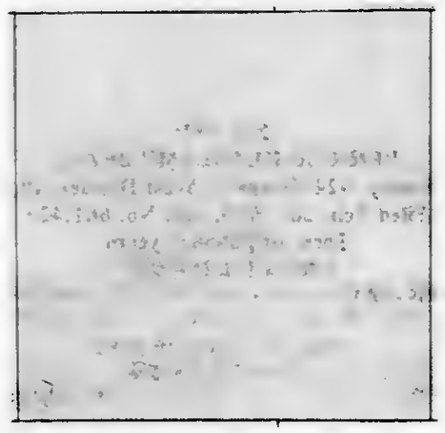


244,801
VIDEO PROGRAM SELECTION AND DISPLAY SYSTEM
George R. DeLand, Yorba Linda, Calif., assignor to Odetics, Inc., Anaheim, Calif.
Filed Dec. 15, 1975, Ser. No. 640,838
Term of patent 14 years
Int. Cl. D14—*03*
U.S. Cl. D14—82



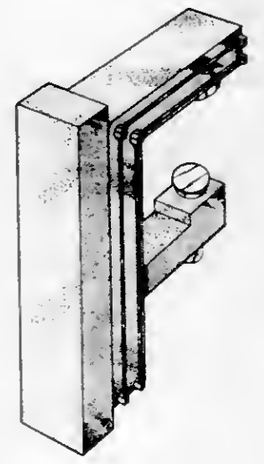
244,802
EMBOSSED PLASTIC SHEET MATERIAL
Jared R. Kies, Newark, Ohio, assignor to Owens-Corning Fiberglas Corporation, Toledo, Ohio
Filed Apr. 21, 1975, Ser. No. 569,901
Term of patent 14 years
Int. Cl. D5—*06*
U.S. Cl. D87—3 G

244,803
EMBOSSED PLASTIC SHEET MATERIAL
Jared R. Kies, Newark, Ohio, assignor to Owens-Corning Fiberglas Corporation, Toledo, Ohio
Filed Apr. 21, 1975, Ser. No. 570,282
Term of patent 14 years
Int. Cl. D5—*06*
U.S. Cl. D87—3 G



244,804
EMBOSSED PLASTIC SHEET MATERIAL
Jared R. Kies, Newark, Ohio, assignor to Owens-Corning Fiberglas Corporation, Toledo, Ohio
Filed Apr. 21, 1975, Ser. No. 570,290
Term of patent 14 years
Int. Cl. D5—*06*
U.S. Cl. D87—3 G

244,805
X-RAY UNIT STAND
Carl-Eric Ohlson, Solna, Sweden, assignor to AO:s Metall & Mek. Verkstad AB, Stockholm, Sweden
Filed May 23, 1975, Ser. No. 580,360
Claims priority, application Sweden, Nov. 25, 1974, 741966
Term of patent 14 years
Int. Cl. D24—*01*
U.S. Cl. D24—2



LIST OF PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 21ST DAY OF JUNE, 1977

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

A. H. Robins Company, Incorporated: *See*—
Welstead, William John, Jr., 4,031,245.

A. J. Harris & Sons, Inc.: *See*—
Raymond, Paul J., 4,030,156.

A P Products Incorporated: *See*—
Venaleck, John T., 4,030,799.

A-T-O Inc.: *See*—
Mais, James W.; and Myers, L. Paul, 4,030,269.

A. van Kaick "AvK" Generatoren- und Motorenwerke, Firma: *See*—
Beck, Dieter, 4,031,455.

Aaltonen, Olavi August; Andersson, Bengt Torsten; Juusela, Jyrki Tapani; Palperi, Matti Johannes; and Tuominen, Tapio Kalevi, to Outokumpu Oy. Process for producing raw copper continuously in one stage from unrefined sulfidic copper concentrate or ore. 4,030,915, Cl. 75-74.000.

AB Bofors: *See*—
Skagerlund, Lars-Erik, 4,030,420.

Abbots, David: *See*—
White, John; and Abbots, David, 4,030,842.

Abbott Laboratories: *See*—
Jones, Peter Hadley; Ours, Carroll Wayne; and Kyncl, Jaroslav, 4,031,242.

Abernathy, Frank W. Garbage recycling apparatus. 4,030,670, Cl. 241-14.000.

Abram, Doug. Sissy bar for a motorcycle. 4,030,750, Cl. 297-375.000.

Abramson, Irwin J., to Becton, Dickinson and Company. Novel assembly, compositions and methods. 4,030,978, Cl. 195-75.000.

ACF Industries, Incorporated: *See*—
Garner, Gerald D.; Hammonds, James C.; Holt, Jan D.; and Melcher, Conway H., 4,030,424.

Ackeret, Peter, to IDN Inventions and Development of Novelties AG. Holders for tape cassettes. 4,030,601, Cl. 206-387.000.

Ackerman, James H., to Sterling Drug Inc. Iodinated anilic acids. 4,031,088, Cl. 260-247.20A.

Ackerman, William R., Jr., to Olin Corporation. Reflex sight reticle illuminator. 4,030,203, Cl. 33-241.000.

Acme Eng. & Mfg. Corporation: *See*—
Bohanon, Hoy R., 4,031,180.

Acme Staple Company, Inc.: *See*—
Gordon, Stanley H., 4,030,656.

Adachi, Yoshio, to Hitachi, Ltd. Motor driving system and circuit therefor. 4,031,448, Cl. 318-696.000.

Adam, John M.: *See*—
Shelton, Jack P., Sr.; and Adam, John M., 4,030,226.

Adams, Terrence Miller: *See*—
Holloran, Thomas Patrick; Braden, Arthur Buell; Foley, Jerrold Stokes; Maynard, James Lucian; Klosky, John Patrick; Dissauer, Gerald Anthony; Adams, Terrence Miller; and Lorenz, Allan Alfred, 4,031,518.

Addressograph Multigraph Corporation: *See*—
Adhikari, Manoj C.; and Gardner, Joseph G., 4,030,409.
Goodwin, Eber Lyle, 4,030,724.
Holloran, Thomas Patrick; Braden, Arthur Buell; Foley, Jerrold Stokes; Maynard, James Lucian; Klosky, John Patrick; Dissauer, Gerald Anthony; Adams, Terrence Miller; and Lorenz, Allan Alfred, 4,031,518.

Adhikari, Manoj C.; and Gardner, Joseph G., to Addressograph Multigraph Corporation. Printing apparatus controls. 4,030,409, Cl. 101-47.000.

Advance Design Laboratories, Inc.: *See*—
Blair, Michael A.; and Hoffman, Robert M., 4,030,158.

AEG-Kanis Turbinenfabrik GmbH: *See*—
Deinlein-Kalb, Hans, 4,030,296.

Agatsuma, Kunio: *See*—
Nakamura, Yasushi; Agatsuma, Kunio; Tanaka, Yoshihiro; and Aono, Shunji, 4,031,134.

AGFA-Gevaert, A.G.: *See*—
Geisslinger, Wolfgang; and Ungnadner, Peter, 4,030,818.
Idel, Karsten-Josef; Saleck, Wilhelm; Wolff, Erich; and Freitag, Dieter, 4,030,929.
Muller, Gunter; and Kluge, Reimund, 4,030,602.
Renner, Gunter; Boie, Immo; and Scheben, Quirin, 4,031,130.
Stahlke, Kurt-Rainer; Krafft, Werner; Meyer, Rudolf; and Rosenkranz, Hans Jurgen, 4,030,926.
Wick, Richard; Bestenreiner, Friedrich; Deml, Reinhold; and Helmberger, Josef, 4,031,550.

AGFA-GEVAERT N.V.: *See*—
Hofman, Emiel Alexander, 4,030,924.

Agrinskaya, Lidia Ivanovna: *See*—
Khcheyan, Khachik Egorovich; Revenko, Olga Mikhailovna; Shatalova, Alla Nikolaevna; Gelperina, Eleonora Grigorievna; Agrinskaya, Lidia Ivanovna; and Muradian, Georgy Avanesovich, 4,031,128.

Ahlstone, Arthur G., to Vetco Offshore Industries, Inc. Wellhead seal apparatus and pulling tool for releasing and retrieving such apparatus. 4,030,544, Cl. 166-182.000.

Ahrel, Per Johan Ingemar: *See*—
Asplund, Arne Johan Arthur; Reinhall, Rolf Bertil; and Ahrel, Per Johan Ingemar, 4,030,969.

Ahrens, Hanns; Biere, Helmut; Rufer, Clemens; Schmiechen, Ralph; Schroeder, Eberhard; Loge, Olaf; Losert, Wolfgang; and Schillinger, Ekkehard, to Schering Aktiengesellschaft. Novel thiophene derivatives and their preparation. 4,031,236, Cl. 424-275.000.

Aidlin, Joseph W.: *See*—
Kessler, Saul, 4,031,027.

Aircraft Mecbanics, Inc.: *See*—
Kelley, Norman S.; and Pearne, Florentin J., 4,030,618.

Aishita, Hideki: *See*—
Fujii, Setsuro; Kajita, Yasumichi; Hiraku, Seizi; Kira, Heizo; Aishita, Hideki; Muryobayashi, Keiko; Terashima, Hiroshi; Akimoto, Akira; Taniguchi, Ken; and Wada, Minoru, 4,030,977.

Aizawa, Hiroshi: *See*—
Hosoe, Kazuya; Aizawa, Hiroshi; Matsumoto, Seiichi; and Yokota, Hideo, 4,031,383.

Akademiet for de tekniske Videnskaber, Svejsecentralen: *See*—
Lund, Svend Aage; Northeved, Allan; Solfjeld, Poul; and Fabrin, Knud Christian Claus, 4,030,343.
Northeved, Allan; Fabrin, Knud Christian Claus; and Solfjeld, Poul, 4,030,344.

Akae, Kiyoshi; Kitada, Masaya; and Uno, Yoshiyuki, to Unitika Ltd. Method and apparatus for regenerating activated carbon. 4,030,876, Cl. 432-14.000.

Akashi, Goro: *See*—
Suzuki, Osamu; Akashi, Goro; Kasuga, Akira; and Sega, Kenji, 4,030,685.

Akbari-Kenari, Reza: *See*—
Colter, John Cecil; James, Dean B.; Keith, Walter Gill; and Akbari-Kenari, Reza, 4,031,029.

Akebono Brake Industry Co., Ltd.: *See*—
Ogawa, Yutaka; and Hirai, Hiroshi, 4,030,577.

Akhnazariants, Levon Khachaturovich: *See*—
Ponomarenko, Nikolai Borisovich; Kononenko, Vadim Grigorievich; Stelmakh, Viktor Alexeevich; Kotelnikov, Vladimir Ivanovich; Valenya, Ivan Jurievich; Sarancha, Vladimir Nikolaevich; Petrenko, Anatoly Avramovich; Bozhko, Valery Pavlovich; Yatsenko, Sergei Vasilievich; Komnatny, Igor Pavlovich; Akhnazariants, Levon Khachaturovich; Strizhenko, Vitaly Evgenievich; Kolokolov, Boris Alexeevich; Maznichenko, Stanislav Anisimovich; Bozhko, Viktor Vasilievich; Bondarenko, Oleg Alexandrovich; and Zakirov, Robert Sharafutdinovich, 4,030,389.

Akimoto, Akira: *See*—
Fujii, Setsuro; Kajita, Yasumichi; Hiraku, Seizi; Kira, Heizo; Aishita, Hideki; Muryobayashi, Keiko; Terashima, Hiroshi; Akimoto, Akira; Taniguchi, Ken; and Wada, Minoru, 4,030,977.

Akimoto, Hidetoshi; Kaji, Ryuichi; Kikuchi, Hideo; Hishinuma, Yukio; and Arikawa, Yoshijiro, to Hitachi, Ltd.; and Babcock-Hitachi K.K. Process for making nitrogen oxides contained in flue gas harmless. 4,031,185, Cl. 423-239.000.

Akira, Itoh: *See*—
Akira, Kato; Akira, Itoh; Tohru, Uchida; and Masao, Ishihara, 4,030,921.

Akira, Kato; Akira, Itoh; Tohru, Uchida; and Masao, Ishihara, to Konishiroku Photo Industry Co., Ltd. Electrophotographic photosensitive material. 4,030,921, Cl. 96-1.500.

Aksjeselskapet Jotul: *See*—
Tronstad, Knut, 4,030,475.

Akzo N.V.: *See*—
Van Assendelft, Leendert, 4,030,248.

Akzona Incorporated: *See*—
deJongb, Hendrik Paul; and van Bokhoven, Cornelis Wilhelmus, 4,031,074.
Paoli, Alfred, 4,030,798.
Woods, Gilbert Frederick; Logan, Robert Thomas; McGarry, George; and Roy, Robert Gibson, 4,031,075.

Albrecht Baumer KG Spezialmaschinenfabrik: *See*—
Poetzsch, Rolf; and Schuster, Hans Gunther, 4,030,386.

Alcan Research and Development Limited: *See*—
Rodenchuk, William Simon; and Eccles, Anthony Garth, 4,030,536.

Alco Standard Corporation: *See*—
Rogers, Ronald D., 4,030,712.

Alderson, Larry Lee: *See—*
McMath, Jack Alan; Wilder, Paul R.; and Alderson, Larry Lee, 4,030,524.

Aldinger, Ulrich; and Kersten, Gunter, to Robert Bosch G.m.b.H. Radial piston machine. 4,030,405, Cl. 92-58.000.

Aleman, Augusto Cuevas. Apparatus and arrangement for conserving water for toilet flushing. 4,030,144, Cl. 4-3.000.

Alexander, Andrew, to Aluminum Company of America. Low temperature vapor sealing of anodized aluminum. 4,031,275, Cl. 427-248.00R.

Alexander, Robert L., to Hunt Manufacturing Co. Hanging file frame with resilient corner members. 4,030,610, Cl. 211-182.000.

Alexandrov, Vladimir Ilich; Osiko, Vyacheslav Vasilievich; Muraviev, Ernest Nikolaevich; Spiridonov, Eduard Georgievich; Tatarintsev, Vladimir Mikhailovich; and Gordon, Vladimir Grigorlevich. Sintered cermet containing ground monocrystals. 4,030,891, Cl. 75-234.000.

Alexeeva, Ljubov Antonovna: *See—*
Ponomarev, Alexei Ivanovich; Sokolov, Sergei Vasilievich; Larionova, Julia Alexeevna; Klebansky, Alexandr Leibovich; Berenblit, Vsevolod Volfovich; Dolnakov, Jury Pavlovich; Yagupolsky, Lev Moiseevich; Malovik, Vladlen Vasilievich; Lozinsky, Miron Onufrievich; Belous, Viktor Mikhailovich; Gruz, Boris Efimovich; Alexeeva, Ljubov Antonovna; Ankudinov, Anatoly Kirillovich; and Ryazanova, Rufina Mikhailovna, 4,031,119.

Alford, Andrew. Stacked arrays for broadcasting elliptically polarized waves. 4,031,536, Cl. 343-796.000.

Alford, Andrew. Collinear dipole array with reflector. 4,031,537, Cl. 343-704.000.

Alkon Laboratories, Inc.: *See—*
Gordon, Peter H., 4,031,451.

Allard, Michael Duane: *See—*
Parish, Harold Cheney; Allard, Michael Duane; Pettit, Jack Leland; and Spulgis, Ivars Sigurds, 4,030,639.

Allegheny Ludlum Industries, Inc.: *See—*
Shilling, Jack W.; Datta, Amitava; and Malagari, Frank A., Jr., 4,030,950.

Allen, Brockenbrough S.: *See—*
Stebbins, Robert C.; Allen, Brockenbrough S.; and Brown, Charles, 4,030,210.

Allen, Robert K.; Schoenfield, Palmer J.; and Morrison, Howard J., to Marvin Glass & Associates. Figure toy play kit. 4,030,234, Cl. 46-1.00R.

Allen, Robert M., to National Semiconductor Corporation. Stripe on strip plating apparatus. 4,030,999, Cl. 204-206.000.

Allenspach, Walter. Multi-function metal-working machine. 4,030,335, Cl. 72-389.000.

Allgood, Jay R. Arch beams and plates. 4,030,265, Cl. 52-723.000.

Allied Chemical Corporation: *See—*
Mendelsohn, Lewis Isaac; and Nesbitt, Ethan Allen, 4,030,892.
Weiss, William Robert; Cooksey, James Judson; Stables, Wilbur Leon; and Newell, Harry Lee, Jr., 4,030,651.

Altman, Janina: *See—*
Haviv, Fortuna; Patchornik, Abraham; and Altman, Janina, 4,031,083.

Altpeter, Arno: *See—*
Bassler, Gerd; and Altpeter, Arno, 4,030,525.

Alumax Mill Products, Inc.: *See—*
Papafingos, Pandelis N.; and Lance, Richard T., 4,030,914.

Aluminum Company of America: *See—*
Alexander, Andrew, 4,031,275.

Aluminum Plumbing Fixture Corporation: *See—*
Rowan, Frank E., 4,030,145.

Alvis, Robert L.; and Newsom, Melvin M., to United States of America, Energy Research and Development Administration. Well drilling apparatus and method. 4,030,537, Cl. 175-4.500.

Alwirt, Robert S., to United Chemi-Con, Inc. Electrolyte capacitors. 4,031,436, Cl. 361-301.000.

Amano, Yoshifumi: *See—*
Arisawa, Kuniyoshi; and Amano, Yoshifumi, 4,031,541.

Amato, Joseph S.: *See—*
Karady, Sandor; and Amato, Joseph S., 4,031,086.

Amchem Products, Inc.: *See—*
Hall, Wilbur S.; and Steinbrecher, Lester, 4,030,945.

Ament, Richard L., II: *See—*
Fullenwider, Malcolm A., 4,031,291.

American Air Filter Company, Inc.: *See—*
Kniss, Edward L., Jr.; Hisenbaugh, Dennis L.; Maudlin, Jerry A.; and Brozenick, Nicholas J., 4,030,740.

American Cyanamid Company: *See—*
Schmitt, Joseph Lawrence, Jr.; Walker, Philip Leroy, Jr.; and Castellion, George Augustus, 4,031,137.
Schrider, Michael Stanley, 4,031,239.

American Fish Company: *See—*
Hoult, David P., 4,030,450.

American Hoechst Corporation: *See—*
Helsley, Grover C.; and Strupczewski, Joseph, 4,031,221.
Martin, Lawrence Leo; and Duffy, Brian J., 4,031,224.

American Optical Corporation: *See—*
Siegmund, Walter P., 4,031,423.

American Science & Engineering, Inc.: *See—*
Jacob, Daniel, 4,031,401.
Stein, Jay A.; and Annis, Martin, 4,031,545.

AMF Incorporated: *See—*
Koch, Claude V., 4,031,339.

AMP Incorporated: *See—*
Bunnell, Edward Dennman, 4,030,801.
Enomoto, Masahiro, 4,030,804.
Sheesley, Wilmer Lee, 4,030,791.

Amsted Industries Incorporated: *See—*
Lea, Paul M., III, 4,030,919.

Analogic Corporation: *See—*
Neumann, Leopold, 4,031,533.

Anders, Walter G., to Diebold, Incorporated. Bank window construction. 4,030,258, Cl. 52-208.000.

Anderson, Arthur E., to Westinghouse Electric Corporation. Projection color television system. 4,031,542, Cl. 358-60.000.

Anderson, Carl Clement; and Dowbenko, Rostyslaw, to PPG Industries, Inc. Mercaptan blocked thermosetting copolymers. 4,031,290, Cl. 428-480.000.

Anderson, James H., to Sea Solar Power, Inc. Pump starting system for sea thermal power plant. 4,030,301, Cl. 60-641.000.

Anderson, John: *See—*
Jesty, Thomas William; Anderson, John; and 53, 4,030,407.

Andersson, Bengt Torsten: *See—*
Aaltonen, Olavi August; Andersson, Bengt Torsten; Juusela, Jyrki Tapani; Pulperi, Matti Johannes; and Tuominen, Tapio Kalevi, 4,030,915.

Ando, Shizuo; and Okamura, Akira, to Pioneer Electronic Corporation. Remote controllable telephone answering device having a dual playback capability. 4,031,323, Cl. 179-6.00E.

Andrevski, Zygmunt M.; and Lurie, Michael Jay, to RCA Corporation. Hydrostatic bearing apparatus. 4,030,815, Cl. 350-255.000.

Andrews, James R.: *See—*
Lawton, Robert A.; and Andrews, James R., 4,030,840.

Aneshansley, Nicholas E., to Instrulab Incorporated. Digital second-order clock linearizer. 4,031,530, Cl. 340-347.0NT.

Angell and Associates: *See—*
Angell, Robert L., 4,030,603.

Angell, Robert L., to Angell and Associates. Protective package and method therefor. 4,030,603, Cl. 206-521.000.

Angelopoulos, Peter Gregory: *See—*
Krause, Ernest Harry; Seaman, Wesley Arthur; and Angelopoulos, Peter Gregory, 4,031,466.

Anglada, Leonard R.: *See—*
Binard, William J.; Ciarico, Anthony J.; Anglada, Leonard R.; and Patel, Bhupendra C., 4,030,497.

Anglonor S. A.: *See—*
Atmore, Milton Graham Montgomery; and Macpherson, Roy Duncan, 4,030,989.

Angue, Robert: *See—*
Wander, Raoul; and Angue, Robert, 4,030,406.

Ankudinov, Anatoly Kirillovich: *See—*
Ponomarev, Alexei Ivanovich; Sokolov, Sergei Vasilievich; Larionova, Julia Alexeevna; Klebansky, Alexandr Leibovich; Berenblit, Vsevolod Volfovich; Dolnakov, Jury Pavlovich; Yagupolsky, Lev Moiseevich; Malovik, Vladlen Vasilievich; Lozinsky, Miron Onufrievich; Belous, Viktor Mikheilovich; Gruz, Boris Efimovich; Alexeeva, Ljubov Antonovna; Ankudinov, Anatoly Kirillovich; and Ryazanova, Rufina Mikhailovna, 4,031,119.

Annis, Martin: *See—*
Stein, Jay A.; and Annis, Martin, 4,031,545.

Anno, Gousuke, to Tokyo Shibaura Electric Co., Ltd. Artificial kidney device. 4,031,008, Cl. 210-137.000.

Anthony, Andrew James; and Hutchinson, John Jefferson, to Combustion Engineering, Inc. Fuel assembly for a nuclear reactor. 4,030,975, Cl. 176-78.000.

Antonio, Christo; and Uhl, Wyman F., to Litton Business Systems, Inc. Method of manufacture decorative laminate to provide glue adherable back surface. 4,030,955, Cl. 156-235.000.

Anvar Agence Nationale de Valorisation de la Recherche: *See—*
Delcayre, Guy, 4,030,731.

Anki, Hiroyuki: *See—*
Sugiura, Kensuke; Kagaya, Mineo; Fujisou, Tokuo; Anki, Hiroyuki; Takehara, Takeichiro; and Kurata, Shigenori, 4,031,020.

Aono, Sbunji: *See—*
Nakamura, Yasushi; Agatsuma, Kunio; Tanaka, Yoshihiro; and Aono, Shunji, 4,031,134.

Aparicio, Luis; Gayo, Nenesio; M^a ; Martin, Jose Luis; and Ron, Armando, to Juste, S.A. Quimico-Farmaceutica. 2-(4-Isobutyl phenyl)butyric acid, salts thereof, and pharmaceutical compositions containing the same. 4,031,243, Cl. 424-317.000.

Appleton Electric Company: *See—*
Pastorel, Robert J., 4,031,340.

Arai, Takeshi, to Sanyo Electric Co., Ltd. Electronic channel selecting apparatus. 4,031,475, Cl. 325-455.000.

Arcamone, Federico: *See—*
Patelli, Bianca; Bernardi, Luigi; Arcamone, Federico; and di Marco, Aurelio, 4,031,211.

Archer, John L.; Tocci, Leonard R.; and Williams, Jeffrey L., to Rockwell International Corporation. Magnetic bubble domain detection device. 4,031,526, Cl. 340-174.0TF.

Archer, Wendel Edward, to Bell Telephone Laboratories, Incorporated. Multiple path sealed spring switch. 4,031,494, Cl. 335-154.000.

Archibald, G. Kent, to Minnesota Mining and Manufacturing Company. High frequency-high voltage level electrosurgical unit. 4,030,501, Cl. 128-303.140.

Arenco AB: *See—*
Reichstein, Erik Laurits, 4,030,163.

Arguin, Gerard A. Tandem trailer system. 4,030,171, Cl. 280-408.000.

Arikawa, Yosbijiro: *See—*
Akimoto, Hidetoshi; Kaji, Ryuichi; Kikuchi, Hideo; Hishinuma, Yukio; and Arikawa, Yoshijiro, 4,031,185.

Arisawa, Kuniyoshi; and Amano, Yoshifumi, to Sony Corporation. Color video display system. 4,031,541, Cl. 358-56.000.

Armor, Anthony F.; Chari, Madabushi V. K.; Kudlacik, Henry W.; and Reece, Paul, to General Electric Company. Gas cooled flux shield for dynamoelectric machine. 4,031,422, Cl. 310-256.000.

Arnaud, Guy. Molded packaging system. 4,030,267, Cl. 53-27.000.

Arneklev, Duane R.; and Baker, Don R., to Stauffer Chemical Company. Sulfide herbicide antidote compositions and method of use. 4,030,911, Cl. 71-98.000.

Arnold, Robert Harry, to Metal Box Company Limited, The. Pack-forming apparatus. 4,030,270, Cl. 53-183.000.

Arolski, Angel Tomov; Usheva, Velichka Borissova; Gruev, Peter Vassilev; Richev, Georgi Trendafilov; and Doncheva, Zvetana Semkova, to DSO "Bulgarplod". Method for producing durable fruit-dairy and vegetable-dairy drinks. 4,031,264, Cl. 426-590.000.

Aronoff, Elihu J.; and Dhemi, Kewal Singh, to International Telephone and Telegraph Corporation. Crosslinking fluorocarbon compositions using polyallylic esters of polycarboxylic acids. 4,031,167, Cl. 260-884.000.

Aronson, Albert Irving, to RCA Corporation. Passive cooler. 4,030,316, Cl. 62-467.00R.

Arsenault, Albert J.: *See—*
Azadian, Jacques; and Arsenault, Albert J., 4,030,155.

Arthur D. Little, Inc.: *See—*
Trombly, John E., 4,031,449.

Aseo, Maknto; Ito, Susumu; and Umehara, Hidetoshi, to Mikuni Kogyo Kebushiki Kaisha. Ultrasonic air bumidifying apparatus. 4,031,171, Cl. 261-1.000.

ASEA Aktiebolag: *See—*
Dahle, Orvar; von Knorring, Folke; and Siby, Sture, 4,030,346.
Fredrickson, Bengt; and Stenkvist, Sven-Einar, 4,031,308.

Asperger, Paul. Windmill with shroud adjusting means. 4,031,405, Cl. 290-55.000.

Asplund, Arne Johan Arthur; Reinhall, Rolf Bertil; and Ahrel, Per Johan Ingemar, to Defibrator AB. Method of dispersing a bleaching agent into a stream of fibrous cellulosic pulp material in a throttling nozzle. 4,030,969, Cl. 162-23.000.

Atanessov, Haralampi Aangelov: *See—*
Kochemidov, Atanas Dimitrov; Makedonski, Boris Georgiev; Dumanov, Ivan Minkov; Payakov, Stefan Georgiev; Galabov, Peter Konstantinov; and Atanassov, Haralampi Aangelov, 4,030,249.

Atel Products Limited: *See—*
Board, Kenneth B., 4,030,770.

Atlantic Research Corporation: *See—*
Holly, Sandor, 4,030,830.

Atlantic Richfield Company: *See—*
Edison, Robert Raynold; and Dresser, Thorpe, 4,031,154.
Leonard, John J., 4,031,196.
Simpson, Terry Lee, 4,030,752.
Wilson, Leland Earl, 4,030,305.

Atmore, Milton Graham Montgomery; and Macpherson, Roy Duncan, to Anglonor S. A. Electrowinning process. 4,030,989, Cl. 204-104.000.

Atwood, Feliz M., to Square D Company. Safety guard for press brakes. 4,030,364, Cl. 72-389.000.

Audaire, Luc; Borel, Joseph; Le Goascoz, Vincent; and Poujois, Robert, to Commissariat a l'Energie Atomique. Method and device for the integration of analog signals. 4,031,380, Cl. 235-183.000.

Auer, Eberhard: *See—*
Vogt, Wilhelm; Auer, Eberhard; Lenx, Gunter; Merkenich, Karl; Henning, Klaus; and Kandler, Joachim, 4,031,022.

Augat, Inc.: *See—*
Hanlon, Richard J.; Damon, Neil F.; and Yeo, Herbert G., 4,030,793.

Auge, Wolfgang: *See—*
Thiem, Karl-Werner; Auge, Wolfgang; and Neeff, Rutger, 4,031,116.

Auriol, Alain; and Tritten, Paul, to Compagnie Generale d'Electroceramique. Process for the manufacture of articles of translucent alumina. 4,031,177, Cl. 264-65.000.

Austel, Volkhard: *See—*
Kutter, Eberhard; Austel, Volkhard; Eberlein, Wolfgang; Heider, Joachim; Kobinger, Walter; Lillie, Christian; and Kadatz, Rudolf, 4,031,219.

Automobiles Peugeot: *See—*
Colinet, Andre, 4,030,379.

Automotive Products Limited: *See—*
Young, Alastair John, 4,030,771.

Avedisian, Armen O. Impermeable ecological barrier and process of making same from reconstituted shale. 4,030,307, Cl. 61-35.000.

Azadian, Jacques; and Arsenault, Albert J. Clog sole. 4,030,155, Cl. 12-146.00B.

B. F. Goodrich Company, The: *See—*
Eden, Jamal S., 4,031,149.

B-5 Associates of Stamford, Connecticut: *See—*
Leonard, Hamlin, 4,030,373.

Baardman, Frank: *See—*
Lukas, Joachim H.; Baardman, Frank; and Kouwenhoven, Adriaan P., 4,031,152.

Babcock-Hitachi K.K.: *See—*
Akimoto, Hidetoshi; Kaji, Ryuichi; Kikuchi, Hideo; Hishinuma, Yukio; and Arikawa, Yoshijiro, 4,031,185.

Babcock & Wilcox Company, The: *See—*
Coleman, Bob G., 4,030,261.

Babson Bros. Co.: *See—*
McKenzie, Wray V., 4,030,513.

Binard, William J.; Ciarico, Anthony J.; Anglada, Leonard R.; and Patel, Bhupendra C., to Kendall Company, The. Syringe assembly. 4,030,497, Cl. 128-215.000.

Bingham and Taylor: *See*—
Zinn, Frank R., 4,030,519.

Birum, Gail H., to Monsanto Company. Phosphorus compounds. 4,031,170, Cl. 260-932.000.

Bissell, Henry M. Simple machine. 4,030,703, Cl. 254-135.00R.

Bittermann, Hans, to Siemens Aktiengesellschaft. Arrangement for connecting information transducers in program controlled processing systems. 4,031,314, Cl. 178-3.000.

BJ-Hughes Inc.: *See*—
Langowski, Faustyn Cornell, 4,030,746.

Black Clawson Company, The: *See*—
Couture, Joseph Walter, 4,030,671.

Blackwell, Samuel E., to Eastman Kodak Company. Solvent dyeing compositions and a method of dyeing polyester fibers therewith. 4,030,882, Cl. 8-39.00R.

Blair, Michael A.; and Hoffman, Robert M., to Advance Design Laboratories, Inc. Hair brush. 4,030,158, Cl. 15-159.00A.

Blanke, John David; and Brunell, Norman Eliot, to Beckman Instruments, Inc. Engine analysis apparatus. 4,030,349, Cl. 73-116.000.

Bleeker, Raymond A., to Westinghouse Electric Corporation. Non-exposed drawer lock. 4,030,788, Cl. 312-333.000.

Bly, Herbert Arthur. Method of forming captive can closure. 4,030,433, Cl. 113-121.00C.

Board, Kenneth B., to Atel Products Limited. Rear wheel jacking system. 4,030,770, Cl. 280-43.230.

Bobka, George R., to Raymond Lee Organization, Inc., The. Portable trailer dump bed. 4,030,751, Cl. 298-1.00A.

Bode, Herbert, to Claudius Peters AG. Thrust grate such as a heat exchange grate. 4,030,206, Cl. 34-164.000.

Boden, Heinrich; and Knipp, Ulrich, to Bayer Aktiengesellschaft. Apparatus for dosing and mixing fluid reactants. 4,030,637, Cl. 222-137.000.

Boehringer Ingelheim GmbH: *See*—
Koppe, Herbert; Zeile, Karl; Kummer, Werner; Stahle, Helmut; and Danneberg, Peter, 4,031,244.

Kutter, Eberhard; Austel, Volkhard; Eberlein, Wolfgang; Heider, Joachim; Kobioger, Walter; Lillie, Christian; and Kadetz, Rudolf, 4,031,219.
Losel, Walter; Traunecker, Werner; and Hoefke, Wolfgang, 4,031,212.

Boehringer Mannheim G.m.b.H.: *See*—
Kuhn, Rolf; Hardebeck, Klaus; and Heinemann, Helmut, 4,031,213.

Boeing Company, The: *See*—
Brogan, Joseph; and Baker, Irwin Gerald, 4,030,787.
Cacciola, Michael John; and Mjolsnes, Leonard Olaf, 4,030,578.
Hapke, Donald William, 4,030,687.
Stachowiak, Claude R., 4,030,290.

Boettcher, William A. Brush accessory for floor sanders. 4,030,251, Cl. 51-177.000.

Boetto, Charles; Orkwiszewski, Wayne L.; and Connor, Donald E., to International Harvester Company. Folding flex toolbar. 4,030,551, Cl. 172-126.000.

Boffa, Gioacchino: *See*—
Pieri, Giampiero; Carlini, Filippo Maria; Paffoni, Camillo; and Boffa, Gioacchino, 4,031,096.

Bogue, John C.: *See*—
Sarbacher, Robert I.; and Bogue, John C., 4,031,296.

Bohanon, Hoy R., to Acme Eng. & Mfg. Corporation. Cooling pad system. 4,031,180, Cl. 261-106.000.

Boie, Immo: *See*—
Renner, Gunter; Boie, Immo; and Scheben, Quirin, 4,031,130.

Boll, Jurgen: *See*—
Buttner, Karl; Boll, Jurgen; and Wolfel, Kurt, 4,030,174.

Bolles, Theodore F.: *See*—
Jackson, Richard A.; and Bolles, Theodore F., 4,031,198.

Bond, Walter L.; Cutler, Cassius C.; and Lemons, Ross A., to Leland Stanford Junior University, The Board of Trustees of. Acoustic microscope for scanning an object stereo-optically and with dark field imaging. 4,030,342, Cl. 73-67.50R.

Bondarenko, Oleg Alexandrovich: *See*—
Ponomarenko, Nikolai Borisovich; Kononenko, Vadim Grigorievich; Stelmakh, Viktor Alexeevich; Kotelnikov, Vladimir Ivanovich; Valenye, Ivan Jurievich; Sarancha, Vladimir Nikolaevich; Petrenko, Anatoly Avramovich; Bozhko, Valery Pavlovich; Yatsenko, Sergei Vasilievich; Komnatny, Igor Pavlovich; Akhnazariants, Levon Khachaturovich; Strizhenko, Vitaly Evgenievich; Kolokolov, Boris Alexeevich; Maznichenko, Stanislav Anisimovich; Bozhko, Viktor Vasilievich; Bondarenko, Oleg Alexandrovich; and Zakirov, Robert Sharafutdinovich, 4,030,389.

Bonner, John J.: *See*—
Kazahaya, Masahiro; and Bonner, John J., 4,030,366.

Bontrager, Jacob. Vehicle supported motor lift. 4,030,705, Cl. 254-139.100.

Borel, Joseph; and Robert, Jacques, to Commissariat a l'Energie Atomique. Thermal method for controlling the optical properties of a liquid crystal and devices for the application of said method. 4,031,529, Cl. 340-324.00R.

Borel, Joseph: *See*—
Audaire, Luc; Borel, Joseph; Le Goascoz, Vincent; and Poujois, Robert, 4,031,380.

Borg-Warner Corporation: *See*—
Harnish, James R., 4,030,315.
Robinson, Elmer D.; and Struttmann, Hilarius S., 4,030,785.

Borgqvist, Lennart Rickard, to Kamas Industri Aktiebolag. Process and an apparatus for producing fluffed fiber materials. 4,030,672, Cl. 241-18.000.

Borys, Emil G., Jr., to Hydrometals, Inc. Impedance matcbing device. 4,031,540, Cl. 343-860.000.

Bosa, Primo, to Hooker Chemicals & Plastics Corporation. Electrolytic cell for the production of alkali metal hydroxides having removable orifices for metering fluids to the anode and cathode compartments. 4,031,001, Cl. 204-257.000.

Boser, Ronald J.; and Siegel, Walter P., to Special Sewing Systems, Inc. Sewing machine attachment. 4,030,429, Cl. 112-104.000.

Bossart, Clayton J.: *See*—
Poli, Albert A.; Bossart, Clayton J.; and Benzie, Thomas P., 4,030,887.

Bosserman, David A.; and Freeman, Charles F., to United States of America, Army. Miniature flat panel photocathode and microchannel plate picture element array image intensifier tube. 4,031,552, Cl. 358-241.000.

Bossert, Friedrich; Meyer, Horst; and Vater, Wulf, to Bayer Aktiengesellschaft. 1,4-Dihydropyridine carboxylic acid esters. 4,031,104, Cl. 260-295.50R.

Bouchal, Karel: *See*—
Kalal, Jaroslav; Coupek, Jiri; Pokorny, Svatopluk; Svec, Frantisek; and Bouchal, Karel, 4,031,037.

Bouck, Larry S., to Cities Service Company. Recovery of geothermal energy. 4,030,549, Cl. 166-280.000.

Bourgeois, Jean-Luc: *See*—
Bouy, Pierre; Juillard, Michel; and Bourgeois, Jean-Luc, 4,031,041.

Bourgery, Guy R.: *See*—
Fauran, Claude P.; Bourgery, Guy R.; Raynaud, Guy M.; and Dorme, Nicole A. M., 4,031,089.

Bouvier, David William; Green, William Geary; and Moore, Randolph Gaylon, to Motorola, Inc. Frequency spectrum analyzer. 4,031,462, Cl. 324-77.00B.

Bouy, Pierre; Juillard, Michel; and Bourgeois, Jean-Luc, to Rhone-

Poulenc Industries. Cloth comprising asbestos fibers and method of producing said cloth. 4,031,041, Cl. 260-2.50M.

Bower, Lewis Robert: *See—*
Dudley, Philip; Bower, Lewis Robert; and Wake, Malcolm, 4,030,308.

Bowers, David L., to General Electric Company. Standby heart pacer. 4,030,510, Cl. 128-419.0PG.

Boyce, John G.; and Boyce, Richard G. Wiggle table electronic ball game device. 4,030,555, Cl. 273-110.000.

Boyce, Richard G.: *See—*
Boyce, John G.; and Boyce, Richard G., 4,030,555.

Boyd, Violet; Fishwick, Brian Ribbons; and Glover, Brian, to Imperial Chemical Industries Limited. Coloration process. 4,030,881, Cl. 8-39.00C.

Bozhko, Valery Pavlovich: *See—*
Ponomarenko, Nikolai Borisovich; Kononenko, Vadim Grigorievich; Stelmakh, Viktor Alexeevich; Kotelnikov, Vladimir Ivanovich; Valenya, Ivan Jurievich; Sarancha, Vladimir Nikolaevich; Petrenko, Anatoly Avramovich; Bozhko, Valery Pavlovich; Yatsenko, Sergei Vasilievich; Komnatny, Igor Pavlovich; Akhnazariants, Levon Khachaturovich; Strizhenko, Vitaly Evgenievich; Kolokolov, Boris Alexeevich; Maznichenko, Stanislav Anisimovich; Bozhko, Viktor Vasilievich; Bondarenko, Oleg Alexandrovich; and Zakirov, Robert Sharafutdinovich, 4,030,389.

Bozhko, Viktor Vasilievich: *See—*
Ponomarenko, Nikolai Borisovich; Kononenko, Vadim Grigorievich; Stelmakh, Viktor Alexeevich; Kotelnikov, Vladimir Ivanovich; Valenya, Ivan Jurievich; Sarancha, Vladimir Nikolaevich; Petrenko, Anatoly Avramovich; Bozhko, Valery Pavlovich; Yatsenko, Sergei Vasilievich; Komnatny, Igor Pavlovich; Akhnazariants, Levon Khachaturovich; Strizhenko, Vitaly Evgenievich; Kolokolov, Boris Alexeevich; Maznichenko, Stanislav Anisimovich; Bozhko, Viktor Vasilievich; Bondarenko, Oleg Alexandrovich; and Zakirov, Robert Sharafutdinovich, 4,030,389.

Braden, Arthur Buell: *See—*
Holloran, Thomas Patrick; Braden, Arthur Buell; Foley, Jerrold Stokes; Maynard, James Lucian; Klosky, John Patrick; Dissauer, Gerald Anthony; Adams, Terrence Miller; and Lorenz, Allan Alfred, 4,031,518.

Brand, Bridget A.; and Brand, Joseph. Sound producing device. 4,031,320, Cl. 179-1.0AA.

Brand, Joseph: *See—*
Brand, Bridget A.; and Brand, Joseph, 4,031,320.

Brand, Wayne R. Safety check hill receptacle. 4,031,357, Cl. 235-12.000.

Brandenstein, Manfred: *See—*
Ernst, Horst M.; Olschewski, Armin; and Brandenstein, Manfred, 4,030,191.

Brax, Harri J.; Porinchak, Joseph F.; and Weinberg, Alan S., to W. R. Grace & Co. Polymer film with narrow molecular weight distribution and saran and laminates thereof. 4,031,162, Cl. 260-837.0PV.

Breuker, Jacobus H.: *See—*
Berger, Hans; De Lind Van Wijngaarden, Gerhard; and Breuker, Jacobus H., 4,031,016.

Bricknell, William H.; and Sunderlage, Gerald N., to Clark Equipment Company. Fairlead and implement hitch and method of implement retrieval. 4,030,776, Cl. 280-477.000.

Bridges, Alvin C. Adjustable mounting for pivotal wheel support. 4,030,737, Cl. 280-661.000.

Bridges, Ronald P. Electrical interrupter switch. 4,031,346, Cl. 200-146.00R.

Bridwell, John W.; Hopkins, Donald L.; and Lohbeuer, Kenneth R., to Caterpillar Tractor Co. Hydraulic circuitry for an excavator. 4,030,623, Cl. 214-138.00R.

Briney, Douglas W., to General Dynamics Corporation. Optical scanning system with canted and tilted reflectors. 4,030,807, Cl. 350-7.000.

Brinza, Joseph E.: *See—*
Stock, Arthur J.; Christofer, Donald E.; and Brinza, Joseph E., 4,030,708.

Bristol-Myers Company: *See—*
Juhy, Peter Frederick; and Partyka, Richard Anthony, 4,031,093.

British Aircraft Corporation Limited: *See—*
Pedlar, Roy; Spencer, Alan Roderick; and Edwards, Colin, 4,030,434.

British Petroleum Company Limited, The: *See—*
Telfer, Ian Edmund, 4,030,438.

Britton, James S., to Westinghouse Electric Corporation. CMOS comparator. 4,031,511, Cl. 340-146.200.

Brock, Helmut E. Sun shade apparatus. 4,030,748, Cl. 297-184.000.

Brogan, Joseph; and Baker, Irwin Gerald, to Boeing Company, The. Turntable bearing. 4,030,787, Cl. 308-227.000.

Bromels, Marilyn H.: *See—*
Pedersen, Charles John; and Bromels, Marilyn H., 4,031,111.

Bronstert, Klaus; Fahrbach, Gerhard; Krahe, Eduard; Ladenberger, Volker; Kastning, Ernst-Guenther; Mittnacht, Hans; Willersinn, Herbert; and Trieschmann, Hans-Georg, to Badische Anilin- & Soda-Fabrik Aktiengesellschaft. Impact-resistant polystyrene, α-olefin, block copolymer blends. 4,031,166, Cl. 260-876.00B.

Brooks, Norman B.; and Gimstead, Michael M., to Pass-Port Systems, Inc. Wafer transport system. 4,030,622, Cl. 214-17.00B.

Brown, Charles: *See—*
Stebbins, Robert C.; Allen, Brockenbrough S.; and Brown, Charles, 4,030,210.

Brown, Harold Ben. Air treating dispenser. 4,030,474, Cl. 126-113.000.

Brown, John William. Storage device for shared game pieces. 4,030,765, Cl. 273-148.00R.

Brown Oil Tools, Inc.: *See—*
Rogers, Jerry L.; and Cochran, Chudleigh B., 4,030,546.

Brown, Omar L., to Fraze, Ermal C. Easy-open ecology end. 4,030,631, Cl. 220-269.000.

Brown, Paul L., to Dow Corning Corporation. Organobromosilicone fluids. 4,031,121, Cl. 260-448.80R.

Brown, Paul L., to Dow Corning Corporation. Arylorganobromosilicone compounds. 4,031,122, Cl. 260-448.80R.

Brown, Robert Saul; Eschenbach, Paul W.; and King, Herbert Ray, to Milliken Research Corporation. Quick disconnect coupling. 4,030,582, Cl. 192-67.00P.

Brown & Root, Inc.: *See—*
Rafferty, Andrew J., 4,030,311.

Brozenick, Nicholas J.: *See—*
Kniss, Edward L., Jr.; Hixenbaugh, Dennis L.; Maudlin, Jerry A.; and Brozenick, Nicholas J., 4,030,740.

Brueckner, Wolfgang, to Siemens Aktiengesellschaft. Thermistor device. 4,031,499, Cl. 338-23.000.

Brugger, Richard D.; and Lovercheck, Charles L. Copying machine. 4,030,823, Cl. 355-8.000.

Brugger, Richard D.; and Barna, Joseph A., to Zurn Industries, Inc. Electronic remote reading system for a meter. 4,031,362, Cl. 235-92.0FL.

Brunell, Norman Eliot: *See—*
Blanke, John David; and Brunell, Norman Eliot, 4,030,349.

Bruni, Rudolph C. Spade bit holder. 4,030,599, Cl. 206-379.000.

Brunswick Corporation: *See—*
Puryear, John W., 4,030,473.

Bucalo, Louis. Method and apparatus for providing living beings with absorbable implants. 4,030,499, Cl. 128-260.000.

Buchman, William W., to Hughes Aircraft Company. Position determining systems. 4,030,686, Cl. 244-3.130.

Buckle, Derek Richard; Cantello, Barrie Christian Charles; and Smith, Harry, to Beecham Group Limited. 4-Hydroxy-3-nitro-5,6,7,8 tetrahydro-carbostyrils. 4,031,099, Cl. 260-289.00K.

Buckley, Donald J.: *See—*
Thaler, Warren A.; Buckley, Donald J.; and Kennedy, Joseph P., 4,031,300.

Buckner, William L. Traction apparatus. 4,030,489, Cl. 128-75.000.

Bucyrus-Erie Company: *See—*
Christian, Edward H.; Mains, Donald M.; and Treiber, James H., 4,031,440.

Budevski, Evgueni Bogdanov; Iliev, Iliya Dimitrov; Kaisheva, Anastasiya Rostislavova; Gamburtzev, Sergei Sergeev; and Vakanova, Elena Borisova, to ZLEHIT pri BAN. Method for producing powdered wetproofed material useful in making gas-diffusion electrodes. 4,031,033, Cl. 252-511.000.

Bugaut, Andree: *See—*
Kalopissis, Gregoire; and Bugaut, Andree, 4,031,160.

Buildex Incorporated: *See—*
Loikitz, Frank F., 4,030,161.

Bukowick, Peter Anthony, to Hercules Incorporated. Certain oximinyl allophanates and their use as herbicides. 4,030,912, Cl. 71-120.000.

Bulman, David Nicholas; and Maunder, Leonard, to National Research Development Corporation. Gyroscopic apparatus. 4,030,371, Cl. 74-5.00F.

Bultez, Alain E.: *See—*
Vaesken, Maryvonne J.; Bultez, Alain E.; and Dalle, Jean-Paul, 4,030,883.

Bunce, Donald A., to Kelvinator, Inc. Refrigerator construction and the manufacture of panels therefor. 4,030,870, Cl. 425-383.000.

Bunkley, Rex L.; and Powanda, Thomas M., to Celanese Corporation. Protective colloids from alcoholysis products of polyalcohols and polyacrylate esters. 4,031,053, Cl. 260-29.6RW.

Bunnell, Edward Dennman, to AMP Incorporated. Electrical connector junction for carpeted floor. 4,030,801, Cl. 339-121.000.

Burger, William R.: *See—*
Christou, Kyriakos; Kruklitis, Karlis; and Burger, William R., 4,031,359.

Smith, Edwin Studley, 4,031,297.

Gordon, Peter H., to Alkon Laboratories, Inc. Charging circuit with SCR's triggered by pedestal and cosine modified ramp unijunction circuit having means for current limiting by controlling pedestal level. 4,031,451, Cl. 320-23.000.

Gordon, Stanley H., to Acme Staple Company, Inc. Stapler. 4,030,656, Cl. 227-131.000.

Gordon, Vladimir Grigorievich: *See*—
Alexandrov, Vladimir Ilich; Osiko, Vyacheslav Vasilievich; Muraviev, Ernest Nikolaevich; Spiridonov, Eduard Georgievich; Tatarintsev, Vladimir Mikhailovich; and Gordon, Vladimir Grigorievich, 4,030,891.

Gorin, Everett; Jasulaitis, William A.; Theodore, Frank W.; and Wasson, George E., to Consolidation Coal Company. Process of making formcoke from non-caking or weakly caking coals. 4,030,982, Cl. 201-6.000.

Gorog, Istvan: *See*—
Firester, Arthur Herbert; and Gorog, Istvan, 4,030,835.

Goshima, Takeshi; and Mochizuki, Noritaka, to Canon Kabushiki Kaisha. Scanning optical system. 4,030,806, Cl. 350-7.000.

Goswami, Jagadish Chandra, to Stauffer Chemical Company. Foamable PVC resin formulation, process for foaming, and product thereof. 4,031,045, Cl. 260-2.50R.

Gottschlich, Rudolf; Rogalski, Werner; Bergmann, Rolf; Steinigeweg, Rosmerie; and Wehlig, Helmut, to Merck Patent Gesellschaft mit beschrankter Haftung. Novel penicillins and their preparation. 4,031,230, Cl. 424-271.000.

Gougeon, Thomas William: *See*—
Laughlin, Robert Gene; and Gougeon, Thomas William, 4,031,202.

Gough, Stanley T.; Tohias, Michael A.; and Napier, Roger P., to Mobil Oil Corporation. Carbamate insecticides from 5,8-dihydro-5,8-methano-1-naphthol and its derivatives. 4,031,237, Cl. 424-278.000.

Gowrinathan, Sankaran, to United States of America, Navy. Phase detector for optical figure sensing. 4,030,831, Cl. 356-109.000.

Grado, Joseph F. Electromagnetic pickup with magnetic gap displacement generator. 4,031,336, Cl. 179-100.41K.

Graham, John C., to Hooker Chemicals & Plastics Corporation. Process for the directed chlorination of alkylbenzenes. 4,031,142, Cl. 260-650.00R.

Graham, John C., to Hooker Chemicals & Plastics Corporation. Process for directed chlorination of alkylbenzenes. 4,031,147, Cl. 260-650.00R.

Granges Essem Aktiebolag: *See*—
Wallin, Jan-Olof, 4,030,682.

Grannis, Roland K., to Pacific Utilities Supply Co. Utility pole drill guide. 4,030,854, Cl. 408-115.00B.

Graupe, Daniel, to United States of America, Veterans Administration. Multi-function control system for an artificial upper-extremity prosthesis for above-elbow amputees. 4,030,141, Cl. 3-1.100.

Gray, Robert. Pallet racks. 4,030,612, Cl. 211-192.000.

Graybeal, Walter C. Manhole closure including a two-way pressure relief valve. 4,030,851, Cl. 404-25.000.

Grayhill, Inc.: *See*—
Garcia, Ricardo L., 4,031,345.

Grechinsky, Dmitry Alexeevich: *See*—
Yakshin, Alexandr Sergeevich; Novikov, Oleg Nikolaevich; Grechinsky, Dmitry Alexeevich; Klochko, Viktor Alexandrovich; and Rygalin, Viktor Georgievich, 4,030,339.

Green, William Geary: *See*—
Bouvier, David William; Green, William Geary; and Moore, Randolph Gaylon, 4,031,462.

Griffin, Thomas J., Jr., to Dow Chemical Company, The. Method of reducing friction loss. 4,031,014, Cl. 252-8.55R.

Griffith, Glen R.: *See*—
Deutsch, Ralph; and Griffith, Glen R., 4,031,377.

Griffiths, Clifford H.; and Keezer, Richard C., to Xerox Corporation. Method for the preparation of X-form metal phthalocyanine and X-form metal free compounds. 4,031,109, Cl. 260-314.500.

Grigat, Ernst: *See*—
Sundermann, Rudolf; Rottloff, Gunther; and Grigat, Ernst, 4,031,067.

Grigorenko, Anatoly Sergeevich; Moroz, Jury Antonovich; and Landyshev, Vladimir Vladislavovich. Hydraulic protection device for presses. 4,030,336, Cl. 72-432.000.

Grilli, Victor J.: *See*—
Conn, Thomas E.; and Grilli, Victor J., 4,030,663.

Grinberg, Jan: *See*—
Miller, Leroy J.; and Grinberg, Jan, 4,030,997.

Grinsteed, Robert R.; and Nasutavicus, Wilmonte A., to Dow Chemical Company, The. Water insoluble chelate exchange resins having a crosslinked polymer matrix and pendant thereto a plurality of methyleneaminopyridine groups. 4,031,038, Cl. 260-2.20R.

Grondahl, Clayton M.; and Gerhold, Bruce W., to General Electric Company. Integreted ceramic-metal combustor. 4,030,875, Cl. 431-352.000.

Gross, Erwin; and Vowinkel, Hans, to Hoechst Aktiengesellschaft. Multi-element type radiator of plastic material. 4,030,541, Cl. 165-175.000.

Gross, Thomas A. O., to Gillette Company, The. Ground fault circuit interrupter. 4,031,431, Cl. 307-326.000.

Grot, Walther Gustav, to Du Pont de Nemours, E. I., and Company. Process for producing halogen and metal hydroxides with cation exchange membranes of improved permselectivity. 4,030,988, Cl. 204-98.000.

Grottola, Oresto P. Closed peg box on stringed instrument. 4,030,399, Cl. 84-304.000.

Groudan, Alan I.; Schroeder, George F.; and Treffinger, H. Lee, to Singer Company, The. Error correction system for random access memory. 4,031,374, Cl. 235-153.0AM.

Groupement Atomique Alsacienne Atlantique: *See*—
Martin, Jean, 4,031,351.

Groupement pour les Activities Atomiques et Advancees "GAAA" S.A.: *See*—

Hashimoto, Michiyoshi; and Shako, Hisahumi, to Honda Giken Kogyo Kabushiki Kaisha. Safety kickstarter for motorcycles. 4,030,561, Cl. 180-33.00R.
Haskell, Donald M., to Phillips Petroleum Company. Separation of styrene from xylenes. 4,031,153, Cl. 260-669.00A.
Hasty, James H., to Kendall Company, The. Intermittent compression device. 4,030,488, Cl. 128-24.00R.
Hata, Yoshitaka, to Nissan Motor Co., Ltd. Multi-cylinder internal combustion engine. 4,030,293, Cl. 60-285.000.
Hatsukano, Yoshikazu: *See—*
Shimada, Shunji; Hatsukano, Yoshikazu; and Yamashiro, Osamu, 4,031,456.
Hattori, Shuzo: *See—*
Tokudome, Katsumi; and Hattori, Shuzo, 4,031,428.
Hauni-Werke Korber & Co., KG: *See—*
Wahle, Gunter, 4,030,511.
Havens, Richard Calvin, to Motorola, Inc. Medium Q high power dual cavity oscillator. 4,031,486, Cl. 331-96.000.
Haverbeck, Gunther: *See—*
Kleinschmit, Einhard; Tattermusch, Peter; and Haverbeck, Gunther, 4,030,714.
Haviv, Fortuna; Patchornik, Abraham; and Altman, Janina, to Yeda Research and Development Co., Ltd. Cephalosporin antibiotics. 4,031,083, Cl. 260-243.00C.
Hawkins, Charles T., to PPG Industries, Inc. Grooving glass batch. 4,030,905, Cl. 65-135.000.
Hawryluk, Peter, to Raymond Lee Organization, Inc., The, a part interest. Vapor carburetor. 4,030,457, Cl. 123-34.00A.
Hayashi, Masahiro; Haba, Masanori; Watanabe, Misuzu; and Hirano, Shinji, to Kabushiki Kaisha Meidensha. Non-linear voltage-dependent resistor. 4,031,498, Cl. 338-21.000.
Hayashi, Yoshiaki: *See—*
Suzuki, Kazuo; Hayashi, Yoshiaki; and Nagamine, Seiichi, 4,031,287.
Hayashida, Yoshihiro, to Tokico Ltd. Dual system hydraulic braking apparatus for vehicle. 4,030,758, Cl. 303-84.00A.
Healy, Frank J.; and Geissler, Paul R., to Exxon Research and Engineering Company. Separation of hydrocarbons. 4,031,151, Cl. 260-666.00A.
Healy, Frank J.; and Geissler, Paul R., to Exxon Research and Engineering Company. Dual desorbent composition and temperature separation processes. 4,031,155, Cl. 260-674.0SA.
Healy, Frank J.: *See—*
Geissler, Paul R.; and Healy, Frank J., 4,031,156.
Heaman, James Patrick; and Michaud, James Anthony, to Bendix Corporation, The. Interpolation and control epparatus and method for a numerical control system. 4,031,369, Cl. 235-151.110.
Heaps, Harry D., to Connelly Containers, Inc. Collapsible bulk shipping container. 4,030,600, Cl. 206-386.000.
Heberlein Hispano S.A.: *See—*
Schopper, Alf; and Linder, Jean, 4,030,281.
Hedrick, Ross Melvin; and Gabbert, James D., to Monsanto Company. Lactam-polyol-polyacyl lactam terpolymers. 4,031,164, Cl. 260-857.0PG.
Heeren, Richard H., to Teletype Corporation. Read-only memories, and readout circuits therefor. 4,031,524, Cl. 340-173.00R.
Heide, Henry A.: *See—*
Euverard, Maynard R.; and Heide, Henry A., 4,030,620.
Heidelberger Druckmaschinen Aktiengesellschaft: *See—*
Jeschke, Willi, 4,030,727.
Heider, Joachim: *See—*
Kutter, Eberhard; Austel, Volkhard; Eberlein, Wolfgang; Heider, Joachim; Kobinger, Walter; Lillie, Christian; and Kadatz, Rudolf, 4,031,219.
Heiland, Wolfgang K.: *See—*
Sullivan, John F.; Konstance, Richard P.; and Heiland, Wolfgang K., 4,031,252.
Heilman, Marlin S.; Langer, Alois A.; Mirowski, Mieczyslaw; Mower, Morton M.; and Reilly, David M., to Mirowski, Mieczyslaw. Implantable electrodes for accomplishing ventricular defibrillation and pacing and method of electrode implantation and utilization. 4,030,509, Cl. 128-419.00D.
Heim Universal Corporation: *See—*
McCloskey, Albert R., 4,030,783.
Heimke, Wolfram, to Union Industrielle et D'Entreprise. Handling device for shifting heavy loads along a sliding track. 4,030,699, Cl. 254-108.000.
Heimke, Wolfram, to Union Industrielle et d'Entreprise. Method and apparatus for fluidifying powderous substances. 4,030,755, Cl. 302-29.000.
Hein, Richard D., to General Tire & Rubber Company, The. Compression seal for variably spaced joints. 4,030,852, Cl. 404-66.000.
Heinemann, Helmut: *See—*
Kuhn, Rolf; Hardebeck, Klaus; and Heinemann, Helmut, 4,031,213.
Heinold, Lloyd K., to Caterpillar Tractor Co. High visibility mast for lift trucks. 4,030,568, Cl. 187-9.00E.
Heinroth, Karl-August; Dietrich, Theo; Bach, Hans; and Jurischka, Hans-Dieter, to Bayer Aktiengesellschaft. Highly elastic crimp yarn. 4,030,278, Cl. 57-34.0HS.
Heinsohn, Howard H., Jr.: *See—*
Evers, William J.; Heinsohn, Howard H., Jr.; and Mayers, Bernard J., 4,031,256.
Heiser, Joachim, to Robert Bosch G.m.b.H. Hydraulic control valve arrangement. 4,030,522, Cl. 137-596.130.
Heiskell, Robert F.: *See—*
Zerlaut, Gene A.; and Heiskell, Robert F., 4,031,385.
Heiss, Lorenz, to Hoechst Aktiengesellschaft. Process for the preparation of trans, trans-muconic acid. 4,031,136, Cl. 260-537.00N.
Heiting, Richard H., to Fox Valley Tool & Die, Inc. Apparatus for cutting items from a sheet. 4,030,390, Cl. 83-123.000.
Helfert, Herbert: *See—*
Oppenlaender, Knut; Uhl, Guenter; Helfert, Herbert; Scharpenberg, Hans-Georg; and Stork, Karl, 4,031,112.
Helgorsky, Jacques, to Rhone-Poulenc Industries. Method of separating chlorinated aliphatic hydrocarbons from mixtures thereof by liquid-liquid extraction. 4,031,148, Cl. 260-652.00P.
Helmberger, Josef: *See—*
Wick, Richard; Bestenreiner, Friedrich; Deml, Reinhold; and Helmberger, Josef, 4,031,550.
Helsley, Grover C.; and Strupczewski, Joseph, to American Hoechst Corporation. Method of treating pain and hypertension. 4,031,221, Cl. 424-267.000.
Henderson, John Goodchilde Norie: *See—*
Rast, Robert Morgan; Wine, Charles Martin; and Henderson, John Goodchilde Norie, 4,031,549.
Hendricks, Lorenzo R. Nested hunting knife. 4,030,194, Cl. 30-143.000.
Hendry, James W.: *See—*
Reuschel, Donald L.; and Hendry, James W., 4,030,299.
Henegar, Dale L., to Lake Aid Inc. Floating aerator having means to vary the length of the draft pipe. 4,030,859, Cl. 417-61.000.
Heniser, Richard J.: *See—*
Miller, Stanley J.; and Heniser, Richard J., 4,030,432.
Hennessy, Robert Thomas: *See—*
Doobenen, William; and Hennessy, Robert Thomas, 4,030,221.
Henning, Klaus: *See—*
Vogt, Wilhelm; Auer, Eberhard; Lenz, Gunter; Merkenich, Karl; Henning, Klaus; and Kandler, Joachim, 4,031,022.
Hercules Incorporated: *See—*
Bukowick, Peter Anthony, 4,030,912.
Merlette, John Barton, 4,030,754.
Herman, Edwin Bernard: *See—*
Hass, Gerhard Julius; Herman, Edwin Bernard; and Lugay, Joaquin Castro, 4,031,250.
Hervert, George L., to UOP, Inc. Method for the preparation of an electrocatalyst. 4,031,292, Cl. 429-40.000.
Herzl, Peter J., to Fischer & Porter Co. Obstacle assembly for vortex type flowmeter. 4,030,355, Cl. 73-194.0VS.
Hess, Howard V.; Frantz, William F.; and Cole, Edward L., to Texaco Inc. Process for making oil from aqueous reactive sludges and slurries. 4,030,981, Cl. 201-2.500.
Hesse, Jurgen: *See—*
Grund, Peter; Schmidt, Jurgen; and Hesse, Jurgen, 4,030,247.
Heyer Inc.: *See—*
Springer, Edward M., 4,030,412.
Hicks, Robert M. Combined leaching and sump catch-basin. 4,031,009, Cl. 210-164.000.
Hildebrand, Larry R.; and Carpenter, John F., to Packaging Corporation of America. Foldable support member and blank therefor. 4,030,604, Cl. 206-521.000.
Hill, David George: *See—*
Curran, Adrian Charles Ward; Crossley, Roger; and Hill, David George, 4,031,102.
Hill, Ira D.: *See—*
Sanders, James Milton; Taylor, William I.; Hill, Ira D.; and Kryschuk, John J., 4,031,161.
Hill, John C., to Pro-Tec Industries. Apparatus for aligning hitches of towing and towed vehicles. 4,030,775, Cl. 280-477.000.
Hill, Lucius D. Manometric pressure sensing and liquid evacuating device for intraoperative hiatal hernia repair. 4,030,481, Cl. 128-2.00S.
Hill, William Frank, to Lucas Electrical Company Limited, The. Road vehicle electrical systems. 4,031,403, Cl. 290-38.00R.

Hilleman, Maurice R.: *See—*
Provost, Philip J.; Ittensohn, Oswald L.; and Hilleman, Maurice R., 4,031,203.
Hinden, Milton; and Giannone, Charles, to Duro-Dyne Corporation. Method of resistance welding. 4,031,350, Cl. 219-99.000.
Hippert, Lawrence, Jr. Tamper-proof container cap cover. 4,030,628, Cl. 220-85.00P.
Hirai, Hiroshi: *See—*
Ogawa, Yutaka; and Hirai, Hiroshi, 4,030,577.
Hiraku, Seizi: *See—*
Fujii, Setsuro; Kajita, Yasumichi; Hiraku, Seizi; Kira, Heizo; Aishita, Hideki; Muryobayashi, Keiko; Terashima, Hiroshi; Akimoto, Akira; Taniguchi, Ken; and Wada, Minoru, 4,030,977.
Hirano, Koichi: *See—*
Itoh, Yasuo; Suzuki, Yoshitake; Shibutami, Hirohiko; Hirano, Koichi; and Tagami, Muneo, 4,030,533.
Hirano, Masachika: *See—*
Fujimoto, Keimei; Ohno, Nobuo; Okuno, Yoshitoshi; Mizutani, Toshio; Ohno, Isao; Hirano, Masachika; Itaya, Nobushige; and Matsuo, Takashi, 4,031,235.
Hirano, Shinji: *See—*
Hayashi, Masahiro; Haba, Masanori; Watanabe, Misuzu; and Hirano, Shinji, 4,031,498.
Hirosawa, Frank N.; and Lee, Ming H., to Furane Plastics, Inc. Polyurethane cross-linking agents. 4,031,049, Cl. 260-2.5AM.
Hirtle, Allen C., to Honeywell Information Systems, Inc. Emulation of target system interrupts through the use of counters. 4,031,517, Cl. 364-200.000.
Hiruma, Mituo, to Nissan Motor Co., Ltd. Suspension system. 4,030,739, Cl. 280-708.000.
Hiscoe, Ernest C., to Nashua Corporation. Apparatus and method for stacking rolls of pressure sensitive tape. 4,030,619, Cl. 214-6.00M.
Hishinuma, Yukio: *See—*
Akimoto, Hidetoshi; Kaji, Ryuichi; Kikuchi, Hideo; Hishinuma, Yukio; and Arikawa, Yoshijiro, 4,031,185.
Hitachi, Ltd.: *See—*
Adachi, Yoshio, 4,031,448.

Idel, Karsten-Josef; Saleck, Wilhelm; Wolff, Erich; and Freitag, Dieter, to AGFA-Gevaert, A.G. Photographic silver halide emulsion. 4,030,929, Cl. 96-114.000.

IDN Inventions and Development of Novelties AG: *See—*
Ackeret, Peter, 4,030,601.

Iglesias, Jose Juan. Anti-arcing resectoscope. 4,030,502, Cl. 128-303.150.

Iljima, Zenshiro, to Kawamura Seichu Kogyo Kabushiki Kaisha. Coloring composition for line- or pattern- drawing elements. 4,030,934, Cl. 106-23.000.

Iliev, Iliya Dimitrov: *See—*
Budevski, Evgueni Bogdanov; Iliev, Iliya Dimitrov; Kaisheva, Anastasiya Rostislavova; Gamburtzev, Sergei Sergeev; and Vakanova, Elena Borisova, 4,031,033.

Imperial Chemical Industries Limited: *See—*
Barrault, Michel Raymond, 4,030,998.
Boyd, Violet; Fishwick, Brian Ribbons; and Glover, Brian, 4,030,881.
Ibbotson, Arthur, 4,031,026.

Inazaki, Tsunenori: *See—*
Ogawa, Yoshihisa; Inazaki, Tsunenori; and Kouda, Michihiro, 4,031,194.

Indicon Inc.: *See—*
Citrin, Paul S.; and Gurski, Frank, 4,030,640.

Industriewerke Karlsruhe Augsburg Aktiengesellschaft: *See—*
Enneking, Heinrich; Schubert, Gunter; and Baumann, Karl-Heinz, 4,030,169.

Ing. Alfred Schmidt GmbH: *See—*
Mutter, Werner, 4,030,380.

Ing. C. Olivetti & C., S.p.A.: *See—*
Longa, Pier Luigi; and Gamba, Piero, 4,031,452.

Ing. Polin & C di Polin Ing. Antonio & C. S.a.s.: *See—*
Polin, Antonio, 4,030,594.

Ingenior F. Selmer A/S: *See—*
Einstabland, Tomas Berge; and Opedal, Torlak, 4,030,864.

Ingersoll-Rand Company: *See—*
Poe, Curtis Eugene; and Cheers, Ronald Murray, 4,030,542.

Ingraham, Glen E., to Colorguard Corporation. Insulated and grounded fence fabric. 4,031,284, Cl. 428-222.000.

Ingram, Arthur: *See—*
Linck, Donald W., II; and Kaprelian, George, 4,030,197.

Ingrey, Sidney Ivor Joseph; Nentwich, Heinz Josef; and Poulsen, Robert Gordon, to Northern Telecom Limited. Gaseous plasma etching of aluminum and aluminum oxide. 4,030,967, Cl. 156-643.000.

Innovative Electronics, Inc.: *See—*
Pitre, Lester M., 4,031,318.

Inose, Fumiyuki: *See—*
Fujiwara, Hideo; Ichinose, Yukio; Taniguchi, Satoshi; Kobayashi, Tsutomu; Ichino, Kazuo; Itoh, Michiyasu; Uesaka, Yasutaro; Inose, Fumiyuki; and Ueno, Sadayasu, 4,031,496.

Inoue, Naohiko: *See—*
Yanagishima, Takayuki; and Inoue, Naohiko, 4,031,527.

Insolio, Thomas A., to Fletcher-Terry Company, The. Scoring device with edge guide. 4,030,195, Cl. 30-164.900.

Institut National de la Sante et de la Recherche Medicale (Inserm): *See—*
Delhaye, Michel; Moschetto, Yves J. M.; and Dhamelincourt, Paul, 4,030,827.

Institutul de Cercetare Proiectare si Documentare Pentru Industria Materialelor de Constructii: *See—*
Stanasila, Virgil Corneliu; Florica, Mihai; and Lungu, Onut Antoniu, 4,030,879.

Instrulab Incorporated: *See—*
Aneshansley, Nicholas E., 4,031,530.

Intel Corporation: *See—*
Schwartz, Samuel, 4,031,379.

Interlake, Inc.: *See—*
Marlin, Louis Allen; and Beaucaire, Victor D., 4,030,894.

InterMed, Inc.: *See—*
Wolfe, Gerald W., 4,030,142.

International Business Machines Corporation: *See—*
Findley, Gerald I., 4,031,519.
Hall, Phil H.; and Irwin, John W., 4,031,521.
Keenan, William Andrew; and Kroll, Charles Thomas, 4,030,942.
Krause, Donald Lester; and Presley, Kenneth Dale, 4,030,923.
Martin, Blair Robertson; Meier, Johann Hans; and Raider, Jerry Wesley, 4,030,591.
Varker, Kenneth James, 4,030,190.

International Environmental Dynamics: *See—*
Labie, Allan S.; Thornton, Charles; Lew, Irwin Paul; and Gutman, Abraham, 4,030,257.

International Flavors & Fragrances Inc.: *See—*
Evers, William J.; Heinsohn, Howard H., Jr.; and Mayers, Bernard J., 4,031,256.
Sanders, James Milton; Taylor, William I.; Hill, Ira D.; and Kryschuk, John J., 4,031,161.
Schreiber, William Lewis; Mosciano, Gerard Joseph; Pittet, Alan O.; Vock, Manfred; and Shuster, Edward Joseph, 4,031,140.
Wilson, Richard A.; Pascale, John V.; and Vock, Manfred Hugo, 4,031,257.
Wilson, Richard Arnold; Katz, Ira; Vock, Manfred H.; and Shuster, Edward J., 4,031,034.

International Harvester Company: *See—*
Boetto, Charles; Orkwiszewski, Wayne L.; and Connor, Donald E., 4,030,551.
Cremer, George D.; and Long, John V., 4,031,279.

International Nuclear Fuel Co., Ltd.: *See—*
Morita, Masato; Morita, Reiko; and Otozai, Kiyoteru, 4,031,388.

International Telephone and Telegraph Corporation: *See—*
Aronoff, Elihu J.; and Dhami, Kewal Singh, 4,031,167.
Clark, James Monroe, 4,031,478.
Fouratt, George Thomas, 4,031,333.
Kern, Edmund R., 4,031,426.
Langenbach, Jack E., 4,030,803.
Nieman, Gerald R., 4,030,797.
Saxon, B. Ronald, 4,031,329.

Intertechnique S.A.: *See—*
Giraud, Pierre; Palais, Conrad; and Rapkin, Edward, 4,031,392.

Inverness Corporation: *See—*
Mann, Samuel, 4,030,507.

Irik, Harry: *See—*
Beierle, Carl; and Irik, Harry, 4,030,704.

Ironside's Machine & Welding Ltd.: *See—*
Nyssen, Adrianus Marinus; and Rauch, Gerhard Josef, 4,030,330.

Irvine, Robert; and Luperti, Harry E., to Pitney-Bowes, Inc. Sheet-material separator and feeder system. 4,030,722, Cl. 271-10.000.

Irvine, Robert; and Luperti, Harry E., to Pitney-Bowes, Inc. Vacuum-controlled, sheet-material separator and feeder system. 4,030,723, Cl. 271-11.000.

Irwin, John W.: *See—*
Hall, Phil H.; and Irwin, John W., 4,031,521.

Isa, Hiroshi; Ukigai, Toshiyuki; Tominaga, Anri; Taniyasu, Ryozo; and Nagayama, Masuzo, to Lion Fat & Oil Co., Ltd. Method for preparation of polyolefin oil. 4,031,158, Cl. 260-683.15B.

Isbister, Eric J., to Sperry Rand Corporation. Multiple frequency navigation radar system. 4,031,535, Cl. 343-6.50R.

Ishida, Teisuke, to Japan Patent Center Inc. Compressed air generating device for forklift trucks. 4,030,294, Cl. 60-407.000.

Ishikawajima-Harima Jukogyo Kabushiki Kaisha: *See—*
Ogawa, Yutaka; and Hirai, Hiroshi, 4,030,577.

Ishizawa, Seiya: *See—*
Ishizawa, Toushichi, 4,030,951.

Ishizawa, Toushichi, to Fuji Sangyo Kabushiki Kaisha; and Ishizawa, Seiya. Method of hardening saw teeth. 4,030,951, Cl. 148-147.000.

Isikawa, Tosio; Ozawa, Jun; and Kikuchi, Takehiro, to Hitachi, Ltd. Protective gas cap for electric power apparatuses. 4,031,347, Cl. 200-148.00B.

Isobe, Mitsuhide, to Shimano Industrial Company, Limited. Front derailleur for bicycle. 4,030,374, Cl. 74-217.00B.

Isooo, Tomoyuki: *See—*
Suda, Kazuyoshi; Isono, Tomoyuki; Uchida, Takashi; and Tsuda, Kiyoshi, 4,030,607.

Itagaki, Tadasi, to Pioneer Electronic Corporation; and Tokorozawa Electrooic Corporation. Loud speaker with stable damping. 4,030,564, Cl. 181-166.000.

Itaya, Nobushige: *See—*
Fujimoto, Keimei; Ohno, Nobuo; Okuno, Yoshitoshi; Mizutani, Toshio; Ohno, Isao; Hirano, Masachika; Itaya, Nobushige; and Matsuo, Takashi, 4,031,235.

Ito, Kakutaro, to Ito, Kakutaro; and Katoh, Yuzoh. One-piece sandal made from a flat sheet. 4,030,212, Cl. 36-11.500.

Ito, Susumu: *See—*
Asao, Makoto; Ito, Susumu; and Umehara, Hidetoshi, 4,031,171.

Ito, Yasuo; and Suzuki, Yoshitake, to Nippon Steel Corporation. Apparatus for continuous casting using linear magnetic field for core agitation. 4,030,534, Cl. 164-147.000.

Itoh, Hirotaka: *See—*
Nagata, Yasunori; Itoh, Hirotaka; Yazaki, Susumu; Hamamura, Takeyuki; and Yoshiya, Shigeo, 4,030,884.

Itoh, Michiyasu: *See—*
Fujiwara, Hideo; Ichinose, Yukio; Taniguchi, Satoshi; Kobayashi, Tsutomu; Ichino, Kazuo; Itoh, Michiyasu; Uesaka, Yasutaro; Inose, Fumiyuki; and Ueno, Sadayasu, 4,031,496.

Itoh, Yasuo; Suzuki, Yoshitake; Shibutami, Hirohiko; Hirano, Koichi; and Tagami, Muneo, to Nippon Steel Corporation; and Kabushiki Kaisha Yaskawa Denki Seizakusho. Continuous casting system. 4,030,533, Cl. 164-147.000.

ITT Industries, Incorporated: *See—*
Hahm, Heinz Gunter; and Pocci, Nedo Igor, 4,030,185.
Schat, Hermannus; and Freyberger, Laurin Clemens, 4,031,411.

Ittensohn, Oswald L.: *See—*
Provost, Philip J.; Ittensohn, Oswald L.; and Hilleman, Maurice R., 4,031,203.

Itus Patent Holding (IPH) N.V.: *See—*
Raggiotti, Guglielmo; and Colonnelli, Domenico, 4,031,365.

Iwasaka, Tatsuo: *See—*
Kaneko, Takashi; Yuminaka, Tokeo; Iwasaka, Tatsuo; and Kinoshita, Hiroshi, 4,030,571.
Kaneko, Takashi; Iwasaka, Tatsuo; and Yuminaka, Tokeo, 4,030,572.

J. I. Case Company: *See—*
Baylor, John Merlin, 4,030,782.
Khatti, Ramkishan; and Lourigan, Patrick M., 4,030,295.
Parquet, Donald J.; and Pedersen, Carl O., 4,030,560.

J. M. Huber Corporation: *See—*
Kunkle, Albert C.; and Kollmar, Carl E., Jr., 4,030,941.

Jablecki, Elizabeth S. Liquid phase separator with valved outlet means. 4,031,032, Cl. 210-474.000.

Jachimowicz, Ludwik, to General Cable Corporation. Shrinkable electrical cable core for cryogenic cable. 4,031,310, Cl. 174-15.00C.

Jackson, Edgar D., to Steel Web Corporation. Wood rivet and method of installation in a truss. 4,030,264, Cl. 52-693.000.

Jackson, George J.: *See—*
Cobb, Delwin E.; Jackson, George J.; Livesay, Richard E.; and Stemler, Orrin A., 4,030,566.

Jackson, Richard A.; and Bolles, Theodore F., to Minnesota Mining and Manufacturing Company. Technetium-labeled complexes, production and use thereof. 4,031,198, Cl. 424-1.000.

Jackson, Thomas E., to Sandoz, Inc. Substituted 2H,3H-2,1-benzisothiazole-S-oxides, method of use and pharmaceutical compositions thereof. 4,031,227, Cl. 424-270.000.

Jacob, Daniel, to American Science & Engineering, Inc. Radiant energy imaging scanning. 4,031,401, Cl. 250-503.000.

Jacob, Friedrich; Voigt, Gerhard; and Frank, Freidhelm, to Volkswagenwerk Aktieengesellschaft. Bumper arrangement and connection. 4,030,735, Cl. 293-71.00R.

Jacob, Friedrich; and Morsch, Dieter, to Volkswagenwerk Aktiengesellschaft. Frame. 4,030,772, Cl. 280-106.00R.

Jacob, Lothar: *See—*
Franz, Arnold; Huthwelker, Dirk; and Jacob, Lothar, 4,031,313.

Jaeger: *See—*
Dussartre, Roger, 4,030,367.

Jagenberg-Werke AG: *See—*
Vetten, Wilhelm, 4,030,616.

Jakobsson, Goran: *See—*
Colding, Bertil; Novak, Arne; Sandstrom, Unto; and Jakobsson, Goran, 4,031,368.

Jameel, Khaja M.; Mueller, Von W.; and Foerster, Ronald A., to GTE Automatic Electric Laboratories Incorporated. Device for measuring the magnetic flux distribution along the length of elongated magnetized element. 4,031,460, Cl. 324-34.00R.

James, Dean B.: *See—*
Colter, John Cecil; James, Dean B.; Keith, Walter Gill; and Akbari-Kenari, Reza, 4,031,029.

Jan Lelous, Arnoldus Willem, to Wavin B.V. Method of manufacturing plastic bags in a continuous way. 4,030,956, Cl. 156-290.000.

Janssen, Paul Adriaan Jao: *See—*
Soudijn, Willem; van Wijngaarden, Ineke; and Janssen, Paul Adriaan Jan, 4,031,226.

Janssen Pharmaceutica N.V.: *See—*
Soudijn, Willem; van Wijngaarden, Ineke; and Janssen, Paul Adriaan Jan, 4,031,226.

Japan Patent Center Inc.: *See—*
Ishida, Teisuke, 4,030,294.

Jaquith, Burton Kent, to Technical Industries, Inc. Continuous weighing mechanism for fluids. 4,030,356, Cl. 73-195.000.

Jaskulke, Gerhard; Schwarz, Alois; and Rutter, Armin, to Siemens Aktiengesellschaft. Arrangement for fault diagnosis in the communication controller of a program controlled data switching system. 4,031,375, Cl. 235-153.0AK.

Jasulaitis, William A.: *See—*
Gorin, Everett; Jasulaitis, William A.; Theodore, Frank W.; and Watson, George E., 4,030,982.

Jefferson, Eva Imogene: *See—*
York, Alvin, 4,030,654.

Jerabek, Robert D., to PPG Industries, Inc. Cationic electrodepositable compositions of blocked NCO and acid salt of adduct of amine and polyeposide. 4,031,050, Cl. 260-29.2TN.

Jeschke, Willi, to Heidelberger Druckmaschinen Aktiengesellschaft. Sheet transfer device for printing presses. 4,030,727, Cl. 271-276.000.

Jesty, Thomas William; Anderson, John; and 53, to T.W. Jesty & Partners. Binding apparatus. 4,030,407, Cl. 100-4.000.

Jeumont-Schneider: *See—*
Le Comte, Michel L., 4,031,378.

Jewett, Harold A. Pool diver safety and research apparatus. 4,030,147, Cl. 4-172.000.

Jin, Jung Il, to Stauffer Chemical Company. Flame-retardant binder comprising vinylidene halide-bis(hydrocarbyl)vinyl phosphonate polymer latices blended with antimony oxide and chloroparaffin. 4,031,054, Cl. 260-29.60T.

John Wyeth & Brother Limited: *See—*
Curran, Adrian Charles Ward; Crossley, Roger; and Hill, David George, 4,031,102.

Johnson, Curtis A.; and Prochazka, Svante, to General Electric Company. Strength improvement in machined SiC bodies. 4,031,178, Cl. 264-65.000.

Johnson, David W. Inflatable streamlining structure for vehicles. 4,030,779, Cl. 296-1.00S.

Johnson, Dennis L.: *See—*
Ramirez, Ernest R.; and Johnson, Dennis L., 4,031,006.

Johnson, Edgar A., to Singer Company, The. Receiver gain calibration. 4,031,469, Cl. 325-363.000.

Johnson & Johnson: *See—*
Sung, Pei; and Schweder, Frederic James, 4,030,918.

Johnson, Melvin Kermit; and Pilarski, Regis Victor, to Firestone Tire & Rubber Company, The. Carrier support apparatus. 4,030,648, Cl. 224-31.000.

Johnson, Ronald P.; and Bell, Reynold W., to Singer Company, The. Traffic controller, electromechanical sequencer for a traffic controller. 4,031,507, Cl. 340-41.00R.

Johnson, Wayne F.: *See—*
Bauer, Martin L.; Johnson, Wayne F.; and Lakomy, Dale G., 4,030,834.

Johnson, Wayne O., to Rohm and Haas Company. Process for preparing phenoxybenzoic acids. 4,031,131, Cl. 260-473.00G.

Johnston, Howard, to Dow Chemical Company, The. Substituted pyridinyloxy(thio)phenyl -acetamides, -ureas and urea derivatives, herbicidal compositions and methods containing same. 4,030,910, Cl. 71-94.000.

Jones, Gary E. Paper stacker. 4,030,720, Cl. 270-61.00F.

Jones, Peter Hadley; Ours, Carroll Wayne; and Kyncl, Jaroslav, to Abbott Laboratories. Diacylated derivatives of γ-glutamyl dopamine. 4,031,242, Cl. 424-311.000.

Josef Bautz GmbH: *See—*
Reber, Erwin; and Schollhorn, Fritz, 4,030,274.

Joslyn, Wallace G., to Dow Corning Corporation. Polyether based, high resilient polyurethane foam. 4,031,044, Cl. 260-2.5AH.

Juby, Peter Frederick; and Partyka, Richard Anthony, to Bristol-Myers Company. 1,6-Dihydro-6-oxo-2-(ortho-substituted phenyl)pyrimidine-5-carboxylic acid derivatives. 4,031,093, Cl. 260-251.00R.

Juillard, Michel: *See—*
Bouy, Pierre; Juillard, Michel; and Bourgeois, Jean-Luc, 4,031,041.

Jung, Arthur: *See—*
Hornschu, Joachim; and Jung, Arthur, 4,030,808.

Junge, Karl-Wilhelm: *See—*
Gahler, Siegfried; Juoge, Karl-Wilhelm; Fischer, Gunther; Scheithauer, Steffen; and Viola, Horst, 4,030,928.

Jurischka, Hans-Dieter: *See—*
Heinroth, Karl-August; Dietrich, Theo; Bach, Hans; and Jurischka, Hans-Dieter, 4,030,278.

Juste, S.A. Quimico-Farmaceutica: *See—*
Aparicio, Luis; Gayo, Nenesio; M° ; Martin, Jose Luis; and Ron, Armando, 4,031,243.

Justus, Edgar J., to Beloit Corporation. System compensating for pressure fluctuations in a paper machine headbox. 4,030,971, Cl. 162-216.000.

Juusela, Jyrki Tapani: *See—*
Aaltonen, Olavi August; Andersson, Bengt Torsten; Juusela, Jyrki Tapani; Palperi, Matti Johannes; and Tuominen, Tapio Kalevi, 4,030,915.

Kabel-und Metallwerke Gutehoffnungshutte Aktiengesellschaft: *See—*
Buttner, Karl; Boll, Jurgen; and Wolfel, Kurt, 4,030,174.

Kabushiki Kaisha Japan Metal Finishing Company: *See—*
Fujita, Shigeru; Murayama, Koichi; and Kaneda, Toyohito, 4,030,987.

Kabushiki Kaisha Kawai Oakki Seisakusho: *See—*
Kugisawa, Toshio, 4,030,395.

Kabushiki Kaisha Meidensha: *See—*
Hayashi, Masahiro; Haba, Masanori; Watanabe, Misuzu; and Hirano, Shinji, 4,031,498.

Kabushiki Kaisha Toyoda Jidoshokki Seisakusho: *See—*
Miyamoto, Noriaki, 4,030,372.

Kabushiki Kaisha Yaskawa Denki Seisakusho: *See—*
Itoh, Yasuo; Suzuki, Yosbitake; Shibutami, Hirohiko; Hirano, Koichi; and Tagami, Muneo, 4,030,533.

Kadatz, Rudolf: *See—*
Kutter, Eberhard; Austel, Volkhard; Eberlein, Wolfgang; Heider, Joachim; Kobinger, Walter; Lillie, Christian; and Kadatz, Rudolf, 4,031,219.

Kadin, Saul B.; and Moore, Peter F., to Pfizer Inc. 1-Oxo-1H-6-substituted-pyrimido(1,2-a)-quinoline-2-carboxylic acids and esters useful as antiulcer agents. 4,031,217, Cl. 424-251.000.

Kadowaki, Hidejiro: *See—*
Takahashi, Toru; Nakahata, Kimio; and Kadowaki, Hidejiro, 4,030,447.

Kagaya, Mineo: *See—*
Sugiura, Kensuke; Kagaya, Mineo; Fujisou, Tokuo; Aoki, Hiroyuki; Takehara, Takeichiro; and Kurata, Shigenori, 4,031,020.

Kahan, Frederick M., to Merck & Co., Inc. Antibacterial composition comprising 3-fluoro-D-alanine or deutero analog in combination with auto-antagonist inhibitor. 4,031,231, Cl. 424-272.000.

Kahaner, Joel M., to Goodyear Tire & Rubber Company, The. Method and apparatus for splicing tire cord fabric. 4,030,653, Cl. 227-25.000.

Kaiser, Peter, to Bell Telephone Laboratories, Incorporated. Method for drawing fibers. 4,030,901, Cl. 65-2.000.

Kaisheva, Anastasiya Rostislavova: *See—*
Budevski, Evgueni Bogdanov; Iliev, Iliya Dimitrov; Kaisheva, Anastasiya Rostislavova; Gamburtzev, Sergei Sergeev; and Vakanova, Elena Borisova, 4,031,033.

Kaji, Ryuichi: *See—*
Akimoto, Hidetoshi; Kaji, Ryulchi; Kikuchi, Hideo; Hishinuma, Yukio; and Arikawa, Yoshijiro, 4,031,185.

Kajita, Yasumichi: *See—*
Fujii, Setsuro; Kajita, Yasumichi; Hiraku, Seizi; Kira, Heizo; Aishita, Hideki; Muryobayashi, Keiko; Terashima, Hiroshi; Akimoto, Akira; Taniguchi, Ken; and Wada, Minoru, 4,030,977.

Kaken Chemical Co., Ltd.: *See—*
Sasaki, Kazuya; Naito, Takanobu; Momoki, Yoshio; Sega, Toshio; and Satomi, Toshiyuki, 4,031,215.

Kalal, Jaroslav; Coupek, Jiri; Pokorny, Svatopluk; Svec, Frantisek; and Bouchal, Karel. Three-dimensional polymeric gel materials containing phosphoric acid residues capable of dissociation and a method for their preparation. 4,031,037, Cl. 260-2.20R.

Kali-Chemie Aktiengesellschaft: *See—*
Becher, Wilfried; and Massonne, Joachim, 4,031,193.

Kallmann, George T.; and Waddell, Theodore P., to United States of America, Navy. Noise resistant zone penetration detection system. 4,031,534, Cl. 343-12.0MD.

Kalopissis, Gregoire; and Bugaut, Andree, to Societe Anonyme dite: L'Oreal. 2-Amino-4-hydroxy-5-chloro toluene and the hydrochloride thereof. 4,031,160, Cl. 260-575.000.

Kalopissis, Gregoire; and Vanlerberghe, Guy, to Societe Anonyme dite: L'Oreal. Manufacture of food powders. 4,031,263, Cl. 426-588.000.

Kamas Industri Aktiebolag: *See—*
Borgqvist, Lennart Rickard, 4,030,672.

Kammerer, Archer W., Jr.; and Curington, Alfred R., to Bakerdrill, Inc. Bore hole airhammer and anvil bit. 4,030,554, Cl. 173-17.000.

Kampe, Robert F., to Chandler Evans Inc. Thrust augmentation technique and apparatus. 4,030,289, Cl. 60-204.000.

Kamyr Aktiebolag: *See—*
Skretting, Arne, 4,031,013.

Kandler, Joachim: *See—*
Vogt, Wilhelm; Auer, Eberhard; Lenz, Gunter; Merkenich, Karl; Henning, Klaus; and Kandler, Joachim, 4,031,022.

Kanebo, Ltd.: *See—*
Nagata, Yasunori; Itoh, Hirotaka; Yazaki, Susumu; Hamamura, Takayuki; and Yoshiya, Shigeo, 4,030,884.

Kaneda, Toyohito: *See—*
Fujita, Shigeru; Murayama, Koichi; and Kaneda, Toyohito, 4,030,987.

Kanegafuchi Chemical Industries Co., Ltd.: *See—*
Suzuki, Kazuo; Hayashi, Yoshiaki; and Nagamine, Seiichi, 4,031,287.

Kaneko, Takashi; Yuminaka, Takeo; Iwasaka, Tatsuo; and Kinoshita, Hiroshi, to Hitachi, Ltd. Elevator control system. 4,030,571, Cl. 187-29.00R.

Kaneko, Takashi; Iwasaka, Tatsuo; and Yuminaka, Takeo, to Hitachi, Ltd. Elevator control apparatus. 4,030,572, Cl. 187-29.00R.

Kaneko, Yoichi: *See—*
Shinkawa, Keiro; Sodeyama, Chiuichi; Kaneko, Yoichi; and Kimura, Katsuhiro, 4,031,472.

Kanner, Bernard: *See—*
Prokai, Bela; and Kanner, Bernard, 4,031,042.

Kantz, Don B.; and Lezotte, Tim F., to Ford Motor Company. Hydrogen compression system for Stirling engine power control. 4,030,297, Cl. 60-521.000.

Kapl, Ladislav: *See—*
Rambousek, Miroslav; Kapl, Ladislav; and Mladek, Milos, 4,030,279.

Kaprelian, George: *See—*
Linck, Donald W., II; and Kaprelian, George, 4,030,197.

Karady, Sandor; and Amato, Joseph S., to Merck & Co., Inc. Process for cleavage of 7-amino-adipoylamino side chain in cephalosporins. 4,031,086, Cl. 260-243.00C.

Karlsson, Tom Orvar Bjorn, to Nordnero AB. Method for liquid level control. 4,030,521, Cl. 137-566.000.

Karp, Joel Allen: *See—*
Reed, John Anthony; and Karp, Joel Allen, 4,031,522.

Karr, Allan V., to Electrostatic Equipment Corporation. Directed flow ionization chamber in electrostatic coating. 4,030,446, Cl. 118-654.000.

Kashio, Toshio, to Casio Computer Co., Ltd. Apparatus for transmitting changeable length records having variable length words with interspersed record and word positioning codes. 4,031,515, Cl. 364-200.000.

Kashio, Toshio, to Casio Computer Co., Ltd. Transmission data processing device. 4,031,516, Cl. 364-200.000.

Kasik, Robert L.; and Peterson, Marvin A., to Beatrice Foods Co. Instant cheese, cheese sauces and related compositions. 4,031,254, Cl. 426-573.000.

Kastning, Ernst-Guenther: *See—*
Bronstert, Klaus; Fahrbach, Gerhard; Krahe, Eduard; Ladenberger, Volker; Kastning, Ernst-Guenther; Mittnacht, Hans; Willersinn, Herbert; and Trieschmann, Hans-Georg, 4,031,166.

Kasuga, Akira: *See—*
Suzuki, Osamu; Akashi, Goro; Kasuga, Akira; and Sega, Kenji, 4,030,685.

Kathawala, Faizulla G., to Sandoz, Inc. Phenoxyphenyl imidazolyl methanols and ketone derivatives thereof. 4,031,233, Cl. 424-273.000.

Kato, Iwao: *See—*
Sonobe, Shigeru; Watanabe, Makoto; Kato, Iwao; and Sato, Tomoyoshi, 4,030,828.

Kato, Mikio, to Nippon Felt Co., Ltd. Bed for the invalid. 4,030,149, Cl. 5-90.000.

Kato, Yoshiro; and Fujita, Choichi, to Sony Corporation. Plural receiving and recording television system. 4,031,548, Cl. 358-188.000.

Katoh, Yuzoh: *See—*
Ito, Kakutaro, 4,030,212.

Katz, Ira: *See—*
Wilson, Richard Arnold; Katz, Ira; Vock, Manfred H.; and Shuster, Edward J., 4,031,034.

Kaufmann, Wilfried: *See—*
Bauer, Klaus; Frommer, Werner; Kaufmann, Wilfried; Metzger, Georg; Scheer, Martin; Schmidt, Delf; Schroder, Theo; and Schafer, Dietmar, 4,031,207.
Bauer, Klaus; Frommer, Werner; Kaufmann, Wilfried; Metzger, Karl Georg; Scheer, Martin; Schmidt, Delf; Schroder, Theo; and Schafer, Dietmar, 4,031,208.

Kaut, William, Jr. Leakproof coupling means for garden hoses and the like. 4,030,778, Cl. 285-174.000.

Kawakami, Katsuhiko: *See—*
Yamaguchi, Kineo; Kawakami, Katsuhiko; and Nakamoto, Yukimasa, 4,031,031.

Kawamura Seichu Kogyo Kabushiki Kaisha: *See—*
Iljima, Zenshiro, 4,030,934.

Kawasaki, Kunijiro: *See—*
Nagatu, Toshio; Kawasaki, Kunijiro; Takahama, Ryuichiro; Miyatani, Yoshifusa; and Funakoshi, Sozo, 4,030,441.

Kawneer Company, Inc.: *See—*
Sukolics, Ronald D.; and Biebuyck, Lawrence F., 4,030,260.

Kazahaya, Masahiro; and Bonner, John J., to Fischer & Porter Co. Pressure transmitter. 4,030,366, Cl. 73-406.000.

Keasling, David E. Knurling tool. 4,030,331, Cl. 72-110.000.

Keedy, David Edward: *See—*
Davis, Warren Wiley; and Keedy, David Edward, 4,030,288.

Keeling, Ronald James, to Formica Corporation. Flocked metallic laminated wallcoverings. 4,031,281, Cl. 428-90.000.

Keen, Everett M.; and Siciliano, Anthony J., to Diamond International Corporation. Feed dispensing hopper. 4,030,452, Cl. 119-52.00B.

Keenan, William Andrew; and Kroll, Charles Thomas, to International Business Machines Corporation. Semiconductor masking for device fabrication utilizing ion implantation and other methods. 4,030,942, Cl. 148-1.500.

Keezer, Richard C.: *See—*
Griffiths, Clifford H.; and Keezer, Richard C., 4,031,109.

Kefauver, Bernard C.; and Little, Norman, to United States of America, Health, Education and Welfare. Apparatus for capping and uncapping containers. 4,030,271, Cl. 53-305.000.

Keifert, Hibbard G.; and Waters, Frank J., deceased (by Waters, Ethel M., administratrix), to Fansteel Inc. Lined equipment with dual base metal inserts. 4,030,848, Cl. 403-272.000.

Keifert, Hibbard G.; and Waters, Frank J., deceased (by Waters, Ethel M., administratrix), to Fansteel Inc. Lined equipment and method of fabrication. 4,030,849, Cl. 403-272.000.

Keith, Thomas R., Jr., to Continental Oil Company. Transducer positioner for testing tubes from inside diameter. 4,030,370, Cl. 73-67.80S.

Keith, Walter Gill: *See—*
Colter, John Cecil; James, Dean B.; Keith, Walter Gill; and Akbari-Kenari, Reza, 4,031,029.

Keller Corporation, The: *See—*
Keller, Leonard J., 4,030,893.

Keller & Knappich Augsburg Zweigneiderlassung der Industrie-Werke Karlsruhe Augsburg Aktienegesellschaft: *See—*
Richter, Hans, 4,030,617.

Keller, Leonard J., to Keller Corporation, The. Method of preparing low-sulfur, low-ash fuel. 4,030,893, Cl. 44-1.00B.

Kelley, Norman S.; and Pearne, Florentin J., to Aircraft Mechanics, Inc. Semi-automatic palletizer. 4,030,618, Cl. 214-6.00P.

Kelvinator, Inc.: *See—*
Bunce, Donald A., 4,030,870.

Kemper, Eugene L. Heating treatment method and system of utilizing same. 4,030,947, Cl. 148-12.900.

Kendall Company, The: *See—*
Binard, William J.; Ciarico, Anthony J.; Anglada, Leonard R.; and Patel, Bhupendra C., 4,030,497.
Hasty, James H., 4,030,488.

Kennedy, Joseph P.: *See—*
Thaler, Warren A.; Buckley, Donald J.; and Kennedy, Joseph P., 4,031,300.

Kenny, Garry R.: *See—*
Sommer, Edward J., Jr.; Kenny, Garry R.; Knoll, Frank S.; and Mitchell, David W., 4,031,004.

Kent, David Earl: *See—*
Dempsey, Edward Justin; and Kent, David Earl, 4,031,437.

Kenyon, David L. Padlock with protected slide bolt and locking means. 4,030,321, Cl. 70-34.000.

Kern, Edmund R., to International Telephone and Telegraph Corporation. Emissive coating for electrodes. 4,031,426, Cl. 313-346.00R.

Kernforschungsanlage Julich Gesellschaft mit beschrankter Haftung: *See—*
Guggi, Diether Josef; and Klein, Rolf, 4,030,615.
Holzbrecher, Horst, 4,031,562.
Neef, Hanns-Joachim, 4,030,974.

Kersten, Gunter: *See—*
Aldinger, Ulrich; and Kersten, Gunter, 4,030,405.

Keske, Frank E., to Caterpillar Tractor Co. Rotary drive assembly. 4,030,377, Cl. 74-412.00R.

KESO AG: *See—*
Ehrat, Kurt, 4,030,325.

Kessler, Clarence W., to NCR Corporation. Data processing machine. 4,030,589, Cl. 197-1.00R.

Kessler, Saul, to Aidlin, Joseph W. Chemical surface coating bath. 4,031,027, Cl. 252-186.000.

Khaber, Nikolai Vasilievich: *See—*
Chuiko, Alexei Alexeevich; Tertykh, Valentin Anatolievich; Sobolev, Vilyam Alexandrovich; Maschenko, Valery Mikhailovich; Pavlov, Vyacheslav Valentinovich; Chugai, Alexei Dmitrievich; Khaber, Nikolai Vasilievich; Kondratenko, Anatoly Borisovich; Vatamanjuk, Vasily Ivanovich; Khoma, Mikhail Ivanovich; Kutin, Alexandr Nikolaevich; Shaposhnikov, Jury Davydovich; and Galashina, Malvina Leontievna, 4,030,940.

Khanna, Satya Pal, to Bell Telephone Laboratories, Incorporated. Hybrid integrated circuit including thick film resistors and thin film conductors and technique for fabrication thereof. 4,031,272, Cl. 427-96.000.

Khatti, Ramkishan; and Lourigan, Patrick M., to J. I. Case Company. Control valve for tractor-implement hydraulic system. 4,030,295, Cl. 60-445.000.

Khcheyan, Khachik Egorovich; Revenko, Olga Mikhailovna; Shatalova, Alla Nikolaevna; Gelperina, Eleonora Grigorievna; Agrinskaya, Lidia Ivanovna; and Muradian, Georgy Avanesovich. Method of preparing acrylonitrile. 4,031,128, Cl. 260-465.900.

Khoe, Giok Djan, to U.S. Philips Corporation. Method of coupling light conductors. 4,030,810, Cl. 350-96.00C.

Khoe, Giok Djan; Kuyt, Gerard; and Franken, Adrianus Jacobus Jozef, to U.S. Philips Corporation. Device for coupling a light source to an optical fiber. 4,030,811, Cl. 350-96.00C.

Khoma, Mikhail Ivanovich: *See—*
Chuiko, Alexei Alexeevich; Tertykh, Valentin Anatolievich; Sobolev, Vilyam Alexandrovich; Maschenko, Valery Mikhailovich, Pavlov, Vyacheslav Valentinovich; Chugai, Alexei Dmitrievich; Khaber, Nikolai Vasilievich; Kondratenko, Anatoly Borisovich; Vatamanjuk, Vasily Ivanovich; Khoma, Mikhail Ivanovich; Kutin, Alexandr Nikolaevich; Shaposhnikov, Jury Davydovich; and Galashina, Malvina Leontievna, 4,030,940.

Kibbel, William Henry, Jr.: *See—*
Goldstein, David; Kibbel, William Henry, Jr.; and Hollenbach, Roger C., 4,031,090.

Kidratschky, Hermann: *See—*
Wagner, Alfred; and Kidratschky, Hermann, 4,030,328.
Wagner, Alfred; and Kidratschky, Hermann, 4,030,334.

Kiener, Christian, to Tex International, S.A. Multiple loom. 4,030,526, Cl. 139-18.000.

Kieserling & Albrecht: *See—*
Koch, Rolf Eckart; and Fangmeier, Ralf, 4,030,332.

Kihara, Toshimasa, to Hitachi, Ltd. Addressing system in an information processor. 4,031,514, Cl. 364-200.000.

Kikuchi, Hideo: *See—*
Akimoto, Hidetoshi; Kaji, Ryuichi; Kikuchi, Hideo; Hishinuma, Yukio; and Arikawa, Yoshijiro, 4,031,185.

Kikuchi, Tadao, to Hitachi, Ltd. Three-state discernment circuit. 4,031,410, Cl. 307-209.000.

Kikuchi, Takehiro: *See—*
Isikawa, Tosio; Ozawa, Jun; and Kikuchi, Takehiro, 4,031,347.

Kim, Young Sul. Methampicillin lysinate and its method of manufacturing. 4,031,076, Cl. 260-239.100.

Kimberly-Clark Corporation: *See—*
Melnikov, Igor V., 4,030,629.

Kimmon Electric Co., Ltd.: *See—*
Tokudome, Katsumi; and Hattori, Shuzo, 4,031,428.

Kimura, Hiroyuki; and Saito, Takahiko, to Sony Corporation. Apparatus for magnetic recording and/or reproducing of signals received by one or more signal receiving devices. 4,031,334, Cl. 179-100.110.

Kimura, Katsuhiro: *See—*
Shinkawa, Keiro; Sodeyama, Chiuichi; Kaneko, Yoichi; and Kimura, Katsuhiro, 4,031,472.

King, Donald J.; Lura, Loren E.; and Maurushat, Ewalt, to General Motors Corporation. Gas bearing roll shell assembly with selective drive means. 4,030,784, Cl. 308-107.000.

King, Frederick N. Speed detection system for automobiles and other motor-driven objects. 4,031,510, Cl. 340-62.000.

King, Herbert Ray: *See—*
Brown, Robert Saul; Eschenbach, Paul W.; and King, Herbert Ray, 4,030,582.

Kinnucan, Walter Frederick, Jr. Longitudinal joint assembly in combination with a paving form. 4,030,693, Cl. 249-9.000.

Kinoshita, Hiroshi: *See—*
Kaneko, Takashi; Yuminaka, Takeo; Iwasaka, Tatsuo; and Kinoshita, Hiroshi, 4,030,571.

Kipping, Joachim: *See—*
Schmitt, Ludwig; and Kipping, Joachim, 4,030,165.

Kira, Heizo: *See—*
Fujii, Setsuro; Kajita, Yasumichi; Hiraku, Seizi; Kira, Heizo; Aishita, Hideki; Muryobayashi, Keiko; Terashima, Hiroshi; Akimoto, Akira; Taniguchi, Ken; and Wada, Minoru, 4,030,977.

Kirose, Yutaka: *See—*
Yamamoto, Kenichi; Kirose, Yutaka; and Maeda, Tooru, 4,030,454.

Kise, Masahiro: *See—*
Murai, Hiromu; Kitaguchi, Koji; Suminokura, Tatsuo; Sano, Akira; Kise, Masahiro; Kitano, Masahiko; and Tomita, Toshio, 4,031,303.

Kistner, Hermann; and Lehmann, Gunthart, to Maschinenbau Oppenweiler GmbH. Device for cutting through a pile of sheets with a revolving blade. 4,030,394, Cl. 83-409.000.

Kita, Shinichiro: *See—*
Shirayama, Kenzo; Kita, Shinichiro; and Fujimoto, Masanori, 4,031,062.

Kitada, Masaya: *See—*
Akae, Kiyoshi; Kitada, Masaya; and Uno, Yoshiyuki, 4,030,876.

Kitagawa, Norishisa: *See—*
Redwine, Donald J.; and Kitagawa, Norishisa, 4,031,415.

Kitaguchi, Koji: *See—*
Murai, Hiromu; Kitaguchi, Koji; Suminokura, Tatsuo; Sano, Akira; Kise, Masahiro; Kitano, Masahiko; and Tomita, Toshio, 4,031,303.

Kitano, Masahiko: *See—*
Murai, Hiromu; Kitaguchi, Koji; Suminokura, Tatsuo; Sano, Akira; Kise, Masahiro; Kitano, Masahiko; and Tomita, Toshio, 4,031,303.

Kiwior, Alexander Michael, to Bendix Corporation, The. Electromagnetically operated fuel injection valve. 4,030,668, Cl. 239-585.000.

Kiyota, Yuhiko: *See—*
Nakagami, Tatsuro; and Kiyota, Yuhiko, 4,030,465.

Klebansky, Alexandr Leibovich: *See—*
Ponomarev, Alexei Ivanovich; Sokolov, Sergei Vasilievich; Larionova, Julia Alexeevna; Klebansky, Alexandr Leibovich; Berenblit, Vsevolod Volfovich; Dolnakov, Jury Pavlovich; Yagupolsky, Lev Moiseevich; Malovik, Vladlen Vasilievich; Lozinsky, Miron Onufrievich; Belous, Viktor Mikhailovich; Gruz, Boris Efimovich; Alexeeva, Ljubov Antonovna; Ankudinov, Anatoly Kirillovich; and Ryazanova, Rufina Mikhailovna, 4,031,119.

Klein, Gerald Lee; and Meyer, Richard C., to Beckman Instruments, Inc. Fluorometer. 4,031,399, Cl. 250-461.00B.

Klein, Rolf: *See—*
Guggi, Diether Josef; and Klein, Rolf, 4,030,615.

Klelnschmit, Einhard; Tattermusch, Peter; and Haverbeck, Gunther, to Daimler-Benz Aktiengesellschaft. Connecting element for wheel suspensions of motor vehicles. 4,030,714, Cl. 267-21.00A.

Kling, Gunter: *See—*
Meisner, Rudolf; and Kling, Gunter, 4,030,773.

Klink, Otto W.: *See—*
Snyder, Robert O.; and Klink, Otto W., 4,030,596.

Klochko, Viktor Alexandrovich: *See—*
Yakshin, Alexandr Sergeevich; Novikov, Oleg Nikolaevich; Grechinsky, Dmitry Alexeevich; Klochko, Viktor Alexandrovich; and Rygalin, Viktor Georgievich, 4,030,339.

Klockner-Humboldt-Deutz Aktiengesellschaft: *See—*
Kunath, Paul, 4,030,878.

Klockner-Werke AG: *See—*
Chitil, Manfred; and Hubatsch, Gotthard, 4,031,309.

Klosky, John Patrick: *See—*
Holloran, Thomas Patrick; Braden, Arthur Buell; Foley, Jerrold Stokes; Maynard, James Lucian; Klosky, John Patrick; Dissauer, Gerald Anthony; Adams, Terrence Miller; and Lorenz, Allan Alfred, 4,031,518.

Kluge, Reimund: *See—*
Muller, Gunter; and Kluge, Reimund, 4,030,602.

Knipp, Ulrich: *See—*
Boden, Heinrich; and Knipp, Ulrich, 4,030,637.

Kniss, Edward L., Jr.; Hixenbaugh, Dennis L.; Maudlin, Jerry A.; and Brozenick, Nicholas J., to American Air Filter Company, Inc. Expansion joint. 4,030,740, Cl. 285-16.000.

Knoll A.G. Chemische Fabriken: *See—*
Cyrus, Richard; and Raschack, Manfred, 4,031,216.

Knoll, Frank S.: *See—*
Sommer, Edward J., Jr.; Kenny, Garry R.; Knoll, Frank S.; and Mitchell, David W., 4,031,004.

Kobayashi, Tadashi. Apparatus for simultaneous defiberization of waste paper stock and uniform dispersion and accumulation of the defiberized fine fiber stock for dry web formation. 4,030,865, Cl. 425-82.000.

Kobayashi, Takashi: *See—*
Taneda, Yukinori; and Kobayashi, Takashi, 4,030,614.

Kobayashi, Tsutomu: *See—*
Fujiwara, Hideo; Ichinose, Yukio; Taniguchi, Satoshi; Kobayashi, Tsutomu; Ichino, Kazuo; Itoh, Michiyasu; Uesaka, Yasutaro; Inose, Fumiyuki; and Ueno, Sadayasu, 4,031,496.

Kobinger, Walter: *See—*
Kutter, Eberhard; Austel, Volkhard; Eberlein, Wolfgang; Heider, Joachim; Kobinger, Walter; Lillie, Christian; and Kadatz, Rudolf, 4,031,219.

Kobzina, John W., to Chevron Research Company. Herbicidal N-haloacetyl-1,2-dihydro-4H-3,1-benzoxazine. 4,030,906, Cl. 71-66.000.

Koch, Claude V., to AMF Incorporated. Modular time sequence controller. 4,031,339, Cl. 200-38.0BA.

Koch, Frederick William: *See—*
Musser, Jerry Lee; and Koch, Frederick William, 4,031,023.

Koch, Rolf Eckart; and Fangmeier, Ralf, to Kieserling & Albrecht. Machine for straightening elongated workpieces. 4,030,332, Cl. 72-164.000.

Kochemidov, Atanas Dimitrov; Makedonski, Boris Georgiev; Dumanov, Ivan Minkov; Payakov, Stefan Georgiev; Galabov, Peter Konstantinov; and Atanassov, Haralampi Aangelov, to Zniitmash. Automatic machine for magnetic abrasive polishing of internal rotational surfaces. 4,030,249, Cl. 51-105.00R.

Koegel, Wolfram: *See—*
Tatzel, Hermann; Koegel, Wolfram; Beck, Gilbert; Zuern, Ludwig; and Caesar, Arndt Christian, 4,031,179.

Koehler, Peggy Joe: *See—*
York, Alvin, 4,030,654.

Koehnen, Edward L. Loader attachment for handling logs, bales and the like. 4,030,625, Cl. 214-147.00G.

Koepke, Barry G.: *See—*
Bernal G., Enrique; Koepke, Barry G.; and Maciolek, Ralph B., 4,031,190.

Kohan Sendan Kikai Kabushiki Kaisha: *See—*
Nagata, Toshio; Kawasaki, Kunijiro; Takahama, Ryuichiro; Miyatani, Yoshifusa; and Funakoshi, Sozo, 4,030,441.

Kohashi, Tadao; and Kurosawa, Toshiharu, to Matsushita Electric Industrial Co., Ltd. Control element having liquid layer attainable to geometrically uneven state in response to electrical signal. 4,030,813, Cl. 350-161.00S.

Kohler, Gunter A., to Minnesota Mining and Manufacturing Company. Process for forming carbonaceous fibers. 4,031,188, Cl. 423-447.600.

Kohout, Otto James: *See—*
Giles, Thomas Clyde; Kohout, Otto James; and Rinaldi, Gerald Michael, 4,031,414.

Koiwa, Seki; and Hasegawa, Hajime. Hair cutter. 4,030,196, Cl. 30-133.000.

Kojima, Kojiro; Sakurai, Yoshihisa; Sugai, Tetuya; and Motegi, Masayoshi, to Nippon Steel Corporation. Method and apparatus for automatically measuring distribution of reflectance of coals. 4,030,837, Cl. 356-209.000.

Kokado, Naoyuki; and Makino, Shinichi, to Tokyo Shibaura Electric Co., Ltd. Operation program-presetting system. 4,031,470, Cl. 325-396.000.

Kokubu, Yoshikazu: *See—*
Nakamura, Tadashi; Hagiwara, Hisami; and Kokubu, Yoshikazu, 4,031,000.

Kollmar, Carl E., Jr.: *See—*
Kunkle, Albert C.; and Kollmar, Carl E., Jr., 4,030,941.

Kollonitsch, Janos, to Merck & Co., Inc. Substitutive fluorination of organic compounds. 4,030,994, Cl. 204-159.110.

Kolokolov, Boris Alexeevich: *See—*
Ponomarenko, Nikolai Borisovich; Kononenko, Vadim Grigorievich; Stelmakh, Viktor Alexeevich; Kotelnikov, Vladimir Ivanovich; Valenya, Ivan Jurievich; Sarancha, Vladimir Nikolaevich; Petrenko, Anatoly Avramovich; Bozhko, Valery Pavlovich; Yatsenko, Sergei Vasilievich; Komnatny, Igor Pavlovich; Akhnazariants, Levon Khachaturovich; Strizhenko, Vitaly Evgenievich; Kolokolov, Boris Alexeevich; Maznichenko, Stanislav Anisimovich; Bozhko, Viktor Vasilievich; Bondarenko, Oleg Alexandrovich; and Zakirov, Robert Sharafutdinovich, 4,030,389.

Komnatny, Igor Pavlovich: *See—*
Ponomarenko, Nikolai Borisovich; Kononenko, Vadim Grigorievich; Stelmakh, Viktor Alexeevich; Kotelnikov, Vladimir Ivanovich; Valenya, Ivan Jurievich; Sarancha, Vladimir Nikolaevich; Petrenko, Anatoly Avramovich; Bozhko, Valery Pavlovich; Yatsenko, Sergei Vasilievich; Komnatny, Igor Pavlovich; Akhnazariants, Levon Khachaturovich; Strizhenko, Vitaly Evgenievich; Kolokolov, Boris Alexeevich; Maznichenko, Stanislav Anisimovich; Bozhko, Viktor Vasilievich; Bondarenko, Oleg Alexandrovich; and Zakirov, Robert Sharafutdinovich, 4,030,389.

Kondo, Toshihiro, to Kondo, Toshihiro; and Fuji Photo Film Co., Ltd. Spring drum. 4,030,567, Cl. 185-37.000.

Kondratenko, Anatoly Borisovich: *See—*
Chuiko, Alexei Alexeevich; Tertykh, Valentin Anatolievich; Sobolev, Vilyam Alexandrovich; Maschenko, Valery Mikhailovich; Pavlov, Vyacheslav Valentinovich; Chugai, Alexei Dmitrievich; Khaber, Nikolai Vasilievich; Kondratenko, Anatoly Borisovich; Vatamanjuk, Vasily Ivanovich; Khoma, Mikhail Ivanovich; Kutin, Alexandr Nikolaevich; Shaposhnikov, Jury Davydovich; and Galashina, Malvina Leontievna, 4,030,940.

Konig, Hans-Bodo; Metzger, Karl Georg; and Schrock, Wilfried, to Bayer Aktiengesellschaft. Penicillins and processes for their preparation and use. 4,031,229, Cl. 424-271.000.

Konishi, Toji, to Eisai Co., Ltd. Method for treating nervous bladder. 4,031,205, Cl. 424-94.000.

Konishiroku Photo Industry Co., Ltd.: *See—*
Akira, Kato; Akira, Itoh; Tohru, Uchida; and Masao, Ishihara, 4,030,921.

Konomi, Toshiaki: *See—*
Yamaguchi, Shunzo; Ozaki, Tadashi; and Konomi, Toshiaki, 4,030,464.

Kononenko, Vadim Grigorievich: *See—*
Ponomarenko, Nikolai Borisovich; Kononenko, Vadim Grigorievich; Stelmakh, Viktor Alexeevich; Kotelnikov, Vladimir Ivanovich; Valenya, Ivan Jurievich; Sarancha, Vladimir Nikolaevich; Petrenko, Anatoly Avramovich; Bozhko, Valery Pavlovich; Yatsenko, Sergei Vasilievich; Komnatny, Igor Pavlovich; Akhnazariants, Levon Khachaturovich; Strizhenko, Vitaly Evgenievich; Kolokolov, Boris Alexeevich; Maznichenko, Stanislav Anisimovich; Bozhko, Viktor Vasilievich; Bondarenko, Oleg Alexandrovich; and Zakirov, Robert Sharafutdinovich, 4,030,389.

Konstance, Richard P.: *See—*
Sullivan, John F.; Konstance, Richard P.; and Heiland, Wolfgang K., 4,031,252.

Konstant, Anthony N., to Speedrack Inc. Adjustable storage racks. 4,030,611, Cl. 211-191.000.

Kooch, Walter: *See—*
Dupont, John A.; Kooch, Walter; and Scott, Joseph D., 4,031,055.

Koppe, Herbert; Zeile, Karl; Kummer, Werner; Stahle, Helmut; and Danneberg, Peter, to Boehringer Ingelheim GmbH. Pharmaceutical compositions containing a 1-(2,6-dimethyl-phenoxy)-2-aminoalkane and method of use. 4,031,244, Cl. 424-330.000.

Kornfeld, Edmund C.: *See—*
Bach, Nicholas J.; Hall, David A.; and Kornfeld, Edmund C., 4,031,097.

Kortenbach & Rauh Kommanditgesellschaft: *See—*
Schultes, Tilmann, 4,030,514.

Koshar, Robert J., to Minnesota Mining and Manufacturing Company. Use of bis(fluoroaliphaticsulfonyl) imides in cationic polymerization. 4,031,036, Cl. 260-2.00N.

Kotchen, Deborah L. Frame for textiles, needlework and the like. 4,030,220, Cl. 40-156.000.

Kotelnikov, Vladimir Ivanovich: *See—*
Ponomarenko, Nikolai Borisovich; Kononenko, Vadim Grigorievich; Stelmakh, Viktor Alexeevich; Kotelnikov, Vladimir Ivanovich; Valenya, Ivan Jurievich; Sarancha, Vladimir Nikolaevich; Petrenko, Anatoly Avramovich; Bozhko, Valery Pavlovich; Yatsenko, Sergei Vasilievich; Komnatny, Igor Pavlovich; Akhnazariants, Levon Khachaturovich; Strizhenko, Vitaly Evgenievich; Kolokolov, Boris Alexeevich; Maznichenko, Stanislav Anisimovich; Bozhko, Viktor Vasilievich; Bondarenko, Oleg Alexandrovich; and Zakirov, Robert Sharafutdinovich, 4,030,389.

Kotter, James I.: *See—*
Folk, Craig L.; and Kotter, James I., 4,030,280.

Kouda, Michihiro: *See—*
Ogawa, Yoshihisa; Inazaki, Tsunenori; and Kouda, Michihiro, 4,031,194.

Kouwenhoven, Adriaan P.: *See—*
Lukas, Joachim H.; Baardman, Frank; and Kouwenhoven, Adriaan P., 4,031,152.

Koyama, Masaya, to Goldwell GmbH. Apparatus for foaming liquid cosmetic substances. 4,030,665, Cl. 239-373.000.

Kozlowski, Matthew A.: *See—*
Pines, Seemon H.; and Kozlowski, Matthew A., 4,031,085.

Krabetz, Richard: *See—*
Engelbach, Heinz; Krabetz, Richard; Duembgen, Gerd; Willersinn, Carl-Heinz; Lebert, Ulrich; and Thiessen, Fritz, 4,031,135

Krafft, Werner: *See—*
Stahlke, Kurt-Rainer; Krafft, Werner; Meyer, Rudolf; and Rosenkranz, Hans Jurgen, 4,030,926.

Krahe, Eduard: *See—*
Bronstert, Klaus; Fahrbach, Gerhard; Krahe, Eduard, Ladenberger, Volker; Kastning, Ernst-Guenther; Mittnacht, Hans; Willersinn, Herbert; and Trieschmann, Hans-Georg, 4,031,166.

Krammer, Robert, to Standard Conveyor Company. Material handling system. 4,030,423, Cl. 104-172.00S.

Kraus, Edmund J.: *See—*
Kraus, Robert A.; and Kraus, Edmund J., 4,030,303.

Kraus, Robert A.; and Kraus, Edmund J. Waste heat regenerating system. 4,030,303, Cl. 60-688.000.

Krause, Donald Lester; and Presley, Kenneth Dale, to International Business Machines Corporation. Mixture of binder materials for use in connection with a charge transport layer in a photoconductor. 4,030,923, Cl. 96-1.500.

Krause, Ernest Harry; Seaman, Wesley Arthur; and Angelopoulos, Peter Gregory, to Pioneer Electric and Research Corporation, The. Digital photo-optical tachometer. 4,031,466, Cl. 324-175.000.

Krauss, Helmut: *See—*
Moeller, Jurgen; Mitrach, Werner; Krauss, Helmut; and Schulte, Hubert, 4,031,459.

Kress, Dieter, to Mapal Dr. Kress KG. Reaming tool. 4,030,855, Cl 408-226.000.

Krezanoski, Joseph Zenon, to Flow Pharmaceuticals, Inc. Aqueous solution suitable for dissipating available iodine contained in an iodophor. 4,031,209, Cl. 424-150.000.

Kroesser, Edward James, to United Technologies Corporation. Redundant pushrod-to-bellcrank connection. 4,030,378, Cl. 74-469.000.

Kroll, Charles Thomas: *See—*
Keenan, William Andrew; and Kroll, Charles Thomas, 4,030,942.

Kron, Gerald J., to Singer Company, The. G-seat with skin tension cue generator. 4,030,207, Cl. 35-12.00E.

Kroupa, Kenneth M.: *See—*
Hornig, Carl F.; Kroupa, Kenneth M.; and Simpson, Earle E., 4,030,966.

Kruklitis, Karlis: *See—*
Christou, Kyriakos; Kruklitis, Karlis; and Burger, William R., 4,031,359.

Krunchak, Vladimir Georgievich: *See—*
Shults, Mikhail Mikhailovich; Parfenov, Anatoly Ivanovich; Shnypikov, Alexandr Dmitrievich; Krunchak, Vladimir Georgievich; Evnina, Sarra Borisovna; Dolidze, Vladimir Alexandrovich; and Tarasova, Valentina Mikhailovna, 4,030,935.

Kryschuk, John J.: *See—*
Sanders, James Milton; Taylor, William I.; Hill, Ira D.; and Kryschuk, John J., 4,031,161.

Kubik Hydradrives, Inc.: *See—*
Poppelreiter, Joseph C., II, 4,031,442.

Kubinek, Milan: *See—*
Sommer, Karel; Zdrazil, Jiri; Kubinek, Milan; Bahna, Jarolim; Kyselica, Stanislav; Habrovec, Frantisek; and Skarek, Jiri, 4,030,944

Kuchenmeister, Rolf: *See—*
Dhein, Rolf; Zabrocki, Karl; Beer, Wolfgang; and Kuchenmeister, Rolf, 4,031,047.
Dhein, Rolf; Schoeps, Jochen; and Kuchenmeister, Rolf, 4,031,052.

Kudelka, Herbert: *See—*
Piret, Norbert L.; Rabben, Hans Joachim; Kudelka, Herbert; and Schmidt, Siegbert, 4,030,990.

Kudlacik, Henry W.: *See—*
Armor, Anthony F.; Chari, Madabushi V. K.; Kudlacik, Henry W.; and Reece, Paul, 4,031,422.

Kugisawa, Toshio, to Kabushiki Kaisha Kawai Gakki Seisakusho. Musical-tone signal forming apparatus for an electronic musical instrument. 4,030,395, Cl. 84-1.030.

Kuh, Arthur David; and Condit, Paul Brainard, to Eastman Kodak Company. Processing compositions containing glycols for color transfer processes comprising direct positive silver halide development. 4,030,920, Cl. 96-29.00D.

Kuhn, Rolf; Hardebeck, Klaus; and Heinemann, Helmut, to Boehringer Mannheim G.m.b.H. Pharmaceutical composition and method for the treatment of hydropic conditions. 4,031,213, Cl. 424-229.000.

Kukolja, Stjepan; and Spry, Douglas O., to Eli Lilly and Company. Process for cephalosporin antibiotic intermediates. 4,031,084, Cl. 260-243.00C.

Kummer, Werner: *See—*
Koppe, Herbert; Zeile, Karl; Kummer, Werner; Stahle, Helmut; and Danneberg, Peter, 4,031,244.

Kuna, Wayne A.: *See—*
Terzian, Rouben T.; Schoenfield, Palmer J.; Dunn, Kathy A.; and Kuna, Wayne A., 4,030,235.

Kunath, Paul, to Klockner-Humboldt-Deutz Aktiengesellschaft. Method and apparatus for the connection of a rotary drum drive of a rotary furnace. 4,030,878, Cl. 432-45.000.

Kunkle, Albert C.; and Kollmar, Carl E., Jr., to J. M. Huber Corpora-

tion. Method for reducing the viscosity and for refining kaolin clays. 4,030,941, Cl. 106-309.000.

Kurata, Shigenori: *See—*
Sugiura, Kensuke; Kagaya, Mineo; Fujisou, Tokuo; Aoki, Hiroyuki; Takehara, Takeichiro; and Kurata, Shigenori, 4,031,020.

Kureha Kagaku Kogyo Kabushiki Kaisha: *See—*
Nakamura, Tadashi; Hagiwara, Hisami; and Kokubu, Yoshikazu, 4,031,000.

Kurkov, Victor P., to Chevron Research Company. Alpha, beta-butenolide preparation. 4,031,114, Cl. 260-343.600.

Kurkov, Victor P., to Chevron Research Company. 4-Pentenoic acid conversion. 4,031,115, Cl. 260-343.600.

Kurosaki, Takefumi, to Rank Xerox Ltd. Automatic manuscript discharging device for copying machines. 4,030,721, Cl. 271-3.000.

Kurosawa, Toshiaki: *See—*
Sakai, Yoshio; and Kurosawa, Toshiaki, 4,031,439.

Kurosawa, Toshiharu: *See—*
Kohashi, Tadao; and Kurosawa, Toshiharu, 4,030,813.

Kusaka, Satoru, to Sony Corporation. Head drum assembly with electrical noise shield. 4,031,558, Cl. 360-130.000.

Kuska, Walter J.; and McGowan, Edward J., Jr., to Stoelting Company. Non-invasive blood pressure monitor. 4,030,484, Cl. 128-2.05R.

Kutin, Alexandr Nikolaevich: *See—*
Chuiko, Alexei Alexeevich; Tertykh, Valentin Anatolievich; Sobolev, Vilyam Alexandrovich; Maschenko, Valery Mikhailovich; Pavlov, Vyacheslav Valentinovich; Chugai, Alexei Dmitrievich; Khaber, Nikolai Vasilievich; Kondratenko, Anatoly Borisovich; Vatamanjuk, Vasily Ivanovich; Khoma, Mikhail Ivanovich; Kutin, Alexandr Nikolaevich; Shaposhnikov, Jury Davydovich; and Galashina, Malvina Leontievna, 4,030,940.

Kutter, Eberhard; Austel, Volkhard; Eberlein, Wolfgang; Heider, Joachim; Kobinger, Walter; Lillie, Christian; and Kadatz, Rudolf, to Boehringer Ingelheim GmbH. Bis-homophthalimides and salts thereof. 4,031,219, Cl. 424-258.000.

Kuykendall, Charles N.: *See—*
Hammel, Ronald O.; Kuykendall, Charles N.; and Fischer, William A., 4,031,450.

Kuyt, Gerard: *See—*
Khoe, Giok Djan; Kuyt, Gerard; and Franken, Adrianus Jacobus Jozef, 4,030,811.

Kuzel, Frank J.: *See—*
Swanson, Kermit E.; and Kuzel, Frank J., 4,030,621.

Kyncl, Jaroslav: *See—*
Jones, Peter Hadley; Ours, Carroll Wayne; and Kyncl, Jaroslav, 4,031,242.

Kyselica, Stanislav: *See—*
Sommer, Karel; Zdrazil, Jiri; Kubinek, Milan; Bahna, Jarolim; Kyselica, Stanislav; Habrovec, Frantisek; and Skarek, Jiri, 4,030,944.

Labie, Allan S.; Thornton, Charles; Lew, Irwin Paul; and Gutman, Abraham, to International Environmental Dynamics. Folded slab floor construction and method. 4,030,257, Cl. 52-126.000.

Laboratoires Jacques Logeais: *See—*
Maillard, Jacques Georges, 4,031,133.

Laboratorios del Dr. Esteve S.A.: *See—*
Esteve-Subirana, Antonio, 4,031,240.

Laboratorios Hermes, S.A.: *See—*
Chimeno, Jose-Alfonso Canicio, 4,031,105.

Lace, Melvin Arthur, to Motorola, Inc. Synchronous rotor indexing mechanism. 4,030,466, Cl. 123-146.50A.

Lacombe, Gaetan Y., to D.C. Glass Ltd. Protective capping channel for glass sealed unit. 4,030,263, Cl. 52-616.000.

Ladenberger, Volker: *See—*
Bronstert, Klaus; Fahrbach, Gerhard; Krahe, Eduard; Ladenberger, Volker; Kastning, Ernst-Guenther; Mittnacht, Hans; Willersinn, Herbert; and Trieschmann, Hans-Georg, 4,031,166.

Laidlaw Corporation: *See—*
Barnes, Tracy W., 4,031,270.

Lake Aid Inc.: *See—*
Henegar, Dale L., 4,030,859.

Lake St. Louis Research Products, Inc.: *See—*
Navato, Jose Miguel Antonio Rosario, 4,030,482.

Lakin, Willis M. Rotating toys, particularly flying toys. 4,030,238, Cl. 46-86.00R.

Lakomy, Dale G.: *See—*
Bauer, Martin L.; Johnson, Wayne F.; and Lakomy, Dale G., 4,030,834.

Lalin, Andre; and Piret, Jean, to Regie Nationale des Usines Renault. Hydraulic control device for automatic change-speed transmissions. 4,030,381, Cl. 74-867.000.

Lambertz, Martin R.; and Fiorelli, Maria, to Stanley Works, The. Corner bracket and roller assembly for sliding doors. 4,030,160, Cl. 16-105.000.

Lamm, August Uno. Rotary piston engine. 4,030,458, Cl. 123-44.00D.

Lamparter, Hansruedi: *See—*
Hablutzel, Kurt; and Lamparter, Hansruedi, 4,030,635.

Lampietti, Bernard P.: *See—*
Collins, Charles P.; and Lampietti, Bernard P., 4,030,327.

Lampman, Duncan L., to Diagraph-Bradley Industries, Inc. Stencil cutting apparatus. 4,030,592, Cl. 197-6.400.

Lance, Richard T.: *See—*
Papafingos, Pandelis N.; and Lance, Richard T., 4,030,914.

Landis Tool Company: *See—*
Price, Ralph E., 4,030,252.

Landyshev, Vladimir Vladislavovich: *See—*
Grigorenko, Anatoly Sergeevich; Moroz, Jury Antonovich; and Landyshev, Vladimir Vladislavovich, 4,030,336.

Langenbach, Jack E., to International Telephone and Telegraph Corporation. Electrical contact and retention means therefor. 4,030,803, Cl. 339-217.00S.

Langer, Alois A.: *See—*
Heilman, Marlin S.; Langer, Alois A.; Mirowski, Mieczyslaw; Mower, Morton M.; and Reilly, David M., 4,030,509.

Langowski, Faustyn Cornell, to BJ-Hughes Inc. Pipe handling head 4,030,746, Cl. 294-88.000.

Lanno, Joseph P. Fluid dispenser system. 4,030,638, Cl. 222-180.000.

Lapetina, Robert Anthony, to Edo Western Corporation. Sonar/television system for use in underwater exploration. 4,031,544, Cl. 358-99.000.

Larionova, Julia Alexeevna: *See—*
Ponomarev, Alexei Ivanovich; Sokolov, Sergei Vasilievich; Larionova, Julia Alexeevna; Klebansky, Alexandr Leibovich; Berenblit, Vsevolod Volfovich; Dolnakov, Jury Pavlovich; Yagupolsky, Lev Moiseevich; Malovik, Vladlen Vasilievich; Lozinsky, Miron Onufrievich; Belous, Viktor Mikhailovich; Gruz, Boris Efimovich; Alexeeva, Ljuhov Antonovna; Ankudinov, Anatoly Kirillovich; and Ryazanova, Rufina Mikhailovna, 4,031,119.

Lark S.p.A.: *See—*
Palladino, Gaetano, 4,031,080.

Larsen, Ole Fjord. Apparatus for preventing erosion of the seabed in front of hydraulic structures. 4,030,306, Cl. 61-3.000.

Larson, Raymond L.: *See—*
Dombrowski, Frank R.; and Larson, Raymond L., 4,030,184.

Larsson, Erik. Helical gear pump and method of manufacturing the same. 4,030,862, Cl. 418-48.000.

Lasswell, Tull C.; and Monier, John L. Method of coating metal with vinylidene chloride-vinyl chloride copolymer. 4,031,277, Cl. 427-388.00R.

Lattin, Kenneth R., to United States of America, Energy Research and Development Administration. Method of determining whether radioactive contaminants are inside or outside a structure. 4,031,387, Cl. 250-252.000.

Laughlin, Robert Gene; and Gougeon, Thomas William, to Procter & Gamble Company, The. Controlled release contraceptive article. 4,031,202, Cl. 424-28.000.

Laughter, Clifford M., to General Electric Company. Luminaire assembly. 4,031,382, Cl. 240-25.000.

Lawrence Peska Associates, Inc.: *See—*
Everman, Don D., 4,030,867.

Lawton, Robert A.; and Andrews, James R., to United States of America, Air Force. Waveform sampler. 4,030,840, Cl. 356-256.000.

Lazzari, Jean-Pierre, to Compagnie Internationale pour l'Informatique. Method of making magnetic head devices. 4,030,189, Cl. 29-603.000.

Lea, Paul M., III, to Amsted Industries Incorporated. Continuous method of and apparatus for making bars from powdered metal. 4,030,919, Cl. 75-214.000.

Leader, Victor. Rotary cutting and bagging machine. 4,030,273, Cl. 56-13.400.

Lebert, Ulrich: *See—*
Engelbach, Heinz; Krabetz, Richard; Duembgen, Gerd; Willersinn, Carl-Heinz; Lebert, Ulrich; and Thiessen, Fritz, 4,031,135.

LeBlanc, Joseph David: *See—*
St. Andre, Arthur Francis; LeBlanc, Joseph David; and Robillard, Edward George, 4,031,446.

Le Comte, Michel L., to Jeumont-Schneider. Method and apparatus for fast multiplication including conversion of operand format. 4,031,378, Cl. 235-164.000.

Lee, Don H.; Weller, Kenneth P.; and Thrower, William F., to Hughes Aircraft Company. Planar process for making high frequency ion implanted passivated semiconductor devices and microwave integrated circuits. 4,030,943, Cl. 148-1.500.

Lee, Ming H.: *See—*
Hirosawa, Frank N.; and Lee, Ming H., 4,031,049.

Leedom, Marvin Allan, to RCA Corporation. Disc player and stylus therefor. 4,031,546, Cl. 358-128.000.

Lefaudeux, Francois L. M.; and Quivy, Michel Georges, to Etat Francais. Hydrophone with acoustic reflector. 4,031,502, Cl. 340-10.000.

Le Goascoz, Vincent: *See—*
Audaire, Luc; Borel, Joseph; Le Goascoz, Vincent; and Poujois, Robert, 4,031,380.

Le Guillou, Felix Francois, to Establissements Valois S.A. Push-button having a calibrated outlet for a container under pressure. 4,030,667, Cl. 239-573.000.

Lehmann, Gunthart: *See—*
Kistner, Hermann; and Lehmann, Gunthart, 4,030,394.

Leighton, Peter Watson; and Davidson, Charles Patrick Duncan, to Lucas Industries Limited. Motor and pedal propeller cycle. 4,030,562, Cl. 180-34.000.

Leland Stanford Junior University, The Board of Trustees of: *See—*
Bond, Walter L.; Cutler, Cassius C.; and Lemons, Ross A., 4,030,342.

LeMay, Christopher Archibald Gordon, to EMI Limited. Radiography. 4,031,395, Cl. 250-360.000.

Lemons, Ross A.: *See—*
Bond, Walter L.; Cutler, Cassius C.; and Lemons, Ross A., 4,030,342.

Lench, Jack; and Ferrari, Luigi M., to Del Laboratories, Inc. Roll-on dispenser bottle assembly. 4,030,844, Cl. 401-213.000.

Lennon, David C.; and Wandler, Richard A., to General Electric Company. Terminal block assembly and multiple connector assembly therefor. 4,030,802, Cl. 339-192.00R.

Lentz, William P. TV bulb funnel construction. 4,030,627, Cl. 220-2.10A.

Lenz, Gunter: *See—*
Vogt, Wilhelm; Auer, Eberhard; Lenz, Gunter; Merkenich, Karl; Henning, Klaus; and Kandler, Joachim, 4,031,022.

Leonard, Hamlin, to B-5 Associates of Stamford, Connecticut. Variable speed drive for a bicycle. 4,030,373, Cl. 74-230.190.

Leonard, John J., to Atlantic Richfield Company. Preparing aqueous alkaline slurry of thallic oxide. 4,031,196, Cl. 423-624.000.

Leoncavallo, Richard Anthony: *See—*
White, Peter Charles; Benson, John Terry; and Leoncavallo, Richard Anthony, 4,030,239.

Leone, Ronald E.; Weber, Wayne W., II; and Wrathall, Donald P., to Eastman Kodak Company. Photographic compositions and elements including internal latent image silver halide grains and acylhydrazinophenylthiourea nucleating agents therefor. 4,030,925, Cl. 96-73.000.

Leone, Ronald E.; Weber, Wayne W., II; and Wrathall, Donald P., to Eastman Kodak Company. Acyl hydrazino thiourea derivatives as photographic nucleating agents. 4,031,127, Cl. 260-465.00D.

Leonik, Stephen A., Jr. Multi-channel temperature responsive process control system. 4,031,355, Cl. 219-502.000.

Letot, Incorporated: *See—*
Churchill, Steven T., 4,031,322.

Leuschner, Horst: *See—*
Ehni, George John, III; and Leuschner, Horst, 4,031,474.

Levin, Nathan. Yarn tensioning device. 4,030,684, Cl. 242-152.100.

Lew, Irwin Paul: *See—*
Labie, Allan S.; Thornton, Charles; Lew, Irwin Paul; and Gutman, Abraham, 4,030,257.

Lewis, Nathanial H. Spinning balloon novelty. 4,030,237, Cl. 46-53.000.

Leyde, Warren L.; and Marker, Delbert E., to Pacific Technology, Inc. Method and apparatus for controlling electrical loads. 4,031,406, Cl. 307-41.000.

Lezotte, Tim F.: *See—*
Kantz, Don B.; and Lezotte, Tim F., 4,030,297.

Lie, Bjorn: *See—*
Dorph, Thor, 4,030,224.

Lie, Gina: *See—*
Dorph, Thor, 4,030,224.

Liebetrau, Richard E.; and Miller, Larry J., to Swiss Aluminium Ltd. Storage and display apparatus employing cantilevered roller track. 4,030,609, Cl. 211-162.000.

Liehl, Helmut: *See—*
Buzzi, Leo; Buzzi, Valentin; Opietnik, Walter; Liebl, Helmut; and Malohahic, Peter, 4,030,573.

Lillie, Christian: *See—*
Kutter, Eberhard; Austel, Volkhard; Eberlein, Wolfgang; Heider, Joachim; Kobinger, Walter; Lillie, Christian; and Kadatz, Rudolf, 4,031,219.

Linck, Donald W., II; and Kaprelian, George, to Linck, Donald W., II; Kaprelian, George; Basta, Tom; Corbett, Maury; Danzig, William; Hunt, Gary; Ingram, Arthur; McNeill, Charles; Preiner, Gerald; and Roth, Ronald. Base plates for dental articulators. 4,030,197, Cl. 32-32.000.

Linde Aktiengesellschaft: *See—*
Wimber, Hans; Rohde, Wilhelm; and Reyhing, Jorg, 4,030,896.

Linder, Jean: *See—*
Schopper, Alf; and Linder, Jean, 4,030,281.

Losel, Walter; Traunecker, Werner; and Hoefke, Wolfgang, to Boehringer Ingelheim GmbH. 3β-(4-Oxo-α-L-rhamnosyl)-β-hydroxy-bufa-4,20,22-trienolide. 4,031,212, Cl. 424-182.000.

Losert, Wolfgang: *See—*
Ahrens, Hanns; Biere, Helmut; Rufer, Clemens; Schmiechen, Ralph; Schroeder, Eberhard; Loge, Olaf; Losert, Wolfgang; and Schillinger, Ekkehard, 4,031,236.

Lostia, Onofrio; and Bartoli, Francesco, to Snam Progetti S.p.A. Fibres incorporating antibodies, antigens and antisera, method for their preparation and their use. 4,031,201, Cl. 424-27.000.

Loundagin, James A.: *See—*
Cram, Robert E.; Gill, Walter; and Loundagin, James A., 4,030,523.

Lourigan, Patrick M.: *See—*
Khatti, Ramkishan; and Lourigan, Patrick M., 4,030,295.

Lovercheck, Charles L.: *See—*
Brugger, Richard D.; and Lovercheck, Charles L., 4,030,823.

Lowery, Robert D.; and Mehrbrodt, Alphonso W., to Marquette Metal Products Company. Normally disengaged electro-magnetic spring clutch capable of field adjustment of the wrap angle. 4,030,584, Cl. 192-84.00T.

Lozinsky, Miron Onufrievich: *See—*
Ponomarev, Alexei Ivanovich; Sokolov, Sergei Vasilievich; Larionova, Julia Alexeevna; Klebansky, Alexandr Leibovich; Berenblit, Vsevolod Volfovich; Dolnakov, Jury Pavlovich; Yagupolsky, Lev Moiseevich; Malovik, Vladlen Vasilievich; Lozinsky, Miron Onufrievich; Belous, Viktor Mikhailovich; Gruz, Boris Efimovich; Alexeeva, Ljubov Antonovna; Ankudinov, Anatoly Kirillovich; and Ryazanova, Rufina Mikhailovna, 4,031,119.

Lubrizol Corporation, The: *See—*
Miller, Clark Ober, 4,031,015.
Miller, Clark Ober, 4,031,118.
Musser, Jerry Lee; and Koch, Frederick William, 4,031,023.

Lucas Electrical Company Limited, The: *See—*
Hill, William Frank, 4,031,403.

Lucas Industries Limited: *See—*
Glaze, Stanley George, 4,030,580.
Leighton, Peter Watson; and Davidson, Charles Patrick Duncan, 4,030,562.

Luce, Robert L.; Perry, Joseph P.; and Sansburry, James D., to Fairchild Camera and Instrument Corporation. Method of MOS circuit fabrication. 4,030,952, Cl. 148-187.000.

Lucia, Emmanuel A.: *See—*
Vinansky, George, Jr.; and Lucia, Emmanuel A., 4,031,301.

Luebkemann, Leroy, to Fiat-Allis Construction Machinery, Inc. Method of manufacturing track roller with open cell plastic foam in lubrication cavity. 4,030,178, Cl. 29-149.5NM.

Lugash, Max J. Steerable wheeled garment bag. 4,030,768, Cl. 280-47.170.

Lugay, Joaquin Castro; and Feldman, Jacob Richard, to General Foods Corporation. Process of preparing nutritive sweetening compositions. 4,031,259, Cl. 426-548.000.

Lugay, Joaquin Castro: *See—*
Haas, Gerhard Julius; Herman, Edwin Bernard; and Lugay, Joaquin Castro, 4,031,250.

Lukas, Joachim H.; Baardman, Frank; and Kouwenhoven, Adriaan P.,

to Shell Oil Company. Preparation of derivatives of cyclobutane and cyclobutene. 4,031,152, Cl. 260-666.00A.

Lund, Svend Aage; Northeved, Allan; Solfjeld, Poul; and Fahrin, Knud Christian Claus, to Akademiet for de tekniske Videnskaber, Svejsecentralen. Apparatus for providing an ultrasonic sectional view stating the proportion of meat and lard in biological material. 4,030,343, Cl. 73-67.80S.

Lundgren, Carl William, Jr., to Bell Telephone Laboratories, Incorporated. Antenna with echo cancelling elements. 4,031,538, Cl. 343-781.0CA.

Lungu, Onut Antoniu: *See—*
Stanasila, Virgil Corneliu; Florica, Mihai; and Lungu, Onut Antoniu, 4,030,879.

Luperti, Harry E.: *See—*
Irvine, Rubert; and Luperti, Harry E., 4,030,722.
Irvine, Robert; and Luperti, Harry E., 4,030,723.

Lura, Loren E.: *See—*
King, Donald J.; Lura, Loren E.; and Maurushat, Ewalt, 4,030,784.

Lurie, Michael Jay: *See—*
Andrevski, Zygmunt M.; and Lurie, Michael Jay, 4,030,815.

Luzzi, John J.: *See—*
Ramey, Chester E.; and Luzzi, John J., 4,031,095.

Lyle Development, Inc.: *See—*
Oberlolier, John W., 4,030,650.

Lyons, Joseph. Trav-L-safe. 4,030,426, Cl. 109-51.000.

M.A. Buckley (Engraving) Limited: *See—*
Fellows, Stanley, 4,030,415.

M & W Gear Company: *See—*
Meiners, Elmo R., 4,030,753.

M° : *See—*
Aparicio, Luis; Gayo, Nenesio; M° ; Martin, Jose Luis; and Ron, Armando, 4,031,243.

Maass, Jurgen: *See—*
Nieschulz, Otto; Rudiger, Gunther; and Maass, Jurgen, 4,031,199.

Macchi, Giorgio: *See—*
Barba, Diego; Battistoni, Fabrizio; D'Agostini, Candido; and Macchi, Giorgio, 4,031,187.

Maciolek, Ralph B.: *See—*
Bernal G., Enrique; Koepke, Barry G.; and Maciolek, Ralph B., 4,031,190.

Mackey, James R.: *See—*
Meisner, Merlin M.; Matulis, Raymond M.; and Mackey, James R., 4,030,959.

Macklin, Bernard: *See—*
Coleman, Allan; and Macklin, Bernard, 4,031,312.

MacMillan, Kenneth T. Venting retainer for curing tube. 4,030,863, Cl. 425-17.000.

Macpherson, Roy Duncan: *See—*
Atmore, Milton Graham Montgomery; and Macpherson, Roy Duncan, 4,030,989.

Madej, Edward A., to Robroy Industries. Molding apparatus. 4,030,866, Cl. 425-116.000.

Maeda, Tooru: *See—*
Yamamoto, Kenichi; Kirose, Yutaka; and Maeda, Tooru, 4,030,454.

Magee, Philip S., to Chevron Research Company. Fungicidal vinyl 2-substituted-thiovinyl sulfones. 4,031,247, Cl. 424-337.000.

Magerlein, Barney J., to Upjohn Company, The. Bicyclic intermediates for preparing 16-alkylated prostaglandin analogs. 4,031,081, Cl. 260-240.00R.

Maggioni, Virginio: *See—*
Gemmellaro, Carmelo; Maggioni, Virginio; and Moretti, Renzo, 4,030,759.

Magnin, Roland. Articulated bracelet. 4,030,287, Cl. 59-85.000.

Maguire, Roy L., to Caterpillar Tractor Co. Symmetrical seal assembly for a hinge joint. 4,030,730, Cl. 277-92.000.

Maier, Vincent P.: *See—*
Guadagni, Dante G.; Horowitz, Robert M.; Gentili, Bruno; and Maier, Vincent P., 4,031,265.

Maillard, Jacques Georges, to Laboratoires Jacques Logeais. Phenylacetic acids. 4,031,133, Cl. 260-520.00R.

Maillefer S.A.: *See—*
Veyrassat, Louis, 4,030,673.

Mains, Donald M.: *See—*
Christian, Edward H.; Mains, Donald M.; and Treiber, James H., 4,031,440.

Mais, James W.; and Myers, L. Paul, to A-T-O Inc. Filling head detection device. 4,030,269, Cl. 53-61.000.

Makedonski, Boris Georgiev: *See—*
Kochemidov, Atanas Dimitrov; Makedonski, Boris Georgiev; Dumanov, Ivan Minkov; Payakov, Stefan Georgiev; Galabov, Peter Konstantinov; and Atanassov, Haralampi Aangelov, 4,030,249.

Makino, Shinichi: *See—*
Kokado, Naoyuki; and Makino, Shinichi, 4,031,470.

Malagari, Frank A., Jr.: *See—*
Shilling, Jack W.; Datta, Amitava; and Malagari, Frank A., Jr., 4,030,950.

Malizia, Peter Donato; and Mitchell, William Alexander, to General Foods Corporation. Fixing acetaldehyde in sucrose. 4,031,255, Cl. 426-534.000.

Malkki, Yrjo: *See—*
Suortti, Mikko Tapani; Malkki, Yrjo; and Nikkila, Olavi Elis, 4,031,253.

Mallinckrodt, Inc.: *See—*
El-Antably, Samir M., 4,031,218.

Mallow, William A., to Southwest Research Institute. Cement composition. 4,030,939, Cl. 106-74.000.

Malobabic, Peter: *See—*
Buzzi, Leo; Buzzi, Valentin; Opietnik, Walter; Liebl, Helmut; and Malobabic, Peter, 4,030,573.

Malovik, Vladlen Vasilievich: *See—*
Ponomarev, Alexei Ivanovich; Sokolov, Sergei Vasilievich; Larionova, Julia Alexeevna; Klebansky, Alexandr Leibovich; Berenblit, Vsevolod Volfovich; Dolnakov, Jury Pavlovich; Yagupolsky, Lev Moiseevich; Malovik, Vladlen Vasilievich; Lozinsky, Miron Onufrievich; Belous, Viktor Mikhailovich; Gruz, Boris Efimovich; Alexeeva, Ljubov Antonovna; Ankudinov, Anatoly Kirillovich; and Ryazanova, Rufina Mikhailovna, 4,031,119.

Mandai, Hiroshi; Ukigai, Toshiyuki; Tominaga, Anri; and Sato, Michito, to Lion Fat & Oil Co., Ltd. Method for preparation of polyolefin oil. 4,031,159, Cl. 260-683.15B.

Mandilaras, Stephen Emmanuel. Haircutting machine. 4,030,193, Cl. 30-30.000.

Mandras, Christian Maurice; and Stanik, Carol, to Societe Metallurgique de Revigny. Automatic device for seizing the end of a drawn product for a drum of a drawing bench. 4,030,680, Cl. 242-78.300.

Manduley, Flavio M.: *See—*
Dlugos, Daniel F.; and Manduley, Flavio M., 4,031,402.

Mankouski, Peter. Steam power plant. 4,030,302, Cl. 60-667.000.

Mann, Samuel, to Inverness Corporation. Sterile earlobe-piercing assembly. 4,030,507, Cl. 128-330.000.

Manner, James A., to PPG Industries, Inc. Drying of dialkyl peroxydicarbonates. 4,031,126, Cl. 260-463.000.

Mannesmann Aktiengesellschaft: *See—*
Bellmann, Manfred; and Goldberg, Hannes, 4,030,333.
Wunnenberg, Klaus; and Dubendorff, Joachim, 4,030,531.

Mapal Dr. Kress KG: *See—*
Kress, Dieter, 4,030,855.

Marcantonio, Livio F., to Chicago Pneumatic Tool Company. Sanding shoe with removable clamping jaw. 4,030,254, Cl. 51-386.000.

Marchetti, Joseph R.: *See—*
Dowbenko, Rostyslaw; and Marchetti, Joseph R., 4,031,051.

Maresh, Richard L. Chopped light relay keyer. 4,031,560, Cl. 361-175.000.

Margolis, Geoffrey; Rushmore, Dean Frederick; and Liu, Richard Tien-Szu, to Societe d'Assistance Technique pour Produits Nestle S.A. Decaffeination of vegetable material. 4,031,251, Cl. 426-387.000.

Mariner, Ralph E. Acoustic pickups. 4,030,396, Cl. 84-1.160.

Marinkovich, Vincent A., to GTE New Ventures Corporation. In vitro method for determining allergic hypersensitivity. 4,031,197, Cl. 424-1.000.

Marker, Delbert E.: *See—*
Leyde, Warren L.; and Marker, Delbert E., 4,031,406.

Marlin, Louis Allen; and Beaucaire, Victor D., to Interlake, Inc. Stabilized fuel slurry. 4,030,894, Cl. 44-51.000.

Marquette Metal Products Company: *See—*
Lowery, Robert D.; and Mehrbrodt, Alphonso W., 4,030,584.

Martin, Adolph; and Edwards, William Joseph, to Singer Company, The. Sewing machine take-up thread shield. 4,030,431, Cl. 112-241.000.

Martin, Blair Robertson; Meier, Johann Hans; and Raider, Jerry Wesley, to International Business Machines Corporation. Controls for a movable disk printer. 4,030,591, Cl. 197-53.000.

Martin, Jean, to Groupement Atomique Alsacienne Atlantique. High energy laser beam cutting method and apparatus. 4,031,351, Cl. 219-121.00L.

Martin, Jose Luis: *See—*
Aparicio, Luis; Gayo, Nenesio; M° ; Martin, Jose Luis; and Ron, Armando, 4,031,243.

Martin, Lawrence Leo; and Duffy, Brian J., to American Hoechst Corporation. 1,3-Dihydro-heteroarylspiro (isobenzofuran)s. 4,031,224, Cl. 424-267.000.

Martin Marietta Corporation: *See—*
Strauss, Eric L., 4,031,059.

Martz, Lyle F.; and Plotnick, Richard J., to Westinghouse Electric Corporation. Combined cycle electric power plant and a heat recovery steam generator having improved temperature control of the steam generated. 4,031,404, Cl. 290-40.00R.

Marvin Glass & Associates: *See—*
Allen, Robert K.; Schoenfield, Palmer J.; and Morrison, Howard J., 4,030,234.
Terzian, Rouben T.; Schoenfield, Palmer J.; Dunn, Kathy A.; and Kuna, Wayne A., 4,030,235.

Masaki, Kenji; and Minami, Hidehiro. Method and apparatus of controlling an air fuel mixture for a multi-cylinder internal combustion engine. 4,030,292, Cl. 60-274.000.

Masao, Ishihara: *See—*
Akira, Kato; Akira, Itoh; Tohru, Uchida; and Masao, Ishihara, 4,030,921.

Maschenko, Valery Mikhailovich: *See—*
Chuiko, Alexei Alexeevich; Tertykh, Valentin Anatolievich; Sobolev, Vilyam Alexandrovich; Maschenko, Valery Mikhailovich; Pavlov, Vyacheslav Valentinovich; Chugai, Alexei Dmitrievich; Khaber, Nikolai Vasilievich; Kondratenko, Anatoly Borisovich; Vatamanjuk, Vasily Ivanovich; Khoma, Mikhail Ivanovich; Kutin, Alexandr Nikolaevich; Shaposhnikov, Jury Davydovich, and Galashina, Malvina Leontievna, 4,030,940.

Maschinenbau Oppenweiler GmbH: *See—*
Kistner, Hermann; and Lehmann, Gunthart, 4,030,394.

Maschinenfabrik Fahr Aktiengesellschaft: *See—*
Ruprecht, Hermann, 4,030,275.

Kadin, Saul B.; and Moore, Peter F., 4,031,217.
Moore, Randolph Gaylon: *See—*
Bouvier, David William; Green, William Geary; and Moore, Randolph Gaylon, 4,031,462.
Moore, Robert L.: *See—*
Fish, Leonard A.; and Moore, Robert L., 4,030,559.
Moppett, Charles E.: *See—*
Celmer, Walter D.; Cullen, Walter P.; Moppett, Charles E.; Routien, John B.; Shibakawa, Riichiro; and Tone, Junsuke, 4,031,206.
Morbark Industries, Inc.: *See—*
Smith, Leward N.; and Morey, Larry L., 4,030,606.
Moreton, George C., to Electronic Data Controls Corporation. Blender. 4,030,707, Cl. 259-8.000.
Moretti, Renzo: *See—*
Gemmellaro, Carmelo; Maggioni, Virginio; and Moretti, Renzo, 4,030,759.
Morey, Larry L.: *See—*
Smith, Leward N.; and Morey, Larry L., 4,030,606.
Morgan Construction Company: *See—*
Smola, Raymond L., 4,030,183.
Mori, Atsushi; and Muramoto, Hiroo, to Nippon Soda Company Limited. Flexible polybutadiene resin composition having excellent electrical properties. 4,031,066, Cl. 260-77.5CR.
Mori, Yasunori: *See—*
Sugiura, Noboru; Mori, Yasunori; and Suda, Seiji, 4,030,468.
Moring, Rodger L.; and Frauenhoff, Richard E., to Caterpillar Tractor Co. Piston assembly with safety vent means for brakes and the like. 4,030,575, Cl. 188-71.100.
Morita, Masahiro. Quick freezing apparatus. 4,030,898, Cl. 62-345.000.
Morita, Masato; Morita, Reiko; and Otozai, Kiyoteru, to International Nuclear Fuel Co., Ltd. Method for the analysis of isotopes. 4,031,388, Cl. 250-272.000.
Morita, Reiko: *See—*
Morita, Masato; Morita, Reiko; and Otozai, Kiyoteru, 4,031,388.
Morooka, Yasuo; and Tanifuji, Shinya, to Hitachi, Ltd. Gage control apparatus and method for tandem rolling mills. 4,030,326, Cl. 72-8.000.
Moroz, Jury Antonovich: *See—*
Grigorenko, Anatoly Sergeevich; Moroz, Jury Antonovich; and Landyshev, Vladimir Vladislavovich, 4,030,336.
Morris, H. Rodney. Wear determination of drilling bits. 4,030,558, Cl. 175-39.000.
Morris, Harris L., to Uniroyal Inc. Thermoplastic elastomeric polymer blend. 4,031,169, Cl. 260-897.00A.
Morrison, Charles B., to Phillips Petroleum Company. Rotary feeder construction. 4,030,642, Cl. 222-368.000.
Morrison, Charles Glenn: *See—*
Dudonis, Ronald Michael; Morrison, Charles Glenn; Potter, Robert Lawrence; and Streisand, Kenneth, 4,031,325.
Morrison, Donald R., to Morrison, Lewis T., a part interest. Vibrating concrete screed. 4,030,873, Cl. 425-456.000.
Morrison, Howard J.: *See—*
Allen, Robert K.; Schoenfield, Palmer J.; and Morrison, Howard J., 4,030,234.
Morrison, Lewis T.: *See—*
Morrison, Donald R., 4,030,873.
Morsch, Dieter: *See—*
Jacob, Friedrich; and Morsch, Dieter, 4,030,772.
Morse, Charles Richard; and Ross, Alan Leslie, to Morse, Charles Richard. Sheet structure hoisting gripper. 4,030,747, Cl. 294-92.000.
Morton-Norwich Products, Inc.: *See—*
Pelosi, Stanford S., Jr., 4,031,113.
Mory, Rudolf; and Hari, Stefan, to Ciba-Geigy Corporation. Monoazo pigments containing barbituric acid or thio- or imino-derivatives thereof. 4,031,073, Cl. 260-154.000.
Moschetto, Yves J. M.: *See—*
Delhaye, Michel; Moschetto, Yves J. M.; and Dhamelincourt, Paul, 4,030,827.
Mosciano, Gerard Joseph: *See—*
Schreiber, William Lewis; Mosciano, Gerard Joseph; Pittet, Alan O.; Vock, Manfred; and Shuster, Edward Joseph, 4,031,140.

Desai, Samir Tbakorbhai, 4,031,319.
Havens, Richard Calvin, 4,031,486.
Lace, Melvin Arthur, 4,030,466.
Maze, Robert Craig, 4,031,028.
Shaw, Mark Layne, 4,031,477.
Mott, James D., to Hydril Company. Method of operating a subsurface safety valve in response to an increase or decrease in ambient well fluid pressure. 4,030,550, Cl. 166-314.000.
Mount Royal Transportation Equipment Ltd.: *See—*
Strahm, Charles, 4,030,749.
Mower, Morton M.: *See—*
Heilman, Marlin S.; Langer, Alois A.; Mirowski, Mieczyslaw; Mower, Morton M.; and Reilly, David M., 4,030,509.
Mueller, Von W.: *See—*
Jameel, Khaja M.; Mueller, Von W.; and Foerster, Ronald A., 4,031,460.
Muller, Gunter; and Kluge, Reimund, to AGFA-Gevaert, A.G. Device for separably coupling section of cassettes for motion picture film or the like. 4,030,602, Cl. 206-404.000.
Muller, Karl-Heinz; Rindfleisch, Volker; Rauch, Moriz V.; and Willasch, Dieter, to Siemens Aktiengesellschaft. Method of operating a particle-beam apparatus. 4,031,390, Cl. 250-307.000.
Mulvey, Dennis M.: *See—*
Weinstock, Leonard M.; Tull, Roger J.; and Mulvey, Dennis M., 4,031,125.
Muradian, Georgy Avanesovich: *See—*
Khcheyan, Khachik Egorovich; Revenko, Olga Mikhailovna; Shatalova, Alla Nikolaevna; Gelperina, Eleonora Grigorievna; Agrinskaya, Lidia Ivanovna; and Muradian, Georgy Avanesovich, 4,031,128.
Murai, Hiromu; Kitaguchi, Koji; Suminokura, Tatsuo; Sano, Akira; Kise, Masahiro; Kitano, Masahiko; and Tomita, Toshio, to Nippon Shinyaku Co., Ltd. Steryl-β-D-glucoside esters and method of preparation. 4,031,303, Cl. 536-5.000.
Muramoto, Hiroo: *See—*
Mori, Atsushi; and Muramoto, Hiroo, 4,031,066.
Muraviev, Ernest Nikolaevich: *See—*
Alexandrov, Vladimir Ilich; Osiko, Vyacheslav Vasilievich; Muraviev, Ernest Nikolaevich; Spiridonov, Eduard Georgievich; Tatarintsev, Vladimir Mikhailovich; and Gordon, Vladimir Grigorievich, 4,030,891.
Murayama, Koichi: *See—*
Fujita, Shigeru; Murayama, Koichi; and Kaneda, Toyohito, 4,030,987.
Murphy, Richard D., to Schlumberger Technology Corporation. Methods and apparatus for pulse height analyzer offset control. 4,031,367, Cl. 235-151.300.
Murphy, Zatis L., to Shell Oil Company. Auxiliary antioxidants. 4,031,018, Cl. 252-47.500.
Muryobayashi, Keiko: *See—*
Fujii, Setsuro; Kajita, Yasumichi; Hiraku, Seizi; Kira, Heizo; Aishita, Hideki; Muryobayashi, Keiko; Terashima, Hiroshi; Akimoto, Akira; Taniguchi, Ken; and Wada, Minoru, 4,030,977.
Musser, Jerry Lee; and Koch, Frederick William, to Lubrizol Corporation, The. Lubricating compositions and methods utilizing hydroxy thioethers. 4,031,023, Cl. 252-48.200.
Mutter, Werner, to Ing. Alfred Schmidt GmbH. Safety gear change apparatus for snow clearing vehicles. 4,030,380, Cl. 74-866.000.
Muzyka, Donald R.; and Walley, Robert F., to Carpenter Technology Corporation. Eliminating prior particle boundary delineation. 4,030,946, Cl. 148-11.50P.
Myers, Gary L.; and Staiger, Donald W., to HPM Corporation. Method for facilitating access to the mold halves of a molding machine. 4,030,186, Cl. 29-427.000.
Myers, Harry K., Jr.: *See—*
Suld, George; Schneider, Abraham; and Myers, Harry K., Jr., 4,031,150.
Myers, L. Paul: *See—*
Mais, James W.; and Myers, L. Paul, 4,030,269.
Naegeli, Peter, to Givaudan Corporation. Isopropenyl cyclopentene carboxylic acids. 4,031,132, Cl. 260-514.00L.
Nagae, Yasuyuki, to Central Glass Co., Ltd. Float glass band width control method. 4,030,902, Cl. 65-29.000.
Nagamine, Seiichi: *See—*
Suzuki, Kazuo; Hayashi, Yoshiaki; and Nagamine, Seiichi, 4,031,287.
Nagano, Katsuyuki: *See—*
Onishi, Makoto; Nagano, Katsuyuki; Tanaka, Toshiki P.; Matsuoka, Sadao; and Tanaka, Mitsuo, 4,030,809.
Nagano, Masashi, to Shimano Industrial Company, Limited. Derailleur for bicycle. 4,030,375, Cl. 74-217.00B.
Nagata, Toshio; Kawasaki, Kunijiro; Takahama, Ryuichiro; Miyatani, Yoshifusa; and Funakoshi, Sozo, to Kohan Sendan Kikai Kabushiki Kaisha; Sasebo Jukogyo Kabushiki Kaisha; and Nishi Nippon Harbor Service Kabushiki Kaisha. Device for connecting tugboat with ship to be tugged. 4,030,441, Cl. 114-242.000.

Nagata, Yasunori; Itoh, Hirotaka; Yazaki, Susumu; Hamamura, Takayuki; and Yoshiya, Shigeo, to Kanebo, Ltd. Method for continuously washing a yarn with a washing liquid. 4,030,884, Cl. 8-151.200.

Nagayama, Masuzo: *See—*
Isa, Hiroshi; Ukigai, Toshiyuki; Tominaga, Anri; Taniyasu, Ryozo; and Nagayama, Masuzo, 4,031,158.

Naito, Takanobu: *See—*
Sasaki, Kazuya; Naito, Takanobu; Momoki, Yoshio; Sega, Toshio; and Satomi, Toshiyuki, 4,031,215.

Najer, Henry: *See—*
Giudicelli, Doo Pierre Rene Lucien; and Najer, Henry, 4,031,094.

Nakagami, Tatsuro; and Kiyota, Yuhiko, to Mitsubishi Jidosha Kogyo Kabushiki Kaisha. Multi-cylinder internal combustion engine. 4,030,465, Cl. 123-127.000.

Nakahata, Kimio: *See—*
Takahashi, Toru; Nakahata, Kimio; and Kadowaki, Hidejiro, 4,030,447.

Nakai, Tomotoshi; Utsumi, Kazuaki; and Ohno, Tomeji, to Nippon Electric Co., Ltd. Ceramic dielectric material having improved temperature stability. 4,030,937, Cl. 106-73.200.

Nakamoto, Yukimasa: *See—*
Yamaguchi, Kineo; Kawakami, Katsuhiko; and Nakamoto, Yukimasa, 4,031,031.

Nakamura, Nobutaka; and Saeki, Yukio, to Sumitomo Durez Company, Ltd. Preparation of densified wood impregnated with phenolic resins. 4,031,276, Cl. 427-369.000.

Nakamura, Shigeo: *See—*
Hori, Kenji; and Nakamura, Shigeo, 4,030,459.

Nakamura, Tadashi; Hagiwara, Hisami; and Kokubu, Yoshikazu, to Kureha Kegaku Kogyo Kabushiki Kaisha. Diaphragm for electrolytic production of caustic alkali. 4,031,000, Cl. 204-252.000.

Nakamura, Yasushi; Agatsuma, Kunio; Tanaka, Yoshihiro; and Aono, Shunji, to Sumitomo Chemical Company, Limited. Phenoay carboxylic acid derivative. 4,031,134, Cl. 260-520.00C.

Nakanishi, Susumu, to Pfizer Inc. 2-Hydroaymethyl-3-benzyloxypyridine-6-eposyethane. 4,031,108, Cl. 260-297.00R.

Nakeyama, Michio; and Nakayama, Setuko, to Tojo, Eigo; and Nakayama, Sadao. Ice cream and the process for making same. 4,031,262, Cl. 426-565.000.

Nakayama, Sadao: *See—*
Nakayama, Michio; and Nakayama, Setuko, 4,031,262.

Nakayama, Setuko: *See—*
Nakayama, Michio; and Nakeyama, Setuko, 4,031,262.

Napier, Roger P.: *See—*
Gough, Stanley T.; Tobias, Michael A.; and Napier, Roger P., 4,031,237.

Nashua Corporation: *See—*
Hiscoe, Ernest C., 4,030,619.

Nasutavicus, Wilmonte A.: *See—*
Grinstead, Robert R.; and Nasutavicus, Wilmonte A., 4,031,038.

Nathaniel, Elmer O. Ice skating surface. 4,030,729, Cl. 272-3.000.

National Patent Development Corporation: *See—*
Stockel, Richard Frederick; and Valenti, Peter Carl, 4,031,110.

National Research Development Corporation: *See—*
Bulman, David Nicholas; and Maunder, Leonard, 4,030,371.
Elloy, Martin Arthur; and Beddow, Frank Howard, 4,030,143.

National Semiconductor Corporation: *See—*

Yanagishima, Takayuki; and Inoue, Naohiko, 4,031,527.

Niva, Russell N. Collapsible crustacean trap. 4,030,232, Cl. 43-105.000.

Nixdorf Computer AG: *See—*
Huellwegen, Josef, 4,031,480.

Nobutoki, Saburo; Ogusu, Chihaya; and Sugimoto, Masao, to Hitachi, Ltd.; and Nippon Hoso Kyokai. Image pickup device. 4,031,551, Cl. 358-223.000.

Noguchi, Toshitake, to Nippon Electric Co., Ltd. Automatic frequency control circuit. 4,031,471, Cl. 325-423.000.

Noguchi, Yasuhiro; Ukai, Toshinao; Sashihara, Kenji; and Masuda, Takao, to Fuji Photo Film Co., Ltd. Heat developable light-sensitive material. 4,030,931, Cl. 96-114.100.

Noguchi, Yasuhiro: *See—*
Sashihara, Kenji; Masuda, Takao; Noguchi, Yasuhiro; Sekikawa, Nobuyoshi; and Shishido, Tadao, 4,030,930.

Noll, Robert W., to Cambridge Filter Corporation. Portable air velocity measuring unit. 4,030,358, Cl. 73-212.000.

Nor-Am Resources Technology Inc.: *See—*
Willums, Jan-Olaf, 4,030,216.

Norberg, Gayle Russell, to Control Data Corporation. Power brownout detector. 4,031,463, Cl. 324-77.00A.

Norberg, Gayle Russell, to Control Data Corporation. Line power distortion detector. 4,031,464, Cl. 324-78.00Z.

Norden Laboratories, Inc.: *See—*
Davis, Eldon, 4,031,204.

Nordnero AB: *See—*
Karlsson, Tom Orvar Bjorn, 4,030,521.

Norris, Elwood B.; and Yeakley, Lester M., to Electrical Power Research Institute. Biaxial capacitance strain transducer. 4,030,347, Cl. 73-88.50R.

Northern Electric Company Limited: *See—*
Copeland, Miles Alexander, 4,031,490.
Sencer, Mevhibe Gulay, 4,031,331.

Northern Illinois Gas Company: *See—*
Simciak, Walter, 4,031,513.

Northern Telecom Limited: *See—*
Ingrey, Sidney Ivor Joseph; Nentwich, Heinz Josef; and Poulsen, Robert Gordon, 4,030,967.

Northeved, Allan; Fabrin, Knud Christian Claus; and Solfjeld, Poul, to Akademiet for de tekniske Videnskaber, Svejsecentralen. Apparatus for recording an ultrasonic sectional view. 4,030,344, Cl. 73-67.80S.

Northeved, Allan: *See—*
Lund, Svend Aage; Northeved, Allan; Solfjeld, Poul; and Fabrin, Knud Christian Claus, 4,030,343.

Nose, Yukihiko, to Takeda Chemical Industries, Ltd. Combined dialyzer and adsorber unit. 4,031,010, Cl. 210-202.000.

Nottke, James E., to Du Pont de Nemours, E. I., and Company. Cyanoperfluoroether acid fluorides and their preparation. 4,031,124, Cl. 260-465.400.

Novak, Arne: *See—*
Colding, Bertil; Novak, Arne; Sandstrom, Unto; and Jakobsson, Goran, 4,031,368.

Novikov, Oleg Nikolaevich: *See—*
Yakshin, Alexandr Sergeevich; Novikov, Oleg Nikolaevich; Grechinsky, Dmitry Alexeevich; Klochko, Viktor Alexandrovich; and Rygalin, Viktor Georgievich, 4,030,339.

Nupla Corporation: *See—*
Carmien, Joseph Allen, 4,030,847.

Nutrilite Products, Inc.: *See—*
Westall, Edward B.; and Messing, Alan W., 4,031,260.

Nuttall, Judi. Cat litter dispensing container. 4,030,448, Cl. 119-1.000.

Nyquist, Stephen E.: *See—*
Swanson, James P.; and Nyquist, Stephen E., 4,030,391.

Nyssen, Adrianus Marinus; and Rauch, Gerhard Josef, to Ironside's Machine & Welding Ltd. Multiple roll recorrugator. 4,030,330, Cl. 72-105.000.

Oberbeck, George A., to Charles Stark Draper Laboratory, Inc., The. Saturable reactor current limiter. 4,031,457, Cl. 323-92.000.

Oberloier, John W., to Lyle Development, Inc. Tail flash removal apparatus. 4,030,650, Cl. 225-100.000.

O'Doherty, George O. P., to Eli Lilly and Company. Method for introducing amino groups into benzimidazole or imidazopyridine compounds. 4,031,107, Cl. 260-296.00H.

Oftedahl, Everett J. Bait bucket. 4,030,227, Cl. 43-56.000.

Ogawa, Yoshihisa; Inezeki, Tsunenori; and Kouda, Michihiro, to Nissan Chemical Industries, Ltd. Continuous process for preparing bromine. 4,031,194, Cl. 423-500.000.

Ogawa, Yutaka; and Hirai, Hiroshi, to Akebono Brake Industry Co., Ltd.; and Ishikawajima-Harima Jukogyo Kabushiki Kaisha. Negative disc brake with a clearance-takeup mechanism. 4,030,577, Cl. 188-71.900.

Oger, Robert: *See—*
Baudoin, Jean-Claude; and Oger, Robert, 4,030,376.

Ogino, Masanori: *See—*
Saiki, Yukimi; Ogino, Masanori; and Watanabe, Shutoku, 4,031,547.

Ogle, James A.: *See—*
Holz, George E.; and Ogle, James A., 4,031,429.

Ogusu, Chihaya: *See—*
Nobutoki, Saburo; Ogusu, Chihaya; and Sugimoto, Masao, 4,031,551.

Ohhinata, Ichiro; and Okuhara, Shinzi, to Hitachi, Ltd. Memory circuit. 4,031,412, Cl. 307-238.000.

Ohhinata, Ichiro; Okuhara, Shinzi; and Takeshita, Tetsuo, to Hitachi, Ltd. Memory circuit. 4,031,413, Cl. 307-238.000.

Ohno, Isao: *See—*
Fujimoto, Keimei; Ohno, Nobuo; Okuno, Yoshitoshi; Mizutani, Tosbio; Ohno, Isao; Hirano, Masachika; Itaya, Nobushige; and Matsuo, Takashi, 4,031,235.

Ohno, Nobuo: *See—*
Fujimoto, Keimei; Ohno, Nobuo; Okuno, Yoshitoshi; Mizutani, Toshio; Ohno, Isao; Hirano, Masachika; Itaya, Nobushige; and Matsuo, Takashi, 4,031,235.

Ohno, Tomeji: *See—*
Nakai, Tomotoshi; Utsumi, Kazuaki; and Ohno, Tomeji, 4,030,937.

Oka, Masaaki: *See—*
Yamamoto, Hiroshi; and Oka, Masaaki, 4,030,888.

Okamura, Akira: *See—*
Ando, Shizuo; and Okamura, Akira, 4,031,323.

Okamura, Yasushi; Tanaka, Kiichiro; and Takeda, Takashi, to Matsushita Electric Industrial Co., Ltd. Loudspeaker. 4,031,337, Cl. 179-115.50H.

Okuhara, Shinzi: *See—*
Ohhinata, Ichiro; and Okuhara, Shinzi, 4,031,412.
Ohhinata, Ichiro; Okuhara, Shinzi; and Takeshita, Tetsuo, 4,031,413.

Okuno, Yoshitoshi: *See—*
Fujimoto, Keimei; Ohno, Nobuo; Okuno, Yoshitoshi; Mizutani, Toshio; Ohno, Isao; Hirano, Masachika; Itaya, Nobusbige; and Matsuo, Takashi, 4,031,235.

Olander, Stanley J.: *See—*
Holmen, Reynold E.; and Olander, Stanley J., 4,031,048.

Olashaw, William Francis, to General Electric Company. Insulative modular mounting panels for electrical switchboards. 4,031,433, Cl. 361-338.000.

Olasz, Joseph S.: *See—*
Fadl, Mohamed F. A.; and Olasz, Joseph S., 4,030,202.

Olin Corporation: *See—*
Ackerman, William R., Jr., 4,030,203.

Ollman, Melvin L. Building construction. 4,030,256, Cl. 52-90.000.

Olmstead, Michael M.: *See—*
Brooks, Norman B.; and Olmstead, Michael M., 4,030,622.

Olschewski, Armin: *See—*
Ernst, Horst M.; Olschewski, Armin; and Brandenstein, Manfred, 4,030,191.

Olympus Optical Co., Ltd.: *See—*
Ichikawa, Kazuo, 4,031,458.

Omori, Seita. Puncture alarm device for a tire. 4,031,508, Cl. 340-58.000.

Onishi, Makoto; Nagano, Katsuyuki; Tanaka, Toshiki P.; Matsuoka, Sadao; and Tanaka, Mitsuo, to Hitachi, Ltd. Optical connector. 4,030,809, Cl. 350-96.00C.

Ono Pharmaceutical Co., Ltd.: *See—*
Fujii, Setsuro; Kajita, Yasumichi; Hiraku, Seizi; Kira, Heizo; Aishita, Hideki; Muryobayashi, Keiko; Terashima, Hiroshi; Akimoto, Akira; Taoiguchi, Ken; and Wada, Minoru, 4,030,977.

Onsrud, Charles R. Tensioning device for a double drive profile cutter. 4,030,402, Cl. 90-19.000.

Oosterberg, Cedric Siegfried, to C. S. Oosterberg (Proprietary) Limited. Electric blanket. 4,031,352, Cl. 219-212.000.

Opedal, Torlak: *See—*
Einstabland, Tomas Berge; and Opedal, Torlak, 4,030,864.

Armor, Anthony F.; Chari, Madabushi V. K.; Kudlacik, Henry W.; and Reece, Paul, 4,031,422.
Reed, John Anthony; and Karp, Joel Allen, to Burroughs Corporation. Ultra high sensitivity sense amplifier for memories employing single transistor cells. 4,031,522, Cl. 340-173.00R.
Reed, Terry J., to Westinghouse Electric Corporation. System and method employing a digital computer with improved programmed operation for automatically synchronizing a gas turbine or other electric power plant generator with a power system. 4,031,407, Cl. 307-87.000.
Reef-Baker Corporation: *See—*
Pyle, Kenneth E., 4,030,517.
Reesman, Stanley H.: *See—*
Berry, Martin F.; Reesman, Stanley H.; Smith, Marvin L.; and Middlesworth, Peter Van, 4,031,267.
Regber, Norman; Dukic, Ferdinando V.; and Diorio, Frank, to United States of America, Army. Gravity deployed mine with combined upper clearing charge firing and delayed main charge initiation. 4,030,418, Cl. 102-8.000.
Regie Nationale des Usines Renault: *See—*
Colinet, Andre, 4,030,379.
Lalin, Andre; and Piret, Jean, 4,030,381.
Reichsteio, Erik Laurits, to Arenco AB. Cutter for removing a tough surface layer from pieces of material. 4,030,163, Cl. 17-50.000.
Reid, Joanne; de la Teja, Elpidio Leoncio; and Farrell, Francis, to Thomas J. Lipton, Inc. Process for preparing instant beverage cubes. 4,031,238, Cl. 426-285.000.
Reif, Robert Bruce, to Hoffmann-La Roche Inc. Manufacture of pharmaceutical unit dosage forms. 4,031,200, Cl. 424-27.000.
Reiland, Dennis J., to General Pattern Co., Inc. Method of making shaker plates. 4,030,188, Cl. 29-527.100.
Reilly, David M.: *See—*
Heilman, Marlin S.; Langer, Alois A.; Mirowski, Mieczyslaw; Mower, Morton M.; and Reilly, David M., 4,030,509.
Reiner, Carl Casper, to Deere & Company. Source related potential indicating continuity tester. 4,031,461, Cl. 324-51.000.
Reinert, Gerhard; Fallows, Jack; and Dussy, Paul, to Ciba-Geigy Corporation. Continuous process for optical brightening. 4,031,273, Cl. 427-158.000.
Reinhall, Rolf Bertil: *See—*
Asplund, Arne Johan Arthur; Reinhall, Rolf Bertil; and Ahrel, Per Johan Ingemar, 4,030,969.
Reisioger, Konrad; and Holzl, Ludwig, to Siemens Aktiengesellschaft. Apparatus for the time division multiplex transmission of binary signals. 4,031,316, Cl. 178-50.000.
Remy, David C., to Merck & Co., Inc. Trifluoromethylthio (and sulfonyl) derivatives of cyproheptadine analogs. 4,031,222, Cl. 424-267.000.
Remy, David C., to Merck & Co., Inc. Trifluoromethylthio derivatives of cyproheptadine. 4,031,223, Cl. 424-267.000.
Renner, Gunter; Boie, Immo; and Scheben, Quirin, to AGFA-Gevaert, A.G. Aliphatic β-keto esters. 4,031,130, Cl. 260-468.00K.
Rescalli, Carlo; and Pacifico, Antonio, to Snam Progetti S.p.A. Method for removing acetylenic compounds from saturated, olefinic and

dienic hydrocarbons or mixtures thereof. 4,031,157, Cl. 260-676.00R.
Research Corporation: *See—*
Callis, James B.; and Davidson, Ernest R., 4,031,398.
Reuschel, Donald L.; and Hendry, James W., to Ex-Cell-O Corporation. intensified cylinder assembly. 4,030,299, Cl. 60-560.000.
Revenko, Olga Mikhailovna: *See—*
Khcheyan, Khachik Egorovich; Revenko, Olga Mikhailovna; Shatalova, Alla Nikolaevna; Gelperina, Eleonora Grigorievna; Agrinskaya, Lidia Ivanovna; and Muradian, Georgy Avanesovich, 4,031,128.
Reyhing, Jorg: *See—*

Reinert, Gerhard; Fallows, Jack; and Dussy, Paul, to Ciba-Geigy Corporation. Continuous process for optical brightening. 4,031,273, Cl. 427-158.000.

Reinhall, Rolf Bertil: *See—*
Asplund, Arne Johan Arthur; Reinhall, Rolf Bertil; and Abrel, Per Johan Ingemar, 4,030,969.

Reisinger, Konrad; and Holzl, Ludwig, to Siemens Aktiengesellschaft. Apparatus for the time division multiplex transmission of binary signals. 4,031,316, Cl. 178-50.000.

Remy, David C., to Merck & Co., Inc. Trifluoromethylthio (and sulfonyl) derivatives of cyproheptadine analogs. 4,031,222, Cl. 424-267.000.

Remy, David C., to Merck & Co., Inc. Trifluoromethylthio derivatives of cyproheptadine. 4,031,223, Cl. 424-267.000.

Renner, Gunter; Boie, Immo; and Scheben, Quirin, to AGFA-Gevaert, A.G. Aliphatic β-keto esters. 4,031,130, Cl. 260-468.00K.

Rescalli, Carlo; and Pacifico, Antonio, to Snam Progetti S.p.A. Method for removing acetylenic compounds from saturated, olefinic and

dienic hydrocarbons or mixtures thereof. 4,031,157, Cl. 260-676.00R.

Research Corporation: *See—*
Callis, James B.; and Davidson, Ernest R., 4,031,398.

Reuschel, Donald L.; and Hendry, James W., to Ex-Cell-O Corporation. Intensified cylinder assembly. 4,030,299, Cl. 60-560.000.

Revenko, Olga Mikhailovna: *See—*
Khcheyan, Khachik Egorovich; Revenko, Olga Mikhailovna; Shatalova, Alla Nikolaevna; Gelperina, Eleonora Grigorievna; Agrinskaya, Lidia Ivanovna; and Muradian, Georgy Avanesovich, 4,031,128.

Reyhing, Jorg: *See—*
Wimber, Hans; Rohde, Wilhelm; and Reyhing, Jorg, 4,030,896.

Reynolds Metals Company: *See—*
Farquhar, Melville T., 4,030,661.

Rhone-Poulenc Industries: *See—*
Bouy, Pierre; Juillard, Michel; and Bourgeois, Jean-Luc, 4,031,041.
Helgorsky, Jacques, 4,031,148.

Rice, Jeffrey C.; and Tucker, Terry A., to Sperry Rand Corporation. Synchro-to-digital converter. 4,031,531, Cl. 340-347.0SY.

Richards, William Henry George, to Burroughs Wellcome Co. Method for the treatment of malaria. 4,031,220, Cl. 424-258.000.

Richardson, Edwin A.; and Scheuerman, Ronald F., to Shell Oil Company. Economically dissolving barium sulfate scale with a chelating agent. 4,030,548, Cl. 166-279.000.

Richev, Georgi Trendafilov: *See—*
Arolski, Angel Tomov; Usheva, Velichka Borissova; Gruev, Peter Vassilev; Richev, Georgi Trendafilov; and Doncheva, Zvetana Semkova, 4,031,264.

Richter, Hans, to Keller & Knappich Augsburg Zweigneiderlassung der Industrie-Werke Karlsruhe Augsburg Aktienegesellschaft. Robot device. 4,030,617, Cl. 214-1.0CM.

Rickert, Glenn Edward. Frequency selective reflex sight. 4,030,839, Cl. 356-251.000.

Rickmann, Bernard C.: *See—*
Rozenboom, Gustave; and Rickmann, Bernard C., 4,030,794.

Rieber & Son Plastic-Industri A/S: *See—*
Parmann, Gunnar, 4,030,872.

Riedel, Dieter, to Drabert Sohne. Decatizing of fabrics. 4,030,320, Cl. 68-5.00R.

Rieter Machine Works, Ltd.: *See—*
Hablutzel, Kurt; and Lamparter, Hansruedi, 4,030,635.

Rigazio, Anthony W., to General Time Corporation. Combination housing with compartment and ejector mechanism for ejecting a battery therefrom. 4,031,295, Cl. 429-100.000.

Rinaldi, Gerald Michael: *See—*
Giles, Thomas Clyde; Kohout, Otto James; and Rinaldi, Gerald Michael, 4,031,414.

Rindfleisch, Volker: *See—*
Muller, Karl-Heinz; Rindfleisch, Volker; Rauch, Moriz V.; and Willasch, Dieter, 4,031,390.

Rittler, Hermann L., to Corning Glass Works. Exuded transition metal films on glass-ceramic articles. 4,030,903, Cl. 65-32.000.

Rizio, Leo A. Lock hardware for outboard motor. 4,030,324, Cl. 70-232.000.

Robert Bosch G.m.b.H.: *See—*
Aldinger, Ulrich; and Kersten, Gunter, 4,030,405.
Bassler, Gerd; and Altpeter, Arno, 4,030,525.
Heiser, Joachim, 4,030,522.

Robert, Jacques: *See—*
Borel, Joseph; and Robert, Jacques, 4,031,529.

Robertson, Joseph D.; and Ward, Dean L. Drying system for particles. 4,030,205, Cl. 34-12.000.

Robillard, Edward George: *See—*
St. Andre, Arthur Francis; LeBlanc, Joseph David; and Robillard, Edward George, 4,031,446.

Robinson, Christopher Thomas. Vehicle jacks. 4,030,697, Cl. 254-8.00R.

Robinson, Elmer D.; and Struttmann, Hilarius S., to Borg-Warner Corporation. Bearing cartridge. 4,030,785, Cl. 308-187.000.

Robinson, Philip W. Furnace waste gas heat recovery device and method of using same. 4,030,877, Cl. 432-29.000.

Robinson, Ralph C.: *See—*
Freeman, John D.; Robinson, Ralph C.; and Swonger, Kenneth D., 4,031,363.

Robroy Industries: *See—*
Madej, Edward A., 4,030,866.

Roch, Jacques L., to Xynetics, Inc. Automatic cable forming system. 4,030,527, Cl. 140-92.100.

Rockwell International Corporation: *See—*
Archer, John L.; Tocci, Leonard R.; and Williams, Jeffrey L., 4,031,526.
Bake, Earl A.; and Schoeneweis, E. Frederick, 4,030,696.
Moll, Eberhard; and Walch, Leo M., Jr., 4,031,361.
Recker, Gary B., 4,031,386.

Rockwell, Thomas H. Percussion tool with noise reducing characteristics and method of making. 4,030,553, Cl. 173-1.000.

Rodenchuk, William Simon; and Eccles, Anthony Garth, to Alcan Research and Development Limited. Apparatus for continuous casting of metals. 4,030,536, Cl. 164-274.000.

Rodgers, Harris G., Sr.: *See—*
Phillips, Lawrence W.; and Rodgers, Harris G., Sr., 4,030,181.

Rodier, Rene Jean: *See—*
Droux, Jacques Pierre Leon; and Rodier, Rene Jean, 4,031,443.

Rodriguez, Jose E. Canopy release activating device for parachutes. 4,030,689, Cl. 244-151.00B.

Rogalski, Werner: *See—*
Gottschlich, Rudolf; Rogalski, Werner; Bergmann, Rolf; Steinigeweg, Rosmarie; and Wahlig, Helmut, 4,031,230.

Rogell, Paul S. Simulated gemstone. 4,030,317, Cl. 63-32.000.

Rogers, Jerry L.; and Cochran, Chudleigh B., to Brown Oil Tools, Inc. Swivel assembly. 4,030,546, Cl. 166-208.000.

Rogers, Paul. Efficiency and utilization of cooling towers. 4,031,173, Cl. 261-24.000.

Rogers, Philip John, to Pilkington P-E Limited. Infra-red lenses. 4,030,805, Cl. 350-2.000.

Rogers, Ronald D., to Alco Standard Corporation. Method and apparatus for circulating a heat treating gas. 4,030,712, Cl. 266-252.000.

Rohde, Wilhelm: *See—*
Wimber, Hans; Rohde, Wilhelm; and Reyhing, Jorg, 4,030,896.

Rohde, Wolfgang: *See—*
Beck, Kurt Gunther; Rohde, Wolfgang; Habermehl, Diethard; and Siebert, Werner, 4,030,983.

Rohm and Haas Company: *See—*
deBenneville, Peter, 4,031,186.
Dupont, John A.; Kooch, Walter; and Scott, Joseph D., 4,031,055.
Johnson, Wayne O., 4,031,131.

Rohner, Michel Alexandre, to Singer Company, The. Multistage sorter having pushdown stacks with concurrent access to interstage buffer memories for arranging an input list into numerical order. 4,031,520, Cl. 364-200.000.

Roma, Carlo, to Belleli Industrie Meccaniche S.p.A. Tube nest for heat exchangers, and modular elements for said nest consisting of thermoplastic tubes, and process for manufacturing the modular elements and the tube nests. 4,030,540, Cl. 165-172.000.

Ron, Armando: *See—*
Aparicio, Luis; Gayo, Nenesio; M° ; Martin, Jose Luis; and Ron, Armando, 4,031,243.

Ronnquist, Hadar Yngve. Fecal matter collector. 4,030,500, Cl. 128-283.000.

Rooney, Clarence Stanley: *See—*
Williams, Haydn Windsor Richard; and Rooney, Clarence Stanley, 4,031,103.

Rosenberg, Jeffrey. Swimming pool surface cleaning device. 4,030,148, Cl. 4-172.000.

Rosenkranz, Hans Jurgen: *See—*
Stahlke, Kurt-Rainer; Krafft, Werner; Meyer, Rudolf; and Rosenkranz, Hans Jurgen, 4,030,926.

Ross, Alan Leslie: *See—*
Morse, Charles Richard; and Ross, Alan Leslie, 4,030,747.

Ross, Sigmund L., to Shuffman, Rose, Executrix. Apparatus for cryothermal fracturing of rock formations. 4,030,547, Cl. 166-212.000.

Roth, Ronald: *See—*
Linck, Donald W., II; and Kaprelian, George, 4,030,197.

Rothfuss, Robert G.; and Becht, Carl T., to Senco Products, Inc. Improved fastener applying device. 4,030,655, Cl. 227-130.000.

Rottloff, Gunther: *See—*
Sundermann, Rudolf; Rottloff, Gunther; and Grigat, Ernst, 4,031,067.

Rourke, Terence Arthur. Process for calcining limestone. 4,031,183, Cl. 423-175.000.

Roussel-UCLAF: *See—*
Chazan, Jean-Bernard; and Gasc, Jean-Claude, 4,031,210.

Routien, John B.: *See—*
Celmer, Walter D.; Cullen, Walter P.; Moppett, Charles E.; Routien, John B.; Shibakawa, Riichiro; and Tone, Junsuke, 4,031,206.

Rowan, Frank E., to Aluminum Plumbing Fixture Corporation. Combination plumbing fisture having single floor waste outlet. 4,030,145, Cl. 4-10.000.

Roy, Robert Gibson: *See—*
Woods, Gilbert Frederick; Logan, Robert Thomas; McGarry, George; and Roy, Robert Gibson, 4,031,075.

Rozenboom, Gustave; and Rickmann, Bernard C., to Square D Company. Bus bar and switchboard assemblage. 4,030,794, Cl. 339-22.00B.

Ruddick, Marie T.: *See—*
Ruddick, Roy M.; and Ruddick, Marie T., 4,030,449.

Ruddick, Roy M.; and Ruddick, Marie T. Pet litter deodorizing apparatus. 4,030,449, Cl. 119-1.000.

Rudiger, Gunther: *See—*
Nieschulz, Otto; Rudiger, Gunther; and Maass, Jurgen, 4,031,199.

Rudolph, Paul, to Metallgesellschaft Aktiengesellschaft. Process for treating raw gas produced by the pressure gasification of coal. 4,031,030, Cl. 252-373.000.

Rueda Segura, Eduardo, to Empresa De Representaciones Unidas, S.A. (Erusa). Electric radiant heater. 4,031,353, Cl. 219-345.000.

Rufer, Clemens: *See—*
Ahrens, Hanns; Biere, Helmut; Rufer, Clemens; Schmiechen, Ralph; Schroeder, Eberhard; Loge, Olaf; Losert, Wolfgang; and Schillinger, Ekkehard, 4,031,236.

Rumpf, Robert John: *See—*
Pilarski, Regis Victor; and Rumpf, Robert John, 4,031,344.

Runge, Hans-Jurgen, to Warner Lewis Jr. Industrie- Filter GmbH. Spring-loaded differential pressure gage. 4,030,368, Cl. 73-419.000.

Ruprecht, Hermann, to Maschinenfabrik Fahr Aktiengesellschaft. Rotary mower. 4,030,275, Cl. 56-192.000.

Rushmore, Dean Frederick: *See—*
Margolia, Geoffrey; Rushmore, Dean Frederick; and Liu, Richard Tien-Szu, 4,031,251.

Russell, Gary R.; Chen, Che Jen; and Harstad, Kenneth G., to United States of America, National Aeronautics and Space Administration. Isotope separation using metallic vapor lasers. 4,031,389, Cl. 250-283.000.

Russell Harrington Cutlery, Inc.: *See*—
Umholtz, Franklyn G., 4,030,192.

Russell, John R., to E-Z Floss. Handle for disposable appliance. 4,030,199, Cl. 32-40.00R.

Rutschow, Joseph Fredrick; and Zucconi, Bruno, to Scala Radio Corporation; and Millifect. Method of molding fiberglass reflecting antenna. 4,030,953, Cl. 156-79.000.

Rutter, Armin: *See*—
Jaskulke, Gerhard; Schwarz, Alois; and Rutter, Armin, 4,031,375.

Ryazanova, Rufina Mikhailovna: *See*—
Ponomarev, Alexei Ivanovich; Sokolov, Sergei Vasilievich; Larionova, Julia Alexeevna; Klebansky, Alexandr Leibovich; Berenblit, Vsevolod Volfovich; Dolnakov, Jury Pavlovich; Yagupolsky, Lev Moiseevich; Malovik, Vladlen Vasilievich; Lozinsky, Miron Onufrievich; Belous, Viktor Mikhailovich; Gruz, Borix Efimovich; Alexeeva, Ljubov Antonovna; Ankudinov, Anatoly Kirillovich; and Ryazanova, Rufina Mikhailovna, 4,031,119.

Rye, Grover W.: *See*—
Bhakuni, Roop S.; and Rye, Grover W., 4,031,288.

Rygalin, Viktor Georgievich: *See*—
Yakshin, Alexandr Sergeevich; Novikov, Oleg Nikolaevicb; Grechinsky, Dmitry Alexeevich; Klochko, Viktor Alexandrovich; and Rygalin, Viktor Georgievich, 4,030,339.

Sabol, Albert R., to Standard Oil Company (Indiana). Phosphosulfurized hydrocarbon modified N-(hydroxy and alkyl-substituted benzyl) alkylene polyamine. 4,031,017, Cl. 252-46.700.

Saeki, Yukio: *See*—
Nakamura, Nobutaka; and Saeki, Yukio, 4,031,276.

Saiki, Noritsugu; Takeuchi, Yoshihiko; and Sakai, Hiroshi, to Teijin Limited. Process for preparing polyester elastomers. 4,031,165, Cl. 260-860.000.

Saiki, Yukimi; Ogino, Masanori; and Watanabe, Shutoku, to Hitachi, Ltd. Noise reducing circuit for video signals. 4,031,547, Cl. 358-167.000.

St. Andre, Arthur Francis; LeBlanc, Joseph David; and Robillard, Edward George, to Cincinnati Milacron-Heald Corporation. Machine tool. 4,031,446, Cl. 318-665.000.

Saint-Gobain Industries: *See*—
Pelzer, Rudolf; and Scholl, Heinz, 4,030,897.
Straeten, Franz-Josef; Pelzer, Rudolf; Feiten, Karl-Josef; and Stevens, Wilhelm-Josef, 4,030,961.

Saito, Takahiko: *See*—
Kimura, Hiroyuki; and Saito, Takahiko, 4,031,334.

Saka, Yoshimi, to Hitachi Metals, Ltd. Molding system. 4,030,535, Cl. 164-207.000.

Sakai, Hiroshi: *See*—
Saiki, Noritsugu; Takeuchi, Yoshihiko; and Sakai, Hiroshi, 4,031,165.

Sakai, Yoshio; and Kurosawa, Toshiaki, to Hitachi, Ltd. Over-speed preventing apparatus for DC motor. 4,031,439, Cl. 318-338.000.

Sakamoto, Yoichi, to Matsushita Electric Industrial Co., Ltd. Tuning apparatus using a voltage-dependent reactance element. 4,031,491, Cl. 334-15.000.

Sakanaka, Yasuhiro: *See*—
Shimizu, Akihiko; and Sakanaka, Yasuhiro, 4,031,302.

Sakurai, Yoshihisa: *See*—
Kojima, Kojiro; Sakurai, Yoshihisa; Sugai, Tetuya; and Motegi, Masayoshi, 4,030,837.

Sale, Morris D. Bird trap. 4,030,229, Cl. 43-69.000.

Saleck, Wilhelm: *See*—
Idel, Karsten-Josef; Saleck, Wilhelm; Wolff, Erich; and Freitag, Dieter, 4,030,929.

Sanders, James Milton; Taylor, William I.; Hill, Ira D.; and Kryschuk, John J., to International Flavors & Fragrances Inc. Process for producing mixture containing 4-(4'-methyl-4'-hydroxyamyl)-Δ^3-cyclohexene carboxaldehyde. 4,031,161, Cl. 260-598.000.

Sandoval, Dante J. Thermal motor. 4,030,298, Cl. 60-527.000.

Sandoz, Inc.: *See*—
Jackson, Thomas E., 4,031,227.
Kathawala, Faizulla G., 4,031,233.

Sandoz Ltd.: *See*—
Bastian, Jean-Michel; and Berthold, Richard, 4,031,225.

Sands, Asa D. Ball-type safety valve. 4,030,520, Cl. 137-513.500.

Sandstrom, Unto: *See*—
Colding, Bertil; Novak, Arne; Sandstrom, Unto; and Jakobsson, Goran, 4,031,368.

Sangster, Arlon G. Exposure station for a contact printing device. 4,030,826, Cl. 355-104.000.

Sankyo Electric Company, Limited: *See*—
Harashima, Ikuo, 4,030,632.

Sano, Akira: *See*—
Murai, Hiromu; Kitaguchi, Koji; Suminokura, Tatsuo; Sano, Akira; Kise, Masahiro; Kitano, Masahiko; and Tomita, Toshio, 4,031,303.

Sano, Ichiro, to Furukawa Battery Co., Ltd., The. Splash-proof device for use in a storage battery. 4,031,294, Cl. 429-82.000.

Sansburry, James D.: *See*—
Luce, Robert L.; Perry, Joseph P.; and Sansburry, James D., 4,030,952.

Sant'Andrea Novara Officine Meccaniche e Fonderie S.p.A.: *See*—
Vedani, Augusto, 4,030,674.

Santer, James O.: *See*—
Hahn, Frank J.; and Santer, James O., 4,031,057.

Sanyo Chemical Industries, Ltd.: *See*—
Tominaga, Yoichi; and Shibahara, Yasuo, 4,030,970.

Sanyo Electric Co., Ltd.: *See*—
Arai, Takeshi, 4,031,475.

Sarancha, Vladimir Nikolaevich: *See*—
Ponomarenko, Nikolai Borisovich; Kononenko, Vadim Grigorievich; Stelmakh, Viktor Alexeevich; Kotelnikov, Vladimir Ivanovich; Valenya, Ivan Jurievich; Sarancha, Vladimir Nikolaevich; Petrenko, Anatoly Avramovich; Bozhko, Valery Pavlovich; Yatsenko, Sergei Vasilievich; Komnatny, Igor Pavlovich; Akhnazariants, Levon Khachaturovich; Strizhenko, Vitaly Evgenievich; Kolokolov, Boris Alexeevich; Maznichenko, Stanislav Anisimovich; Bozhko, Viktor Vasilievich; Bondarenko, Oleg Alexandrovich; and Zakirov, Robert Sharafutdinovich, 4,030,389.

Sarbacher, Robert I.; and Bogue, John C., to Bogue, John C. Electrochemical energy cell. 4,031,296, Cl. 429-116.000.

Sargisson, Donald Farley, to General Electric Company. Thrust reverser for a gas turbofan engine. 4,030,291, Cl. 60-226.00A.

Sasaki, Kazuya; Naito, Takanobu; Momoki, Yoshio; Sega, Toshio; and Satomi, Toshiyuki, to Kaken Chemical Co., Ltd. Streptovaricinone C derivatives as antibiotics. 4,031,215, Cl. 424-244.000.

Sasayama, Takao; and Nishimiya, Torazo, to Hitachi, Ltd. Air-fuel ratio controller for internal-combustion engine. 4,030,462, Cl. 123-119.0EC.

Sasebo Jukogyo Kabushiki Kaisha: *See*—
Nagata, Toshio; Kawasaki, Kunijiro; Takahama, Ryuichiro; Miyatani, Yoshifusa; and Funakoshi, Sozo, 4,030,441.

Sashihara, Kenji; Masuda, Takao; Noguchi, Yasuhiro; Sekikawa, Nobuyoshi; and Shishido, Tadao, to Fuji Photo Film Co., Ltd. Heat-developable light-sensitive material. 4,030,930, Cl. 96-114.100.

Sashihara, Kenji: *See*—
Noguchi, Yasuhiro; Ukai, Toshinao; Sashihara, Kenji; and Masuda, Takao, 4,030,931.

Sato, Michito: *See*—
Mandai, Hiroshi; Ukigai, Toshiyuki; Tominaga, Anri; and Sato, Michito, 4,031,159.

Sato, Tomoyoshi: *See*—
Sonobe, Shigeru; Watanabe, Makoto; Kato, Iwao; and Sato, Tomoyoshi, 4,030,828.

Satomi, Toshiyuki: *See*—
Sasaki, Kazuya; Naito, Takanobu; Momoki, Yoshio; Sega, Toshio; and Satomi, Toshiyuki, 4,031,215.

Satterwhite, Charles R., to Unit Rig & Equipment Co. Two wheel excavating and loading system. 4,030,217, Cl. 37-190.000.

Sauthier, Pierre A.; and Vuilleumier, Cyril, to Societe Suisse Pour l'Industrie Horlogere Management Services S.A. Electrically driven time piece with means for effecting a precise setting of time. 4,030,283, Cl. 58-23.00R.

Saxon, B. Ronald, to International Telephone and Telegraph Corporation. Time limited telephone paging employs a relay switch actuated by dual frequency tone. 4,031,329, Cl. 179-18.0BF.

Scala Radio Corporation: *See*—
Rutschow, Joseph Fredrick; and Zucconi, Bruno, 4,030,953.

Scans Associates, Inc.: *See*—
Smith, Richard L.; and Mosher, Peter J., 4,030,352.
Smith, Richard Lawrence, 4,030,351.

Schaefer, William H.; and Bender, Richard E., to General Dynamics Corporation. Method for molding high strength facing. 4,031,181, Cl. 264-135.000.

Schaefers, Elvin J. Cartridge for fishing flies and leaders. 4,030,228, Cl. 43-57.50R.

Schafer, Dietmar: *See*—
Bauer, Klaus; Frommer, Werner; Kaufmann, Wilfried; Metzger, Georg; Scheer, Martin; Schmidt, Delf; Schroder, Theo; and Schafer, Dietmar, 4,031,207.
Bauer, Klaus; Frommer, Werner; Kaufmann, Wilfried; Metzger, Karl Georg; Scheer, Martin; Schmidt, Delf; Schroder, Theo; and Schafer, Dietmar, 4,031,208.

Schaffer, Claus: *See*—
Spiesberger, August; and Schaffer, Claus, 4,031,419.

Schampers, Paulus Philippus Maria; and De Rijke, Pieter Adrianus, to U.S. Philips Corporation. Method of manufacturing an electric discharge tube. 4,030,789, Cl. 316-19.000.

Schank, Richard L., to Xerox Corporation. Waterless printing masters. 4,030,416, Cl. 101-450.000.

Scharpenberg, Hans-Georg: *See*—
Oppenlaender, Knut; Uhl, Guenter; Helfert, Herbert; Scharpenberg, Hans-Georg; and Stork, Karl, 4,031,112.

Schat, Hermannus; and Freyberger, Laurin Clemens, to ITT Industries, Inc. Monolithic integrated circuit for the distortion of a saw-tooth signal. 4,031,411, Cl. 307-228.000.

Scheben, Quirin: *See*—
Renner, Gunter; Boie, Immo; and Scheben, Quirin, 4,031,130.

Scheer, Martin: *See*—
Bauer, Klaus; Frommer, Werner; Kaufmann, Wilfried; Metzger, Georg; Scheer, Martin; Schmidt, Delf; Schroder, Theo; and Schafer, Dietmar, 4,031,207.
Bauer, Klaus; Frommer, Werner; Kaufmann, Wilfried; Metzger, Karl Georg; Scheer, Martin; Schmidt, Delf; Schroder, Theo; and Schafer, Dietmar, 4,031,208.

Scheffer, Harvey Dow Gibson, to RCA Corporation. Wire lead bonding tool. 4,030,657, Cl. 228-1.00R.

Scheithauer, Steffen: *See*—
Gahler, Siegfried; Junge, Karl-Wilhelm; Fischer, Gunther; Scheithauer, Steffen; and Viola, Horst, 4,030,928.

Schellenbaum, Max; Duennenberger, Max; and Casagrande, Fulvio, to Ciba-Geigy AG. Microbicidal agents containing as active ingredient monohydroxyphenyl carbinols. 4,031,248, Cl. 424-347.000.

Scherbel, Gordon H.: *See*—
Shepard, E. Dwayne; and Scherbel, Gordon H., 4,030,709.

Schering Aktiengesellschaft: *See*—
Ahrens, Hanns; Biere, Helmut; Rufer, Clemens; Schmiechen, Ralph; Schroeder, Eberhard; Loge, Olaf; Losert, Wolfgang; and Schillinger, Ekkehard, 4,031,236.

Scheuerman, Ronald F.: *See*—
Richardson, Edwin A.; and Scheuerman, Ronald F., 4,030,548.

Schieber, Michael M.; Beinglass, Israel; and Dishon, Giora, to United States of America, Energy Research and Development Administration. Temperature cycling vapor deposition HgI_2 crystal growth. 4,030,964, Cl. 156-610.000.

Schild, Ekkehard, to Bayerische Motoren Werke Aktiengesellschaft. Centrifugal adjusting mechanism for ignition interrupters of internal combustion engines. 4,030,467, Cl. 123-146.50A.

Schillinger, Ekkehard: *See*—
Ahrens, Hanns; Biere, Helmut; Rufer, Clemens; Schmiechen, Ralph; Schroeder, Eberhard; Loge, Olaf; Losert, Wolfgang; and Schillinger, Ekkehard, 4,031,236.

Schimmel, Vernon R., to Symons Corporation. Composite concrete wall form unit with a special transition bolt. 4,030,694, Cl. 249-196.000.

Schirtzinger, Joseph F., to Sea-Log Corporation. Monopod drilling platform with directional drilling. 4,030,310, Cl. 61-86.000.

Schlumberger Technology Corporation: *See*—
Murphy, Richard D., 4,031,367.

Schluter, Wilhelm; and Pohler, Heinz, to Hoesch Werke Aktiengesellschaft. Multi-row anti-friction bearing. 4,030,786, Cl. 308-227.000.

Schmermund, Alfred. Control arrangement for a cam production machine. 4,031,445, Cl. 318-568.000.

Schmidt, Delf: *See*—
Bauer, Klaus; Frnmmer, Werner; Kaufmann, Wilfried; Metzger, Georg; Scheer, Martin; Schmidt, Delf; Schroder, Theo; and Schafer, Dietmar, 4,031,207.
Bauer, Klaus; Frommer, Werner; Kaufmann, Wilfried; Metzger, Karl Georg; Scheer, Martin; Schmidt, Delf; Schroder, Theo; and Schafer, Dietmar, 4,031,208.

Schmidt, Jurgen: *See*—
Grund, Peter; Schmidt, Jurgen; and Hesse, Jurgen, 4,030,247.

Schmidt, Siegbert: *See*—
Piret, Norbert L.; Rabben, Hans Joachim; Kudelka, Herbert; and Schmidt, Siegbert, 4,030,990.

Schmiechen, Ralph: *See*—
Ahrens, Hanns; Biere, Helmut; Rufer, Clemens; Schmiechen, Ralph; Schroeder, Eberhard; Loge, Olaf; Losert, Wolfgang; and Schillinger, Ekkehard, 4,031,236.

Schmitt, Joseph Lawrence, Jr.; Walker, Philip Leroy, Jr.; and Castellion, George Augustus, to American Cyanamid Company. Catalysts based on carbon supports ano use in catalytic deoxidation process. 4,031,137, Cl. 260-559.0AT.

Schmitt, Ludwig; and Kipping, Joachim, to Schubert & Salzer Maschinenfabrik Aktiengesellschaft. Device for drafting long staple fibre sliver. 4,030,165, Cl. 19-.200.

Schmitter, Andre; and Seiz, Wolfgang, to Ciba-Geigy Corporation. Process for the manufacture of foams from epoxide resins. 4,031,043, Cl. 260-2.5EP.

Schnabel, Walter. Toy building blocks. 4,030,236, Cl. 46-25.000.

Schnee, Karl; Tichy, Dieter; and Piesch, Steffen, to Cassella Farbwerke Mainkur Aktiengesellschaft. Aminoplast curing agents. 4,031,064, Cl. 260-67.60R.

Schneider, Abraham: *See*—
Suld, George; Schneider, Abraham; and Myers, Harry K., Jr., 4,031,150.

Schoeffler, Romona B.: *See*—
Schoeffler, William N.; and Schoeffler, Romona B., 4,030,745.

Schoeffler, William N.; and Schoeffler, Romona B. Tool retriever for wells. 4,030,745, Cl. 294-86.140.

Schoeneweis, E. Frederiek: *See*—
Bake, Earl A.; and Schoeneweis, E. Frederick, 4,030,696.

Schoenfield, Palmer J.: *See*—
Allen, Robert K.; Schoenfield, Palmer J.; and Morrison, Howard J., 4,030,234.
Terzian, Rouben T.; Schoenfield, Palmer J.; Dunn, Kathy A.; and Kuna, Wayne A., 4,030,235.

Schoeps, Jochen: *See*—
Dhein, Rolf; Schoeps, Jochen; and Kuchenmeister, Rolf, 4,031,052.

Scholin, Harold W.; and Lisiecke, Hieronim L., to Scholin Industries, Inc. Washer cutting machine. 4,030,385, Cl. 82-48.000.

Scholin Industries, Inc.: *See*—
Scholin, Harold W.; and Lisiecke, Hieronim L., 4,030,385.

Scholl, Heinz: *See*—
Pelzer, Rudolf; and Scholl, Heinz, 4,030,897.

Schollhorn, Fritz: *See*—
Reber, Erwin; and Schollhorn, Fritz, 4,030,274.

Schopper, Alf; and Linder, Jean, to Heberlein Hispano S.A. Surveying device. 4,030,281, Cl. 57-87.000.

Schott, Charles M., Jr., to Gloucester Engineering Co. Inc. Roll winder. 4,030,681, Cl. 242-81.000.

Schreiber, William Lewis; Mosciano, Gerard Joseph; Pittet, Alan O.; Vock, Manfred; and Shuster, Edward Joseph, to International Flavors & Fragrances Inc. 4- and 5-Phenyl pentenal acetals. 4,031,140, Cl. 260-611.00A.

Schrider, Michael Stanley, to American Cyanamid Company. Cyclopropanecarboxylates for systemic control of ectoparasites. 4,031,239, Cl. 424-304.000.

Schrock, Wilfried: *See*—
Konig, Hans-Bodo; Metzger, Karl Georg; and Schrock, Wilfried, 4,031,229.

Schroder, Theo: *See*—
Bauer, Klaus; Frommer, Werner; Kaufmann, Wilfried; Metzger, Georg; Scheer, Martin; Schmidt, Delf; Schroder, Theo; and Schafer, Dietmar, 4,031,207.
Bauer, Klaus; Frommer, Werner; Kaufmann, Wilfried; Metzger, Karl Georg; Scheer, Martin; Schmidt, Delf; Schroder, Theo; and Schafer, Dietmar, 4,031,208.

Schroeder, Eberhard: *See*—
Ahrens, Hanns; Biere, Helmut; Rufer, Clemens; Schmiechen, Ralph; Schroeder, Eberhard; Loge, Olaf; Losert, Wolfgang; and Schillinger, Ekkehard, 4,031,236.

Groudan, Alan I.; Schroeder, George F.; and Treffinger, H. Lee, 4,031,374.

Schubert, Gunter: *See*—
Enneking, Heinrich; Schubert, Gunter; and Baumann, Karl-Heinz, 4,030,169.

Schubert & Salzer Maschinenfabrik Aktiengesellschaft: *See*—
Schmitt, Ludwig; and Kipping, Joachim, 4,030,165.

Schulte, Hubert: *See*—
Moeller, Jurgen; Mitrach, Werner; Krauss, Helmut; and Schulte, Hubert, 4,031,459.

Schultes, Tilmann, to Kortenbach & Rauh Kommanditgesellschaft. Shortenable umbrella. 4,030,514, Cl. 135-25.00R.

Schultz, Thomas W.: *See*—
Williams, G. Norman; and Schultz, Thomas W., 4,030,790.

Schulze, Ehrhart, to Felix Stiegler Maschinenfabrik. Equalizing device for movements in packing machines, especially machines for making bags and the like. 4,030,652, Cl. 226-114.000.

Schuster, Hans Gunther: *See*—
Poetzsch, Rolf; and Schuster, Hans Gunther, 4,030,386.

Schwartz, Samuel, to Intel Corporation. Propagation line adder and method for binary addition. 4,031,379, Cl. 235-175.000.

Schwarz, Alois: *See*—
Jaskulke, Gerhard; Schwarz, Alois; and Rutter, Armin, 4,031,375.

Schwarz, Leonard H., to Dunham-Bush, Inc. Method of manufacturing low cost non-porous metal connecting rods. 4,030,179, Cl. 29-156.50A.

Schweder, Frederic James: *See*—
Sung, Pei; and Schweder, Frederic James, 4,030,918.

Schwuchow, Norbert; and Hutai, Hubert, to Daimler-Benz Aktiengesellschaft. Motor vehicle bumper. 4,030,744, Cl. 293-71.00R.

Scott, Joseph D.: *See*—
Dupont, John A.; Kooch, Walter; and Scott, Joseph D., 4,031,055.

Scott, Kenneth F. Testing of ram and annular blowout preventers. 4,030,354, Cl. 73-151.000.

Sea-Log Corporation: *See*—
Schirtzinger, Joseph F., 4,030,310.

Sea Solar Power, Inc.: *See*—
Anderson, James H., 4,030,301.

Seaman, Wesley Arthur: *See*—
Krause, Ernest Harry; Seaman, Wesley Arthur; and Angelopoulos, Peter Gregory, 4,031,466.

Sebag, Henri: *See*—
Vanlerberghe, Guy; and Sebag, Henri, 4,031,025.

Sega, Kenji: *See*—
Suzuki, Osamu; Akashi, Goro; Kasuga, Akira; and Sega, Kenji, 4,030,685.

Sega, Toshio: *See*—
Sasaki, Kazuya; Naito, Takanobu; Momoki, Yoshio; Sega, Toshio; and Satomi, Toshiyuki, 4,031,215.

Seidel, William C.: *See*—
Mitchell, William A.; and Seidel, William C., 4,031,266.

Seifert, Horst: *See*—
Ziegler, Reinhard; and Seifert, Horst, 4,031,425.

Seiz, Wolfgang: *See*—
Schmitter, Andre; and Seiz, Wolfgang, 4,031,043.

Seki, Mitsuaki: *See*—
Hanagata, Takayoshi; Gushima, Hideki; and Seki, Mitsuaki, 4,030,588.

Sekikawa, Nobuyoshi: *See*—
Sashihara, Kenji; Masuda, Takao; Noguchi, Yasuhiro; Sekikawa, Nobuyoshi; and Shishido, Tadao, 4,030,930.

Sell, Leslie James, to Picker X-Ray Mfg. Limited. Lineal lock for X-ray apparatus. 4,030,579, Cl. 188-171.000.

Semperit Aktiengesellschaft: *See*—
Steiner, Anton, 4,030,393.

Sencer, Mevhibe Gulay, to Northern Electric Company Limited. Telephone speech network. 4,031,331, Cl. 179-81.00A.

Senco Products, Inc.: *See*—
Rothfuss, Robert G.; and Becht, Carl T., 4,030,655.

Sensibar, Ezra, to Construction Aggregates Corporation. Hopper valve module for hopper dredge. 4,030,435, Cl. 114-36.000.

Sergovic, John A., to Burns & Russell Company of Baltimore City, The. Stain resistant polyester-coated block. 4,031,289, Cl. 428-451.000.

Serlovsky, Frank V., to D.N.S. Precision Machining. Adjustable printed circuit board pallet. 4,030,717, Cl. 269-118.000.

Sesselmann, Hans Dieter: *See—*
Pickert, Hansjurgen; Sesselmann, Hans Dieter; and Timmers, Leonardes August, 4,030,430.
Seymour, Claude W. Rake device. 4,030,157, Cl. 15-142.000.
Seymus, Herman Ernest, to Du Pont de Nemours, E. I., and Company. Fluorocarbon polymer coating compositions containing mica particles. 4,031,286, Cl. 428-324.000.
Shaare Zedek Hospital: *See—*
Zioni, Dov; and Halperin, Levi Y., 4,031,435.
Shaduya, Vladimir Leontievich: *See—*
Chachin, Viktor Nikolaevich; Zhuravsky, Alexandr Julyanovich; Zdor, Gennady Nikolaevich; Shaduya, Vladimir Leontievich; and Golovkina, Elena Yakovlevna, 4,030,329.
Shako, Hisahumi: *See—*
Hashimoto, Michiyoshi; and Shako, Hisahumi, 4,030,561.
Shantzer, Aaron, deceased: *See—*
Wallin, Mark; and Shantzer, Aaron, deceased, 4,030,312.
Shantzer, Helen, executrix: *See—*
Wallin, Mark; and Shantzer, Aaron, deceased, 4,030,312.
Shantzer-Wallin Corporation: *See—*
Wallin, Mark; and Shantzer, Aaron, deceased, 4,030,312.
Shaposhnikov, Jury Davydovich: *See—*
Chuiko, Alexei Alexeevich; Tertykh, Valentin Anatolievich; Sobolev, Vilyam Alexandrovich; Maschenko, Valery Mikhailovich; Pavlov, Vyacheslav Valentinovich; Chugai, Alexei Dmitrievich; Khaber, Nikolai Vasilievich; Kondratenko, Anatoly Borisovich; Vatamanjuk, Vasily Ivanovich; Khoma, Mikhail Ivanovich; Kutin, Alexandr Nikolaevich; Shaposhnikov, Jury Davydovich; and Galashina, Malvina Leontievna, 4,030,940.
Sharkey, William Henry; and Harris, John Ferguson, Jr., to Du Pont de Nemours, E. I., and Company. Copolymers of isobutylene and a vinylbenzene and graft polymers thereof with pivalolactone. 4,031,168, Cl. 260-896.000.
Shatalova, Alla Nikolaevna: *See—*
Khcheyan, Khachik Egorovich; Revenko, Olga Mikhailovna; Shatalova, Alla Nikolaevna; Gelperina, Eleonora Grigorievna; Agrinskaya, Lidia Ivanovna; and Muradian, Georgy Avanesovich, 4,031,128.
Shaw, Mark Layne, to Motorola, Inc. System for transferring four commands over a single conductor utilizing dual threshold logic gates. 4,031,477, Cl. 328-70.000.
Sheesley, Wilmer Lee, to AMP Incorporated. Electrical contact system. 4,030,791, Cl. 339-5.00M.
Shell Oil Company: *See—*
Berger, Hans; De Lind Van Wijngaarden, Gerhard; and Breuker, Jacobus H., 4,031,016.
Lukas, Joachim H.; Baardman, Frank; and Kouwenhoven, Adriaan P., 4,031,152.
Murphy, Zatis L., 4,031,018.
Powell, James E., 4,031,087.
Richardson, Edwin A.; and Scheuerman, Ronald F., 4,030,548.
Shelton, Jack P., Sr.; and Adam, John M. Insect carrier and dispenser apparatus. 4,030,226, Cl. 43-55.000.
Shemtov, Sami, to I-T-E Imperial Corporation EFCOR Division. Attachment for thread cutting apparatus. 4,030,153, Cl. 10-89.0WH.
Shepard, E. Dwayne; and Scherbel, Gordon H., to FMC Corporation. Method of plugging tapholes in phosphorus furnaces. 4,030,709, Cl. 266-45.000.
Sherman, Benjamin F., Jr. Catoptric system for simultaneous concentration of light, laser, and other type paraxial rays into beams. 4,031,384, Cl. 250-203.00R.
Sheth, Harshadrai D. Electronic hour glass clock. 4,030,285, Cl. 58-50.00R.
Shibahara, Yasuo: *See—*
Tominaga, Yoichi; and Shibahara, Yasuo, 4,030,970.
Shibakawa, Riichiro: *See—*
Celmer, Walter D.; Cullen, Walter P.; Moppett, Charles E.; Routien, John B.; Shibakawa, Riichiro; and Tone, Junsuke, 4,031,206.
Shibutami, Hirohiko: *See—*
Itoh, Yasuo; Suzuki, Yoshitake; Shibutami, Hirohiko; Hirano, Koichi; and Tagami, Muneo, 4,030,533.
Shilling, Jack W.; Datta, Amitava; and Malagari, Frank A., Jr., to Allegheny Ludlum Industries, Inc. Process for cube-on-edge oriented boron-bearing silicon steel including normalizing. 4,030,950, Cl. 148-112.000.
Shima, Masao: *See—*
Togo, Masaaki; Shima, Masao; and Mochizuki, Kiyoshi, 4,031,447.
Shimada, Shunji; and Wakimoto, Harumi, to Hitachi, Ltd. Signal converter circuit. 4,031,409, Cl. 307-208.000.
Shimada, Shunji; Hatsukano, Yoshikazu; and Yamashiro, Osamu, to Hitachi, Ltd. Coostant-current circuit. 4,031,456, Cl. 323-4.000.
Shimano Industrial Company, Limited: *See—*
Isobe, Mitsuhide, 4,030,374.
Nagano, Masashi, 4,030,375.
Shimizu, Akihiko; and Sakanaka, Yasuhiro, to Toyo Soda Manufacturing Co., Ltd. Process for preparing granular rubber. 4,031,302, Cl. 528-486.000.
Shinkawa, Keiro; Sodeyama, Chiuichi; Kaneko, Yoichi; and Kimura, Katsuhiro, to Hitachi, Ltd. Mixer circuit. 4,031,472, Cl. 325-446.000.
Shinskey, Francis G., to Foxboro Company, The. Control for maximizing capacity and optimizing product cost of distillation column. 4,030,986, Cl. 203-2.000.
Shionogi & Co., Ltd.: *See—*
Sugasawa, Tsutomu, 4,031,098.
Shirayama, Kenzo; Kita, Shinichiro; and Fujimoto, Masanori, to Sumitomo Chemical Company, Limited. Polyolefin composition and process for preparing the same. 4,031,062, Cl. 260-42.450.
Shishido, Tadao: *See—*
Sashihara, Kenji; Masuda, Takao; Noguchi, Yasuhiro; Sekikawa, Nobuyoshi; and Shishido, Tadao, 4,030,930.
Shnypikov, Alexandr Dmitrievich: *See—*
Shults, Mikhail Mikhailovich; Parfenov, Anatoly Ivanovich; Shnypikov, Alexandr Dmitrievich; Krunchak, Vladimir Georgievich; Evnina, Sarra Borisovna; Dolidze, Vladimir Alexandrovich; and Tarasova, Valentina Mikhailovna, 4,030,935.
Shuffman, Rose, Executrix: *See—*
Rose, Sigmund L., 4,030,547.
Shults, Mikhail Mikhailovich; Parfenov, Anatoly Ivanovich; Shnypikov, Alexandr Dmitrievich; Krunchak, Vladimir Georgievich; Evnina, Sarra Borisovna; Dolidze, Vladimir Alexandrovich; and Tarasova, Valentina Mikhailovna. Glass. 4,030,935, Cl. 106-52.000.
Shuster, Edward J.: *See—*
Wilson, Richard Arnold; Katz, Ira; Vock, Manfred H.; and Shuster, Edward J., 4,031,034.
Shuster, Edward Joseph: *See—*
Schreiber, William Lewis; Mosciano, Gerard Joseph; Pittet, Alan O.; Vock, Manfred; and Shuster, Edward Joseph, 4,031,140.
Shutt, Donald P., to Western Gear Corporation. Effort limiting and interruptiog actuator. 4,030,353, Cl. 73-139.000.
Shylo, Paul, to Cook Electric Company. Telephone ringer insolator. 4,031,332, Cl. 179-84.00R.
Siby, Sture: *See—*
Dahle, Orvar; von Knorring, Folke; and Sihy, Sture, 4,030,346.

Onishi, Makoto; Nagano, Katsuyuki; Tanaka, Toshiki P.; Matsuoka, Sadao; and Tanaka, Mitsuo, 4,030,809.

Tanaka, Yoshihiro: *See—*
Nakamura, Yasushi; Agatsuma, Kunio; Tanaka, Yoshihiro; and Aono, Shunji, 4,031,134.

Taneda, Yukinori; and Kobayashi, Takashi, to Hitachi, Ltd. Reciprocal transfer apparatus. 4,030,614, Cl. 214-1.0BT.

Tani, Tadaaki, to Fuji Photo Film Co., Ltd. Supersensitizing combinations of halogen substituted benzotriazoles and cyanine dyes. 4,030,927, Cl. 96-100.000.

Tanifuji, Shinya: *See—*
Morooka, Yasuo; and Tanifuji, Shinya, 4,030,326.

Taniguchi, Isao, to Nippon Piston Ring Co., Ltd. Chrome insert ring. 4,030,767, Cl. 277-235.00R.

Taniguchi, Ken: *See—*
Fujii, Setsuro; Kajita, Yasumichi; Hiraku, Seizi; Kira, Heizo; Aishita, Hideki; Muryobayashi, Keiko; Terashima, Hiroshi; Akimoto, Akira; Taniguchi, Ken; and Wada, Minoru, 4,030,977.

Taniguchi, Satoshi: *See—*
Fujiwara, Hideo; Ichinose, Yukio; Taniguchi, Satoshi; Kobayashi, Tsutomu; Ichino, Kazuo; Itoh, Michiyasu; Uesaka, Yasutaro; Inose, Fumiyuki; and Ueno, Sadayasu, 4,031,496.

Taniyasu, Ryozo: *See—*
Isa, Hiroshi; Ukigai, Toshiyuki; Tominaga, Anri; Taniyasu, Ryozo; and Nagayama, Masuzo, 4,031,158.

Tank, Eggert: *See—*
Stute, Manfred; and Tank, Eggert, 4,030,539.

Tarasova, Valentina Mikhailovna: *See—*
Shults, Mikhail Mikhailovich; Parfenov, Anatoly Ivanovich; Shnypikov, Alexandr Dmitrievich; Krunchak, Vladimir Georgievich; Evnina, Sarra Borisovna; Dolidze, Vladimir Alexandrovich; and Tarasova, Valeotina Mikhailovna, 4,030,935.

Tatarintsev, Vladimir Mikhailovich: *See—*
Alexandrov, Vladimir Ilich; Osiko, Vyacheslav Vasilievich; Muraviev, Ernest Nikolaevich; Spiridonov, Eduard Georgievich; Tatarintsev, Vladimir Mikhailovich; and Gordon, Vladimir Grigorievich, 4,030,891.

Tattermusch, Peter: *See—*
Kleinschmit, Einhard; Tattermusch, Peter; and Haverbeck, Gunther, 4,030,714.

Tatzel, Hermann; Koegel, Wolfram; Beck, Gilbert; Zuern, Ludwig; and Caesar, Arndt Christian, to BASF Aktiengesellschaft. Manufacture of shaped articles of formed olefin polymers. 4,031,179, Cl. 264-91.000.

Taylor, William I.: *See—*
Sanders, James Milton; Taylor, William I.; Hill, Ira D.; and Kryschuk, John J., 4,031,161.

Technical Industries, Inc.: *See—*
Jaquith, Burton Kent, 4,030,356.

Technovators, Inc.: *See—*
Fisher, Glen W., 4,030,633.

Teijin Limited: *See—*
Saiki, Noritsugu; Takeuchi, Yoshihiko; and Sakai, Hiroshi, 4,031,165.

Tekonsha Engineering Company: *See—*
Eden, Edward Joseph, 4,030,756.

Tektronix, Inc.: *See—*
Fessler, Jon Leroy, 4,030,838.

Telesco Brophey Limited: *See—*
Weber, Heinz, 4,030,515.

Teletype Corporation: *See—*
Heeren, Richard H., 4,031,524.

Telfer, Ian Edmund, to British Petroleum Company Limited, The. Ships for liquid cargoes. 4,030,438, Cl. 114-74.00R.

Telic Corporation: *See—*
Penfold, Alan S.; and Thornton, John A., 4,030,996.
Penfold, Alan S.; and Thornton, John A., 4,031,424.

Templeton, William B.: *See—*
Wallace, Harry L.; and Templeton, William B., 4,030,728.

Tenczar, Francis. Fluid connectors. 4,030,494, Cl. 128-214.00R.

Tenneco Chemicals, Inc.: *See—*
Di Bella, Eugene P., 4,031,144.
Di Bella, Eugene P., 4,031,145.
Di Bella, Eugene P., 4,031,146.
Patel, Piyush J.; and Miringoff, William, 4,031,056.

Tennes, Bernard R.; and Burton, Clyde L., to United States of America, Agriculture. Metering and spray apparatus for horticultural applications. 4,030,244, Cl. 47-1.700.

Terashima, Hiroshi: *See—*
Fujii, Setsuro; Kojita, Yasumichi; Hiraku, Seizi; Kira, Heizo; Aishita, Hideki; Muryobayeshi, Keiko; Terashima, Hiroshi; Akimoto, Akira; Taniguchi, Ken; and Wada, Minoru, 4,030,977.

Tertykh, Valentin Anatolievich: *See—*
Chuiko, Alexei Alexeevich; Tertykh, Valentin Anatolievich; Sobolev, Vilyam Alexandrovich; Maschenko, Valery Mikhailovich; Pavlov, Vyacheslav Valentinovich; Chugai, Alexei Dmitrievich; Kheber, Nikolai Vasilievich; Kondratenko, Anatoly Borisovich; Vetamenjuk, Vasily Ivanovich; Khoma, Mikhail Ivanovich; Kutin, Alexandr Nikolaevich; Shaposhnikov, Jury Davydovich; and Galashina, Malvina Leontievna, 4,030,940.

Terzian, Rouben T.; Schoenfield, Palmer J.; Dunn, Kathy A.; and Kuna, Wayne A., to Mervin Glass & Associates. Toy play kit. 4,030,235, Cl. 46-11.000.

Tessler, Arthur N., to Calculus Instruments Ltd. Method and device for disintegrating stones in human ducts. 4,030,505, Cl. 128-328.000.

Teuling, Dirk Johan Adriaan, to U.S. Philips Corporation. Triggered transistor switching regulator. 4,031,453, Cl. 321-2.000.

Tex International, S.A.: *See—*
Kiener, Christian, 4,030,526.

Texaco Development Corporation: *See—*
Nich, Edward C. Y.; and Moss, Philip H., 4,031,138.

Texaco Inc.: *See—*
Hess, Howard V.; Franz, William F.; and Cole, Edward L., 4,030,981.
Owens, Gary D., 4,031,505.

Texas Instruments Incorporated: *See—*
Ehni, George John, III; and Leuschner, Horst, 4,031,474.
Redwine, Donald J.; and Kitagawa, Norishisa, 4,031,415.

Thalen, Hilbert J. Th., to Vitatron Medical B.V. Low output electrode for cardiac pacing. 4,030,508, Cl. 128-418.000.

Thaler, Warren A.; Buckley, Donald J.; and Kennedy, Joseph P., to Exxon Research and Engineering Company. High molecular weight, high unsaturation isobutylene-cyclopentadiene copolymers. 4,031,300, Cl. 526-308.000.

Theodore, Frank W.: *See—*
Oorin, Everett; Jasulaitis, William A.; Theodore, Frank W.; and Wasson, George E., 4,030,982.

Thiem, Karl-Werner; Auge, Wolfgang; and Neeff, Rutger, to Bayer Aktiengesellschaft. Process for preparing pure 1-nitroanthraquinone. 4,031,116, Cl. 260-369.000.

Thiessen, Fritz: *See—*
Engelbech, Heinz; Krabetz, Richard; Duembgen, Gerd; Willersinn, Carl-Heinz; Lebert, Ulrich; and Thiessen, Fritz, 4,031,135.

Thomas, Erwin: *See—*
Rapp, Guenther; Fuchs, Hugo; and Thomas, Erwin, 4,031,139.

Thomas, Ian M., to Owens-Illinois, Inc. Method for the manufacture of borosilicate glasses. 4,030,938, Cl. 106-73.500.

Thomas Industries of Tennessee, Inc.: *See—*
Ware, William P.; and Wheeler, Robert D., 4,030,702.

Thomas J. Lipton, Inc.: *See—*
Reid, Joanne; de la Teja, Elpidio Leoncio; and Farrell, Francis, 4,031,238.

Thomas, James L., to FMC Corporation. Rigid polyvinyl chloride compositions with high heat-deflection temperatures. 4,031,061, Cl. 260-42.290.

Thomas, Virgil E., Jr.; and Quist, Donald G., to United States of America, Navy. Peak detecting demodulator. 4,031,479, Cl. 329-50.000.

Thompson-Hayward Chemical Co.: *See—*
McNall, Lester Ray, 4,030,907.

Thompson, William C. Power generating system. 4,030,300, Cl. 60-639.000.

Thomson-CSF: *See—*
Butin, Henri; and Deman, Pierre, 4,031,327.
Deman, Pierre, 4,031,326.
Felix, Pierre; Gamot, Philippe; Moiroud, Guy; and Veron, Serge, 4,031,394.
Ranpou, Jean, 4,031,487.

Thornley, Brian Robert, to Pleasey Handel und Investments A.G. Optical code readers. 4,031,358, Cl. 235-61.11E.

Thornton, Charles: *See—*
Labie, Allan S.; Thornton, Charles; Lew, Irwin Paul; and Gutman, Abraham, 4,030,257.

Thornton, John A.: *See—*
Penfold, Alan S.; and Thornton, John A., 4,030,996.
Penfold, Alan S.; and Thornton, John A., 4,031,424.

Thrower, William F.: *See—*
Lee, Don H.; Weller, Kenneth P.; and Thrower, William F., 4,030,943.

Thurne Engineering Company Limited: *See—*
Payne, Richard, 4,030,268.

Tiberg, Lars, to Fagersta AB. Method for casting steel ingots. 4,030,532, Cl. 164-66.000.

Tichy, Dieter: *See—*
Schnee, Karl; Tichy, Dieter; and Piesch, Steffen, 4,031,064.

TIDO Chemisch-technische Produkte GmbH, Firma: *See—*
Tiaza, Julianna, 4,031,046.

Timex Corporation: *See—*
Wuthrich, Paul; and Mascia, Frank P., 4,031,341.

Timmers, Leonardes August: *See—*
Pickert, Hansjurgen; Sesselmann, Hans Dieter; and Timmers, Leonardes August, 4,030,430.

Timmins, John C.: *See—*
Vidoni, John; Lingaraju, Bhartoor; and Timmins, John C., 4,030,800.

Tinney, Francis John, to Parke, Davis & Company. Tetrapeptides. 4,031,070, Cl. 260-112.5LH.

Tinney, Francis John: *See—*
Nicolaides, Ernest D.; Tinney, Francis John; and French, James Clark, 4,031,069.

Tisbo, Cosmo N.; and Tisbo, Thomas A., to Custom Plastics, Inc. Spraying and watering can. 4,030,664, Cl. 239-289.000.

Tisbo, Thomas A.: *See—*
Tisbo, Cosmo N.; and Tisbo, Thomas A., 4,030,664.

Tisza, Julianna, to TIDO Chemisch-technische Produkte GmbH, Firma. Exothermic lining for metallurgical purposes and method of making the same. 4,031,046, Cl. 260-17.200.

Toa Medical Electronics Co., Ltd.: *See—*
Yamamoto, Hiroshi; and Oka, Masaaki, 4,030,888.

Tobias, Michael A.: *See—*
Gough, Stanley T.; Tobias, Michael A.; and Napier, Roger P., 4,031,237.

Tocci, Leonard R.: *See—*
Archer, John L.; Tocci, Leonard R.; and Williams, Jeffrey L., 4,031,526.

Tocquet, Bernard: *See—*
Cluzel, Philippe; Quivy, Michel; and Tocquet, Bernard, 4,031,418.

Togo, Masaaki; Shima, Masao; and Mochizuki, Kiyoshi, to Yamatake-Honeywell Company Limited. Improved control system for energizing a stepping motor. 4,031,447, Cl. 318-685.000.

Tohru, Uchida: *See—*
Akira, Kato; Akira, Itoh; Tohru, Uchida; and Masao, Ishihara, 4,030,921.

Tojo, Eigo: *See—*
Nakayama, Michio; and Nakayama, Setuko, 4,031,262.

Tokico Ltd.: *See—*
Hayashida, Yoshihiro, 4,030,758.

Tokorozawa Electronic Corporation: *See—*
Itagaki, Tadasi, 4,030,564.

Tokudome, Katsumi; and Hattori, Shuzo, to Kimmon Electric Co., Ltd. Discharge tube having multiple electrodes arranged in tandem. 4,031,428, Cl. 315-111.000.

Tokyo Shibaura Electric Co., Ltd.: *See—*
Anno, Gousuke, 4,031,008.
Kokado, Naoyuki; and Makino, Shinichi, 4,031,470.

Tominaga, Anri: *See—*
Isa, Hiroshi; Ukigai, Toshiyuki; Tominaga, Anri; Taniyasu, Ryozo; and Nagayama, Masuzo, 4,031,158.
Mandai, Hiroshi; Ukigai, Toshiyuki; Tominaga, Anri; and Sato, Michito, 4,031,159.

Tominaga, Yoichi; and Shibahara, Yasuo, to Sanyo Chemical Industries, Ltd. Surface sizing of paper with an acrylic copolymer where scum formation is minimized. 4,030,970, Cl. 162-168.00R.

Tomita, Toshio: *See—*
Murai, Hiromu; Kitaguchi, Koji; Suminokura, Tatsuo; Sano, Akira; Kise, Masahiro; Kitano, Masahiko; and Tomita, Toshio, 4,031,303.

Tompkins, Douglas L., to Baxter Travenol Laboratories, Inc. Syringe. 4,030,498, Cl. 128-218.00P.

Tone, Junsuke: *See—*
Celmer, Walter D.; Cullen, Walter P.; Moppett, Charles E.; Routien, John B.; Shibakawa, Riichiro; and Tone, Junsuke, 4,031,206.

Toneray Covers, Inc.: *See—*
Petretti, Raymond H., 4,030,780.

Torin Corporation: *See—*
Collins, Charles P.; and Lampietti, Bernard P., 4,030,327.

Toro Company, The: *See—*
Christopherson, Herman P., 4,030,277.

Torres, Lorenzo. Can slitting device. 4,030,392, Cl. 83-178.000.

Torrington GmbH: *See—*
Eckhardt, Hellmuth, 4,030,170.

Toyo Kogyo Co., Ltd.: *See—*
Yamamoto, Kenichi; Kirose, Yutaka; and Maeda, Tooru, 4,030,454.

Toyo Soda Manufacturing Co., Ltd.: *See—*
Shimizu, Akihiko; and Sakanaka, Yasuhiro, 4,031,302.

Toyota Jidosha Kogyo Kabushiki Kaisha: *See—*
Yamaguchi, Shunzo; Ozaki, Tadashi; and Konomi, Toshiaki, 4,030,464.

Trascandica AG: *See—*
Bengtsson, Bo Gunnar, 4,030,437.

Traunecker, Werner: *See—*
Losel, Walter; Traunecker, Werner; and Hoefke, Wolfgang, 4,031,212.

Trautvetter, Werner: *See—*
Vollkommer, Norbert; and Trautvetter, Werner, 4,031,163.

Treffinger, H. Lee: *See—*
Groudan, Alan I.; Schroeder, George F.; and Treffinger, H. Lee, 4,031,374.

Treiber, James H.: *See—*
Christian, Edward H.; Mains, Donald M.; and Treiber, James H., 4,031,440.

Trieschmann, Hans-Georg: *See—*
Bronstert, Klaus; Fahrbach, Gerhard; Krahe, Eduard; Ladenberger, Volker; Kastning, Ernst-Guenther; Mittnacht, Hans; Willerainn, Herbert; and Trieschmann, Hans-Georg, 4,031,166.

Triffterer, Adolf: *See—*
Frey, Jurgen; Weber, Andreas; and Triffterer, Adolf, 4,030,463.

Trio Electronics Incorporated: *See—*
Mitarai, Kaoru, 4,031,473.

Tritten, Paul: *See—*
Auriol, Alain; and Tritten, Paul, 4,031,177.

Trombly, John E., to Arthur D. Little, Inc. Electromagnetically coupled battery charger. 4,031,449, Cl. 320-2.000.

Trombly, John E.: *See—*
Perron, Robert Richard; and Trombly, John E., 4,031,434.

Tronstad, Knut, to Aksjeselskapet Jotul. Fireplace. 4,030,475, Cl. 126-121.000.

Troyer, Terrance J.: *See—*
Phillips, James W.; and Troyer, Terrance J., 4,030,365.

Truax, James R. Native grass seed drill. 4,030,428, Cl. 111-85.000.

TRW Inc.: *See—*
Glorioso, Paul A., 4,031,349.

Tsuda, Kiyoshi: *See—*
Suda, Kazuyoshi; Isono, Tomoyuki; Uchida, Takashi; and Tsuda, Kiyoshi, 4,030,607.

Tsurushima, Katsuaki, to Sony Corporation. Bias circuit for FET. 4,031,482, Cl. 330-35.000.

Tucker, Terry A.: *See—*
Rice, Jeffrey C.; and Tucker, Terry A., 4,031,531.

Tull, Roger J.: *See—*
Weinstock, Leonard M.; Tull, Roger J.; and Mulvey, Dennis M., 4,031,125.

Tuominen, Tapio Kalevi: *See—*
Aaltonen, Olavi August; Andersson, Bengt Torsten; Juusela, Jyrki Tapani; Palperi, Matti Johannes; and Tuominen, Tapio Kalevi, 4,030,915.

Turney, Lorry R., to Victor Equipment Company. Floating tube torch. 4,030,710, Cl. 266-48.000.

Uchida, Takashi: *See—*
Suda, Kazuyoshi; Isono, Tomoyuki; Uchida, Takashi; and Tsuda, Kiyoshi, 4,030,607.

Ueno, Sadayasu: *See—*
Fujiwara, Hideo; Ichinose, Yukio; Taniguchi, Satoshi; Kobayashi, Tsutomu; Ichino, Kazuo; Itoh, Michiyasu; Uesaka, Yasutaro; Inose, Fumiyuki; and Ueno, Sadayasu, 4,031,496.

Uesaka, Yasutaro: *See—*
Fujiwara, Hideo; Ichinose, Yukio; Taniguchi, Satoshi; Kobayashi, Tsutomu; Ichino, Kazuo; Itoh, Michiyasu; Uesaka, Yasutaro; Inose, Fumiyuki; and Ueno, Sadayasu, 4,031,496.

Uhl, Guenter: *See—*
Oppenlaender, Knut; Uhl, Guenter; Helfert, Herbert; Scharpenberg, Hans-Georg; and Stork, Karl, 4,031,112.

Uhl, Wyman F.: *See—*
Antonio, Christo; and Uhl, Wyman F., 4,030,955.

Uhring, Gary S.: *See—*
Hood, Frederick E.; Mitchell, Donald K.; and Uhring, Gary S., 4,030,439.

Ukai, Toshinao: *See—*
Noguchi, Yasuhiro; Ukai, Toshinao; Sashihara, Kenji; and Masuda, Takao, 4,030,931.

Ukigai, Toshiyuki: *See—*
Isa, Hiroshi; Ukigai, Toshiyuki; Tominaga, Anri; Taniyasu, Ryozo; and Nagayama, Masuzo, 4,031,158.
Mandai, Hiroshi; Ukigai, Toshiyuki; Tominaga, Anri; and Sato, Michito, 4,031,159.

Umeda, Tomoyoshi; and Haraguchi, Yoshimasa, to Beltek Corporation. Magnetic recording and reproducing apparatus. 4,031,554, Cl. 360-73.000.

Umehara, Hidetoshi: *See—*
Asao, Makoto; Ito, Susumu; and Umehara, Hidetoshi, 4,031,171.

Umholtz, Franklyn G., to Russell Harrington Cutlery, Inc. Mat cutter for circles. 4,030,192, Cl. 30-310.000.

Ungnadner, Peter: *See—*
Geisslinger, Wolfgang; and Ungnadner, Peter, 4,030,818.

Union Carbide Corporation: *See—*
Prokai, Bela; and Kanner, Bernard, 4,031,042.

Garrett, David Aubrey, 4,031,441.

Vaesken, Maryvonne J.; Bultez, Alain E.; and Dalle, Jean-Paul, to Opi Cryochimie S.A. Process for treating natural polyamide fibres of asymmetric structure, such as wool, with liquid ammonia. 4,030,883, Cl. 8-115.500.

Vakanova, Elena Borisova: *See—*
Budevski, Evgueni Bogdanov; Iliev, Iliya Dimitrov; Kaisheva, Anastasiya Rostislavova; Gamburtzev, Sergei Sergeev; and Vakanova, Elena Borisova, 4,031,033.

Valenti, Peter Carl: *See—*
Stockel, Richard Frederick; and Valenti, Peter Carl, 4,031,110.

Valenya, Ivan Jurievich: *See—*
Ponomarenko, Nikolai Borisovich; Kononenko, Vadim Grigorievich; Stelmakh, Viktor Alexeevich; Kotelnikov, Vladimir Ivanovich; Valenya, Ivan Jurievich; Sarancha, Vladimir Nikolaevich; Petrenko, Anatoly Avramovich; Bozhko, Valery Pavlovich; Yatsenko, Sergei Vasilievich; Komnatny, Igor Pavlovich; Akhnazariants, Levon Khachaturovich; Strizhenko, Vitaly Evgenievich; Kolokolov, Boris Alexeevich; Maznichenko, Stanislav Anisimovich; Bozhko, Viktor Vasilievich; Bondarenko, Oleg Alexandrovich; and Zakirov, Robert Sharafutdinovich, 4,030,389.

Valleylab, Inc.: *See—*
Patzer, Michael D., 4,030,796.

Van Assendelft, Leendert, to Akzo N.V. Method and apparatus for making filament cables. 4,030,248, Cl. 57-9.000.

van Bokhoven, Cornelis Wilhelmus: *See—*
deJongh, Hendrik Paul; and van Bokhoven, Cornelis Wilhelmus, 4,031,074.

Van Der Wielen, Michael Principe, to Bell Telephone Laboratories, Incorporated. Miniature low profile relay. 4,031,493, Cl. 335-128.000.

Van Dine, Walter S.: *See—*
Rasor, William A.; Van Dine, Walter S.; and Whitney, Frank A., 4,030,647.

Van Eeck, Philippe F. Antipollution carburetor device for internal combustion engines. 4,030,455, Cl. 123-25.00E.

Van Geenen, Albert A.: *See—*
Otter, Marinus J.A.M. Den; Nijenhuis, Anne Te; and Van Geenen, Albert A., 4,031,040.

van Leeuwen, Johannes Cornelis, to U.S. Philips Corporation. Digital radio transmission system. 4,031,330, Cl. 179-41.00A.

Vanlerberghe, Guy; and Sebag, Henri, to Societe Anonyme dite: L'Oreal. Chitosan derivative, sequestering agents for heavy metals. 4,031,025, Cl. 252-180.000.

Vanlerberghe, Guy: *See—*
Kalopissis, Gregoire; and Vanlerberghe, Guy, 4,031,263.

Van Litsenburg, Joannes Wilhelmus, to U.S. Philips Corporation. Cooling device. 4,030,899, Cl. 62-514.00R.

Van Litsenburg, Joannes Wilhelmus, to U.S. Philips Corporation. Cooling device. 4,030,900, Cl. 62-514.00R.

van Manen, Dick T., to Voplex Corporation. Contents-conserving plunger for cartridge. 4,030,643, Cl. 222-386.000.

van Wijngaarden, Ineke: *See—*
Soudijn, Willem; van Wijngaarden, Ineke; and Janssen, Paul Adriaan Jan, 4,031,226.

Varian Associates: *See—*
Hooper, Gerald E., 4,030,829.

Varker, Kenneth James, to International Business Machines Corporation. Method for forming a multilayer printed circuit board. 4,030,190, Cl. 29-625.000.

Varta Batterie Aktiengesellschaft: *See—*
Voss, Ernst; and Rabenstein, Heinrich, 4,031,293.

Vatamanjuk, Vasily Ivanovich: *See—*
Chuiko, Alexei Alexeevich; Tertykh, Valentin Anatolievich; Sobolev, Vilyam Alexandrovich; Maschenko, Valery Mikhailovich; Pavlov, Vyacheslav Valeotinovich; Cbugai, Alexei Dmitrievich; Khaber, Nikolai Vasilievich; Kondratenko, Anatoly Borisovich; Vatamanjuk, Vasily Ivanovich; Khoma, Mikhail Ivanovich; Kutin, Alexandr Nikolaevich; Shaposhnikov, Jury Davydovich; and Galashina, Malvina Leontievna, 4,030,940.

Vater, Wulf: *See—*
Bossert, Friedrich; Meyer, Horst; and Vater, Wulf, 4,031,104.

VEB Filmfabrik Wolfen-Fotochemisches Kombinat: *See—*
Gabler, Siegfried; Junge, Karl-Wilhelm; Fischer, Gunther; Scheithauer, Steffen; and Viola, Horst, 4,030,928.

VEB Kabelwerk Oberspree (KWO): *See—*
Volz, Horst; Straubel, Reinhard; and Hager, Arnulf, 4,031,525.

Vedani, Augusto, to Sant'Andrea Novara Officine Meccaniche e Fonderie S.p.A. Device for incorporating an identification marker in a roll of textile substance. 4,030,674, Cl. 242-55.000.

Vefl A/S: *See—*
Gundersen, Marius, 4,030,272.

Velten & Pulver, Inc.: *See—*
Euverard, Maynard R.; and Heide, Henry A., 4,030,620.

Vensleck, John T., to A P Products Incorporated. Jumper connector. 4,030,799, Cl. 339-99.00R.

Verhoeven, John D.: *See—*
Gibson, Edwin D.; and Verboeven, John D., 4,030,963.

Verkaufsgesellschaft fur Teererzeugnisse (VFT): *See—*
Gemmeke, Wilfried; Werner, Heinrich; Echterhoff, Heinz; and Raulf, Erich, 4,031,189.

Verkstadsteknik AB: *See—*
Colding, Bertil; Novak, Arne; Sandstrom, Unto; and Jakobsson, Goran, 4,031,368.

Veron, Serge: *See—*
Felix, Pierre; Gamot, Philippe; Moiroud, Guy; and Veron, Serge, 4,031,394.

Vetco Offsbore Industries, Inc.: *See—*
Ahlstone, Arthur G., 4,030,544.

Vetten, Wilhelm, to Jagenberg-Werke AG. Device for the removal of empty containers from their mandrels. 4,030,616, Cl. 214-1.0BB.

Veyrassat, Louis, to Maillefer S.A. Double wire-winding machine with automatic transfer. 4,030,673, Cl. 242-25.00A.

Victor Equipment Company: *See—*
Turney, Larry R., 4,030,710.

Vidoni, John; Lingaraju, Bhartoor; and Timmins, John C., to Square D Company. Connector cap with cord grip. 4,030,800, Cl. 339-107.000.

Vinansky, George, Jr.; and Lucia, Emmanuel A., to United States of America, Army. Micro particle generation. 4,031,301, Cl. 526-328.000.

Vincent, Max. Harness for the teaching of tennis. 4,030,732, Cl. 273-29.00A.

Viola, Horst: *See—*
Gahler, Siegfried; Junge, Karl-Wilhelm; Fischer, Gunther; Scheithauer, Steffen; and Viola, Horst, 4,030,928.

Virag, Robert Anthony, to Baxter Travenol Laboratories, Inc. Twin check valve pump system having fail-safe characteristic. 4,030,495, Cl. 128-214.200.

Vitatron Medical B.V.: *See—*
Thalen, Hilbert J. Th., 4,030,508.

Fujii, Setsuro; Kajita, Yasumichi; Hiraku, Seizi; Kira, Heizo; Aishita, Hideki; Muryobayashi, Keiko; Terashima, Hiroshi; Akimoto, Akira; Taniguchi, Ken; and Wada, Minoru, 4,030,977.

Waddell, Theodore P.: *See—*
Kallmann, George T.; and Waddell, Theodore P., 4,031,534.

Wafer, John A., to Westinghouse Electric Corporation. Triple break current limiter. 4,031,492, Cl. 335-16.000.

Wagner, Alfred; and Kidratschky, Hermann. Device for continuous lubrication of an extrusion die. 4,030,328, Cl. 72-45.000.

Wagner, Alfred; and Kidratschky, Hermann, to Swiss Aluminium Ltd. Process for the manufacture of composite sections and a device for carrying this out. 4,030,334, Cl. 72-258.000.

Wagner, John Bradley. Nose piece for screwguns. 4,030,383, Cl. 81-54.000.

Wahle, Gunter, to Hauni-Werke Korber & Co., KG. Control system for cigarette producing and processing machines or the like. 4,030,511, Cl. 131-21.00R.

Wahlig, Helmut: *See—*
Gottschlich, Rudolf; Rogalski, Werner; Bergmann, Rolf; Steinigeweg, Rosmarie; and Wahlig, Helmut, 4,031,230.

Wake, Malcolm: *See—*
Dudley, Philip; Bower, Lewis Robert; and Wake, Malcolm, 4,030,308.

Wakimoto, Harumi: *See—*
Shimada, Shunji; and Wakimoto, Harumi, 4,031,409.

Walch, Leo M., Jr.: *See—*
Moll, Eberhard; and Walch, Leo M., Jr., 4,031,361.

Walker, Alexander D. R. Computer terminal. 4,030,587, Cl. 197-1.00R.

Walker, Leonard B. Device for accurately sanding objects such as wooden objects and the like. 4,030,250, Cl. 51-128.000.

Walker, Osman J.: *See—*
Goel, Krishan N.; and Walker, Osman J., 4,030,968.

Walker, Philip Leroy, Jr.: *See—*
Schmitt, Joseph Lawrence, Jr.; Walker, Philip Leroy, Jr.; and Castellion, George Augustus, 4,031,137.

Wall Industries, Inc.: *See—*
Hood, Henry Alexander, 4,030,401.

Wallace, Harry L.; and Templeton, William B., to Burroughs Corporation. Document transport apparatus. 4,030,728, Cl. 271-277.000.

Walley, Robert F.: *See—*
Muzyka, Donald R.; and Walley, Robert F., 4,030,946.

Wallin, Jan-Olof, to Granges Essem Aktiebolag. Locking mechanism for vehicle safety belts. 4,030,682, Cl. 242-107.40B.

Wallin, Mark; and Shantzer, Aaron, deceased (by Shantzer, Helen, executrix), to Shantzer-Wallin Corporation. Heat pumps with solar heat source. 4,030,312, Cl. 62-2.000.

Walters, William T.; and Parlette, Marvin D., Jr., to Conceptual Products, Inc. Respiratory mouthpiece. 4,030,493, Cl. 128-147.000.

Wander, Raoul; and Angue, Robert. Apparatus for sterilization. 4,030,406, Cl. 99-461.000.

Wandler, Richard A.: *See—*
Lennon, David C.; and Wandler, Richard A., 4,030,802.

Ward, Dean L.: *See—*
Robertson, Joseph D.; and Ward, Dean L., 4,030,205.

Ward, George C., to Southwire Company. Thin gauge casting wheel band. 4,030,537, Cl. 164-278.000.

Ward, James S., to Ward; James S. Highway guard rail bumper guard. 4,030,706, Cl. 256-1.000.

Ware, William P.; and Wheeler, Robert D., to Thomas Industries of Tennessee, Inc. Apparatus and method for pneumatically rodding multi-passage cable housing conduits. 4,030,702, Cl. 254-134.400.

Warner, Glenfield. Method and apparatus for continuously monitoring systolic blood pressure. 4,030,485, Cl. 128-2.05A.

Warner Lewis Jr. Industrie- Filter GmbH: *See—*
Runge, Hans-Jurgen, 4,030,368.

Warthen, William P., to Milliken Research Corporation. Synthetic yarn device. 4,030,743, Cl. 289-18.000.

Wasson, George E.: *See—*
Gorin, Everett; Jasulaitis, William A.; Theodore, Frank W.; and Wasson, George E., 4,030,982.

Watanabe, Makoto: *See—*

Williams, Heydn Windsor Richard; and Rooney, Clarence Stanley, to Merck Sharp & Dohme (I.A.) Corporation. 1,8-Naphthyridine compounds. 4,031,103, Cl. 260-295.00N.
Williams, Jeffrey L.: *See—*
Archer, John L.; Tocci, Leonard R.; and Williams, Jeffrey L., 4,031,526.
Williams, Joseph James, to Hoffmann-La Roche Inc. Force measurement and analysis particularly relating to rotary tablet presses. 4,030,868, Cl. 425-149.000.
Willis, Melvin M. Binder for alumina containing refractories. 4,030,936, Cl. 106-65.000.
Willums, Jen-Olaf, to Nor-Am Resources Technology Inc. Method of and apparatus for underwater hydraulic conveying, as for ocean mining and the like, and continued transport of material in controlled floating containers. 4,030,216, Cl. 37-58.000.
Wilmot, Richard D., to Hughes Aircraft Company. Multiple moment video detector. 4,031,364, Cl. 235-151.300.
Wilson, Leland Earl, to Atlantic Richfield Company. Method of moving a floating body into a predetermined float path. 4,030,305, Cl. 61-1.00R.
Wilson, Richard A.; Pascale, John V.; and Vock, Manfred Hugo, to International Flavors & Fragrances Inc. Use in foodstuff flavoring compositions of five or six membered heterocylic oxathio compounds. 4,031,257, Cl. 426-535.000.
Wilson, Richard Arnold; Katz, Ira; Vock, Manfred H.; and Shuster, Edward J., to International Flavors & Fragrances Inc. Altering perfume green notes using trithioacetone. 4,031,034, Cl. 252-522.000.
Wimber, Hans; Rohde, Wilhelm; and Reyhing, Jorg, to Linde Aktiengesellschaft. Regeneration of adsorbents. 4,030,896, Cl. 55-33.000.
Wine, Charles Martin: *See—*
Rast, Robert Morgan; Wine, Charles Martin; and Henderson, John Goodchilde Norie, 4,031,549.
Winkelmann, Erhardt; and Raether, Wolfgang, to Hoechst Aktiengesellschaft. 1-Alkyl-2-(phenoxymethyl)-5-nitro-imidazoles and process for their manufacture. 4,031,232, Cl. 424-273.000.
Wisconsin Alumni Research Foundation: *See—*
Sih, Charles J., 4,031,129.
Wittle, Eugene Leroy; and Nicolaides, Ernest D., to Parke, Davis & Company. Tetrapeptides. 4,031,071, Cl. 260-112.5LH.
Wix Corporation: *See—*
Howard, Fred, 4,030,608.
Wojdyla, Gary A., to NCR Corporation. Spacing and connecting a plurality of print heads. 4,030,590, Cl. 197-1.00R.
Wojdyla, Gery A.; and Hanna, Kenneth W., to NCR Corporation. Record media rewind mechanism. 4,030,677, Cl. 242-65.000.
Wolf, Morris A. Clothing display form. 4,030,645, Cl. 223-68.000.
Wolfe, Gerald W., to InterMed, Inc. Occluder for prosthetic heart valve assembly. 4,030,142, Cl. 3-1.500.
Wolfel, Kurt: *See—*
Buttner, Karl; Boll, Jurgen; and Wolfel, Kurt, 4,030,174.
Wolff, Erich: *See—*
Idel, Karsten-Josef; Saleck, Wilhelm; Wolff, Erich; and Freitag, Dieter, 4,030,929.
Woods, Gilbert Frederick; Logan, Robert Thomas; McGarry, George; and Roy, Robert Gibson, to Akzona Incorporated. Alkylated pregnanes and process for obtaining same. 4,031,075, Cl. 260-239.55D.
Woodstream Corporation: *See—*
Souza, Anthony J., 4,030,152.
Souza, Anthony J., 4,030,230.
Woodward, Oakley McDonald, to RCA Corporation. Broadband turnstile antenna. 4,031,539, Cl. 343-797.000.
Wrathall, Donald P.: *See—*
Leone, Ronald E.; Weber, Wayne W., II; and Wrathall, Donald P., 4,030,925.
Leone, Ronald E.; Weber, Wayne W., II; and Wrathall, Donald P., 4,031,127.
Wunnenberg, Klaus; and Dubendorff, Joachim, to Mannesmann Aktiengesellschaft. Method and apparatus for monitoring and obviating deformations of continuous castings. 4,030,531, Cl. 164-4.000.
Wunsche, Anton E. Cockroach trap. 4,030,233, Cl. 43-121.000.
Wuthrich, Paul; and Mascia, Frank P., to Timex Corporation. Dual function pusher and rotate switch for solid state digital watches having detent spring. 4,031,341, Cl. 200-52.00R.
Xerox Corporation: *See—*
Chu, Joseph Y. C.; and Gunther, W. H. H., 4,030,991.

Chu, Joseph Y. C.; and Gunther, W. H. H., 4,030,993.
Griffiths, Clifford H.; and Keezer, Richard C., 4,031,109.
Schenk, Richard L., 4,030,416.
Smith, Richard S., 4,030,824.
Xynetics, Inc.: *See—*
Roch, Jacques L., 4,030,527.
Yagupolsky, Lev Moiseevich: *See—*
Ponomarev, Alexei Ivanovich; Sokolov, Sergei Vasilievich; Larionova, Julia Aleseevna; Klebansky, Alexandr Leibovich; Berenblit, Vsevolod Volfovich; Dolnakov, Jury Pavlovich; Yagupolsky, Lev Moiseevich; Malovik, Vladlen Vasilievich; Lozinsky, Miron Onufrievich; Belous, Viktor Mikhailovich; Gruz, Boris Efimovich; Alexeeva, Ljubov Antonovna; Ankudinov, Anatoly Kirillovich; and Ryazanova, Rufina Mikhailovna, 4,031,119.
Yakshin, Alexandr Sergeevich; Novikov, Oleg Nikolaevich; Grechinsky, Dmitry Alexeevich; Klochko, Viktor Alexandrovich; and Rygalin, Viktor Georgievich. Impact impulse measuring device. 4,030,339, Cl. 73-12.000.
Yamaguchi, Kineo; Kawakami, Katsuhiko; and Nakamoto, Yukimasa, to Nippon Mining Co., Ltd. Method for treating catalyst used for catalytic reactions of hydrocarbons at the time of catalyst removal. 4,031,031, Cl. 252-414.000.
Yamaguchi, Shunzo; Ozaki, Tadashi; and Konomi, Toshiaki, to Nippon Soken, Inc.; and Toyota Jidosha Kogyo Kabushiki Kaisha. Fuel-air mixture heating device for use with internal combustion engine. 4,030,464, Cl. 123-122.0AC.
Yamamoto, Hiroshi; and Oka, Masaaki, to Toa Medical Electronics Co., Ltd. Automatic blood analyzer. 4,030,888, Cl. 23-253.00R.
Yamamoto, Kenichi; Kirose, Yutaka; and Maeda, Tooru, to Toyo Kogyo Co., Ltd. Rotary piston engines. 4,030,454, Cl. 123-8.450.
Yamashiro, Osamu: *See—*
Shimada, Shunji; Hatsukano, Yoshikazu; and Yamashiro, Osamu, 4,031,456.
Yamatake-Honeywell Company Limited: *See—*
Togo, Masaaki; Shima, Masao; and Mochizuki, Kiyoshi, 4,031,447.
Yanagishima, Takayuki; and Inoue, Naohiko, to Nissan Motor Co., Ltd. Electronic alerting system for a vehicle driver. 4,031,527, Cl. 340-279.000.
Yatsenko, Sergei Vasilievich: *See—*
Ponomarenko, Nikolai Borisovich; Kononeoko, Vadim Grigorievich; Stelmakh, Viktor Alexeevich; Kotelnikov, Vladimir Ivanovich; Valenya, Ivan Jurievich; Saranchа, Vladimir Nikolaevich; Petrenko, Anatoly Avramovich; Bozhko, Valery Pavlovich; Yatsenko, Sergei Vasilievich; Komnatny, Igor Pavlovich; Akhnazariants, Levon Khachaturovich; Strizhenko, Vitaly Evgenievich; Kolokolov, Boris Alexeevich; Maznichenko, Stanislav Anisimovich; Bozhko, Viktor Vasilievich; Bondarenko, Oleg Alexandrovich; and Zakirov, Robert Sharafutdinovich, 4,030,389.
Yazaki, Susumu: *See—*
Negata, Yasunori; Itoh, Hirotaka; Yazaki, Susumu; Hamamura, Takayuki; and Yoshiya, Shigeo, 4,030,884.
Yeakley, Lester M.: *See—*
Norris, Elwood B.; and Yeakley, Lester M., 4,030,347.
Yealy, Carl F., to Penland Container, Inc. All plastic reclosable container closure. 4,030,630, Cl. 220-258.000.
Yeda Research and Development Co., Ltd.: *See—*
Haviv, Fortuna; Patchornik, Abraham; and Altman, Janina, 4,031,083.
Yeo, Herbert G.: *See—*
Hanlon, Richard J.; Damon, Neil F.; and Yeo, Herbert G., 4,030,793.
Yeomans, David L. Article support assembly. 4,030,425, Cl. 108-111.000.
Yeomans, Frederick G., to Draftex Development AG. Channel-shaped sealing and finishing strips. 4,030,245, Cl. 49-490.000.
Yokota, Hideo: *See—*
Hosoe, Kazuya; Aizawa, Hiroshi; Matsumoto, Seiichi; and Yokota, Hideo, 4,031,383.
York, Alvin, to Jefferson, Eva Imogene; and Koehler, Peggy Joe, part interest to each. Hammer tool for carpet strip. 4,030,654, Cl. 227-110.000.
Yoshida, Tadao, to Sony Corporation. Transistor amplifier. 4,031,481, Cl. 330-35.000.
Yoshida, Tadao: *See—*
Suzuki, Tadao; Yoshida, Tadao; and Wachi, Shigeaki, 4,031,454.
Yoshiya, Shigeo: *See—*
Nagata, Yasunori; Itoh, Hirotaka; Yazaki, Susumu; Hamamura, Takayuki; and Yoshiya, Shigeo, 4,030,884.
Yotsukura, Teruo: *See—*
Takenaga, Hisayoshi; and Yotsukura, Teruo, 4,030,445.
Young, Alastair John, to Automotive Products Limited. Vehicle braking system. 4,030,771, Cl. 280-88.000.
Young, Robert D. Mechanisms for feeding documents from a stack thereof. 4,030,413, Cl. 101-232.000.
Yu, Herbert Chia-Chen: *See—*
Peng, Luke Shih-Cheng; and Yu, Herbert Chia-Chen, 4,030,769.

Yuminaka, Takeo: *See—*
Kaneko, Takashi; Yuminaka, Takeo; Iwasaka, Tatsuo; and Kinoshita, Hiroshi, 4,030,571.
Kaneko, Takashi; Iwasaka, Tatsuo; and Yuminaka, Takeo, 4,030,572.
Zabrocki, Karl: *See—*
Dhein, Rolf; Zabrocki, Karl; Beer, Wolfgang; and Kuchenmeister, Rolf, 4,031,047.
Zahnradfabrik Friedrichshafen AG: *See—*
Elser, Dieter, 4,030,403.
Zakirov, Robert Sharafutdinovich: *See—*
Ponomarenko, Nikolai Borisovich; Kononenko, Vadim Grigorievich; Stelmakh, Viktor Alexeevich; Kotelnikov, Vladimir Ivanovich; Valenya, Ivan Jurievich; Saranchа, Vladimir Nikolaevich; Petrenko, Anatoly Avramovich; Bozhko, Valery Pavlovich; Yatsenko, Sergei Vasilievich; Komnatny, Igor Pavlovich; Akhnazariants, Levon Khachaturovich; Strizhenko, Vitaly Evgenievich; Kolokolov, Boris Alexeevich; Maznichenko, Stanislav Anisimovich; Bozhko, Viktor Vasilievich; Bondarenko, Oleg Alexandrovich; and Zakirov, Robert Sharafutdinovich, 4,030,389.
Zdor, Gennady Nikolaevich: *See—*
Chachin, Viktor Nikolaevich; Zhuravsky, Alexandr Julyanovich; Zdor, Gennady Nikolaevich; Shaduya, Vladimir Leontievich; and Golovkina, Elena Yakovlevna, 4,030,329.

53: *See—*
Jesty, Thomas William; Anderson, John; and 53, 4,030,467.

LIST OF REISSUE PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 21ST DAY OF JUNE, 1977

NOTE.—Arranged io accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

American Seating Company: *See—*
Barecki, Chester J., Re. 29,271.

B. F. Goodrich Company, The: *See—*
Kuts, Mathew, Re. 29,268.

Barecki, Chester J., to American Seating Company. Cantilevered seat for motorcoach vehicles or the like. Re. 29,271, Cl. 297-451.000.

Berman, Herbert; and Tenen, Stanley N. Motor control system. Re. 29,275, Cl. 318-227.000.

Braden, Denver, to Illinois Tool Works Inc. Automatic lead straightening of axial leaded components. Re. 29,269, Cl. 140-147.000.

Canon Kabushiki Kaisha: *See—*
Mitani, Taizo; and Shirashaki, Takayuki, Re. 29,276.

Collette, Richard L.; Vojir, Frank S.; and Watts, Roger E., to Guardian Electric Manufacturing Company. Mechanical counter. Re. 29,274, Cl. 235-91.00R.

Coltron Industries, Inc.: *See—*
Leitner, Frank Wilhite; and Griffin, William Thomas, Re. 29,267.

Griffin, William Thomas: *See—*
Leitner, Frank Wilhite; and Griffin, William Thomas, Re. 29,267.

Guardian Electric Manufacturing Company: *See—*
Collette, Richard L.; Vojir, Frank S.; and Watts, Roger E., Re. 29,274.

Hintz, Harold L.; and Webb, Joseph T., to Westvaco Corporation. Water resistant corrugated paperboard. Re. 29,272, Cl. 156-208.000.

Illinois Tool Works Inc.: *See—*
Braden, Denver, Re. 29,269.

Kuts, Mathew, to B. F. Goodrich Company, The. Fabric cutting. Re. 29,268, Cl. 83-488.000.

Leitner, Frank Wilhite; and Griffin, William Thomas, to Coltron Industries, Inc. Apparatus for straightening fabric. Re. 29,267, Cl. 26-51.500.

Mitani, Taizo; and Shirashaki, Takayuki, to Canon Kabushiki Kaisha. Lens attachment for flash-light photographing. Re. 29,276, Cl. 354-32.000.

Nelson, Ardell H. Floating cover for a tank. Re. 29,270, Cl. 220-220.000.

Reiffin, Martin G. Direct-current-coupled transistor power amplifiers. Re. 29,273, Cl. 179-1.00A.

Shirashaki, Takayuki: *See—*
Mitani, Taizo; and Shirashaki, Takayuki, Re. 29,276.

Tenen, Stanley N.: *See—*
Berman, Herbert; and Tenen, Stanley N., Re. 29,275.

Vojir, Frank S.: *See—*
Collette, Richard L.; Vojir, Frank S.; and Watts, Roger E., Re. 29,274.

Watts, Roger E.: *See—*
Collette, Richard L.; Vojir, Frank S.; and Watts, Roger E., Re. 29,274.

Webb, Joseph T.: *See—*
Hintz, Harold L.; and Webb, Joseph T., Re. 29,272.

Westvaco Corporation: *See—*
Hintz, Harold L.; and Webb, Joseph T., Re. 29,272.

LIST OF PLANT PATENTEES

Armstrong Nurseries, Inc.: *See—*
McGredy, Samuel, IV, 4,063.

McGredy, Samuel, IV, to Armstrong Nurseries, Inc. Rose plant. 4,063, 6-21-77, Cl. 15.000.

Minami, William Y. Peach tree. 4,064, 6-21-77, Cl. 43.000.

Pittman, Roy Nyal. Kalanchoe plant. 4,062, 6-21-77, Cl. 68.000.

LIST OF DESIGN PATENTEES

Aktiebolaget Gustavsbergs Fabriker: *See—*
Juhlin, Sven-Eric, 244,738.

AO:s Metall & Mek. Verkstad AB: *See—*
Ohlson, Carl-Eric, 244,805.

Bard, Donald I. Portable adjustable stand for a needlework frame. 244,754, 6-21-77, Cl. D15-66.000.

Bard, Donald I. Portable adjustable stand for supporting an embroidery hoop. 244,755, 6-21-77, Cl. D15-66.000.

Beautiline Systems Limited: *See—*
Bobrovniczky, Bertalan Tamas, 244,777.

Berkline Corporation, The: *See—*
Long, Stapleton, 244,730.

Black and Decker Manufacturing Company, The: *See—*
Bunyea, Roderick Francis, 244,744.

Bobrovniczky, Bertalan Tamas, to Beautiline Systems Limited. Tubular post. 244,777, 6-21-77, Cl. D25-75.000.

Borri, Ambrogio. Shoe. 244,727, 6-21-77, Cl. D2-287.000.

Bott, John A. License plate holder. 244,771, 6-21-77, Cl. D12-193.000.

Bridgestone Tire Company Limited: *See—*
Kojima, Hiroshi; Hayakawa, Toshio; and Yoshihara, Masafumi, 244,770.

Buhk, Randall P., to Steelcase, Inc. Swivel chair. 244,729, 6-21-77, Cl. D6-31.000.

Bunyea, Roderick Francis, to Black and Decker Manufacturing Company, The. Detachable grass shear head for cordless tool. 244,744, 6-21-77, Cl. D8-8.000.

Burgess, Kenneth Peter; and Elsdale, Timothy Sefton, to WCB Containers Limited. Pod module for use as play equipment. 244,788, 6-21-77, Cl. D34-5.00H.

Burgess, Kenneth Peter; and Elsdale, Timothy Sefton, to WCB Containers Limited. Slab module for use as play equipment. 244,789, 6-21-77, Cl. D34-5.00H.

Canterbury, Robert W., to Holly Enterprises. Bracket for mounting accessories over the transmission hump of a vehicle. 244,748, 6-21-77, Cl. D8-380.000.

Carlson, Phillip Howard; and Erickson, Lawrence E., to International Telephone and Telegraph Corporation. Field hockey stick. 244,790, 6-21-77, Cl. D34-5.0BC.

Cohen, Martin B., to Latin Percussion, Inc. Musical whistle. 244,787, 6-21-77, Cl. D34-15.00C.

Concept, Inc.: *See—*
Staub, David E., 244,796.

Contact Systems, Inc.: *See—*
Latanzi, Lewis A., 244,778.

Control Products Inc.: *See—*
Dacal, Perfecto, 244,794.

Curtis, Frank S. Rat trap. 244,773, 6-21-77, Cl. D22-18.000.

D. Swarovski & Co.: *See—*
Grubauer, Emil, 244,764.

Dacal, Perfecto, to Control Products Inc. Explosion proof fluorescent lamp for mines or the like. 244,794, 6-21-77, Cl. D48-20.00E.

Daenen, Robert H. C. M., to Dart Industries Inc. Covered compartmented bowl. 244,741, 6-21-77, Cl. D7-17.000.

Daenen, Robert H. C. M., to Dart Industries Inc. Covered serving bowl or the like. 244,742, 6-21-77, Cl. D7-17.000.

Dart Industries Inc.: *See—*
Daenen, Robert H. C. M., 244,741.
Daenen, Robert H. C. M., 244,742.

Davis, Lee W.: *See—*
Roberts, Leo L.; Davis, Lee W.; and Hollingsworth, Jim S., 244,750.

DeLand, George R., to Odetics, Inc. Video program selection and display system. 244,801, 6-21-77, Cl. D14-82.000.

Ditto, Donald R. Butterfly ornament. 244,767, 6-21-77, Cl. D11-137.000.

Dose, John H. Anti-water splash shield for bathtubs. 244,774, 6-21-77, Cl. D23-69.000.

Dryden, Littleton P., to Premier Manufacturing Co. Bird feeder. 244,786, 6-21-77, Cl. D30-15.000.

Durand, Philippe J. Wine glass or similar article. 244,739, 6-21-77, Cl. D7-13.000.

Durand, Philippe J. Tumbler or similar article. 244,740, 6-21-77, Cl. D7-14.000.

Elsdale, Timothy Sefton: *See—*
Burgess, Kenneth Peter; and Elsdale, Timothy Sefton, 244,788.
Burgess, Kenneth Peter; and Elsdale, Timothy Sefton, 244,789.

Erickson, Lawrence E.: *See—*
Carlson, Phillip Howard; and Erickson, Lawrence E., 244,790.

Fleck, Fred. Drum. 244,798, 6-21-77, Cl. D56-1.00E.

Fratelli Saporiti: *See—*
Introini, Vittorio, 244,732.

Friedr. Dick G.m.b.H.: *See—*
Solf, Johannes Josef, 244,747.

Gelinas, Paul B. Driving iron head. 244,792, 6-21-77, Cl. D34-5.0GH.

General Bathroom Products Corporation: *See—*
Palka, James J., 244,736.

General Electric Company: *See—*
Kolwaite, John S., 244,799.

Goto, Kenjiro. Cigarette lighter. 244,782, 6-21-77, Cl. D27-36.000.

Goulet, Donald L.: *See—*
Ruud, Alan J., 244,793.

Granzow, Clarence E. Grain mill. 244,756, 6-21-77, Cl. D15-98.000.

Graziano, Anthony J.: *See—*
Wasmer, Roger K. F.; McCord, David W.; and Graziano, Anthony J., 244,762.

Grenon, Krystin L. Jewelry pin for display of photographic negative contact prints. 244,765, 6-21-77, Cl. D11-40.000.

Grubauer, Emil, to D. Swarovski & Co. Road-traffic stud. 244,764, 6-21-77, Cl. D10-113.000.

Hayakawa, Toshio: *See—*
Kojima, Hiroshi; Hayakawa, Toshio; and Yoshihara, Masafumi, 244,770.

Henry, Franklin H. Wardrobe systemizer device. 244,737, 6-21-77, Cl. D6-257.000.

Hickey, Larry G.: *See—*
James, Norman J.; Hickey, Larry G.; and Powers, Fred, 244,731.

Hodges, Dale R. Ribbon container. 244,749, 6-21-77, Cl. D9-238.000.

Hollingsworth, Jim S.: *See—*
Roberts, Leo L.; Davis, Lee W.; and Hollingsworth, Jim S., 244,750.

Holly Enterprises: *See—*
Canterbury, Robert W., 244,748.

International Telephone and Telegraph Corporation: *See—*
Carlson, Phillip Howard; and Erickson, Lawrence E., 244,790.

Introini, Vittorio, to Fratelli Saporiti. Chair. 244,732, 6-21-77, Cl. D6-76.000.

James, Norman J.; Hickey, Larry G.; and Powers, Fred, to Rohr Industries, Inc. Bus seat. 244,731, 6-21-77, Cl. D6-48.000.

Juhlin, Sven-Eric, to Aktiebolaget Gustavsbergs Fabriker. Cup and saucer combination. 244,738, 6-21-77, Cl. D7-3.000.

Kael, Diane I. Dual handled hair brush. 244,728, 6-21-77, Cl. D4-31.000.

Katz, Marcella M. Pocket-top shoe. 244,726, 6-21-77, Cl. D2-265.000.

Kennedy, Robert J., Jr.; and Smith, Kendall S., II, to Lincoln Manufacturing Company, Inc. Panel for use with a modular counter unit. 244,735, 6-21-77, Cl. D6-193.000.

Kido, Katsutoshi; and Yamamoto, Susumu, to Matsushita Electric Industrial Co., Ltd. Combined tape recorder and radio receiver. 244,800, 6-21-77, Cl. D14-5.000.

Kies, Jared R., to Owens-Corning Fiberglas Corporation. Embossed plastic sheet material. 244,802, 6-21-77, Cl. D87-3.00G.

Kies, Jared R., to Owens-Corning Fiberglas Corporation. Embossed plastic sheet material. 244,803, 6-21-77, Cl. D87-3.00G.

Kies, Jared R., to Owens-Corning Fiberglas Corporation. Embossed plastic sheet material. 244,804, 6-21-77, Cl. D87-3.00G.

Kindred, William B., to Weigl Co., Inc. Appliance for cutting, sealing and making plastic bags. 244,759, 6-21-77, Cl. D15-146.000.

Kobayashi, Yoshiaki, to Nihon Atsudenki Kabushiki Kaisha. Microphone. 244,779, 6-21-77, Cl. D14-12.000.

Kobayashi, Yoshiaki, to Nihon Atsudenki Kabushiki Kaisha. Microphone. 244,780, 6-21-77, Cl. D14-12.000.

Kojima, Hiroshi; Hayakawa, Toshio; and Yoshihara, Masafumi, to Bridgestone Tire Company Limited. Vehicle tire. 244,770, 6-21-77, Cl. D12-142.000.

Kolwaite, John S., to General Electric Company. Portable radio. 244,799, 6-21-77, Cl. D14-75.000.

Lacativo, Arthur J. Planter and a lid therefor. 244,768, 6-21-77, Cl. D11-149.000.

Laroye, Eric. Desk. 244,734, 6-21-77, Cl. D6-175.000.

Latanzi, Lewis A., to Contact Systems, Inc. Component locater for electronic product assembly operations. 244,778, 6-21-77, Cl. D14-99.000.

Latin Percussion, Inc.: *See—*
Cohen, Martin B., 244,787.

Leaby, William F. Vehicle headlamp bezel. 244,797, 6-21-77, Cl. D48-32.00C.

Lincoln Manufacturing Company, Inc.: *See—*
Kennedy, Robert J., Jr.; and Smith, Kendall S., II, 244,735.

Little Giant Corporation: *See—*
Roberts, Leo L.; Davis, Lee W.; and Hollingsworth, Jim S., 244,750.

Long, Stapleton, to Berkline Corporation, The. Chair. 244,730, 6-21-77, Cl. D6-37.000.

Matsushita Electric Industrial Co., Ltd.: *See—*
Kido, Katsutoshi; and Yamamoto, Susumu, 244,800.

McCord, David W.: *See—*
Wasmer, Roger K. F.; McCord, David W.; and Graziano, Anthony J., 244,762.

Meeker, Paul K. Infant nursing bottle. 244,776, 6-21-77, Cl. D24-47.000.

Morehouse Industries, Inc.: *See—*
Schnear, Donald M., 244,757.

Nescher, Bruce E. Power boat. 244,769, 6-21-77, Cl. D12-62.000.

Nihon Atsudenki Kabushiki Kaisha: *See—*
Kobayashi, Yoshiaki, 244,779.
Kobayashi, Yoshiaki, 244,780.

O'Brien, George, to Tiffany & Company. Cigarette lighter. 244,783, 6-21-77, Cl. D27-36.000.

O'Brien, George, to Tiffany & Company. Cigarette lighter. 244,784, 6-21-77, Cl. D27-36.000.

O'Brien, George, to Tiffany & Company. Cigarette lighter. 244,785, 6-21-77, Cl. D27-36.000.

Odetics, Inc.: *See—*
DeLand, George R., 244,801.

O'Hara, Robert M. Lighting fixture. 244,795, 6-21-77, Cl. D48-23.00R.

Ohlson, Carl-Eric, to AO:s Metall & Mek. Verkstad AB. X-ray unit stand. 244,805, 6-21-77, Cl. D24-2.000.

Owens-Corning Fiberglas Corporation: *See—*
Kies, Jared R., 244,802.
Kies, Jared R., 244,803.
Kies, Jared R., 244,804.

Palka, James J., to General Bathroom Products Corporation. Cabinet door panel. 244,736, 6-21-77, Cl. D6-193.000.

Phillips, Ronald L. Rotary engine model. 244,760, 6-21-77, Cl. D19-62.000.

Powell, Roy R. Crown for a ring. 244,766, 6-21-77, Cl. D11-89.000.

Powers, Fred: *See—*
James, Norman J.; Hickey, Larry G.; and Powers, Fred, 244,731.

Premier Manufacturing Co.: *See—*
Dryden, Littleton P., 244,786.

Puro Co., Inc., The: *See—*
Wilson, Norman E., 244,775.

Roberts, Leo L.; Davis, Lee W.; and Hollingsworth, Jim S., to Little Giant Corporation. Pump. 244,750, 6-21-77, Cl. D15-7.000.

Rohr Industries, Inc.: *See—*
James, Norman J.; Hickey, Larry G.; and Powers, Fred, 244,731.

Ruud, Alan J., to Goulet, Donald L.; and Ruud, Alan J. Lighting fixture. 244,793, 6-21-77, Cl. D48-20.00A.

Saidel, Jack R. Speaker grill. 244,781, 6-21-77, Cl. D14-39.000.

Schnear, Donald M., to Morehouse Industries, Inc. Dispersing apparatus. 244,757, 6-21-77, Cl. D15-122.000.

Slattery, Dugmore Dennis. Metal forming press. 244,758, 6-21-77, Cl. D15-123.000.

Smith, Kendall S., II: *See—*
Kennedy, Robert J., Jr.; and Smith, Kendall S., II, 244,735.

Solf, Johannes Josef, to Friedr. Dick G.m.b.H. Handle for tools. 244,747, 6-21-77, Cl. D8-107.000.

Stabb, Leonard C. Jig for cutting tile. 244,746, 6-21-77, Cl. D8-71.000.

Staub, David E., to Concept, Inc. Penlight. 244,796, 6-21-77, Cl. D48-24.00A.

Steelcase, Inc.: *See—*
Buhk, Randall P., 244,729.

Stefaniak, Philip S., to Stewart-Warner Corporation. Speedometer. 244,763, 6-21-77, Cl. D10-98.000.

Stewart-Warner Corporation: *See—*
Stefaniak, Philip S., 244,763.

Sulek, Eugene Joseph. Digital wrist watch. 244,761, 6-21-77, Cl. D10-38.000.

Sullivan, Edward F., Jr. Golf stance and swing practice device or the like. 244,791, 6-21-77, Cl. D34-5.0CB.

Tammera, Italo. Eyeglass display rack including rotary disks. 244,733, 6-21-77, Cl. D6-136.000.

Tiffany & Company: *See—*
O'Brien, George, 244,783.
O'Brien, George, 244,784.
O'Brien, George, 244,785.

Tohnichi Manufacturing Co. Ltd.: *See—*
Tsuji, Hiroshi, 244,745.

Tsuji, Hiroshi, to Tohnichi Manufacturing Co. Ltd. Torque wrench. 244,745, 6-21-77, Cl. D8-24.000.

Turner, Wendy P. Canister lid. 244,743, 6-21-77, Cl. D7-131.000.

Wasmer, Roger K. F.; McCord, David W.; and Graziano, Anthony J. Electrical leakage analyzer. 244,762, 6-21-77, Cl. D10-75.000.

Watts, Glen A. Hydraulic reset ground ripper implement. 244,751, 6-21-77, Cl. D15-11.000.

Watts, Glen A. Combined ground ripper tooth and hydraulic reset assembly. 244,752, 6-21-77, Cl. D15-29.000.

Watts, Glen A. Ground ripper tooth. 244,753, 6-21-77, Cl. D15-29.000.

WCB Containers Limited: *See—*
Burgess, Kenneth Peter; and Elsdale, Timothy Sefton, 244,788.
Burgess, Kenneth Peter; and Elsdale, Timothy Sefton, 244,789.

Weigl Co., Inc.: *See—*
Kindred, William B., 244,759.

Wilson, Norman E., to Puro Co., Inc., The. Air freshener container. 244,775, 6-21-77, Cl. D23-150.000.

Yamamoto, Susumu: *See—*
Kido, Katsutoshi; and Yamamoto, Susumu, 244,800.

Yoshihara, Masafumi: *See—*
Kojima, Hiroshi; Hayakawa, Toshio; and Yoshihara, Masafumi, 244,770.

Zongker, Floyd E., to Zongker Lead Casting, Inc., (Entire). Decoy anchor. 244,772, 6-21-77, Cl. D12-215.000.

Zongker Lead Casting, Inc., (Entire): *See—*
Zongker, Floyd E., 244,772.

CLASSIFICATION OF PATENTS

ISSUED JUNE 21, 1977

NOTE.—First number, class; second number, subclass; third number, patent number

Proposed Procedures for Recordation of Interviews

The Patent and Trademark Office is considering the adoption of the procedures set forth in the following proposed Commissioner's notice relating to the recordation of interviews in patent application files.

Current Patent and Trademark Office practices relating to the recordation of interviews with the examiner, whether in person or by telephone, are set forth in sections 1.2 and 1.133(b) of Title 37, Code of Federal Regulations and section 713.04 of the Manual of Patent Examining Procedure (MPEP).

Comments are requested on the desirability of issuing such a notice and the content thereof as well as on the desirability of amending 37 CFR 1.133(b) to provide an independent basis for the proposed interview recordation procedure. It should be noted that section 1.133(b) does not in itself support the various interview recordation requirements in effect or as proposed but must be considered in conjunction with the provisions of section 1.2.

Persons wishing to comment on the proposed procedures may do so in writing, by addressing comments to the Commissioner of Patents and Trademarks, Washington, D.C. 20231. Written comments received by August 10, 1977 will be considered before any new procedures are adopted. The contemplated notice would state that:

This notice establishes within the Patent and Trademark Office additional general procedures for the recordation of interviews.

Under present practice it is the responsibility of the applicant or the attorney or agent to make the substance of an interview of record in the application file, unless the examiner indicates he or she will do so. It is the examiner's responsibility to see that such a record is made and to correct material inaccuracies which bear directly on the question of patentability as set forth in section 713.04 of the Manual of Patent Examining Procedure (MPEP). This practice is continued and further amplified as set forth below.

Recent surveys have indicated that the substance of many interviews has not been made of record or the text thereof is incomplete as to substantive matters. In some cases, the substance of an interview may be presented as arguments in a subsequent response filed by the applicant but without any indication that they had been presented at the interview. In order to help insure a better record of examiner-applicant interviews in application files, the following new procedures are adopted to become effective for interviews conducted on and after ————————, 1977. Appropriate changes will be made in the Manual of Patent Examining Procedure (MPEP).

Examiners will complete a two-sheet carbon interleaf Interview Summary Form for each interview held where a matter of substance has been discussed by checking the appropriate boxes and filling in the blanks in neat handwritten form. Discussions regarding only procedural matters, directed solely to restriction requirements (for which interview recordation is otherwise provided for in Section 812.01 of the MPEP), or pointing out typographical errors or unreadable script in Office actions or the like, are excluded from the interview recordation procedures below.

The Interview Summary Form shall be given an appropriate paper number, placed in the file, and listed on the "Contents" list on the file wrapper. The docket and serial register cards will not be updated to reflect this interview. In a personal interview, the duplicate copy of the Form will be removed and given to the applicant (or attorney or agent) at the conclusion of the interview. In the case of a telephonic interview, the copy will be mailed to the applicant's correspondence address either with or prior to the next official communication. If additional correspondence from the examiner before an allowance is not likely or if other circumstances dictate, the Form will be mailed promptly after the telephonic interview rather than with the next official communication. The original of the complete Form will be made of record and placed in the right hand flap of the file.

The Form provides for recordation of the following information:

— Serial Number of the application
— Name of applicant
— Name of examiner
— Date of interview
— Type of interview (personal or telephonic)
— Name of participant(s) (applicant, attorney or agent, etc.)
— An indication whether or not an exhibit was shown or a demonstration conducted
— An indication whether an agreement was reached and if so, a description of the general nature of the agreement (may be by attachment of a copy of amendments or claims agreed as being allowable). (Agreements as to allowability are tentative and do not restrict further action by the examiner to the contrary)
— The signature of the examiner who conducted the interview
— Names of any other Patent and Trademark Office personnel present.

The Form also contains a statement reminding the applicant of his responsibility to record the substance of the interview.

It is desirable that the examiner orally remind the applicant of his obligation to record the substance of the interview in *each case* unless both applicant and examiner agree that the examiner will record same. Where the examiner agrees to record the substance of the interview, or when it is adequately recorded on the Form or in an attachment to the Form, the examiner will check a box at the bottom of the Form informing the applicant that he need not supplement the Form by submitting a separate record of the substance of the interview.

It should be noted, however, that the Interview Summary Form will not be considered a complete and proper recordation of the interview unless it includes, or is supplemented by the applicant or the examiner to include, all of the applicable items required below concerning the substance of the interview:

The complete and proper recordation of the substance of any interview should include at least the following applicable items:

1) A brief description of the nature of any exhibit shown or any demonstration conducted,
2) an identification of the claims discussed,
3) an identification of specific prior art discussed,
4) an identification of the principal proposed amendments of a substantive nature discussed, unless these are already described on the Interview Summary Form completed by the examiner,
5) a brief identification of the general thrust of the principal arguments presented to the examiner. The identification of arguments need not be lengthy or elaborate. A verbatim or highly detailed description of the arguments is not required. The identification of the arguments is sufficient if the general nature or thrust of the principal arguments made to the examiner can be understood in the context of the application file. Of course, the applicant may desire to emphasize and fully describe those arguments which he feels were or might be persuasive to the examiner,
6) an indication of any other pertinent matters discussed, and
7) if appropriate, the general results or outcome of the interview unless already described in the Interview Summary Form completed by the examiner.

Examiners are expected to carefully review the applicant's record of the substance of an interview. If the record is not complete or accurate, the examiner will take appropriate action as set forth in MPEP section 713.04. If the record is complete and accurate, the examiner should place the indication "Interview record OK" on the paper recording the substance of the interview along with the date and the examiner's initials.

Questions and requests for further information concerning the above-proposed notice and procedure may be directed to Mr. Louis O. Maassel by telephone at (703) 557-3070, or by mail marked to his attention and addressed to the Commissioner of Patents and Trademarks, Washington, D.C. 20231.

June 2, 1977.

C. MARSHALL DANN,
Commissioner of Patents and Trademarks.

April and May 1977 Classification Orders

The reclassifications covered by the following classification changes became effective during April and May 1977.

	Class	Subclasses
Classification Order 582, effective April 5, 1977:		
Abolished	29	180-199.
	75	94.
	148	34.
Established	75	228-257; 950 and 951.
	428	539.5; 544-687; and 923-941.
Position change	428	2.
Classification Order 583, effective May 12, 1977:		
Abolished	228	141.
Established	228	141.1; 265.
Classification Order 584, effective May 12, 1977:		
Abolished	280	87.
Established	280	771-780.
Classification Order 585, effective May 27, 1977:		
Abolished	70	146-148.
Established	70	467-489.
Classification Order 586, effective May 31, 1977:		
Abolished	51	8-15.
Established	51	410-439.
Classification Order 587, effective May 31, 1977:		
Abolished	112	218; 219; 252.
Established	112	270-302.

ALFRED C. MARMOR,
Administrator for Documentation,
June 2, 1977.

National Technical Information Service

GOVERNMENT-OWNED INVENTIONS

Availability for Licensing

The inventions listed below are owned by the U.S. Government and are available for U.S. and possibly foreign licensing, in accordance with the policies of the agency sponsors.

Copies of the patents cited are available from the Commissioner of Patents and Trademarks, Washington, D.C. 20231, for $.50 each. Requests for copies of patents must include the patent number.

Copies of the patent applications, either paper copy (PC) or microfiche (MF), can be purchased at the prices cited from the National Technical Information Service (NTIS), Springfield, Va. 22161. Requests for copies of patent applications must include the patent application number. Claims are deleted from patent application copies sold to the public to avoid premature disclosure in the event of an interference before the Patent and Trademark Office. Claims and other technical data will usually be made available to serious prospective licensees by the agency which filed the case.

Requests for licensing information on a particular invention should be directed to the address cited for the agency-sponsor.

DOUGLAS J. CAMPION,
Patent Program Coordinator.

U.S. DEPARTMENT OF THE AIR FORCE
AF/JACP, Washington, D.C. 20314

Patent application 681,018, Two-Dimensional Drawing Board Manikin. Filed Apr. 28, 1976. PC $3.50/MF $3.00.

Patent application 681,084, Digitally Tuned Parametric Amplifier. Filed Apr. 28, 1976. PC $3.50/MF $3.00.

Patent application 681,871, Lubricant Composition. Filed Apr. 30, 1976. PC $3.50/MF $3.00.

Patent application 685,841, Method for the Fabrication of Gallium Arsenide Semiconductor Devices. Filed May 13, 1976. PC $3.50/MF $3.00.

Patent application 687,285, Digital Lock-Loop Frequency Offset Correction and Display Apparatus. Filed May 17, 1976. PC $3.50/MF $3.00.

Patent application 687,581, Self Synchronizing Convolver System. Filed May 18, 1976. P.C. $3.50/MF $3.00.

Patent 3,940,892, Self-Erecting Aircraft Structure. Filed May 23, 1974. Patented Mar. 2, 1976. Not available NTIS.

Patent 3,955,169, High Power Resistor. Filed Nov. 8, 1974. Patented May 4, 1976. Not available NTIS.

Patent 3,957,083, Pressure Sensitive Regulating Valve. Filed Jan. 27, 1975. Patented May 18, 1976. Not available NTIS.

Patent 3,960,814, Poly (Perfluoroalkylene Oxide) Oxadiazoles and Their Synthesis. Filed Feb. 27, 1975. Patented June 1, 1976. Not available NTIS.

Patent 3,963,490, Dye Sensitized Dichromated Gelatin Holographic Material. Filed Sept. 25, 1974. Patented June 15, 1976. Not available NTIS.

Patent 3,965,422, System Channel Distortion Weighting for Predetection Combiners. Filed July 26, 1974. Patented June 22, 1976. Not available NTIS.

U.S. DEPARTMENT OF THE NAVY
Assistant Chief for Patents, Office of Naval Research, Code 302, Arlington, Va. 22217

Patent application 587,475, Target Detection Method and Apparatus for Reducing Range-Smearing Error Caused by Relative Target Motion. Filed June 16, 1975. P.C. $3.50/MF $3.00.

Patent application 680,944, Constant Current Base-Drive Circuit. Filed Apr. 28, 1976. PC $3.50/MF $3.00.

Patent application 681,087, Electrical Conducting Phthalonitrile Polymers. Filed Apr. 28, 1976. PC $3.50/MF $3.00.

Patent application 681,317, Mid-Pulse Detector. Filed Apr. 29, 1976. PC $3.50/MF $3.00.

Patent application 682,693, Bending and Cutting Tool. Filed May 3, 1976. PC $3.50/MF $3.00.

Patent application 684,506, Redundant Oscillator for Clocking Signal Source. Filed May 7, 1976. PC $3.50/MF $3.00.

Patent application 685,877, Material for Magnetic Bubble Devices. Filed May 12, 1976. PC $3.50/MF $3.00.

Patent application 689,417, Low Loss Tuneable Filter. Filed May 24, 1976. PC $3.50/MF $3.00.

Patent 3,916,229, Induction Motor for Superconducting Synchronous/Asynchronous Motor. Filed June 3, 1975. Patented Oct. 28, 1975. Not available NTIS.

Patent 3,924,262, Aural Warning Apparatus. Filed Dec. 2, 1974. Patented Dec. 2, 1975. Not available NTIS.

Patent 3,934,204, AM/AGC Weighted Diversity Combiner/Selector. Filed Oct. 4, 1974. Patented Jan. 20, 1976. Not available NTIS.

Patent 3,937,407, Multiple Strap Shock Absorber. Filed May 24, 1974. Patented Feb. 10, 1976. Not available NTIS.

Patent 3,939,334, Closest Point of Approach Calculator. Filed Jan. 2, 1975. Patented Feb. 17, 1976. Not available NTIS.

Patent 3,940,289, Flash Melting Method for Producing New Impurity Distributions in Solids. Filed Feb. 3, 1975. Patented Feb. 24, 1976. Not available NTIS.

Patent 3,942,511, Sandwiched Structure for Production of Heat and Hydrogen Gas. Filed Sept. 19, 1974. Patented Mar. 9, 1976. Not available NTIS.

Patent 3,943,001, Silver Sulfide Cathode for Liquid Ammonia Batteries and Fuel Cells Containing Sulfur and H_2S in the Electrolyte. Filed July 5, 1973. Patented Mar. 9, 1976. Not available NTIS.

Patent 3,949,378, Computer Memory Addressing Employing Base and Index Registers. Filed Dec. 9, 1974. Patented Apr. 6, 1976. Not available NTIS.

Patent 3,952,186, Apparatus for the Generation of a Two-Dimensional Discrete Fourier Transform. Filed Feb. 10, 1975. Patented Apr. 20, 1976. Not available NTIS.

Patent 3,952,290, Read-Only Optical Memory System. Filed Nov. 11, 1974. Patented Apr. 20, 1976. Not available NTIS.

Patent 3,953,260, Gossypol, an Abundant, Low-Cost Iron Deactivator, Pot-Life Extender, and Processing Aid for HTPB Propellants. Filed May 23, 1975. Patented Apr. 27, 1976. Not available NTIS.

Patent 3,957,340, Electrooptical Amplitude Modulator. Filed Feb. 25, 1975. Patented May 18, 1976. Not available NTIS.

Patent 3,957,840, Preparation of a Ferrocenyl Compound. Filed July 15, 1974. Patented May 18, 1976. Not available NTIS.

Patent 3,958,564, EKG Contact. Filed May 9, 1975. Patented May 25, 1976. Not available NTIS.

Patent 3,963,198, Negative Air Cushion for Airship Ground Handling. Filed Apr. 2, 1975. Patented June 15, 1976. Not available NTIS.

U.S. DEPARTMENT OF THE ARMY
Office of Judge Advocate General, Patent Division,
Room 2C–455, Pentagon, Washington, D.C. 20310

Patent application 647,238. Inflatably Sealed Sterilizer Door. Filed Jan. 7, 1976. PC $3.50/MF $3.00.

Patent 3,940,474. Generation of Hydrogen. Filed Aug. 6, 1974. Patented Feb. 24, 1976. Not available NTIS.

U.S. DEPARTMENT OF THE AIR FORCE
AF/JACP, Washington, D.C. 20314

Patent application 692,720. Method for the Complete Dissolution of Mineral Samples. Filed June 4, 1976. PC $3.50/MF $3.00.

U.S. DEPARTMENT OF AGRICULTURE
Research Agreements and Patent Mgmt. Branch,
General Services Division, Federal Bldg.,
Agricultural Research Service, Hyattsville, Md. 20782

Patent application 705,230. Wood Impingement Dryer. Filed July 14, 1976. PC $3.50/MF $3.00.

U.S. ENERGY RESEARCH AND DEVELOPMENT ADMINISTRATION
Assistant General Counsel for Patents,
Washington, D.C. 20545

Patent 3,904,273. Apodised Aperture Using Rotation of Plane of Polarization. Filed Mar. 18, 1974. Patented Sept. 9, 1975. Not available NTIS.

Patent 3,904,985. Explosive Laser. Filed Feb. 5, 1974. Patented Sept. 9, 1975. Not available NTIS.

U.S. DEPARTMENT OF THE INTERIOR
Branch of Patents, 18th and C Streets NW.,
Washington, D.C. 20240

Patent application 709,990. Production of Supported Raney-Type Catalysts by Reactive Diffusion. Filed July 30, 1976. PC $3.50/MF $3.00.

Patent application 709,999. Massive Catalytic Inserts. Filed July 30, 1976. PC $3.50/MF $3.00.

Patent 3,969,452. Method for Casting and Handling Ultra Thin Reverse Osmosis Membranes. Filed Aug. 8, 1974. Patented July 13, 1976. Not available NTIS.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
Assistant General Counsel for Patent Matters, NASA
Code GP–2, Washington, D.C. 20546

Patent application 706,424. Heat Resistant Polymers of Oxidized Styrylphosphine. Filed July 19, 1976. PC $4/MF $3.00.

Patent application 706,425. Power Factor Control System for AC Induction Motors. Filed July 19, 1976. PC $3.50/MF $3.00.

Patent application 707,125. TV Fatigue Crack Monitoring System. Filed July 20, 1976. PC $3.50/MF $3.00.

Patent application 708,659. Liquid Metal Slip Ring. Filed July 26, 1976. PC $3.50/MF $3.00.

Patent application 708,771. Method of Producing Complex Aluminum Alloy Parts of High Temper, and Products Thereof. Filed July 26, 1976. PC $3.50/MF $3.00.

Patent application 708,795. Pressure Modulating Valve. Filed July 26, 1976. PC $3.50/MF $3.00.

Patent application 708,800. Wrist Joint Assembly. Filed July 26, 1976. PC $3.50/MF $3.00.

Patent application 708,951. Polymeric Foams From Cross-Linkable Poly-N-Arylenebenzimidazoles. Filed July 26, 1976. PC $3.50/MF $3.00.

Patent application 712,419. Flow Separation Detector. Filed Aug. 6, 1976. PC $3.50/MF $3.00.

Patent 3,961,997. Fabrication of Polycrystalline Solar Cells on Low-Cost Substrates. Patented June 8, 1976. Not available NTIS.

Patent 3,971,362. Miniature Ingestible Telemeter Devices To Measure Deep-Body Temperature. Patented July 27, 1976. Not available NTIS.

Patent 3,971,363. Myocardium Wall Thickness Transducer and Measuring Method. Patented July 27, 1976. Not available NTIS.

Patent 3,971,364. Catheter Tip Force Transducer for Cardiovascular Research. Patented July 27, 1976. Not available NTIS.

Patent 3,971,602. Thrust Bearing. Patented July 27, 1976. Not available NTIS.

Patent 3,971,697. Production of I–123. Patented July 27, 1976. Not available NTIS.

Patent 3,971,703. Method of Detecting and Counting Bacteria. Patented July 27, 1976. Not available NTIS.

Patent 3,971,847. Hydrogen Rich Gas Generator. Patented July 27, 1976. Not available NTIS.

Patent 3,971,930. Polarization Compensator for Optical Communications. Patented July 27, 1976. Not available NTIS.

Patent 3,972,008. Method and Apparatus for Generating Coherent Radiation in the Ultraviolet Region and Above by Use of Distributed Feedback. Patented July 27, 1976. Not available NTIS.

Patent 3,972,038. Accelerometer Telemetry System. Patented July 27, 1976. Not available NTIS.

Patent 3,972,651. Solar-Powered Pump. Patented Aug. 3, 1976. Not available NTIS.

Patent 3,972,727. Rechargeable Battery Which Combats Shape Change of the Zinc Anode. Patented Aug. 3, 1976. Not available NTIS.

U.S. DEPARTMENT OF THE ARMY
Office of Judge Advocate General, Patent Division,
Room 2C–455, Pentagon, Washington, D.C. 20310

Patent application 571,175. Discrete Control Correction for Synchronizating Digital Networks. Filed Apr. 24, 1975. PC $4/MF $3.00.

Patent application 650,658. Glass Compositions Having Fluorescence Properties. Filed Jan. 20, 1976. PC $3.50/MF $3.00.

Patent Re. 28,621. Fluid Angular Rate Sensor. Filed July 17, 1969. Reissued Nov. 25, 1975. Not available NTIS.

Patent Re. 28,622. Fluid Angular Rate Sensor. Filed July 17, 1969. Reissued Nov. 25, 1975. Not available NTIS.

Patent 3,931,730. Ramp Current Apparatus and Method of Sensitivity Testing. Filed Dec. 23, 1974. Patented Jan. 13, 1976. Not available NTIS.

Ptaent 3,932,745. Far Field Construction for Optical Fourier Transforms. Filed Sept. 30, 1974. Patented Jan. 13, 1976. Not available NTIS.

Patent 3,933,096. Gyroscopic Rate Switch. Filed Mar. 11, 1974. Patented Jan. 20, 1976. Not available NTIS.

Patent 3,936,902. Automatic Cleaning Apparatus for Fluid Filters. Filed July 11, 1974. Patented Feb. 10, 1976. Not available NTIS.

Patent 3,937,071. Fatigue Test Apparatus. Filed July 11, 1975. Patented Feb. 10, 1976. Not available NTIS.

Patent 3,938,378. Engine Compression Testing. Filed Aug. 26, 1974. Patented Feb. 17, 1976. Not available NTIS.

Patent 3,938,815. Chuck Having Jaw Counterbalance Mechanism. Filed Mar. 31, 1975. Patented Feb. 17, 1976. Not available NTIS.

Patent 3,942,486. Hydraulic Fan Drive System Speed Control. Filed Aug. 21, 1974. Patented Mar. 9, 1976. Not available NTIS.

Patent 3,943,741. Embossing Method. Filed Mar. 25, 1975. Patented Mar. 16, 1976. Not available NTIS.

Patent 3,943,776. Fluidic Acceleration Sensor. Filed Dec. 23, 1974. Patented Mar. 16, 1976. Not available NTIS.

U.S. DEPARTMENT OF THE AIR FORCE
AF/JACP, Washington, D.C. 20314

Patent application 696,341. Dual Pressure Sensing Safing and Arming Mechanism. Filed June 15, 1976. PC $3.50/MF $3.90.

Patent application 696,343. N-Channel Deep Depletion Mode Semiconductor Device. Filed June 15, 1976. PC $3.50/MF $3.00.

Patent application 696,344. Intershaft Balance Weight. Filed June 15, 1976. PC $3.50/MF $3.00.

Patent application 696,345. Turbine Band Cooling System. Filed June 15, 1976. PC $3.50/MF $3.00.

Patent application 696,963. Duct Pressure Actuated Nozzle. Filed June 17, 1976. PC $3.50/MF $3.00.

Patent application 698,984. Low Power Frequency Modulated Hybrid Fiber Optic Data Acquisition System. Filed June 23, 1976. PC $3.50/MF $3.00.

Patent application 699,929. Vortex Generators in Axial Flow Compressor. Filed June 25, 1976. PC $3.50/MF $3.00.

Patent 3,969,907. Cold Cylinder Assembly for Cryogenic Refrigerator. Filed Mar. 25, 1975. Patented July 20, 1976. Not available NTIS.

Patent 3,969,078. Direct Injection Liquid Propellant Gun System. Filed Dec. 20, 1974. Patented July 20, 1976. Not available NTIS.

Patent 3,970,005. Mass Focus Explosive Layered Bomblet. Filed Jan. 25, 1969. Patented July 20, 1976. Not available NTIS.

U.S. ENERGY RESEARCH AND DEVELOPMENT ADMINISTRATION
Assistant General Counsel for Patents,
Washington, D.C. 20545

Patent 3,904,273. Apodised Aperture Using Rotation of Plane of Polarization. Filed Mar. 18, 1974. Patented Sept. 9, 1975. Not available NTIS.

Patent 3,904,985. Explosive Laser. Filed Feb. 5, 1974. Patented Sept. 9, 1975. Not available NTIS.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
Assistant General Counsel for Patent Matters, NASA
Code GP–2, Washington, D.C. 20546

Patent application 712,419. Flow Separation Detector. Filed Aug. 6, 1976. PC $3.50/MF $3.00.

Patent 3,545,262. Method and Apparatus for Nondestructive Testing of Pressure Vessels. Patented Dec. 8, 1970. Not available NTIS.

Patent 3,955,941. Hydrogen Rich Gas Generator. Patented May 11, 1976. Not available NTIS.

Patent 3,971,256. Meteorid Capture Cell Construction. Patented July 27, 1976. Not available NTIS.

Patent 3,971,535. Oblique-Wing Supersonic Aircraft. Patented July 27, 1976. Not available NTIS.

Patent 3,972,008. Method and Apparatus for Generating Coherent Radiation in the Ultraviolet Region and Above by Use of Distributed Feedback. Patented July 27, 1976. Not available NTIS.

PATENT EXAMINING CORPS

RENE D. TEGTMEYER, Assistant Commissioner
WILLIAM FELDMAN, Deputy Assistant Commissioner

CONDITION OF PATENT APPLICATIONS AS OF JUNE 4, 1977

PATENT EXAMINING GROUPS	Actual Filing Date of Oldest New Cass Awaiting Action
CHEMICAL EXAMINING GROUPS	
GENERAL CHEMISTRY AND PETROLEUM CHEMISTRY, GROUP 110—S. N. ZAHARNA, Director. Inorganic Compounds; Inorganic Compositions; Organo-Metal and Organo-Metalloid Chemistry; Metallurgy; Metal Stock; Electro Chemistry; Batteries; Hydrocarbons; Mineral Oil Technology; Lubricating Compositions; Gaseous Compositions; Fuel and Igniting Devices.	8-2-76
GENERAL ORGANIC CHEMISTRY, GROUP 120—A. L. LEAVITT, Director. Heterocyclic, Amides; Alkaloids; Azo; Sulfur; Misc. Esters; Carbohydrates; Herbicides; Poisons; Medicines; Cosmetics; Steroids; Oxo and Oxy; Quinones; Acids; Carboxylic Acid Esters; Acid Anhydrides; Acid Halides.	5-4-76
HIGH POLYMER CHEMISTRY, PLASTICS AND MOLDING, GROUP 140—A. P. KENT, Director. Synthetic Resins; Rubber; Proteins; Macromolecular Carbohydrates; Mixed Synthetic Resin Compositions; Synthetic Resins With Natural Polymers and Resins; Natural Resins; Reclaiming; Pore-Forming; Compositions (Part) e.g.: Coating; Molding; Ink; Adhesive and Abrading Compositions; Molding, Shaping, and Treating Processes.	5-17-76
COATING AND LAMINATING, BLEACHING, DYEING AND PHOTOGRAPHY, GROUP 160—R. FRIEDMAN, Director. Coating; Processes and Misc. Products; Laminating Methods and Apparatus; Stock Materials; Adhesive Bonding; Special Chemical Manufactures; Special Utility Compositions; Bleaching; Dyeing and Photography.	2-9-76
SPECIALIZED CHEMICAL INDUSTRIES AND CHEMICAL ENGINEERING, GROUP 170—H. S. VINCENT, Director. Fertilizers; Foods; Fermentation; Analytical Chemistry; Reactors; Sugar and Starch; Paper Making; Glass Manufacture; Gas; Heating and Illuminating; Cleaning Processes; Liquid Purification; Distillation; Preserving; Liquid, Gas, and Solid Separation; Gas and Liquid Contact Apparatus; Refrigeration; Concentrative Evaporators; Mineral Oils Apparatus; Misc. Physical Processes.	8-2-76
ELECTRICAL EXAMINING GROUPS	
INDUSTRIAL ELECTRONICS, PHYSICS AND RELATED ELEMENTS, GROUP 210—W. L. CARLSON, Director. Generation and Utilization; General Applications; Conversion and Distribution; Heating and Related Art Conductors; Switches; Photography; Motion Pictures; Illumination; Horology; Acoustics; Recorders; Weighing Scales.	1-19-76
SPECIAL LAWS ADMINISTRATION, GROUP 220—C. D. QUARFORTH, Director. Ordnance, Firearms and Ammunition; Radar, Underwater Signalling, Directional Radio, Torpedoes, Seismic Exploring, Radio-Active Batteries; Nuclear Reactors, Powder Metallurgy, Rocket Fuels; Radio-Active Material.	5-24-76
INFORMATION TRANSMISSION, STORAGE AND RETRIEVAL, GROUP 230—J. F. COUCH, Director. Communications; Multiplexing Techniques; Facsimile; Data Processing, Computation and Conversion; Storage Devices and Related Arts.	6-4-76
RECEPTACLES, SANITATION AND CLEANING, WINDING, AND MEASURING, GROUP 240—N. ANSHER, Director. Receptacles; Joint Packing; Conduits; Plumbing Fixtures; Textile Spinning; Food; Agitating; Cleaning; Pressing; Geometrical Instruments; Sound Recording; Winding and Reeling; Measuring and Testing; Indicating.	12-27-76
ELECTRONIC COMPONENT SYSTEMS AND DEVICES, GROUP 250—L. FORMAN, Director. Semi-Conductor and Space Discharge Systems and Devices; Electronic Component Circuits; Wave Transmission Lines and Networks; Optics; Radiant Energy; Measuring.	5-3-76
DESIGNS, GROUP 290—C. D. QUARFORTH, Director. Industrial Arts; Household, Personal and Fine Arts.	10-25-75
MECHANICAL EXAMINING GROUPS	
HANDLING AND TRANSPORTING MEDIA, GROUP 310—D. J. STOCKING, Director. Conveyors; Hoists; Elevators; Article Handling Implements; Store Service; Sheet and Web Feeding; Dispensing; Fluid Sprinkling; Fire Extinguishers; Coin Handling; Check Controlled Apparatus; Classifying and Assorting Solids; Boats; Ships; Aeronautics; Motor and Land Vehicles and Appurtenances; Brakes; Railways and Railway Equipment.	6-7-76
MATERIAL SHAPING, ARTICLE MANUFACTURING, TOOLS, GROUP 320—S. S. MATTHEWS, Director. Manufacturing Processes, Assembling, Combined Machines, Special Article Making; Metal Deforming; Sheet Metal and Wire Working; Metal Fusion—Bonding, Metal Founding; Metallurgical Apparatus; Plastics Working Apparatus; Plastic Block and Earthenware Apparatus; Machine Tools for Shaping or Dividing; Work and Tool Holders, Woodworking; Tools; Cutlery; Jacks.	11-12-76
AMUSEMENT, HUSBANDRY, PERSONAL TREATMENT, INFORMATION, GROUP 330—G. M. FORLENZA, Director. Amusement and Exercising Devices; Projectors; Animal and Plant Husbandry; Butchering; Earth Working and Excavating; Fishing, etc.; Tobacco; Artificial Body Members; Dentistry; Jewelry; Surgery; Toiletry; Printing; Typewriters; Stationery; Information Dissemination.	7-6-76
HEAT, POWER, AND FLUID ENGINEERING, GROUP 340—B. R. GAY, Director. Power Plants; Combustion Engines; Fluid Motors; Reaction Motors; Pumps; Rotary Engines and Pumps; Heat Generation and Exchange; Refrigeration; Ventilation; Drying; Temperature and Humidity Regulation; Machine Elements; Couplings; Gearing; Bearings; Clutches; Power Transmission; Fluid Handling and Control; Lubrication.	7-12-76
GENERAL CONSTRUCTIONS, TEXTILES AND MINING, GROUP 350—M. M. NEWMAN, Director. Joints; Fasteners; Rod, Pipe and Electrical Connectors; Miscellaneous Hardware; Locks; Building Structures; Closure Operators; Bridges; Closures; Earth Engineering; Drilling; Mining; Furniture; Supports; Cabinet Structures; Centrifugal Separations; Coating; Textiles; Apparel and Shoes; Sewing Machines.	11-3-76

Expiration of patents: The patents within the range of numbers indicated below expire during June 1977, except those which may have expired earlier due to shortened terms under the provisions of Public Law 690, 79th Congress, approved August 8, 1946 (60 Stat. 940) and Public Law 619, 83rd Congress, approved August 23, 1954 (68 Stat. 764), or which may have had their terms curtailed by disclaimer under the provisions of 35 U.S.C. 253. Other patents, issued after the dates of the range of numbers indicated below, may have expired before the full term of 17 years for the same reasons, or have lapsed under the provisions of 35 U.S.C. 151.

Patents..... Numbers 2,939,145 to 2,943,326, inclusive
Plant Patents..... Numbers 1,950 to 1,956, inclusive

Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates additions made by reissue.

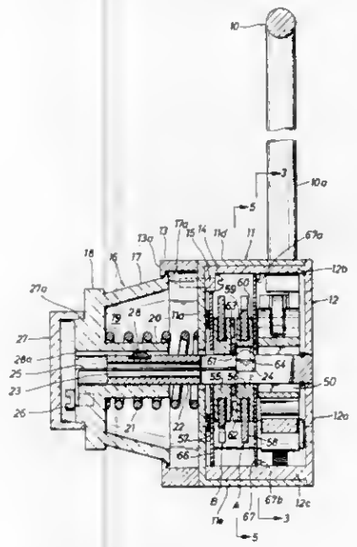
Re. 29,277
COMBINATION LOCK

Richard P. Harrington, and Russell J. Harrington, both of P.O. Box 474, Mountainburg, Ark. 72946

Original No. 3,729,962, dated May 1, 1973, Ser. No. 168,113, Aug. 2, 1971. Application for reissue Apr. 23, 1975, Ser. No. 570,557

Int. Cl.² E05B *37/04*

U.S. Cl. 70—25 **23 Claims**



1. A combination lock comprising

a shackle movable between a locked and an unlocked position;

locking means movable into and out of locking engagement with the shackle;

fence means for moving the locking means out of locking engagement with the shackle;

a plurality of tumbler wheels having peripheral gates to receive the fence means and permit the fence means to move the locking means out of locking engagement with the shackle;

a rotatable dial; and

means rotated by the dial and movable axially between a first position in driving engagement with the tumbler wheels for rotating the tumbler wheels to the desired position for the gates therein to receive the fence means, and a second position out of driving engagement with the tumbler wheels and in driving engagement with the fence means to move the fence means into the gates and move the locking means out of locking engagement with the shackle.

Re. 29,278
WASTE COMPACTING APPARATUS

Rudl Richard Vogel, Kitchener, Canada, assignor to Sargent Industries, Inc., Los Angeles, Calif.

Original No. 3,734,005, dated May 22, 1973, Ser. No. 219,032, Jan. 19, 1972. Application for reissue Apr. 25, 1975, Ser. No. 571,682

Int. Cl.² B30B *15/18, 15/22*

U.S. Cl. 100—52 **25 Claims**

9. Waste compactian apparatus, comprising

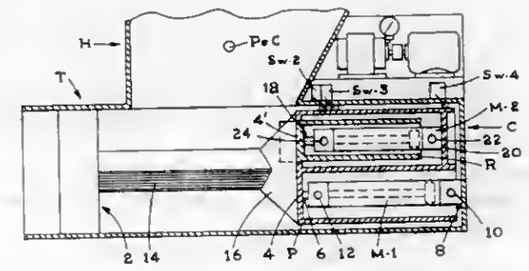
storage means for the waste,

a packer located in the storage means and movable in the storage means in a first direction to advance waste through the storage means and compact such waste during such advance of the waste through the storage means and movable in a direction opposite to the first direction;

a ram forming part of said packer and normally telescoped therein and retractably extendible therefrom in the first direction of movement of said packer, the ram having a leading end which forms a portion of that of the packer as a whole when the ram is telescoped therein;

motor means for reciprocating said packer through successive cycles of operation respectively comprising movement in the first direction for compacting the waste in the storage means and movement in the opposite direction, a standard cycle of operations commencing at a lead-off position with the ram telescoped as aforesaid and with the packer displaced from a position for compacting the waste in the storage means, and

recycling means responsive, upon mechanical stalling of the



packer in the movement of a standard cycle of operations involving compacting the waste in the storage means, to initiate successive cycles of operation for advancing the waste through the storage means, said successive cycles including the termination of said movement of the packer upon the mechanical stalling of the packer; then extension of the ram from the packer in the first direction; then telescopic retraction of the ram into the packer, with the leading end of the ram forming a portion of that of the packer as a whole; upon the completion of the retractible extension of the ram from the packer or upon the exertion of a particular pressure against the ram by the waste in the storage means before the completion of the retractible extension of the ram from the packer; and then movement of the packer, with the ram in the telescoped position in the packer, in the direction for compacting the waste in the storage means.

Re. 29,279
DEVICE FOR LAUNCHING AND DOUSING LIGHT SAILS SUCH AS SPINNAKERS

Jack W. Fretwell, Jr., Millwood, Va. 22646

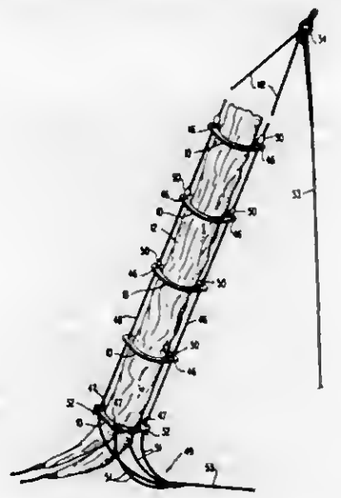
Original No. 3,861,343, dated Jan. 21, 1975, Ser. No. 430,562, Jan. 3, 1974. Application for reissue Nov. 20, 1975, Ser. No. 633,710

Int. Cl.² B63H *9/10*

U.S. Cl. 114—104 **14 Claims**

11. A device for launching a light sail connected to the mast of a sailing vessel comprising at least two rings spaced from each other along the length of said sail and encircling said sail in furled condition, each said ring being of a size which, when positioned on the sail in the furled condition, provides upwardly slideable engagement with the sail, the lowermost ring engaging the lower portions of the sail, the uppermost ring engaging the upper portions of the sail and any intermediate ring or rings engaging intermediate portions of the sail when in the furled condition to retain said sail in the furled condition and means for

raising the lowermost ring into engagement with the next ring above it to raise said next ring and successively to raise all rings



to slide said rings upwardly along said sail to disengage all rings from the sail and thereby launch the sail.

Re. 29,280

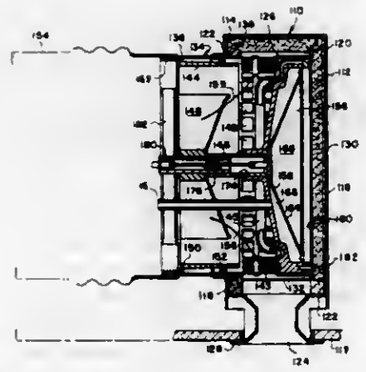
AIR DISTRIBUTION REGULATOR APPARATUS

John C. McNabney, La Crosse, Wis., assignor to The Trane Company, La Crosse, Wis.

Original No. 3,974,859, dated Aug. 17, 1976, Ser. No. 498,826, Aug. 19, 1974. Application for reissue Oct. 15, 1976, Ser. No. 732,938

Int. Cl.² F16K *31/126*

U.S. Cl. 137—625.37 **13 Claims**



1. Air distribution apparatus comprising: an air plenum chamber having front and back sheet metal walls spaced from each other; an air outlet opening from said chamber; a generally circular aperture in said sheet metal front wall, *defining an air inlet opening to said chamber*, that portion of said chamber opposite from said aperture being closed by said back wall; a generally cylindrical sleeve extending axially inward of said inlet opening and having an inner portion disposed inwardly of said inlet opening and an outer portion; retainer means for retaining said sleeve in said inlet opening; an air conveying duct separate from said front wall fastened to the radial outer surface of said outer portion of said sleeve to supply air thereto; means defining at least one first aperture at said inner portion of said sleeve extending radially outwardly communicating the interior of said sleeve with the interior of said plenum chamber; closure means at the end of said inner portion for blocking axial air flow; a generally cylindrically shaped valve disposed radially inwardly of said sleeve; mounting means for mounting said valve for axial movement within said sleeve between a first axial position [at least partially outside of said inlet opening and] substantially noncoextensive with said first aperture thereby opening said first aperture and a second axial position substantially coextensive with said first aperture thereby substantially closing said first aperture; and means for freely communicating the axial ends of said valve through said valve to thereby substantially balance the axial fluid forces exerted on said valve.

Re. 29,281

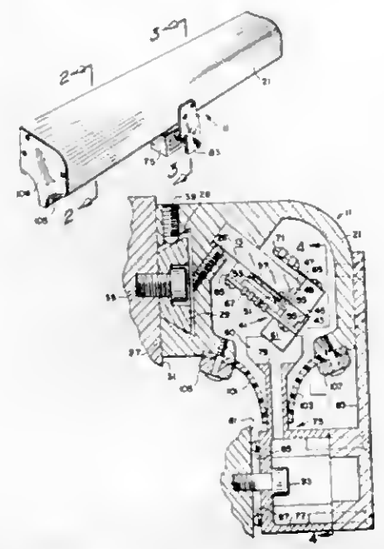
MEASURING APPARATUS USING THE MOIRE FRINGE CONCEPT OF MEASUREMENT

Richard H. Burns, Webster, and Helmut Welker, Jamestown, both of N.Y., assignors to Bausch & Lomb Incorporated, Rochester, N.Y.

Original No. 3,833,303, dated Sept. 3, 1974, Ser. No. 295,777, Oct. 6, 1972. Application for reissue May 19, 1975, Ser. No. 578,594

Int. Cl.² G01B *11/04*

U.S. Cl. 356—169 **11 Claims**



1. Apparatus for measuring displacement between first and second relatively movable members, said apparatus comprising:

a. a scale securable to said first member, said scale including first and second adjacent surfaces, said first scale surface being angled with respect to said second scale surface, one of said first and second scale surfaces having a given line frequency;

b. transducer means including a carriage and an index grating, said carriage including first and second adjacent scale engaging surfaces, said first scale engaging surface being angled with respect to said second scale engaging surface at substantially the same angle that said first scale surface is angled with respect to said second scale surface, said index grating being held by said carriage parallel to and spaced from [said] one of said first and second scale engaging surfaces;

c. support means securable to said second member; and

d. means for continuously maintaining said first scale engaging surface in engagement with said first scale surface and said second scale engaging surface in engagement with said second scale surface, said means for continuously maintaining being secured to one of said transducer means and said support means, said means for continuously maintaining being connected to the other of said transducer means and said support means by means which permit at least limited rotational movement in every direction, said means for continuously maintaining being rigid in a direction parallel to the direction of relative movement between said first and second members and flexible in directions transverse to said direction of movement, whereby in operation when said first member moves relative to said second member the relative spacing and alignment between said index grating and said one of said first and second scale surfaces remains substantially constant.

Re. 29,282

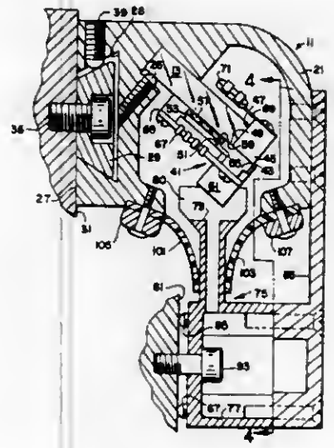
MEASURING APPARATUS USING THE MOIRE FRINGE CONCEPT OF MEASUREMENT

Richard H. Burns, Webster; Donald R. Hosack, and Helmut Welker, both of Jamestown, all of N.Y., assignors to Bausch & Lomb Incorporated, Rochester, N.Y.

Original No. 3,833,303, dated Sept. 3, 1974, Ser. No. 295,777, Oct. 6, 1972. Application for reissue May 19, 1975, Ser. No. 578,595

Int. Cl.² G01B *11/04*

U.S. Cl. 356—169 **1 Claim**



14. *Apparatus for measuring displacement between first and second relatively movable members, said apparatus comprising:*

a. a dovetail mounting member securable to said first member;

b. a spur, said spar being provided with a dovetail mounting means which cooperates with said dovetail mounting member to secure said spar to said first member;

c. a scale secured to said spar, said scale including first and second adjacent surfaces, said first scale surface being angled with respect to said second scale surface, one of said first and second scale surfaces having a given line frequency;

d. transducer means including a carriage and an index grating, said carriage including first and second adjacent scale engaging surfaces, said first scale engaging surface being angled with respect to said second scale engaging surface at substantially the same angle that said first scale surface is angled with respect to said second scale surface, said index grating being held by said carriage parallel to and spaced from one of said first and second scale engaging surfaces;

e. support means securable to said second member; and

f. means for continuously maintaining said first scale engaging surface in engagement with said first scale surface and said second scale engaging surface in engagement with said second scale surface, said means for continuously maintaining being secured to one of said transducer means and said support means, said means for continuously maintaining being connected to the other of said transducer means and said support means by means which permit at least limited rotational movement in every direction, said means for continuously maintaining being rigid in a direction parallel to the direction of relative movement between said first and second members and flexible in directions transverse to said direction of movement, whereby in operation when said first member moves relative to said second member the relative spacing and alignment between said index grating and said one of said first and second scale surfaces remains substantially constant.

Re. 29,283

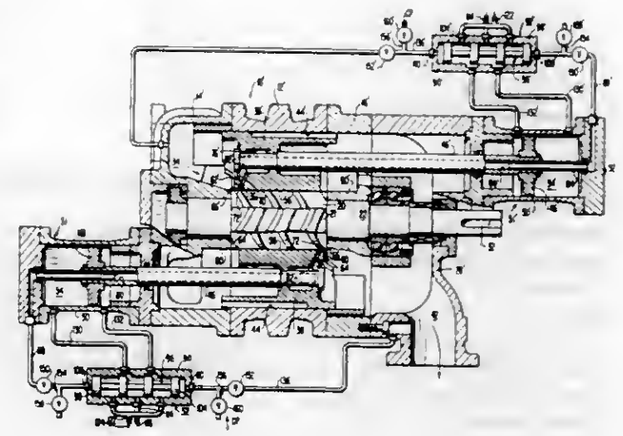
UNDERCOMPRESSION AND OVERCOMPRESSION FREE HELICAL SCREW ROTARY COMPRESSOR

David N. Shaw, Unionville, Conn., assignor to Dunham-Bush, Inc., West Hartford, Conn.

Original No. 3,936,239, dated Feb. 3, 1976, Ser. No. 492,084, July 26, 1974. Application for reissue June 2, 1976, Ser. No. 692,077

Int. Cl.² F04B *49/02*

U.S. Cl. 417—282 **16 Claims**



1. In a positive displacement rotary screw compressor of the type wherein a casing is provided with a barrel portion defined by intersecting bores with coplanar axes located between axially spaced end walls and having low pressure and high pressure ports in communication with said bores at opposite ends of said barrel portion, and helical screw rotors having grooves and lands mounted for rotation within respective bores with the lands and grooves of respective rotors intermeshed, an axially extending recess is provided within the barrel portion of the casing in open communication with the bores, and a slide valve member is axially slidable in the recess with the inner face of the slide valve member being complementary to the envelope of that portion of the bores of the casing structure confronted by the opening of the recess communicating with the bore portion of the casing structure, with the valve member in sealing relation with confronting rotors, the discharge port being located within the barrel portion of the casing structure with the valve member being movable between extreme positions, in one of which, the discharge port is fully open, and the other in which, the discharge port is closed, and wherein the valve member is of sufficient length to cover the entire remaining length of the confronting portion of the rotor structure throughout the range of movement of the valve member between its extreme positions, the improvement comprising:

means for sensing the pressure of the working fluid within a closed thread closely adjacent to the end of the slide valve member closing off the discharge port to the closed thread,

means for sensing the compressor discharge pressure of the working fluid at the discharge port, [and

means for controlling shifting of said slide valve member axially to equalize these pressures]

means for comparing said two pressures, and

means responsive to said pressure comparing means for shifting said slide valve member in a direction tending to equalize said pressures, to prevent undercompression or overcompression of the compressor working fluid within the closed thread, prior to discharge.

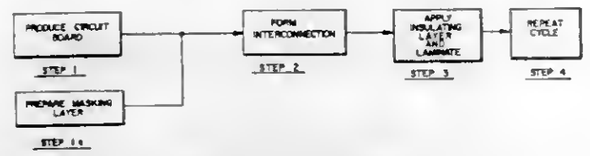
Re. 29,284
PROCESS FOR FORMING INTERCONNECTIONS IN A MULTILAYER CIRCUIT BOARD

Joseph M. Shaheen, La Habra, and Leo J. Quintana, Anaheim, both of Calif., assignors to Rockwell International Corporation, El Segundo, Calif.

Original No. 3,464,855, dated Sept. 2, 1969, Ser. No. 577,438, Sept. 6, 1966. Application for reissue Nov. 6, 1970, Ser. No. 87,512

Int. Cl.² C25D *5/02*

U.S. Cl. 204—15 **3 Claims**



3. A method of fabricating an individual layer of a multilayer printed circuit board, comprising the steps of:

farming a printed circuit on an insulator substrate;

coating said printed circuit with a thin conductive layer of material;

conforming an apertured masking material to said conductive layer on said printed circuit on said insulator substrate;

said masking material including apertures therein in the desired pattern of at least one interlayer connector;

electroforming said connector using said conductive layer as an electrical path in the electroforming operation;

removing the masking material and the resultant exposed material of the conductive layer; and

insulating the printed circuit and the interlayer connector, leaving an exposed surface at the end of said interlayer connector.

Re. 29,285
METHOD FOR CONCOMITANT PARTICULATE DIAMOND DEPOSITION IN ELECTROLESS PLATING, AND THE PRODUCT THEREOF

Theodore Peter Christini, Dushore, Pa.; Albert Lawrence Eustice, Lewiston, N.Y., and Arthur Hughes Graham, Wilmington, Del., assignors to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Original No. 3,936,577, dated Feb. 3, 1976, Ser. No. 341,529, Mar. 15, 1973. Continuation-in-part of Ser. No. 208,233, Dec. 15, 1971, abandoned. Application for reissue June 7, 1976, Ser. No. 694,047

Int. Cl.² B32B *15/00*; **B05D** *3/10*

U.S. Cl. 428—426 **6 Claims**

1. A coated article formed by electroless plating comprising a co-deposited uniform dispersion of diamond particles secured by substantial nucleation within a metallic matrix comprising one of the group consisting of: (1) an alloy including a metal of the sub-group made up of nickel, cobalt and mixtures thereof with one of the elements phosphorus, boron and mixtures thereof and (2) elemental copper, deposited on a supporting substrate consisting of polymer, metal, ceramic or glass.

Re. 29,286
POWER AMPLIFIER WITH A BOOTSTRAPPED DRIVER STAGE

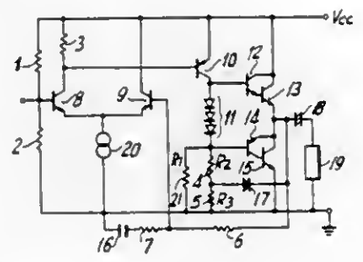
Hirokazu Fukaya, and Naotoshi Higashiyama, both of Tokyo, Japan, assignors to Nippon Electric Company, Limited, Tokyo, Japan

Original No. 3,904,974, dated Sept. 9, 1975, Ser. No. 493,652, July 30, 1974. Application for reissue Oct. 4, 1976, Ser. No. 729,285

Claims priority, application Japan, Aug. 2, 1973, 48-87349

Int. Cl.² H03F *1/38*

U.S. Cl. 330—26 **3 Claims**



1. A power amplifier comprising:

a driver circuit comprising an input terminal, an output terminal, signal amplifying means and a load element formed by two separate resistors, a first end of the first resistor being connected to said signal amplifying means and a second end of said first resistor being connected to said second resistor;

an output circuit comprising at least one input terminal connected directly to the output terminal of said driver circuit, output transistors connected in a single-ended push-pull configuration, and an output terminal;

feedback means for supplying a feedback signal from the output terminal of said output circuit to said second end of said first resistor; and

a third resistor connected directly to and in parallel with said load element.

4,065
KALANCHOE PLANT

Lawrence T. Irwin, P.O. Box 657, Canyon, Tex. 79015

Filed June 7, 1976, Ser. No. 693,880

Int. Cl.² A01H *5/00*

U.S. Cl. Plt.—68 **1 Claim**

1. A new and distinct variety of Kalanchoe Plant, substantially as herein shown and described, characterized particularly as to novelty by the unique combination of tall, upright, vigorous growth; earliness of flower; profusion of flowers carried on a sturdy stem well above the foliage; medium to large size flexible foliage of fern green color; the unique mandarin red color of its blooms together with the adaptability of photoperiod manipulation for year round flowering.

4,066
KALANCHOE PLANT

Lawrence T. Irwin, P.O. Box 657, Canyon, Tex. 79015

Filed June 7, 1976, Ser. No. 693,881

Int. Cl.² A01H *5/00*

U.S. Cl. Plt.—68 **1 Claim**

1. A new and distinct variety of Kalanchoe plant, substantially as herein shown and described, characterized particularly as to novelty by the unique combination of its orange red color with a distinctive yellow eye; medium large sized flexible foliage of fern green color; its tall habit of from 16 inches to 20 inches in height; the profusion of flowers carried on sturdy stems 6 inches above the foliage; and its adaptability to year round flowering by photoperiod manipulation.

4,067
KALANCHOE PLANT

Lawrence T. Irwin, P.O. Box 657, Canyon, Tex. 79015

Filed June 7, 1976, Ser. No. 693,882

Int. Cl.² A01H *5/00*

U.S. Cl. Plt.—68 **1 Claim**

1. A new and distinct variety of Kalanchoe plant, substantially as herein shown and described, characterized particularly as to novelty by the unique combination of tall, vigorous growth habit of from 16 inches to 20 inches in height; its medium large size flexible foliage of fern green color; the profusion of unique crimson color flowers carried on sturdy stems 6 inches above the foliage; the absence of an eye in the flowers; its vigorous free breaking habit; and its adaptability to year round flowering by photoperiod manipulation producing a large pot plant from a single cutting.

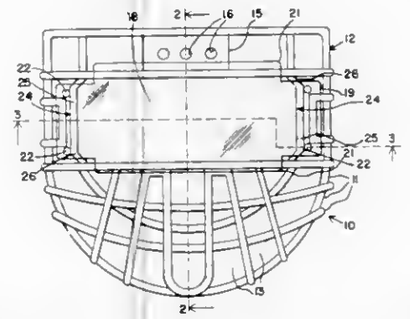
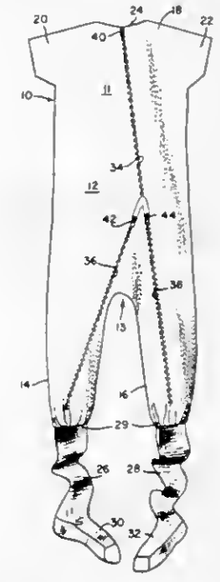
HOCKEY MASK
Theodore W. Wood, 17 Ash St., Sherborn, Mass. 01770
Filed June 24, 1976, Ser. No. 699,268
Int. Cl.² A41D *13/00*
U.S. Cl. 2—9 **11 Claims**



1. A hockey mask comprising:
a grille work for substantially covering the face of a hockey player, said grille work defining a plurality of apertures sufficiently small to prevent passage of a hockey stick and a larger sized, elongated, curved opening positioned to extend adjacently to the player's eyes and to substantially encompass the player's field of vision;
fastening means for securing said grille work to a hockey helmet;
holding means located at each end of said elongated opening;
a curved, flexible, transparent shield with inner surface edge portions bearing against said grille work so as to cover said opening and having ends retained by said holding means, said shield formed from a high impact resistant material and being retained by said holding means in a state of flex corresponding to its normal curvature; and
securing means on said ends of said shield for restraining movement thereof out of said holding means.

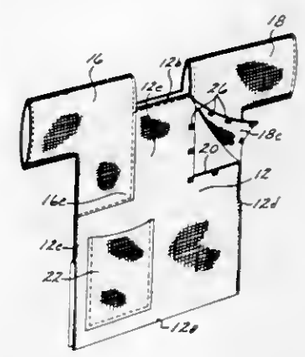
4,031,565
UNITARY BURIAL UNDERGARMENT
John H. Coates, Rte. 3, Box 572, Saluda, S.C. 29138
Filed Feb. 23, 1976, Ser. No. 660,275
Int. Cl.² A41B *9/00*
U.S. Cl. 2—78 R **5 Claims**

1. A unitary burial undergarment comprising upper and lower torso sections, leg sections, and feet sections joined together in an integral garment assembly adapted to cover the full body of the deceased at least below the shoulders, at least said feet sections being knitted, said torso section having a neck opening therein, the back side of said torso section having an upper slit opening therein extending from said neck opening to the waist level of said torso section, the back side of said lower torso section having two lower slit openings diverging from a common termination communicating with the lower end of said upper slit opening in generally inverted Y-shaped fashion across the respective buttocks into at least the upper ends of said leg sections to points at least adjacent



to knitted sections; and closure means to close the respective slit openings.

4,031,566
NURSING GARMENT
Marilyn M. Johnson, 790 Griffith Way, Laguna Beach, Calif. 92651
Filed July 21, 1976, Ser. No. 707,450
Int. Cl.² A41D *1/20*
U.S. Cl. 2—104 **5 Claims**



1. A nursing garment for enabling a mother to nurse a baby comprising in combination,
generally rectangular front and rear garment panels of width approximating the width of the mother's torso, said front panel being formed with a generally right angle cutout in each of two corners providing breast-exposing openings in said front panel,
and a pair of sleeve/shoulder members each of which is connected to and between said front and rear panels and has a generally right angle portion which overlays the corresponding breast-exposing opening in said front panel.

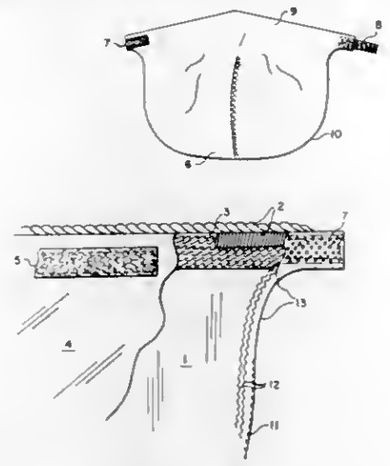
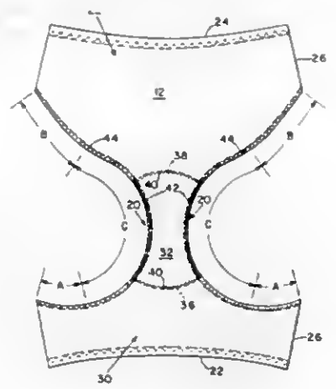
HEADDRESS
Jane S. Planck, 939 26th St. NW., Washington, D.C. 20037
Filed Feb. 26, 1976, Ser. No. 661,680
Int. Cl.² A42B 1/04
U.S. Cl. 2—204 3 Claims



1. A headdress comprising:
A. a head covering fabric, configured as a semi-circle and having:
   i. a leading edge diameter as a headband with fastening portions extending laterally on each side of said semi-circle, said headband at its median portion being positioned over the forehead and adjacent the ears of the wearer with said fastening portions over lapping and being secured to each other behind the head at the nape of the neck; and
   ii. a semi-circular trailing edge defining an arcuate body portion contiguous with said headband and adapted for covering the head and neck of the wearer in which a wedge-like segment is removed from the center of said semi-circle from its trailing edge inwardly and the opposed sides exposed by said wedge are joined by stitching as a dart extending from the nape of the neck towards the dome of the wearer's head;
B. complementary fastening means secured to said fastening portions, so as to secure said portions to each other at a point of overlap adjacent the nape of the wearer's neck; and
C. at least one frictional engagement pad supported on the underside of said headband, so as to engage a side of the wearer's head.

4,031,568
LEGLESS PANTY
Bernice Huff, Hamilton, Ohio, assignor to The Procter & Gamble Company, Cincinnati, Ohio
Filed May 30, 1975, Ser. No. 582,491
Int. Cl.² A41B 9/04
U.S. Cl. 2—406 8 Claims

1. In a legless women's panty having a hip encircling portion for extending completely around a wearer's torso and provided with leg openings with the edges thereof being elasticized and curvilinearly extending along the wearer's groin and generally outwardly over the wearer's hips and completely around the outside of the wearer's thighs, the improvement comprising means for differentially tailoring the elasticity along the leg opening edges, pulling the portion of the leg opening edges adjacent the groin outwardly against the inside of the wearer's legs and pulling the portion of the leg opening edges extending across the outside of the wearer's legs inwardly towards the wearer's groin, said means gathering said leg opening edges generally only along the groin to thereby provide a smooth outside appearance, reduce bunching under the buttocks and riding up thereon together with self adjustable easing of the leg openings outwardly of the groin to accommodate thighs of differing sizes, wherein said means comprises elastic band means extending substantially entirely along each of the leg opening edges secured thereto in a manner to gather said leg opening edges at least along the portions thereof lying along the wearer's groin while leaving

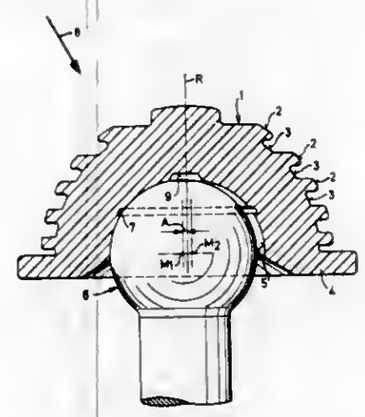


the edge portions which in use overlies the hips and at least the outside of the wearer's legs smooth and ungathered, and elastically providing, during use, a directed pull of the leg opening edges extending about the wearer's legs towards the groin from both the front and the rear directions.

4,031,569
NASAL SEPTUM PLUG
H. John Jacob, 8344 Hendrie, Huntington Woods, Mich. 48070
Filed Mar. 15, 1976, Ser. No. 666,577
Int. Cl.² A61F 1/00, 1/24
U.S. Cl. 3—1 5 Claims

1. In a device for plugging a hole formed through a nasal septum, the improvement comprising:
a. a central portion having opposed ends, the central portion being sized and shaped for disposition within the hole,
b. a disc of greater diameter than the central portion formed on each end of the central portion, and
wherein the device is a unitary, solid member which is formed from a chemically inert, non-toxic, non-irritating flexible material.

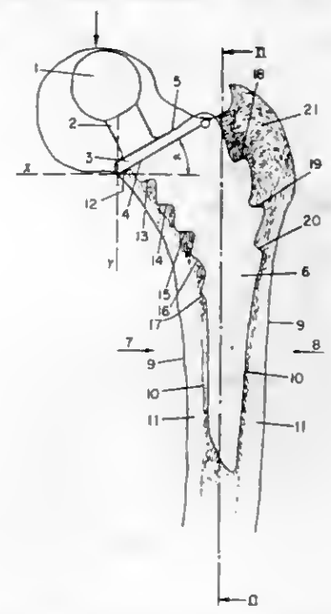
4,031,570
PROSTHETIC ACETABULUM
Otto Frey, Winterthur, Switzerland, assignor to Sulzer Brothers Limited, Winterthur, Switzerland
Filed May 27, 1976, Ser. No. 690,717
Claims priority, application Switzerland, June 18, 1975, 7898/75
Int. Cl.² A61F 1/24
U.S. Cl. 3—1.912 3 Claims



1. A hip joint endoprosthesis comprising
a joint head with a spherical surface; and
a prosthetic acetabulum having a concave articular surface receiving said joint head and at least one groove within said surface extending peripherally of said surface and said joint head, said articular surface being a surface of rotation having as a generatrix a quadrant arc with a radius corresponding to the radius of said joint head spherical surface but a center of curvature spaced a predetermined distance from the rotational axis around which said quadrant arc is rotated for generating said surface of rotation of said acetabulum.

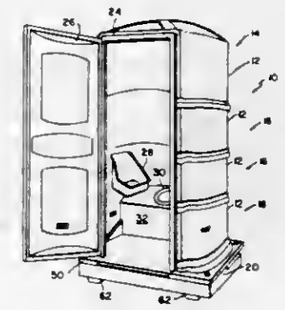
4,031,571
HIP ENDOPROSTHESIS WITH STEPPED LOAD-TRANSFERRING SURFACES
Günther Helmke, Mannheim, and Peter Griss, Plankstadt, both of Germany, assignors to Friedrichsfeld GmbH Steinzeug-und Kunststoffwerke, Postfach, Germany
Filed Dec. 24, 1975, Ser. No. 644,332
Claims priority, application Germany, Dec. 24, 1974, 2461339; Apr. 22, 1975, 2517702
Int. Cl.² A61F 1/24
U.S. Cl. 3—1.913 15 Claims

1. In a thigh portion of a cement-free implant of a hip joint total endoprosthesis, comprising a femur shaft, a head mounted on a neck attached to the upper end of the shaft, and a load supporting contact surface surrounding said neck, said implant having a biologically benign surface, said shaft being provided on its inner and outer sides with a series of outwardly projecting, transverse stepped, load-transferring flat surfaces, each of said surfaces being in a plane perpendicular to the longitudinal direction of orientation of the spicules of the



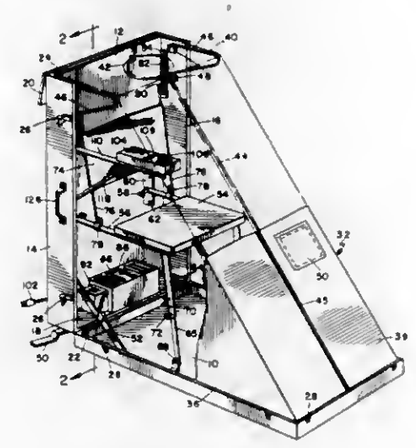
spongy tissue in the femur adapted to be adjacent to each of said surfaces.

4,031,572
CHEMICAL TOILET CABANA SHELL SECTION
George W. Harding, Warren, Mich., assignor to Poly San Corporation, Sarasota, Fla.
Division of Ser. No. 493,256, July 31, 1974, which is a division of Ser. No. 378,316, July 11, 1973, Pat. No. 3,835,480. This application Dec. 8, 1975, Ser. No. 638,815
Int. Cl.² A47K 11/02; A61L 11/00; E04H 14/00
U.S. Cl. 4—111 5 Claims



1. A shell adapted to be used as a top, intermediate, or bottom member of a portable enclosure, and molded of a rigid plastic-like, thermally stable material, comprising:
a dome-like roof;
a side wall extending downwardly from said roof and terminating in a bell-like enlarged lower end; and
a base flange extending outwardly from the enlarged lower end of said side wall;
whereby said dome-like roof may be removed to form a base member of said enclosure, said base flange may be removed to form a top member of said enclosure, and both said dome-like roof and said base flange may be removed to form an intermediate member of said enclosure.

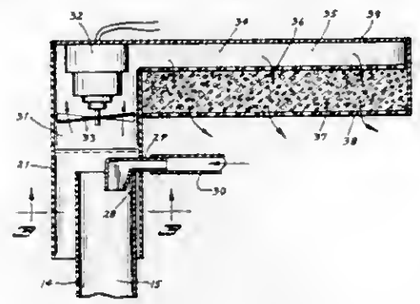
4,031,573
PORTABLE SAUNA
Paul Ira Romanoff, 4602 Collwood Lane, San Diego, Calif. 92115
Filed Sept. 17, 1976, Ser. No. 724,750
Int. Cl.² A61H 33/06
U.S. Cl. 4—164 **10 Claims**



1. A collapsible portable hot air and steam bath apparatus, said apparatus comprising:
a substantially rigid box-like body portion having a deep section and a shallow section hinged together along the bottom, said deep section extending vertically for defining a rigid back wall and a portion of two side walls, said shallow section folding downward for defining a floor;
a flexible cover defined by a pair of generally triangular shaped side panels connected along the base thereof to said floor, a sloping rectangular front panel connected at the lower edge thereof to said floor and extending upward to a horizontally extending rectangular top panel connected to the upper end of the back wall and said side walls so that said cover extends from the edges of said section over the opening thereof for defining an enclosable chamber;
a pair of support arms pivotally mounted on the inside of said deep section and extendable outward for supporting said top portion of said flexible cover outward in a horizontal plane;
a neck receiving opening formed in said top portion of said cover;
an elongated opening formed in said front panel extending from said neck opening downward to said floor;
a foldable seat pivotally connected to said back wall and to said floor and opening to a supporting position upon opening said floor panel to the horizontal position;
heating means mounted in said chamber; and
control means for controlling said heating means pivotally mounted to said deep section for pivotally extending outwardly to a portion above and to one side of said seat for ease of access by an occupant of said chamber.

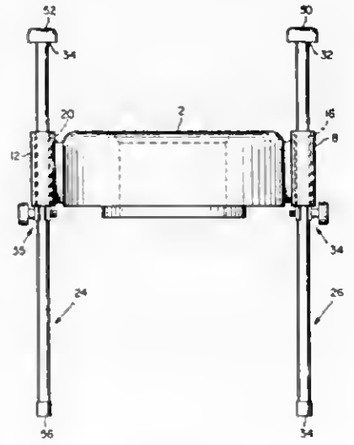
4,031,574
TIMED VENTILATOR FOR TOILETS
Frank D. Werner, Box SR9, Jackson, Wyo. 83001
Filed June 17, 1976, Ser. No. 697,139
Int. Cl.² A47K 3/22; E03D 9/04, 13/00
U.S. Cl. 4—213 **8 Claims**

1. A ventilator for toilets having a water supply tank and an overlap pipe in the tank open to the toilet bowl comprising a housing supported on said overflow pipe on the interior of said tank, said housing including wall means defining a passageway open to said overflow pipe, a filter compartment open to said passageway and having an air discharge side opening to the interior of said tank, fan means in said passageway for causing air flow from the overflow pipe through said passageway and said filter compartment, a power supply and control for said fan mounted on said tank and including a control member on the exterior of said tank for manual operation, said control comprising a manually depressable button completing a circuit to said fan and pneumatic delay means to resist return of said circuit to open position said pneumatic delay means



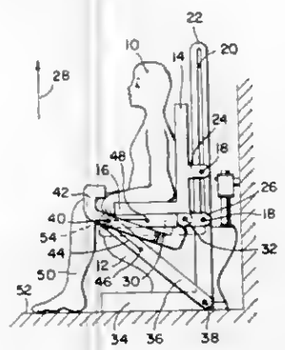
comprising a chamber coupled to said button whereby depressing said button changes the size of said chamber, means tending to return the chamber to its original size, and means to permit air to bleed relative to said chamber at a controlled rate.

4,031,575
ADJUSTABLY MOUNTED SUPERIMPOSABLE TOILET SEAT
Kurt Landsberger, 103 Harrison St., Verona, N.J. 07044
Filed May 24, 1976, Ser. No. 689,130
Int. Cl.² A47K 13/06, 13/28
U.S. Cl. 4—239 **7 Claims**



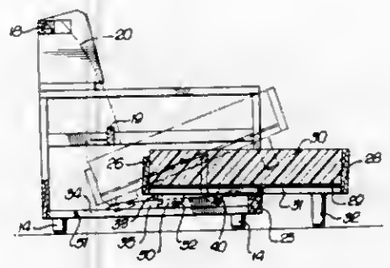
1. An adjustably mounted toilet seat of the type superimposable on a conventional toilet seat, comprising:
a superimposable toilet seat;
a pair of frame members, each of which extends along an opposite side of the superimposable toilet seat;
each of the frame members carrying front and rear corner members;
a pair of vertically disposed rails, each of which has a pair of parallel legs, one of the legs of each of the rails being slidably supported by one of the front and rear corner members of a corresponding frame member and the other leg being slidably supported by the other of the front and rear corner members, the superimposable toilet seat being thereupon longitudinally adjustable along the rails; and
means associated with the rail legs for retaining the superimposable toilet seat in a predetermined longitudinally adjusted position relative to the height of the conventional toilet seat and including a pair of bars, each of which extends between the legs of a corresponding rail for supporting the superimposable seat, a pair of clamps associated with each of the bars, each of the clamps cooperating with a bar end for clamping the end to a corresponding rail leg, means arranged with the clamps and bar ends and loosened for longitudinally displacing the bars along the legs to the adjusted position relative to the height of the conventional toilet seat, and said means tightened for retaining the bars and superimposable toilet seat supported thereby in the adjusted position.

4,031,576
INVALID TOILET AID
Helen Charlotte Epstein, 1193 S. 19th East, Salt Lake City, Utah 84108
Filed May 24, 1976, Ser. No. 689,550
Int. Cl.² A47K 13/10
U.S. Cl. 4—251 **8 Claims**



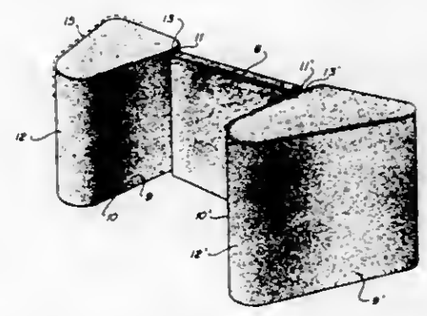
1. An invalid toilet aid comprising a commode seat, a frame, a backrest, at least one arm rest, said at least one arm rest fixedly secured to said backrest, hingeing means for pivotably securing a rear portion of said commode seat to said backrest, spring bias means for urging said at least one arm rest into an uppermost position, said spring bias means for resisting said at least one arm rest being disposed in a lowermost position, said commode seat being disposed in a near vertical position when said at least one arm rest is disposed in said uppermost position, said commode seat being disposed in a horizontal position when said at least one arm rest is disposed in said lowermost position, said frame providing sliding vertical support for said backrest.

4,031,577
CONVERTIBLE SOFA BED
Vincent C. Kanowsky, Newport Beach, and Lloyd A. Blanc, Downey, both of Calif., assignors to Allied Upholstery Mfg. Inc., Lynwood, Calif.
Filed Jan. 5, 1976, Ser. No. 646,625
Int. Cl.² A47C 17/14
U.S. Cl. 5—17 **8 Claims**



1. In a convertible sofa bed, the combination of:
a frame having a base and a back, said base having a front support edge and said back having an overhanging edge;
a seat movable between
a retracted sofa position resting on said frame, with a sloping upper surface positioned partially under said overhanging edge and having front support means adjacent the front edge of said seat and positioned behind said base front support edge thereby concealing said seat front support means behind said base front support edge, and
an extended bed position with said front support means in front of said base front support edge for resting on the floor supporting the seat and having rear support means adjacent the rear edge of said seat,
said base including guide means for said seat rear support means for positioning said seat horizontally; and
a link at each end of said seat pivotally connected to said seat and to said frame.

4,031,578
CONTOURED TRAVEL PILLOW
Doris Sweeney, 512 A Taylor Ave., Warrington, Pa. 18976, and Mary Ellen Lee, 7951 Anita Drive, Philadelphia, Pa. 19111
Filed May 20, 1976, Ser. No. 688,550
Int. Cl.² A47G 9/00; A61G 7/06
U.S. Cl. 5—337 **8 Claims**

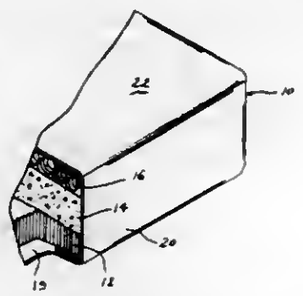


1. A travel pillow comprised of three discrete and resilient sections:
1. a central section which serves as a spacer and supports the back of the user's head and
2. a matching pair of lateral head sections located on opposite sides of said spacer (1) to form a generally H-shaped configuration therewith;
and a snug-fitting cover which accommodates all three sections and maintains them in their generally H-shaped configuration;
both of the head sections (2) being of greater thickness than spacer (1) and possessing a tapered appearance which begins with a flat and generally wide back-wall and a narrower, rounded front portion;
said back-wall being disposed at an angle which slopes toward the central section so that the backward pressure of the user's head on said spacer (1) will cause the said back-walls to form an essentially parallel plane and draw the inner side-walls toward one another, for contact with the user's head.

4,031,579
AIRCRAFT SEAT CUSHION
Thomas A. Larned, Costa Mesa, Calif., assignor to The United States of America as represented by the Secretary of the Air Force, Washington, D.C.
Filed Dec. 19, 1975, Ser. No. 642,525
Int. Cl.² A47C 27/00
U.S. Cl. 5—355 **2 Claims**

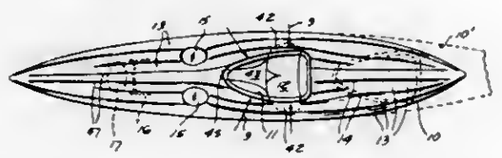
1. A cushion adapted for use in an aircraft seat used by crewmen, comprising: a close cell plastic layer of shock absorbent material; an elastic flow cushioning layer positioned over the shock absorbent layer; a flame resistant cover surrounding

the shock absorbent layer and the cushioning layer; a ventilation layer positioned between the cushioning layer and the



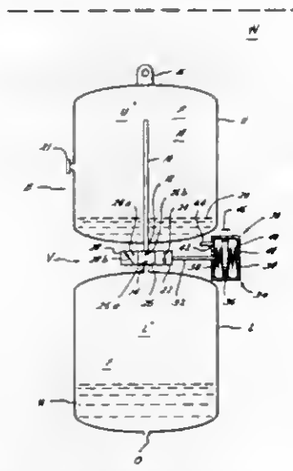
cover; the side of said cover adjacent the ventilation material having high porosity and being mositure absorbent.

4,031,580
INFLATABLE BOAT
Hennlag Neumann, Germering, and Fritz Federer, Turkenfeld, both of Germany, assignors to Metzeler Kautschuk AG, Munich, Germany
Filed Apr. 8, 1976, Ser. No. 675,056
Int. Cl.² B63B *7/08*
U.S. Cl. 9—2 A **34 Claims**



1. In an inflatable boat, a combination comprising an elongated body of elastically yieldable material having a deck portion and a hull portion which together bound an interior of the boat; at least one access opening in said deck portion subdividing the latter into a front section and a rear section as considered in the direction of travel of the boat and communicating the exterior of the boat with said interior; means for giving said body a desired configuration, including a plurality of inflatable tubular elements extending substantially longitudinally of said body, the tubular elements associated with said front section of said deck portion diverging in rearward direction and forming on said front section a plurality of diverging bulges alternating with grooves which are tranversely spaced by a distance which is greatest at said access opening; support means surrounding said access opening, including an elastically yieldable collar-shaped support member connected to said deck portion around said access opening and having an inner and an outer circumferential surface; at least one rigid seat at least partially accommodated in said interior and having a contact portion received in the respective access opening and a marginal portion supported on said support member; sealing means between said inner circumferential surface of said support member and said contact portion of said seat and operative for preventing seepage of water into said interior between the former and the latter; and connecting means for dismountably connecting said seat to said support member, including a ring-shaped element surrounding said support member at said outer circumferential surface thereof, and means for urging said ring-shaped element against said outer circumferential surface to thereby press said sealing means into sealing contact with said contact portion of said seat.

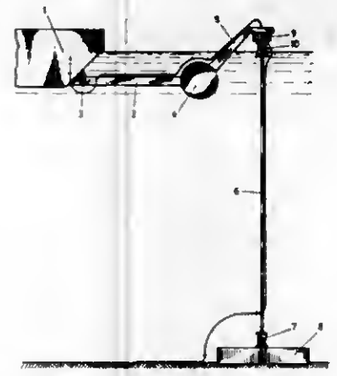
4,031,581
SUB-SEA ADJUSTABLE BUOY
Benton F. Baugh, Houston, TX, assignor to Vetco Offshore Industries, Inc.
Filed Mar. 29, 1976, Ser. No. 671,276
Int. Cl.² B63B *21/52*
U.S. Cl. 9—8 R **3 Claims**



1. A buoy having a controllable buoyancy in water, comprising:
a first chamber member;
a second, buoyant chamber member mounted with said first chamber member;
said first chamber member having a first chamber therein for containing variable amounts of a fluid which is buoyant in water and for containing variable amounts of water;
said first chamber member having an opening formed in its bottom to permit water to pass into and out of said first chamber and fill the portion of said first chamber which is not occupied by buoyant fluid;
control means operably connected to said first chamber for regulating the amount of buoyant fluid in said first chamber so that the buoyancy of the buoy in water is controlled;
said second chamber member has a second chamber therein for containing buoyant fluid under pressure;
said control means is operably connected to said second chamber and said first chamber; and
said control means includes control valve means for controllable movement between a charging position in which buoyant fluid is conveyed from said second chamber to said first chamber, a blocking position in which buoyant fluid is prevented from escaping from said first and second chambers, and a venting position in which buoyant fluid is vented from said first chamber.

4,031,582
FLOATING STRUCTURE
Willem J. Van Heijst, Monte Carlo, Monaco, assignor to N.V. Industrieele Handelscombinatie Holland, Rotterdam, Netherlands
Filed Mar. 9, 1976, Ser. No. 665,333
Claims priority, application Netherlands, Mar. 10, 1975, 74.02829
Int. Cl.² B63B *21/52*
U.S. Cl. 9—8 P **4 Claims**

1. Floating structure comprising a large floating body intersecting the water-level, a small submerged float connected with said body by means of a rigid arm, said arm having a rigid connection with the small float and a pivotal connection about only a horizontal pivot axis with the floating body, said small float further being connected with an anchor by means of a torsion-stiff tube or rod having a hinge with perpendicularly intercrossing or intersecting axes between the lower end of the tube or rod and the anchor as well as between the upper end of the tube or rod and the said small float, said last mentioned

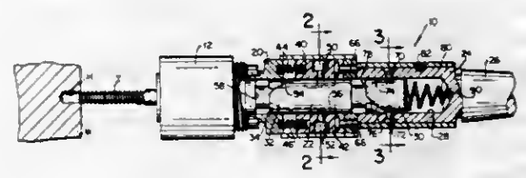


connection further having a vertical axis of rotation between the small float and the upper hinge.

4,031,583
INFLATABLE EMERGENCY EQUIPMENT DEPLOYMENT DEVICE
Ronald Wayne Phillips, II, Akron, Ohio, assignor to The B. F. Goodrich Company, Akron, Ohio
Filed Dec. 22, 1975, Ser. No. 643,344
Int. Cl.² B63C *9/22*
U.S. Cl. 9—14 **4 Claims**

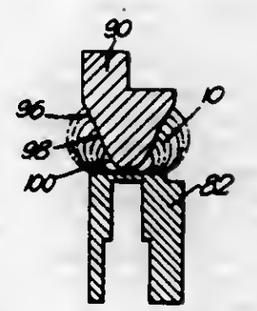
1. An inflatable emergency escape equipment stowage and deployment device comprising:
a. a container having a floor and a back wall;
b. a pivotable panel substantially closing said container, said panel comprising:
1. a front section;
2. a top section;
3. a front hinge pivotally connecting said front section to said floor; and
4. a top hinge pivotally connecting said top section to said front section; and
c. means operable to deploy an emergency evacuation inflatable from said container, said means including an inflation system secured to a deck, an edge of said inflation system being substantially flush with an edge of said deck and wherein said container is removably secured on top, over and flush with said inflation system.

4,031,584
THREADING ATTACHMENT FOR TURNING MACHINES
John Khachiglaa, 78-80 Capitol Ave., Hartford, Conn. 06103
Filed June 8, 1976, Ser. No. 694,032
Int. Cl.² B23G *1/00, 3/00*
U.S. Cl. 10—89 H **10 Claims**



1. An improved threading apparatus for producing threads with a turning machine such as a lathe which rotates a workpiece and threading tool relative to one another comprising:
a tool carrier member connectible in rigid engagement with a thread cutting tool for holding the tool on axis during a thread cutting operation;
a support member located remotely of the tool carrier and the thread cutting tool and connectible in rigid engagement with the turning machine for supporting the tool and tool carrier in the machine during a thread cutting operation;
a sliding spindle member extending between the tool carrier member and the support member in axial alignment with the tool, the spindle member being both axially translatable and rotatable relative to said carrier and support members;
first disengagable torque transmitting means interposed between the carrier member and the spindle member including on one of the two members a first axially extending groove and a first annular groove joined with one end of the axially extending groove, and on the other of the two members a tang engaging the joined grooves;
second disengagable torque transmitting means interposed between the support member and the spindle member and permitting axial translation of the two members relative to one another; and
resilient means extending between the spindle member and one of the other members for urging the tang of the first torque transmitting means into the axially extending groove and away from the annular groove.

4,031,585
BINDING OF PERFORATED SHEETS
Sidney George William Adams, Hersham, England, assignor to James Burn Bindings Limited, Esher, England
Filed Feb. 9, 1976, Ser. No. 656,158
Claims priority, application United Kingdom, Feb. 13, 1975, 6178/75
Int. Cl.² B42C *5/12, 19/00*
U.S. Cl. 11—1 A **7 Claims**



1. A machine used in binding packets of perforated sheets into book form with wire binding elements, each such element being formed from a length of metal wire bent to form a series of curved hairpin-shaped prongs and having a longitudinal slot from one end thereof to the other, and each element being

adapted to receive said sheets in impaled relation prior to closing said element into binding relation with said packet, said machine comprising

a rectifying tool in the form of a wedge-shaped bar adapted to reciprocate into and out of the longitudinal slot in each binding element for conforming the shape and position of said element to a perdetermined standard,

said wedge-shaped bar having a first side comprised of at least two separate discrete surfaces, said first side surfaces being sized and configured to cooperate with two different size binding elements, and

said wedge-shaped bar having a second side comprised of at least two separate discrete surfaces, said second side surfaces also being sized and configured to cooperate with two different size binding elements,

one of said first side surfaces and one of said second side surfaces cooperating to conform the shape and position of a first size binding element, and the other of said first side surfaces and one of said second side surfaces cooperating to conform the shape and position of a second size binding element.

4,031,586

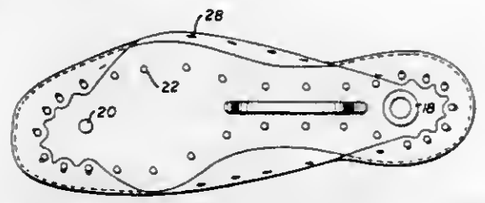
INSOLE FOR FOOTWEAR

Elisabeth von den Benken, and Henry von den Benken, both of 2212 Centre St., West Roxbury, Mass. 02132

Division of Ser. No. 468,223, May 9, 1974, Pat. No. 3,952,427. This application Dec. 8, 1975, Ser. No. 638,827

Int. Cl.² A43D *21/00*

U.S. Cl. 12—145 **1 Claim**



1. A method of assembling footwear which comprises:

a. preparing a shoe upper for lasting by punching a plurality of perforations through the shoe upper along its lasting margin and locating the perforations in such a way that the shoe upper will be properly lasted when tying it to an insole,

b. molding the insole provided with lasting hooks along its edge about ¼ to 1 inch from said edge and giving said lasting hooks a shape which prevents the shoe upper from slipping off once tied to the insole,

c. molding the insole provided with a shank reinforcement rib thus stiffening the insole in the shank area,

d. molding the insole provided with a protrusion which fits a corresponding cavity in an outer sole thereby assuring correct alignment of the outer sole and the insole,

e. molding the insole provided with a contour which fits the bottom contour of a corresponding last,

f. molding the outer sole having corresponding cavities for the lasting hooks, the protrusion and the shank reinforcement rib of the insole,

g. pulling the upper over the last and tying it to the insole by engaging the perforations in the shoe upper with the lasting hooks of the insole and,

h. attaching the molded outer sole to the prior lasted shoe.

4,031,587

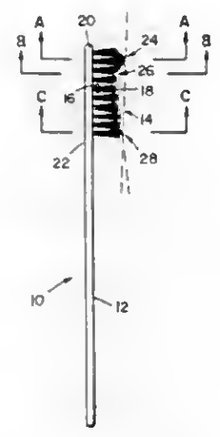
TOOTHBRUSH FOR CANINES

Ursula Dietrich, Hillsborough, Calif., assignor to Deepen Enterprises, Inc., San Mateo, Calif.

Filed July 28, 1975, Ser. No. 599,579

Int. Cl.² A46B *9/04*

U.S. Cl. 15—167 R **2 Claims**



1. A toothbrush for cleaning the teeth of animals which have a long narrow jaw, molars at the rear of the jaw, and secodontal crowned teeth forward of the molars, said toothbrush comprising a handle and a head attached to said handle, said handle having top and bottom ends and an intermediate neck, said head comprising at least three rows of longitudinally extending bristles defining longitudinally a peak adjacent said top end, a heel adjacent said neck, and a substantially linear incline from said heel to the foot of said peak, said incline having a maximum height at said heel substantially corresponding to the maximum height of said peak, and a minimum height at the foot of said peak, said head further defining in cross section along said linear incline from said heel to the foot of said peak, a central longitudinal trough of bristles of uniform diminished height relative to longitudinal outside rows of bristles defining said incline, and at said peak a ridge of bristles of substantially uniform maximum height, the bristles from the top end up to the peaks and down to the foot of said peak being of uniform length in cross-section, the tops of said peak bristles defining surfaces for confronting the tables of the molars at the rear of said jaw, the tops and sides of the outside longitudinal bristle rows of said incline defining surfaces for confronting gums and side faces of secodontal crowned teeth, and the tops and sides of the bristles of said central trough defining surfaces confronting said secodontal crowns, said trough further defining a guideway for tracking the tops of said secodontal crowns along the jaw line upon confrontation between the tops of bristles defining said peak and the tables of the rear molars such that longitudinal translation of said brush head scrubs and massages the gums and the tops and the sides of the teeth.

4,031,588

BROOM

Henri Joseph Marie Adrien Leroy, Le-Pre-Saint-Gervais, and Christian Ludovic Leroy, Perpignan, both of France, assignors to Henri Joseph Marie Andrien Leroy, Le-Pre-Saint-Gervais, France

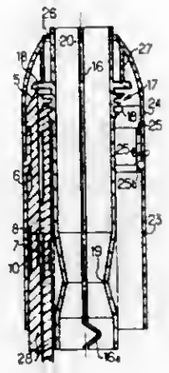
Filed Sept. 15, 1976, Ser. No. 723,469

Claims priority, application France, Oct. 21, 1975, 75.32093

Int. Cl.² A46B *3/18*

U.S. Cl. 15—171 **9 Claims**

1. A broom constituted by a bundle of stems wound around a hollow or tubular bar reserved for the broom handle, the upper portion of the said bundle being fitted into a protective sleeve, the said hollow bar, bundle of stems and protective sleeve constituting with the broom handle on either dismountable or non-dismountable assembly, wherein the winding of the stems is ensured by a separate binding strip of appropriate length of flexible material co-operating with mutually opposite crenels, indentations or notches provided in the thickness of the stems, one of the said crenels serving as a fixing point for the strip and the other crenel serving as a passageway for the spirals or turns of the said strip so as to absorb or compensate for its thickness after the winding.



4,031,589

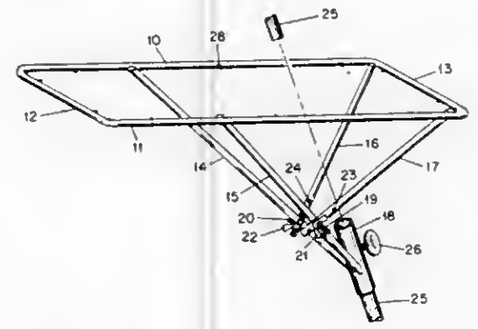
PORTABLE DRIP COLLECTOR

Robert L. Couch, Rte. 3, Box 583, Harriman, Tenn. 37748

Filed Apr. 21, 1976, Ser. No. 678,746

Int. Cl.² B05C *17/02, 21/00*

U.S. Cl. 15—248 R **9 Claims**



1. A portable drip collector for releasible attachment to a handle of a tool for overhead manipulation, which comprises: a rectangular hoop; a collar to receive the handle; a first and second pair of brace arms connecting the hoop to the collar, the first pair of arms each having one end connected to opposite sides of the hoop, the second pair of arms each having one end connected to corners of one end of the hoop; handle engaging means associated with the collar to releasibly engage the handle, and a disposable sheet collector fastened to and spanning the hoop.

4,031,590

PIPE SCRAPER

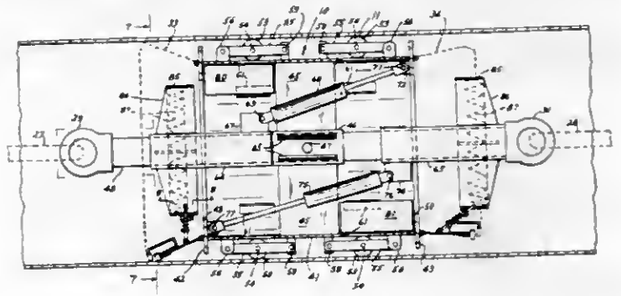
Edward Albert Clavin, Houston, Tex., assignor to Midcon Pipeline Equipmeot Co., Houston, Tex.

Division of Ser. No. 534,823, Dec. 20, 1974, Pat. No. 3,977,331. This application Sept. 9, 1975, Ser. No. 611,696 The portion of the term of this patent subsequent to Aug. 31, 1993, has been disclaimed.

Int. Cl.² B08B *9/02*

U.S. Cl. 15—104.17 **16 Claims**

1. Apparatus for scraping the interior wall of a pipe, comprising carriage means having wheel means for engaging the wall of the pipe whereby said carriage means is movable longitudinally through the pipe, circumferentially segmented scraper means carried at only one end of said carriage means and disposed in a substantially complete circular arrangement around the interior wall of the pipe whereby substantially all of the circumference of the pipe wall will be scraped thereby,



said scraper means being expandable against the pipe wall and retractable therefrom, whereby said apparatus may be employed to scrape the interior wall of a pipe when moved through the pipe in one direction.

4,031,591

STUNNING METHODS AND APPARATUS

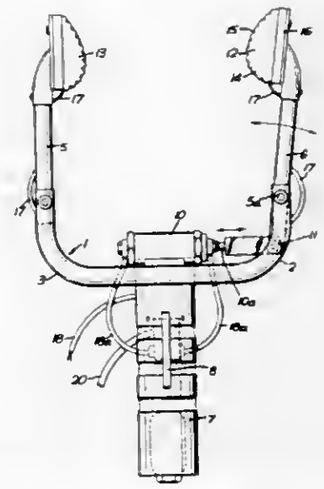
John Joseph Collins, Sudbury, England, assignor to Haverhill Meat Products Limited, Suffolk, England

Continuation-in-part of Ser. No. 514,601, Oct. 15, 1974, abandoned. This application Apr. 21, 1976, Ser. No. 679,047

Claims priority, application United Kingdom, Oct. 23, 1973, 49348/73

Int. Cl.² A22B *3/00*

U.S. Cl. 17—1 E **16 Claims**



1. A stunning tongs for stunning animals prior to slaughter comprising a frame, a handle portion mounted on said frame, a pair of stunning arms mounted on said frame for relative movement of at least one of said arms with respect to said frame, a stunning head on each of said arms, each of said stunning heads comprising a stunning electrode and presenting an area configured for pressure engagement of the head of an animal without penetration, a prime mover operably connected to said at least one arm to effect rapid relative closing movement between said arms to make rapid firm contact on opposite sides of said animal's head disposed between said arms, electronic stunning circuit means including timing means and connected to said electrodes for generating an impulse of predetermined waveform/frequency and voltage/-current; an energizing means operably connected to both said prime mover and said stunning circuit means for energizing said prime mover and said stunning circuit means; manually actuable control means for actuating said energizing means to supply energy simultaneously to said prime mover and said electronic circuit means; said electronic stunning circuit means being operable in timed relation to said prime mover to

energize the electrodes subsequent to activation of said control means but prior to engagement of the electrodes with the animal's head so that instantaneously with the contact of the electrode heads on the animal's head said impulse of predetermined waveform/frequency and voltage/current passes between said stunning heads through said animal's head, for a predetermined period, sufficient to ensure complete stunning until the animal is slaughtered immediately afterwards.

4,031,592

DEVICE FOR CLOSING ELASTIC PACKAGES, PARTICULARLY FLEXIBLE TUBULAR CASINGS

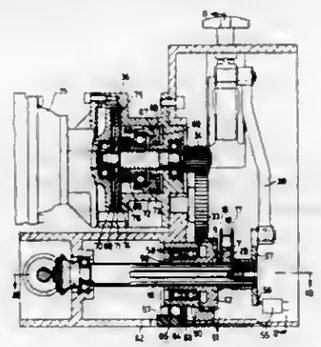
Karl Schnell, Muhlstrasse 28, 7065 Winterbach, Germany

Filed May 20, 1975, Ser. No. 579,140

Claims priority, application Germany, May 22, 1974, 2424979

Int. Cl.[2] A22C 11/00

U.S. Cl. 17—33 12 Claims



1. In a device for closing elastic packages, particularly tubular casings, by means of clamping ties, of the type including a cutting device, feeding means operable to feed a substantially continuous length of clamping tie material intermittently to the cutting device for severing into individual clamping ties, a bending device operable to bend each individual clamping tie into an inverted substantially U-shaped including a pair of spaced legs, a clamping tie closing device operable to wrap each bent clamping tie around the tubular casing to be closed, and means operable to feed bent clamping ties from the bending device to the closing device: the improvement in which said cutting device includes a limit stop for the free end of the clamping tie material fed thereto by said feeding means and further includes a cutting tool spaced from said limit stop by a spacing corresponding to the length of the clamping tie to be cut; said cutting tool and said limit stop being mounted for adjustment and displacement relative to each other.

4,031,593

HOT SHELF SEED COTTON TOWER DRYER APPARATUS AND METHOD

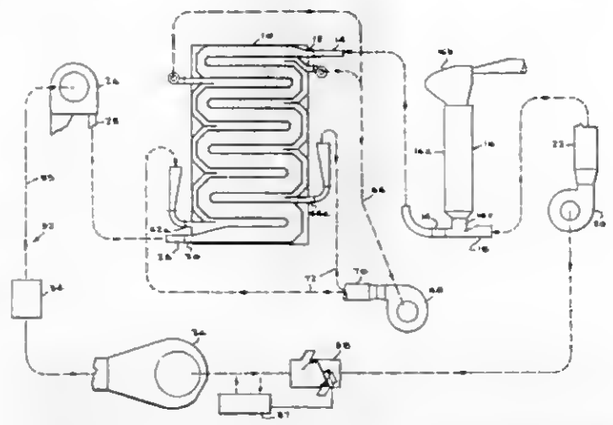
Arvel L. Vandergriff, P.O. Box 457, Corcoran, Calif. 93212

Filed Oct. 7, 1975, Ser. No. 620,495

Int. Cl.[1] D01G 37/00

U.S. Cl. 19—.27 28 Claims

1. Seed cotton dryer apparatus of the parallel flow tower type for conditioning seed cotton for ginning comprising, a vertically elongated drying tower casing having spaced apart vertical lateral walls and front and rear sides and having an inlet adjacent the top for connection to an air duct through which seed cotton is pneumatically conveyed to receive cotton-conveying heated drying air and cotton conveyed by the drying air and having an air and cotton outlet adjacent the bottom means for heating the drying air, a plurality of vertically spaced horizontal metallic shelves fixed in the casing providing flat horizontal upwardly facing shelf surfaces extending in horizontal planes between said lateral walls and spanning the width of the casing, said shelves from the uppermost to the lowermost commencing alternately from opposite front and rear sides of the casing and each terminating short of the side opposite its commencement thereby defining a continuous restricted zig-zag flow path from the upper end to the lower end of the casing communicating respectively with said inlet and said outlet, the heated drying air and cotton conveyed thereby being admitted to the upper end of said flow path at said inlet to be circulated through said flow path for evaporating moisture from the cotton in the dryer while the



drying air impels the cotton along the flow path, and means for supplying heat to said metallic shelves independent of said cotton conveying heated drying air coursing through the drier for heating the surfaces of the shelves substantially throughout their extent to diminish the loss of heat energy from the heated drying air as courses from top to bottom through said flow path and to aid drying of the cotton.

4,031,594

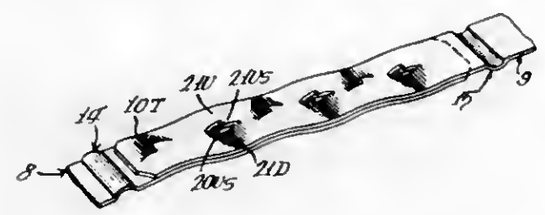
SEALLESS STRAP CONNECTION MEANS

Tallvaldis Cepuritis, Kenilworth, Ill., assignor to Signode Corporation, Glenview, Ill.

Filed Apr. 26, 1976, Ser. No. 680,164

Int. Cl.[2] B65D 63/02

U.S. Cl. 24—20 EE 8 Claims



1. A sealless strap connection between overlapped lengths of strap which comprises an array of longitudinally spaced joints, each joint comprising lengthwise protuberances presenting opposed, overlapping, non-interlocking shoulders each having a transverse face displaced for the respective planes of said overlapped lengths of strap and further comprising lengthwise protuberances presenting opposed interlocking shoulders each having a transverse face displaced from the respective planes of said overlapped lengths of strap, said interlocking shoulders being shaped to interlock with each other, at least one of the protuberances of said array on one of said lengths of strap having, behind the transverse face of one of said interlocking shoulders, an upwardly displaced corner forming a protruding tongue arranged and positioned to irreversibly override the transverse face of an oppositely facing non-interlocking shoulder as the interlocking shoulders are moved into an interlocking position, and to present a stop to the non-interlocking shoulder adjacent to said corner when said interlocking shoulders are interlocked with each other.

4,031,595

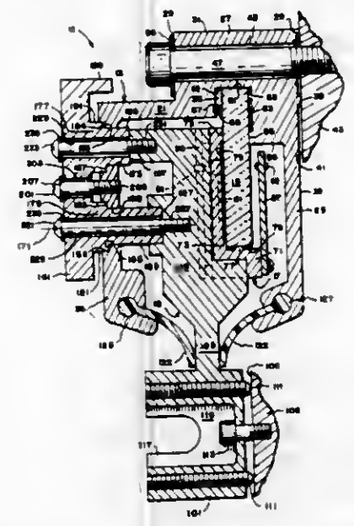
HIGH PRECISION INCREMENTAL DISTANCE MEASURING SYSTEM

Helmut Welker, Jamestown, N.Y., assignor to Bausch & Lomb Incorporated, Rochester, N.Y.

Filed Sept. 2, 1975, Ser. No. 609,863

Int. Cl.[2] H01J 3/14

U.S. Cl. 250—237 G 17 Claims



1. In measuring apparatus securable to first and second relatively movable members for determining the relative displacement therebetween, wherein said first movable member has a substantially flat mounting surface, wherein said apparatus includes a scale, means for supporting said scale, transducer means, transducer support means and means for interconnecting said transducer with said transducer support means, wherein said scale has an edge and a face, and wherein the improvement comprises:

a. a first pair of rails provided on said scale supporting means for engagement with said mounting surface;

b. said scale supporting means including means for positioning means for securing said scale supporting means to said mounting surface, said positioning means locating said securing means between said first rails so as to insure that said first rails engage and conform to said mounting surface when said scale supporting means is secured to said mounting surface; and

c. a second pair of rails provided on said scale supporting means, said second rails cooperating with said scale face to position said scale on said scale supporting means, at least one of said second rails and one of said first rails being approximately aligned and solidly interconnected in a direction substantially perpendicular to the surface defined by said first rails when said scale supporting means is viewed in cross-section.

4,031,596

INTEGRATED FINISHING AND COMPRESSIVE PRESHRINKING OF A HIGH-SHRINKAGE FABRIC

Herman J. Joy, Latham, N.Y., assignor to Cluett, Peabody & Co., Inc., New York, N.Y.

Continuation of Ser. No. 262,579, June 14, 1972, abandoned, which is a continuation-in-part of Ser. No. 224,892, Feb. 9, 1972, abandoned. This application Jan. 7, 1975, Ser. No. 539,216

Int. Cl.[2] D06C 21/00

U.S. Cl. 26—18.6 4 Claims

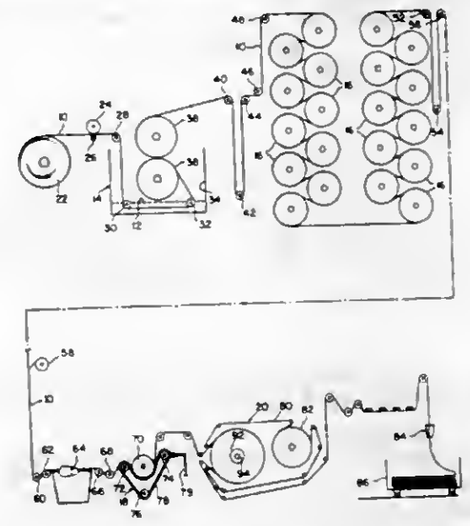
1. A method for continuously manufacturing, finishing and preshrinking fabric, the method comprising the sequential steps of:

creating fabric by using conventional machinery, said fabric being known as greige fabric which has been stretched in said machinery and is susceptible therefor of relatively high shrinkage after washing, taking said greige fabric from said machinery to a padder and impregnating said greige fabric with a finishing liquid therein including starch to a moisture content in excess of 50% by weight, partially drying the fabric, measuring and maintaining a moisture content between 10 and 30% by weight,

compressively preshrinking the fabric, and fully drying the fabric.

4. A method for continuously manufacturing, finishing and preshrinking fabric, the method comprising the sequential steps of:

creating fabric by using conventional machinery, said fabric



being known as greige fabric which has been stretched in said machinery and is susceptible therefor of relatively high shrinkage after washing,

taking said greige fabric from said machinery to a padder and impregnating said greige fabric with a finishing liquid therein including starch to a moisture content in excess of 50% by weight, passing the fabric over a series of hot cans to partially dry the fabric, measuring and maintaining a moisture content in the fabric between 10 and 30% by weight,

compressively preshrinking the fabric in a rubberbelt compressive preshrinking unit, and fully drying the fabric.

4,031,597

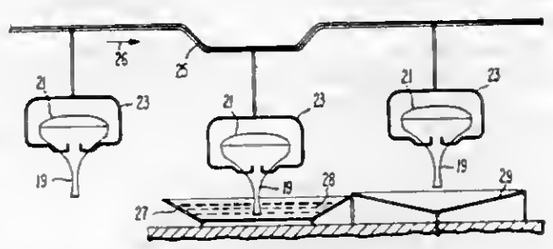
METHOD OF ASSEMBLING A MOUNT ASSEMBLY IN THE NECK OF A CATHODE-RAY TUBE

Jawdat Ibrahim Nubani, Clarks Summit, and Walter Robert Rysz, Moosic, both of Pa., assignors to RCA Corporation, New York, N.Y.

Filed Sept. 22, 1976, Ser. No. 725,583

Int. Cl.[2] H01J 9/18

U.S. Cl. 29—25.16 8 Claims



1. In a method for sealing a mount assembly in the neck of a cathode-ray tube having a faceplate panel and a luminescent screen thereon, the steps in the following order:

a. coating the inner surface of said neck with a film of organic material which is volatilizable when heated in air at temperatures below about 400° C.

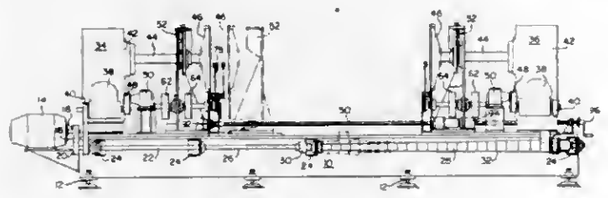
b. sliding said mount assembly into said neck to a perdeter-

mined oriented and spaced position with respect to said screen,
c. sealing said mount assembly into said neck,
d. and volatilizing said film.

4,031,598
END-FORMING MACHINE FOR FLUORESCENT LAMP TUBES

William J. Summers, Mootclair, and William F. Betz, Livingston, both of N.J., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Sept. 16, 1976, Ser. No. 723,673
Int. Cl.² H01J *9/46*
U.S. Cl. 29—25.19 **8 Claims**

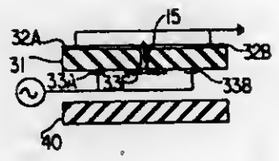


1. An improved end-forming machine for fluorescent lamp tubes, said end-forming machine comprising:
an elongated machine base,
a headstock affixed to said machine base, said headstock including a rotatably indexable lamp tube carrying turret, reciprocating heating and forming tools operable to neck down one end of said lamp tubes and operating means for operating said turret and said heating and forming tools in sequence,
a tailstock including a rotatably indexable lamp tube carrying turret, reciprocating heating and forming tools operable to neck down the other end of said lamp tubes and operating means for operating said turret and said heating and forming tools in sequence, said tailstock being mounted to said machine base for relative movement therewith and selective positioning with respect thereto,
locating drive means associated with said tailstock for selectively positioning said tailstock along the length of said machine base a preselected distance from said headstock whereby lamp tubes of different lengths can be accommodated between the headstock and tailstock,
single drive shaft means extending for substantially the length of said machine base,
drive means for driving said single drive shaft means at a preselected speed, and
means coupling each of said headstock and tailstock operating means to said single drive shaft means.

4,031,599
METHOD OF MAKING STATIC ELECTRICITY SUPPRESSOR WITH PATTERNED COATING

Anthony Q. Testone, Lee, Mass., assignor to Statics Inc., Lee, Mass.

Division of Ser. No. 568,107, April 14, 1975, Pat. No. 3,968,405. This application June 15, 1976, Ser. No. 696,322
Int. Cl.² H01G *4/02*; **H05K** *3/06*
U.S. Cl. 29—25.41 **3 Claims**

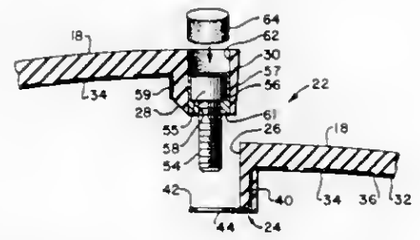


1. A method of making a static electricity suppressor comprising:
a. providing a plate of electrically insulating material,
b. coating said plate on the opposite surfaces thereof with a thin layer of electrically conductive material,
c. removing from a first surface a portion of the layer thereon,
d. removing from the opposite surface a portion of the layer thereon and leaving on said opposite surface an intact portion of the layer thereof which is in alignment with the part of the first surface from which the layer thereon has been removed,
e. passing an emitter wire transversely through said plate,
f. engaging said emitter wire with said intact portion of said second layer only.

4,031,600
ATTACHMENT MEANS FOR A MACHINERY DRUM COVER

Biddle A. Whigham, Lancaster, Pa., assignor to The Fluorocarbon Company, Anaheim, Calif.

Filed Nov. 10, 1975, Ser. No. 630,109
Int. Cl.² B60B *7/00*
U.S. Cl. 29—118 **11 Claims**

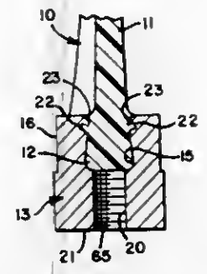


1. A replaceable cover assembly for an anvil roller to provide a contact surface for cutting blades located on an adjacent rotary cutting roller, said anvil roller having a transverse slot generally parallel to the axis of said roller, said cover comprising:
a cover band of an elastomeric material for positioning around said roller and having a first end and a second end;
a backing plate of material more rigid than said elastomeric material securely attached to the interior surface of said cover band;
an inwardly extending backing plate flange integrally connected to said backing plate adjacent said first end of said cover band for insertion in said alot adjacent one edge of the slot, said flange having an offset portion extending beyond said first end for contact with a substantial portion of the bottom of said slot;
a depending inward cover band flange of elastomeric material connected to said second end of said cover band, said depending flange being positioned in said slot above and in contact with said backing plate flange;
a flange of elastomeric material integrally connected to said cover band first end for extending into said slot between said backing plate flange and said cover band flange on said second end;
a flange integrally connected to said backing plate adjacent said cover band second end for extending into said slot adjacent the other edge of the slot, said flanges filling said slot so that the exterior surface of the cover band above said slot is uniform and uninterrupted except for a seam between said cover band ends; and
means for fastening said backing plate flange and said cover band flange to said roller in said slot.

4,031,601
METHOD OF FABRICATING AND MOUNTING A FIBERGLASS FAN BLADE

Norman T. Staub, and Anthony F. Staub, both of Dayton, Ohio, assignors to Dayton Scale Model Company, Dayton, Ohio

Continuation of Ser. No. 549,067, Feb. 11, 1975, abandoned. This application July 30, 1976, Ser. No. 710,175
Int. Cl.² B29D *3/02*; **B29G** *3/00*
U.S. Cl. 29—156.8 B **6 Claims**

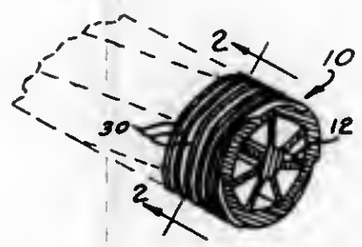


1. A method of fabricating and mounting a fiberglass fan blade in a hub, comprising:
a. producing a metal hub having a dovetail slot in one end thereof and also having a bore extending from the other end thereof into said slot,
b. assembling a plurality of layers of fiberglass sheet material impregnated with heat liquifiable and heat curable resin in superposed relation forming an assembly of predetermined dimensions, each of said layers including a blade portion and a root portion of a width at least equal to the diameter of said hub,
c. interleaving additional pieces of said fiberglass sheet with said root portions of said layers to increase the thickness of the root portion of said assembly to approximately the configuration of said hub slot,
d. inserting said root portion of said assembly into said slot,
e. placing said assembly and hub in a mold which includes cavities for said blank and said hub and a shoulder at the inner end of said hub cavity,
f. heating said mold until said resin substantially liquifies while maintaining said one end of said hub in seated relation with said shoulder,
g. forcing additional substantially liquified resin and fiberglass material through said bore into said slot until said slot and all spaces between adjacent said layers are completely filled,
h. closing said heated mold at a predetermined rate into fully closed relation with said assembly and said hub, and
i. effecting curing of said resin while maintaining said mold closed.

4,031,602
METHOD OF MAKING HEAT TRANSFER TUBE

James L. Cunningham, and Bonnie J. Campbell, both of Decatur, Ala., assignors to UOP Inc., Des Plaines, Ill.

Division of Ser. No. 681,006, April 28, 1976. This application Sept. 14, 1976, Ser. No. 722,922
Int. Cl.² B23P *15/26*
U.S. Cl. 29—157.3 AH **4 Claims**

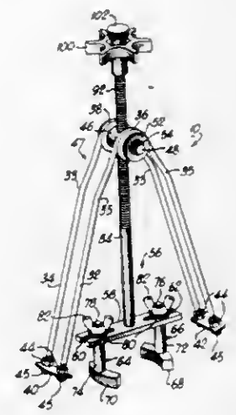


1. A method of making a heat transfer tube having inner and outer fins comprising the steps of inserting a core member having a plurality of radially extending longitudinal fins inside a smooth surfaced cylindrical tube and subjecting at least a portion of the outside surface of the composite assembly to a plurality of finning tools so as to produce external fins on the tube and reduce its internal diameter to a dimension less than the external diameter of the finned core member.

4,031,603
SNAP-IN CLUTCH SPRING

William E. Shultz, 442 W. St. Charles Road, Villa Park, Ill. 60181

Filed July 1, 1976, Ser. No. 701,588
Int. Cl.² B23P *19/02*
U.S. Cl. 29—427 **10 Claims**



1. A method of removing a retaining ring from an automatic transmission, said automatic transmission having a housing including an annular slot, and a spring seat, comprising
connecting a pair of elongated arms to said slot to hold said arms in position relative to said slot;
outwardly biasing said elongated arms to hold said arms within position relative to said slot;
moving a spring seat engaging member relative to said arms to contact said spring seat and thereby compressing said spring seat with said spring seat engaging member;
removing said retainer ring.

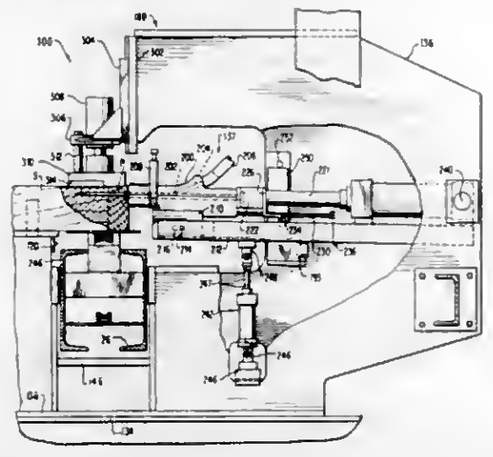
2. An apparatus for disassembling a clutch piston assembly in an automobile automatic transmission, said assembly including a housing having positioned therein a piston, said piston held in said housing by a plurality of springs and a spring seat, said spring seat maintained in said housing by a retaining ring, said housing also including at least one slot fabricated on the peripheral surface of said housing, said apparatus comprising
an elongated stem,
a pair of resilient arms mounted on said stem,
said arms including means for engaging said slot, and said stem including means for engaging said spring seat,
said stem further including means for applying a compressive force to said spring seat when said apparatus is in operative position.

4,031,604

APPARATUS AND METHODS OF FABRICATING WOODEN FRAMES, PANELS AND THE LIKE

John Calvin Jureit, Coral Gables, Fla.; Howell J. Cotten, Keswick, Va.; Adolfo Castillo, and Roy Leutwyler, both of Miami, Fla., assignors to Automated Building Components, Inc., Miami, Fla.

Continuation of Ser. No. 466,176, May 2, 1974, abandoned, which is a division of Ser. No. 328,605, Feb. 1, 1973, Pat. No. 3,848,791. This application Dec. 12, 1975, Ser. No. 640,323
Int. Cl.² B27F 7/00, 7/02
U.S. Cl. 29—429 5 Claims



1. A method of fabricating a wooden panel having a pair of elongated plates and intermediate studs comprising the steps of:

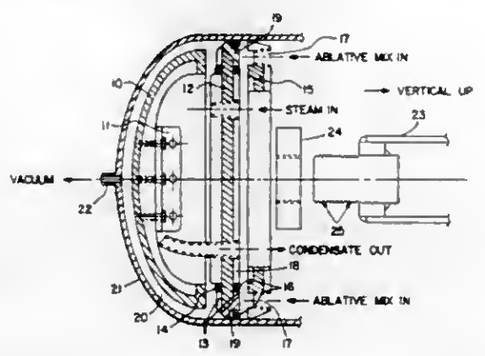
disposing a stud between a pair of plates in substantially horizontal coplanar relation with the plates and stud ends lying on support surfaces between a pair of pivotally mounted nailing assemblies having one end thereof disposed at fixed elevations and other ends thereof disposed at one elevation, clamping the plates and corresponding ends of the studs against the support surface to ensure coplanar relation of the studs and plates, displacing said one end of said nailing assemblies toward said plates to engage the plates and clamp the plates against the stud ends in response to actuation of the nailing assemblies, actuating the nailing assemblies to drive a nail through each plate and into the corresponding end of the stud to secure the plates and the stud one to the other, automatically shifting the elevation of said other ends of said nailing assemblies from said one elevation to another elevation in response to completion of nailing at said one elevation, actuating the nailing assemblies when in said other elevation to drive a second nail through each plate and into the corresponding end of the stud at a like longitudinal location as the first nail thereby forming a partially completed frame, advancing the partially completed frame on an endless conveyor a predetermined distance such that said plates are laterally aligned between the nailing assemblies at the location therealong of a second stud, disposing a second stud between said plates said predetermined distance from said first stud, clamping the plates and corresponding ends of the studs against the support surface to ensure coplanar relation of the studs and plates, displacing said one end of said nailing assemblies toward said plates to engage the plates and clamp the plates against the stud ends in response to actuation of the nailing assemblies, actuating the nailing assemblies to drive a nail through each plate and into the corresponding end of said second stud to secure the plates and said second stud one to the other, automatically shifting the elevation of said other ends of said nailing assemblies from said one elevation to another elevation in response to completion of nailing at said one elevation, actuating the nailing assemblies when in said other elevation to drive a second nail through each plate and into the corresponding end of the second stud at a like longitudinal location as the first nail driven into the second stud.

4,031,605

METHOD OF FABRICATING COMBUSTION CHAMBER LINERS

Harold Thompson Couch, Columbia; Leonard Selwyn Cohen, West Hartford, and Lawrence Joseph Coulter, South Windsor, all of Conn., assignors to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Aug. 5, 1976, Ser. No. 712,128
Int. Cl.² B29C 5/04; B29D 3/02
U.S. Cl. 29—460 5 Claims



1. In a combustion chamber having a nozzle, an inner surface, an outer surface, and at least one domed region, a method of fabricating a liner on the inner surface of said combustion chamber comprising the steps of:

a. first attaching a wire mesh substrate screen to said inner surface of said combustion chamber so as to cover at least the domed region and the nozzle;

b. forming a cavity between said domed region and a parallel domed surface of a mold fixture assembled inside said combustion chamber;

c. forming a cavity between said nozzle and a mold fixture assembled inside said nozzle to form a surface parallel to said nozzle;

d. injecting a fluid curable polymeric material into said cavity between said domed surface and said domed region and into said cavity between said nozzle and said surface parallel to said nozzle; and

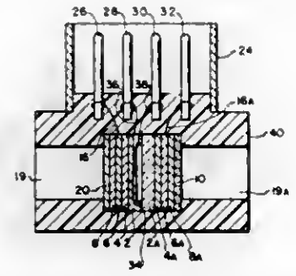
e. curing said fluid polymeric material into a firm solid affixed to said substrate screen.

4,031,606

METHOD OF MAKING A COMBINATION ION RESPONSIVE AND REFERENCE ELECTRODE

Eugene L. Szonntagh, Flourtown, Pa., assignor to Honeywell Inc., Minneapolis, Minn.

Division of Ser. No. 552,284, Feb. 24, 1975, abandoned. This application Feb. 27, 1976, Ser. No. 661,958
Int. Cl.² B01J 17/00
U.S. Cl. 29—570 8 Claims



1. A method of making a combination electrode comprising

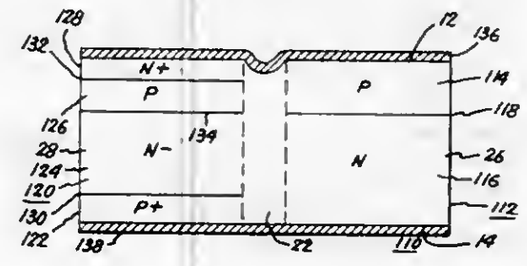
the steps of depositing a first metallic layer on a first surface area of an insulating substrate, depositing a first solid electrolyte layer on said metallic layer and depositing a pH glass layer on said electrolyte layer, depositing a second metallic layer on a second electrically isolated surface area of said insulating substrate, depositing a second solid electrolyte layer on said second metallic layer, depositing a second glass layer on said second electrolyte layer, said second glass layer having a coefficient of thermal expansion mismatched with respect to a coefficient of thermal expansion of said second electrolyte layer to produce differential expansion therebetween causing cracking of said second glass layer during a predetermined temperature cycle and exposing said electrode to said temperature cycle, said second metallic layer, said second electrolyte layer and said second glass layer being electrically isolated from said first metallic layer, said first electrolyte layer and said pH glass layer.

4,031,607

MINORITY CARRIER ISOLATION BARRIERS FOR SEMICONDUCTOR DEVICES

Harvey E. Cline; Thomas R. Anthony, both of Schenectady; Richard A. Kokosa, Skaneateles, and E. Duane Wolley, Auburn, all of N.Y., assignors to General Electric Company, Schenectady, N.Y.

Division of Ser. No. 474,033, May 28, 1974, Pat. No. 3,988,762. This application Apr. 29, 1976, Ser. No. 681,600
Int. Cl.² B01J 17/00
U.S. Cl. 29—577 57 Claims



1. A process for forming a region of a selected minority carrier lifetime in a body of semiconductor material comprising the steps of:

a. selecting a body of single crystal semiconductor material having two major opposed surfaces comprising, respectively, the top and bottom surfaces thereof, a selected level of resistivity, a selected type conductivity, and a preferred planar crystal structure orientation of at least one of the major opposed surfaces, the planar crystal structure orientation is one selected from the group consisting of (111), (100) and (110);

b. orienting the body so that the vertical axis of the body is substantially aligned with a first axis of the crystal structure which is substantially perpendicular to the at least one major opposed surface having the preferred planar crystal structure orientation;

c. disposing at least one metal wire of selected metal composition comprising at least one material suitable for controlling the minority carrier lifetime in a body of semiconductor material on the surface having a preferred planar orientation, each metal wire having a preferred stable wire direction which is dependent upon the planar orientation of the major surface;

d. heating the body and the at least one metal wire to a temperature sufficient to form a melt of metal-rich semiconductor material on the major surface of the body;

e. establishing a thermal gradient substantially parallel with the vertical axis of the body and the first crystal axis of the material of the body;

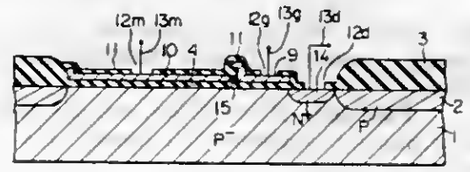
f. thermal migrating each melt into the body a predetermined distance from the one major surface parallel with the first crystal axis in the direction of the higher temperature of the thermal gradient to form a region of recrystallized semiconductor material of the body having solid solubility of the metal of the melt, as determined by the temperature of migration, and a level of minority carrier lifetime which is different from that minority carrier level of the material of the body.

4,031,608

PROCESS FOR PRODUCING SEMICONDUCTOR MEMORY DEVICE UTILIZING SELECTIVE DIFFUSION OF THE POLYCRYSTALLINE SILICON ELECTRODES

Ryoiku Togei; Akira Takei, and Kunihiko Wada, all of Kawasaki, Japan, assignors to Fujitsu Ltd., Japan

Filed Apr. 8, 1976, Ser. No. 675,196
Claims priority, application Japan, Apr. 11, 1975, 50-43388
Int. Cl.² H01L 21/28, 21/22, 29/78
U.S. Cl. 29—578 20 Claims



1. A process for producing a semiconductor memory device, which device comprises:

a semiconductor material substrate having one particular conductivity type and comprising, on the surface thereof, a doped layer with an impurity of conductivity type opposite to said one particular conductivity type, one surface region of the substrate adjoining said doped layer being used as a gate region, and another surface region of said substrate adjoining said one surface region being used as a memory cell region;

a first insulating layer situated on said substrate over said gate region and said memory cell region;

a gate electrode consisting of a doped polycrystalline silicon, said gate electrode being situated on a part of said insulating layer over said gate region;

a memory cell electrode consisting of doped polycrystalline silicon, said memory cell electrode being situated on another part of said insulating layer over said memory cell region;

a resistive layer consisting of non-doped polycrystalline silicon layer, disposed on still another part of said insulating layer, located between and connected to said both electrodes;

wherein an electric charge of said opposite conductivity type is either injected from said doped layer though said gate region into said memory cell region or transferred from said memory cell region through said gate region to said doped layer, depending upon the electric potential level in said substrate, which level is established by an electric field created by each of said electrodes through said insulating layer;

said process comprising the steps of:

forming the first insulating layer on said substrate over at least said memory cell region and said gate region;

forming a first non-doped polycrystalline silicon layer on said first insulating layer;

forming a second insulating layer on said first polycrystalline silicon layer;

removing a part of said second insulating layer and said first polycrystalline silicon layer, thereby selectively placing these layers so as to be used for a masking portion and said memory cell electrode, respectively;

forming a second non-doped polycrystalline silicon layer so as to mask said first insulating layer over said gate region and to mask said masking portion of said second insulating layer;

removing the unmasked parts of both of said first and sec-

ond insulating layers, by an etchant which dissolves these layers, thereby exposing a part of said first and second polycrystalline silicon layers as well as a part of the substrate;

introducing an impurity of said opposite conductivity type into said exposed parts so as to dope the exposed polycrystalline silicon with the impurity and to form on the exposed part of the substrate said opposite conductivity type doped layer, wherein the masking portion of the second insulating layer protects the underlying part of the first non-doped polycrystalline silicon layer from the introduction of impurity so as to form a resistance layer therein

4,031,609

METHOD FOR THE MANUFACTURE OF A SUPERCONDUCTOR WITH A SUPERCONDUCTIVE INTERMETALLIC COMPOUND CONSISTING OF AT LEAST TWO ELEMENTS

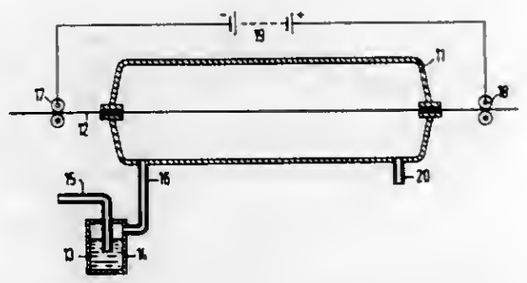
Günther Ziegler, and Sigrun Frohmader, both of Erlangen, Germany, assignors to Siemens Aktiengesellschaft, Munich, Germany

Filed June 12, 1975, Ser. No. 586,164

Claims priority, application Germany, June 14, 1974, 2428817

Int. Cl.² H01V *11/00*

U.S. Cl. 29—599 **12 Claims**



1. A method for the manufacture of a superconductor with a superconducting intermetallic compound consisting of at least two chemical elements comprising:

a. bringing a ductile structural part made of at least one element of the compound into contact with a second structural part containing a ductile carrier metal for the remaining elements of the compound;

b. subsequently supplying the remaining elements of the compound to the second ductile structural part at elevated temperature;

c. diffusing said remaining elements through said second structural part and reacting said remaining elements with the element in said first structural part to form said compound; and

d. wherein the improvement comprises said step of supplying comprising supplying the remaining elements to the second structural part through decomposition of alkyl compounds of said remaining elements.

4,031,610

METHOD OF ASSEMBLY OF DYNAMOELECTRIC MACHINES

Karnel Singh, North Olmsted; Thomas A. Denny, Lorain; Daniel P. Fritz, Elyria, and Orville C. Rising, LaGrange, all of Ohio, assignors to Airborne Mfg. Co., Elyria, Ohio

Filed Apr. 30, 1974, Ser. No. 465,687

Int. Cl.² H02K *15/14, 15/16*

U.S. Cl. 29—598 **7 Claims**

1. In a method of assembling a dynomoelectric machine including

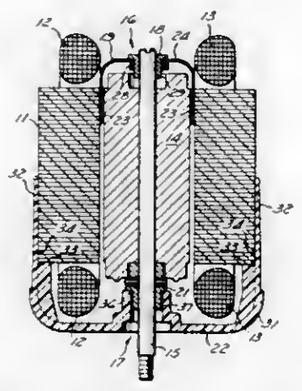
a stator having an axial bore,

a rotor having a shaft,

a rotor shaft bearing,

a bracket having a central opening for receiving said rotor shaft bearing with radially adjustable clearance and having at least two stator locating surfaces for engaging said stator and locating and supporting said bracket in a fixed predetermined positional relationship with respect to said stator and bridging said stator bore with said bore axis extended passing through said opening, the steps comprising

1. positioning and securing said bracket in said predetermined positional relationship with respect to a fixture



having surfaces corresponding to surfaces on said stator related to locating surfaces of said bracket and a bearing locator pin corresponding to said rotor shaft mounted in fixed position on said fixture coaxial with the corresponding location of said bore axis, and

2. positioning said shaft bearing on said bearing locator pin, and

3. positioning said shaft bearing in said bracket opening,

4. securing said bearing to said bracket in its relationship thereto established by said fixture,

the first three steps being performed in any appropriate sequence following by step (4).

4,031,611

METHOD OF MAKING PREINSULATED PIPE ASSEMBLY

Ben C. Johnson, Jr., San Marcos, Tex., assignor to Thermon Manufacturing Company

Division of Ser. No. 497,958, Aug. 16, 1974, Pat. No. 3,971,416. This application Dec. 15, 1975, Ser. No. 640,637

Int. Cl.² H05B *3/00*

U.S. Cl. 29—611 **8 Claims**

1. A method of installing a heating element in a preinsulated pipeline having a pipeline heater housing with a cavity therethrough and terminals for connecting the heating element to an energy source, comprising:

placing an end of the heater element into the heater housing cavity;

connecting a pull line to the heater element;

moving the heating element into the heater housing cavity until the heating element extends through the cavity by exerting a pulling force on the pull line connected to the heating element;

attaching the heater element to terminals for connecting the heater element to an energy source; and

sealing the ends of the heater housing cavity.

6. A method of preparing preinsulated pipe assemblies, and assembling same in the field, comprising the steps of:

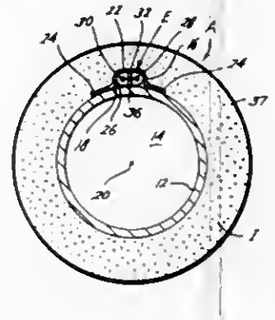
first mounting a heater housing on each of a plurality of sections of pipe at a manufacturing facility remote from the field location where said pipe sections are to be installed;

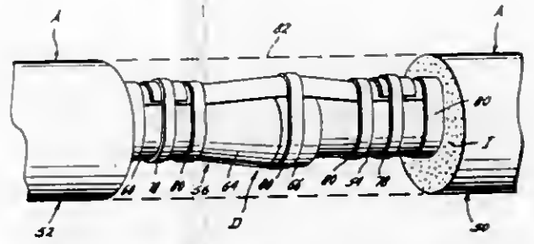
said heater housing for each section of pipe extending for substantially the full length thereof, but terminating short of each end;

applying an insulation layer over each of said pipe sections and heater housings therewith at said manufacturing facility;

said insulation layer on each section of pipe extending for substantially the full length of said heater mounting thereon, but terminating short of each end of said heater;

applying a protective jacket over the insulation on each section of pipe for substantially the full length thereof at a location remote from said field location;





assembling and connecting said sections of pipe at a field location remote from said manufacturing facility;

connecting adjacent ends of said heater housings together to form a continuous heater housing at the field location; and

applying insulation at the areas of the connection of said sections to thereby fully insulate the pipe sections and heater housings therewith.

4,031,612

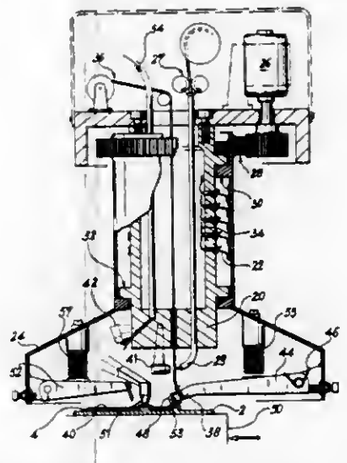
METHOD AND A DEVICE FOR THE INTERCONNECTION OF ELECTRONIC COMPONENTS

Gérard Nicolas, Grenoble, France, assignor to Commissariat a l'Energie Atomique, Paris, France

Filed Mar. 2, 1976, Ser. No. 663,250

Int. Cl.² H05K *3/00*

U.S. Cl. 29—625 **13 Claims**



1. A method for forming an electrical circuit by joining together different conductive zones preformed on an insulating base comprising the steps of

a. soldering an uninsulated end of a length of insulated wire to one of said zones,

b. advancing said wire toward a second zone and stripping insulation off the portion of the wire which will engage the second zone,

c. adhering the unstripped portion of the wire to the base as the wire is being advanced and when it contacts the base,

d. placing the stripped portion of the wire on the second zone,

e. soldering the stripped portion of the wire to the second zone, and

f. cutting the wire to separate the portion thereof extending beyond the second zone.

4,031,613

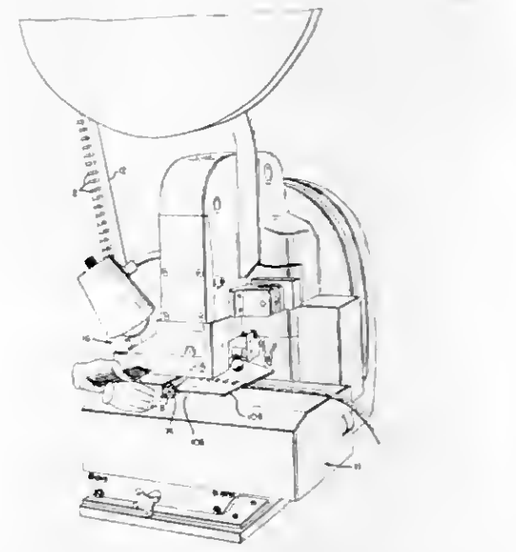
CLOSED BARREL TERMINAL APPLICATOR

Christopher Kingsley Brown, Camp Hill, and Donald Andrew Wion, Harrisburg, both of Pa., assignors to AMP Incorporated, Harrisburg, Pa.

Filed Mar. 4, 1976, Ser. No. 663,882

Int. Cl.² H01R *43/00*

U.S. Cl. 29—628 **14 Claims**



1. In an apparatus for applying terminals, each having an enclosed cylindrical barrel, to the end of wires including:

a crimping press comprising a crimping anvil and a crimping die movable relatively towards and away from said anvil; a crimping zone formed at the convergence of said anvil and said die; and terminal advance means for sequentially and laterally advancing equally spaced strip mounted individual terminals into said crimping zone from a first side and out of said crimping zone on an opposite second side, the improvement comprising:

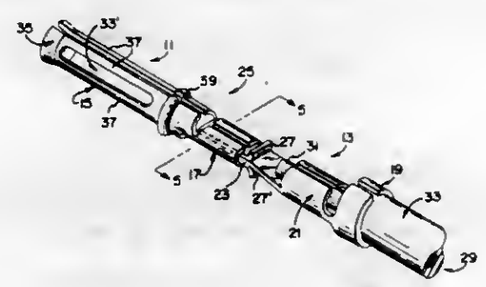
a conical wire positioning funnel located in a first position adjacent to and spaced from said crimping zone with the axis of said funnel in alignment with a terminal barrel located within said crimping zone, said funnel being free to move from said first position to a laterally displaced second position in sequence with the movement of a terminal barrel out of said crimping zone on said second side, said funnel being also free to subseqently return from said second position to said first position, and hinge means allowing said funnel to open when said funnel is in the vicinity of said second position, whereby

one of said wires may be aligned with and inserted into an enclosed cylindrical terminal barrel by use of said funnel whereupon said barrel is crimped onto said wire and said wire is released from said funnel by said hinge means upon relative movement between said funnel and the crimped wire and barrel.

4,031,614
METHOD OF MAKING TWO-PIECE ELECTRICAL CONTACT

Richard Earl Gipe, Warren, Pa., assignor to GTE Sylvania Incorporated, Stamford, Conn.

Filed Nov. 19, 1975, Ser. No. 633,179
Int. Cl.² H01R 9/00
U.S. Cl. 29—630 A 5 Claims



1. A method for making a two-piece electrical contact adapted for electrically interconnecting a male pin and an electrical wire having an electrically conductive lead portion and at least one layer of an electrically insulative material formed substantially about said lead portion, said method comprising:

forming one of said two pieces from a metallic material of substantially uniform thickness to provide a female receptive member including an elongated reception portion for receiving and electrically engaging said male pin and a wrappable end portion, said elongated reception portion being substantially round in configuration and having an open end through which said male pin may enter said reception portion;

forming a second of said two pieces from a metallic material of substantially uniform thickness to provide a deformable member for positively retaining said electrical wire, said deformable member including a first end portion for positively retaining said insulative coating, an intermediate portion for electrically engaging said electrically conductive lead portion, and a multi-layered second end portion opposing said first end portion; and

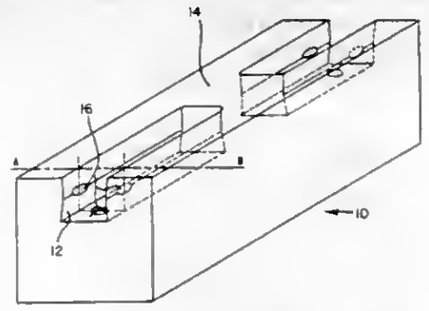
joining said wrappable end portion of said female receptive member to said multi-layered second end portion of said deformable member to provide said two-piece electrical contact, said joining including the steps of wrapping said wrappable end portion substantially about said multi-layered second end portion, followed by welding said multi-layered second end portion to said wrappable end portion after said wrappable end portion has been substantially wrapped about said multi-layered second end portion.

4,031,615
METHOD OF MAKING CATHODES

Daniel Dumas, Saint-Priest, and Gérard Hudault, Saint-Jean-de-Maurienne, both of France, assignors to Societe des Electrodes et Refractaires Savoie, Paris, France

Filed July 7, 1976, Ser. No. 703,265
Claims priority, application France, July 17, 1975, 75.23065
Int. Cl.² H01R 9/02
U.S. Cl. 29—630 R 11 Claims

1. The method of making a cathode element for an electrolytic cell wherein current supplying steel bars are joined to blocks of carbon consisting of the steps of forming an elongated carbon block with means defining a channel extending along at least a major portion of its length, positioning at least one steel bar in spaced relation within and extending substantially the length of said channel and securing the same therewithin for sliding movement along a line generally parallel to the longitudinal axis of said block, anchoring said bar within said channel at at least one anchoring point to preclude transverse displacement of said bar with respect to said channel, and filling selected portions of the space between said channel



and said bar with a cast material while maintaining an expansion zone adjacent a different preselected portion of said bar to permit longitudinal expansion of said bar within said channel in response to variation in a temperature condition.

CARDBOARD CUTTER IMPLEMENT

Clyde A. Hines, 16573 Englewood Ave., Los Gatos, Calif. 95030, and Clyde C. Hines, 1103 N. Kenwood, Burbank, Calif. 91505

Filed Sept. 22, 1975, Ser. No. 615,689
Int. Cl.² B67B 7/30; B26B 3/08
U.S. Cl. 30—2 1 Claim

1. A cardboard cutting implement comprising in combination:

a handle;

a baseplate having a bottom planar surface with an aperture therethrough;

a planar cutter blade having one edge sharpened to form a cutting edge;

blade support means for fixing the blade to the handle with the cutting edge thereof positioned to contact and cut a surface as the handle is grasped and moved along said surface; and

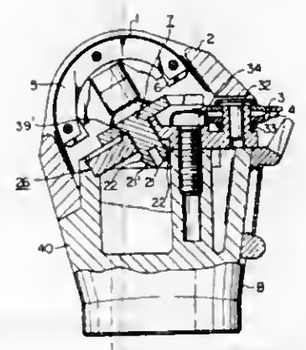
baseplate support means for adjustably attaching said baseplate to said handle such that the blade extends through said baseplate aperture and the baseplate can be pivoted relative to the handle in a direction to change the angle between the plane of the baseplate bottom planar surface and the plane of the planar cutter blade thereby to adjust the angle the blade enters the cardboard surface and vary the angle of the cut made in the cardboard; and

a planar guide in combination with adjustable guide support means fixing the guide to said baseplate in a position to extend beyond the baseplate bottom surface with the plane thereof extending generally parallel to and in the general direction of the plane of the cutter blade with said guide support means being adjustable for varying the angle between the plane of the guide and the plane of the cutter blade.

4,031,617
ELECTRIC SHAVER WITH LONG HAIR TRIMMER

Yosbimasa Tanaka, Hikone; Hirozo Imai, Hirakata; Tadao Tsutsumi, Kadoma, and Takeshi Oda, Hikone, all of Japan, assignors to Matsushita Electric Works Ltd., Osaka, Japan

Filed July 12, 1976, Ser. No. 704,656
Claims priority, application Japan, July 12, 1975, 50-97263[U]
Int. Cl.² B26B 19/10, 19/38
U.S. Cl. 30—34.1 7 Claims

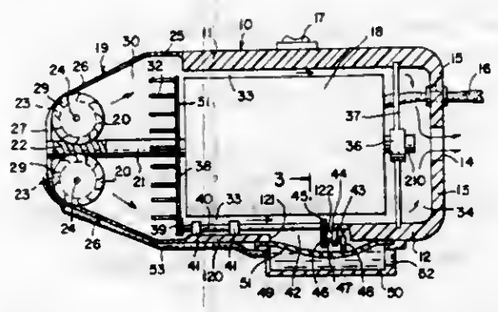


1. An electric shaver comprising an inner blade assembly of a plurality of inner blades supported as spaced on an inner blade supporting frame, a trimmer including a stationary trimming blade and a movable trimming blade slidable along lower surface of said stationary blade, a source of driving power, a reciprocal driving member supporting said inner blade assembly and coupled to said movable trimming blade, means for transmitting said driving power to said reciprocal driving member for reciprocally driving the same, a base member supporting thereon the reciprocal driving member, said stationary trimming blade being fixed to said base member, a shaver body case housing therein respective said elements, and a supporting frame for an outer blade having a plurality of hair introducing holes and cooperating with the inner blade assembly, said outer blade supporting frame being detachably mounted to upper part of said body case.

4,031,618
ELECTRIC SHAVER

Robin Mansfield, 14850 Oka Road No. 31, Los Gatos, Calif. 95030

Filed Jan. 15, 1976, Ser. No. 649,314
Int. Cl.² B26B 19/44
U.S. Cl. 30—41.5 4 Claims



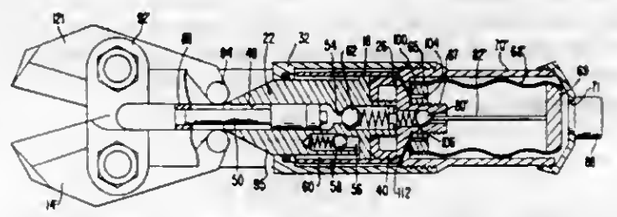
1. An electric dry shaver comprising a casing, a shaving head assembly arranged at the forward end of said casing, said shaving head assembly comprising a slotted cutter guard, a pair of cylindrical reel-type cutters each cylindrical reel-type cutter having an integral worm gear intermediate opposite ends thereof, trunnions at opposite ends, respectively, of each cylindrical cutter arranged to rotatably mount said cylindrical reel-type cutters in over-and-under spaced parallel relationship within said slotted cutter guard with the longitudinal axis of each cylindrical cutter at substantially right angles to the slots in said slotted cutter guard, a vacuum chamber in said shaving head assembly rearwardly of said cylindrical reel-type cutters, a motor mounted within said casing rearwardly of said vacuum chamber, said motor having a drive shaft arranged to extend forwardly into said shaving head assembly, a worm gear integral with the forward end of said drive shaft the said worm gear of said drive shaft arranged in driving engagement with the respective worm gears of said cylindrical reel-type cutters thereby to rotate said cylindrical reel-type cutters, a disc-like vacuum impeller afixed to said drive shaft within said vacuum chamber, a discharge port in the rear end of said casing, internal passage within said casing arranged to connect said vacuum chamber to said discharge port, said drive shaft arranged to rotate said disc-like vacuum impeller to create a vacuum force within said shaving head assembly.

4. An electric dry shaver according to claim 1 wherein said casing is constructed and arranged with lotion dispensing means comprising a chamber having a flexible wall, a conduit arranged to connect the lotion chamber to said shaving head assembly, and rotatable means arranged to be actuated automatically by said disc-like vacuum impeller to engage and deflect the said flexible wall of said lotion chamber thereby to dispense lotion therefrom to said shaving head assembly.

4,031,619
MANUAL, HYDRAULICALLY OPERATED TOOL

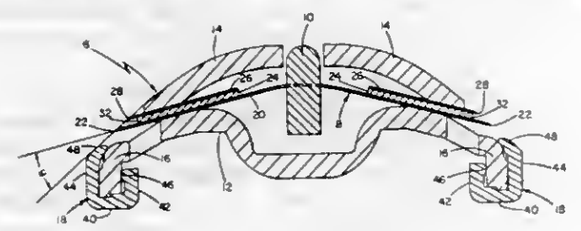
Jack T. Gregory, 390 Redwood Road, San Anselmo, Calif. 94960

Filed Jan. 19, 1976, Ser. No. 650,559
Int. Cl.² B26B 17/00; B25B 7/22
U.S. Cl. 30—180 19 Claims



1. An improved hydraulically operated tool of the type having a cylinder chamber closed at one end, a hydraulic ram within the cylinder chamber, a fluid reservoir, hydraulic pumping means fed by the reservoir for driving the ram out of the cylinder chamber, and work engaging elements operatively connected to the ram and cylinder chamber, wherein the improvement comprises mounting the pumping means in part within the ram, the pumping means including a fluid filled pump chamber within the ram, check valve means mounted in the ram, and wherein the tool further includes means for providing fluid communication between the reservoir and the check valve means and the pumping means further includes means mounted on the ram for pumping fluid from the reservoir through the fluid communication means and the check valve means into the cylinder chamber at the closed end to force the ram to move out of the cylinder chamber thereby operating the work engaging elements.

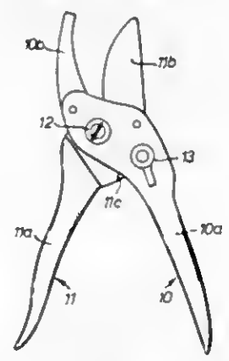
4,031,620
SHAVING SYSTEM
Edward E. Pomfret, Newbury, England, assignor to The Gillette Company, Boston, Mass.
Division of Ser. No. 536,484, Dec. 26, 1974, Pat. No. 3,958,692, which is a division of Ser. No. 381,768, July 23, 1973, abandoned. This application Jan. 28, 1976, Ser. No. 652,995
Claims priority, application United Kingdom, July 25, 1972, 34715/72; July 25, 1972, 34716/72; July 25, 1972, 34717/72
Int. Cl.² B26B 21/54
U.S. Cl. 30—346.57 5 Claims



1. A disposable blade unit comprising a thin, transversely flexible blade which is apertured along its longitudinal center line and has its two longitudinal edges parallel and sharpened to cutting edges, a pair of blade strips each having a length substantially equal to that of the blade and a width less than half that of the blade and each sharpened along one longitudinal edge only, said pair of blade strips lying in a plane parallel to but spaced from that of the blade, and a pair of spacer strips each interposed between the adjacent faces of the blade and a respective one of the blade strips and bonded to both of said faces to secure the two blade strips to the blade with the blade strips disposed symmetrically on opposite sides of the longitudinal center line of the blade with their sharpened edges directed outwardly and extending parallel to the sharpened edges of the blade, said blade having an exposed central portion between the blade strips, the distance between the cutting edge of each blade strip and the longitudinal center line of the blade differing significantly from the distance between each cutting edge of the blade and the said center line, the outer edge of each spacer strip being spaced inwardly from the nearer of the adjacent cutting edges by a distance of at least 0.02 inch, and the cutting edge of each blade strip being spaced from the cutting edge of the blade by a fixed distance of from 0.03 to 0.08 inch, each edge of the blade and the edge of the adjacent blade strip being in a fixed geometrical relation does not change as the blade unit is clamped in a safety razor with said central portion of the blade bent so that the portion of the blade to which one blade strip is secured is exposed at an angle to the portion of the blade to which the other blade strip is secured.

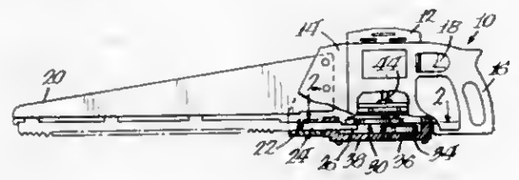
4,031,621
HAND TOOLS
John Arlett, Camberley, England, assignor to Wilkinson Sword Limited, England
Filed July 16, 1976, Ser. No. 706,119
Claims priority, application United Kingdom, July 16, 1975, 29737/75
Int. Cl.² B26B 13/16
U.S. Cl. 30—262 8 Claims

1. A hand tool comprising two members, two handles connected to the respective members and movable to move said members relatively to one another and a manually-operable catch having a shank mounted for rotation in one of said members and including a detent rotatable by the catch into and out of a position in which it prevents or restricts relative movement between the members, the shank being received in an aperture of said one member which is so shaped relative to the shank that over a predetermined range of rotation of the catch away from the position in which the shank was inserted into the aperture, the shank is prevented from withdrawal from the aperture, and said one member is so shaped that it permits the detent to be fitted to or removed from the shank



only when the catch is within said range of rotation and, after fitment of the detent, restricts rotation of the catch to said predetermined range.

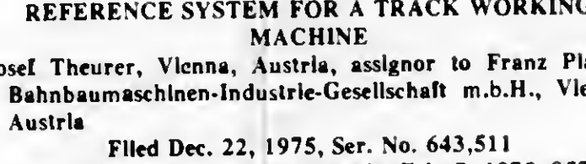
4,031,622
PORTABLE POWER DRIVEN IMPLEMENT
Carl J. Alexander, Moore Park, Mich., assignor to Wells Manufacturing Corporation, Three Rivers, Mich.
Filed Oct. 28, 1975, Ser. No. 626,296
Int. Cl.² B27B 19/04; A01D 46/00
U.S. Cl. 30—392 23 Claims



1. A portable power driven implement comprising:
housing means;
a tool member slidably supported by said housing means for reciprocating motion relative thereto, said tool member having an inner end;
motor means;
drive means adapted to be rotated by said motor means;
the axis of said drive means and the inner end of said tool member defining a plane passing therethrough;
output means rotatably driven by said drive means;
means linking said tool member and said output means for imparting reciprocating motion to said tool member in response to rotation of said output means, said linking means including:
one end portion connected to the inner end of said tool member;
another end portion connected to said output means traversing and intersecting said plane during rotation of said output means; and
an intermediate portion spanning said drive means and configured to remain substantially on one side of said plane.

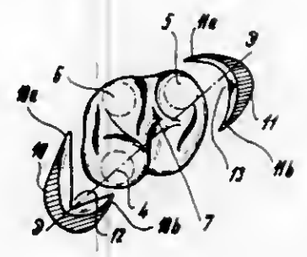
4,031,623
LINGUAL BLADED TOOTH
Bernard Levin, 2077 E. Meadowbrook Road, Altadena, Calif. 91001
Filed June 23, 1975, Ser. No. 589,057
Int. Cl.² A61C 13/00
U.S. Cl. 32—8 11 Claims

1. An insert for use as a lingual cusp of an anatomic artificial tooth, said insert comprising:
means for cutting and shearing food including at least one blade having a convex edge arched outward away from the occlusal surface, said blade being formed of a substance harder than that of the artificial tooth; and
means for securing the insert in the artificial tooth; whereby



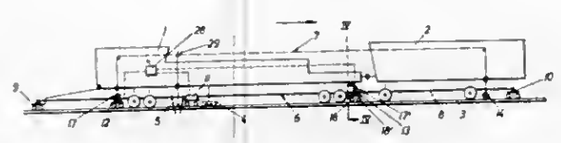
the user is able to chew and shear food with forces substantially less than those required by natural teeth, thereby permitting denture wearers to chew food without distress.

4,031,624
EXTRACTION FORCEPS FOR UPPER MOLARS
Werner Helmann, Warendorfer Strasse 27, 4740 Oelde, Germany
Filed Jan. 15, 1976, Ser. No. 649,466
Int. Cl.² A61C 3/14
U.S. Cl. 32—62 10 Claims



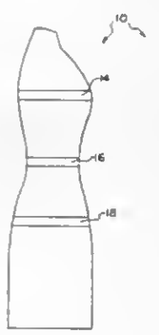
1. Extraction forceps for upper molars, comprising a pair of arms each having an end portion provided with a tooth-engaging jaw formed with claws defining a recess between themselves; and means connecting said arms for relative pivoting movement of said jaws about a pivot axis which extends perpendicularly to planes of closure of said jaws, whereby the forces required for extraction of one of said upper molars are inclined with reference to a skew plane passing through the recesses of said jaws.

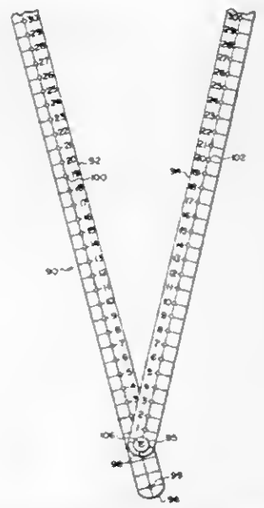
4,031,625
REFERENCE SYSTEM FOR A TRACK WORKING MACHINE
Josef Theurer, Vienna, Austria, assignor to Franz Plasser Bahnbaumaschinen-Industrie-Gesellschaft m.b.H., Vienna, Austria
Filed Dec. 22, 1975, Ser. No. 643,511
Claims priority, application Austria, Feb. 7, 1975, 957/75
Int. Cl.² E01B 33/00
U.S. Cl. 33—1 Q 7 Claims



1. In a reference system for a track working machine mounted for mobility on the rails of a track, which reference system comprises an elongated flexible reference line having two end points and two intermediate measuring points, one of the intermediate measuring points being located in a corrected track section and another one of the intermediate measuring points being located in a track section to be corrected, bogies connected to the machine at each one of the reference line points, the two end point bogies each including means for securing the associated end point of the reference line thereto, and each of the two intermediate bogies including means to sense the position of the associated measuring point of the reference line with respect to the bogie, and drives holding each of the bogies under lateral pressure against a selected one of the track rails: the improvement of two clamping mechanisms associated with the reference line, each clamping mechanism being fixedly connected to a respective one of the intermediate bogies at the intermediate reference line points for selectively reducing and increasing the effective measuring length of the reference line between the end points thereof.

4,031,626
METHOD FOR DRAFTING GARMENT PATTERNS AND MEANS FOR PRACTICING SAME
Marjorie M. Dyal, 1934 S. Kenilworth, Berwyn, Ill. 60402
Filed Feb. 20, 1975, Ser. No. 551,268
Int. Cl.² A41H 3/06
U.S. Cl. 33—17 R 7 Claims





1. A method of making proportionally graded garment pattern component by forming a graphical representation having X and Y axes upon a receptor sheet, said method comprising the steps of: applying a first plurality of equispaced parallel vertical lines and a second plurality of equispaced parallel horizontal intersecting said first plurality and upon said receptor sheet to form the graphical representation, determining the spacing of said first plurality along the X axis by measuring around the figure and dividing the measurement so obtained by a factor of 4 to provide a first spacing factor, measuring the center front length of the figure along a line leading from the base of the neck of the figure to the ground and dividing said last-mentioned measurement by a factor of 4 deriving a tentative factor and adding a predetermined factor of 2 to the tentative factor to provide said second spacing

factor, the spacing between vertical lines being equal to the first factor and the spacing between horizontal lines being equal to the second factor, marking off a pair of rules with quarter-inch spaced graduations representing the first and second factors and carrying indicia correlating the graduation representing said factors to the measurements from which said factors are derived, marking off said distances along the respective X and Y axes and constructing the graphical representation, and thereafter applying universally applicable pattern layout instructions correlated in terms of said graphical graduations to the specific graphical representation whereby when the universal layout instructions are plotted on the graphical representation for any individual figure, patterned components layed out thereon will be properly proportioned for the said individual figure represented by said graphical representation.

4,031,627

LINE HOLDERS FOR BRICK AND CONCRETE BLOCK LAYING

Joseph Dar, 3036 S. Valentia, Denver, Colo. 80231

Filed July 12, 1976, Ser. No. 667,208
Int. Cl.² G01C *15/10*; **B43L** *7/00*; **B44D** *3/00*
U.S. Cl. 33—85 **1 Claim**

1. A pair of mason's line guide holders each of which comprises: a steel wire of a diameter small enough to be inserted into a course of freshly laid morter, the wire being bent to form a generally U-shaped member having two side legs and a base, all of which are generally straight, the side legs being substantially parallel, the connection of each of the side legs to the base comprising a corner formed by a bend in the wire of approximately two hundred seventy degrees so that a loop is formed at each corner, the base extending a distance such that as one of the side legs is pushed into a previously laid course of morter the base spans a plurality of previously laid courses of bricks and the other side leg is spaced a small distance from, and extends over a brick in the course of bricks which is presently being laid, so that the holder can pivot a slight angle about said one leg and the other leg will engage the top surface of said brick and the loop at each corner being formed in a size sufficient to receive said masons line therein.

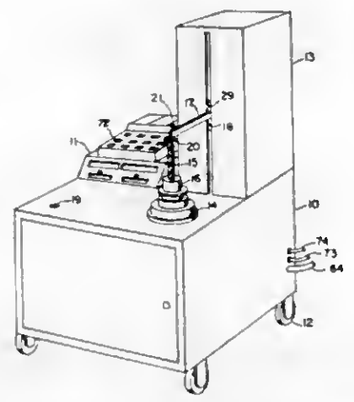
4,031,628

ELECTRONIC TOOL GAGE

Carl W. Kaesemeyer, 2605 Marlington Ave., Cincinnati, Ohio 45208

Filed July 8, 1975, Ser. No. 594,124
Int. Cl.² G01B *5/02*
U.S. Cl. 33—201 **1 Claim**

1. An electronic tool gage device for measuring the length and/or diameter at selected points of tools used in machine tools, the gage device comprising a chassis within a portable cabinet, a column affixed to said chassis, a tool socket affixed to said chassis for receiving tools whose length and/or diameter is to be measured, a slidable carriage adapted to be moved vertically on said column, air bearings mounted on said carriage to give friction free movement between the said carriage and said column, a counter weight to balance said carriage, said carriage supporting a horizontal slidable arm, said carriage having air bearings to give friction free movement between the said arm and said carriage, a first sensing device mounted on said carriage for measuring the length of tools



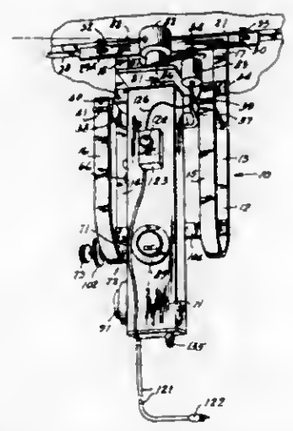
relative to said tool socket, a second sensing device mounted on said arm for measuring the diameter of tools relative to the center line of said tool socket, said sensing devices moving as a single unit, and means for visually displaying the length and/or diameter data.

4,031,629

APPARATUS FOR ESTABLISHING A LEVEL PLANE

George Paluck, 2156 W. Cuyler Ave., Chicago, Ill. 60618

Filed Mar. 30, 1976, Ser. No. 672,035
Int. Cl.² G01C *5/00*; **G01B** *11/26*
U.S. Cl. 33—290 **8 Claims**



1. A laser holding and adjusting bracket for supporting a laser on a wall moulding at a desired orientation and height comprising,

an angle member with one extension of the angle resting on and mating with a horizontal extension of the wall moulding, a pair of clamps releasably clamping said one extension to said horizontal extension, said angle member having its other extension thus held in a vertical orientation,

a main frame member attachable to said other extension.

a C-shaped member pivotally attached to said main frame member and pivotal about a first horizontal axis,

a generally vertical laser supporting frame member pivotally attached to said C-shaped member on a second horizontal axis which is at right angles to said first horizontal axis,

a means for adjusting said supporting frame about said first and second axis,

a laser housing,

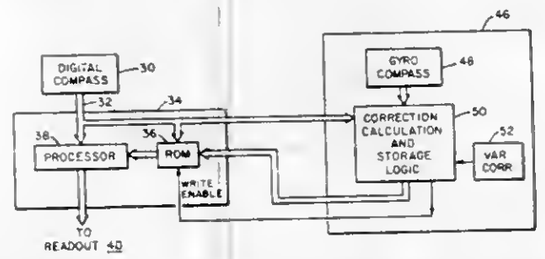
an attachment member conneeted to said laser housing and adjustable attachment means connecting said attachment member to said generally vertical laser supporting frame member for vertical adjustment of said attachment member with respect to said supporting frame member.

4,031,630

CALIBRATION APPARATUS FOR AUTOMATIC MAGNETIC COMPASS CORRECTION

John T. Fowler, Winthrop, Mass., assigoor to The Laitram Corporation, Harahan, La.

Filed June 17, 1976, Ser. No. 697,195
Int. Cl.² G01C *17/38*
U.S. Cl. 33—356 **9 Claims**



1. Apparatus for providing a deviation-correeted output signal representative of an actual compass heading comprising:

a magnetic compass providing an output signal representative of an indicated compass heading;

means for storing deviation-correction signals representative of the deviation of the compass for each of a plurality of different indicated headings;

means for retrieving the stored deviation-correction signal corresponding with the indicated compass heading in response to the output signal from the compass;

means responsive to the retrieved deviation-correction signal and to the compass output signal for producing a deviation-corrected output signal representative of the actual compass heading; and

a calibration eircuit, including

means for providing signals representative of the actual heading of the compass;

means for providing the compass output signal to the calibration eircuit;

means responsive to the signals representative of the actual heading and to the compass output signal for providing signals representative of the difference therebetween; and

means for eausing the difference signals to be stored by the storing means.

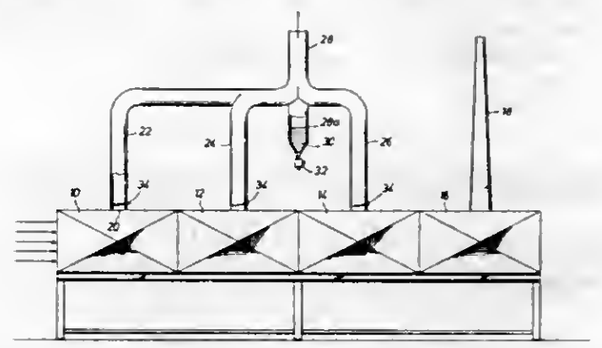
4,031,631

APPARATUS FOR REDUCING THE OPACITY OF THE EMISSIONS FROM WOOD DRYERS

John W. Robinson, Silsbee, Tex., assignor to Kirby Lumber Corporation, Houston, Tex.

Filed Juoe 20, 1975, Ser. No. 588,762
Int. Cl.² F26B *19/00*
U.S. Cl. 34—235 **2 Claims**

1. In a dryer for veneer having a plurality of heated zones through which the veneer moves as it is being dried and an exhaust outlet associated with each zone for venting gases and vapors from the zone, the improvement for reducing the opacity of the vented gases and vapors comprising a common stack, conduit means connecting each stack to the common stack, and means for insulating the conduit means to reduce



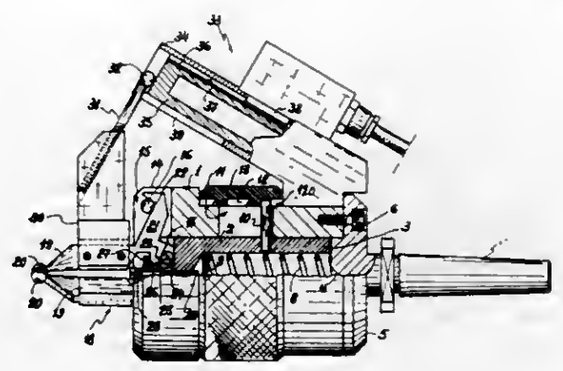
the heat loss of the vented gases and vapors as they travel to the common stack.

4,031,632

CENTERING AND MEASURING HEAD FOR MEASURING MACHINES

Georges Lendi, Crissier; Serge R. Ginggen, Renens, and Gildo Vadi, Cottens, all of Switzerland, assignors to Tesa S.A., Renens, Switzerland

Filed Sept. 29, 1975, Ser. No. 617,384
Claims priority, application Switzerland, Oct. 24, 1974, 14228/74
Int. Cl.² G01B *5/08*, *7/12*
U.S. Cl. 33—178 R **4 Claims**



1. A centering and measuring head for measuring machines, comprising:

a. a tubular body;

b. a piston slidably mounted within said body for longitudinal movement therein;

c. a resilient means biasing said piston towards one end of said tubular body;

d. at least two transverse shafts disposed at said one end of said tubular body, said shafts being tangential with an imaginary circle concentric with the axis of the piston;

e. cylindrical pin means;

f. at least two centering keys disposed at said one end of said tubular body, each said eentering keys formed of a contact arm assembled to a control arm in a substantially L-shape, and each of said control arms comprises two alternate V-shaped parts having ridges which are parallel to each other, and one of said V-shaped parts is oriented in a direction opposite to the piston head and applied against said shaft with its ridge parallel thereto, the other V-shaped part being oriented in the direction of the piston head and engaged on said cylindrical pin means parallel to the ridge thereof and bearing against the piston head;

g. means for connecting said control arms of said centering keys to said piston;

h. means for controlling the displacements of said piston against the bias of said resilient means; and

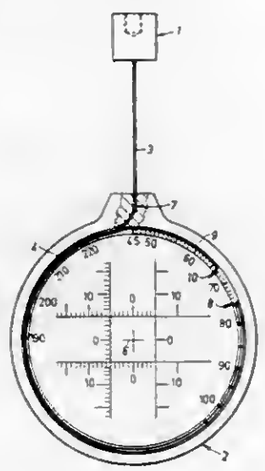
i. bar means connected to each of said control arms and inserted into the ends of said cylindrical pin means, whereby said cylindrical pin means is connected to the V-shaped part with a certain floating play.

4,031,633

SCALE FOR USE IN MEASURING AND STRAIGHTENING DAMAGED VEHICLES IN A SO-CALLED VEHICLE ALIGNMENT APPARATUS

Bengt Anders Bjork, Eskilstuna, Sweden, assignor to Aktiebolaget Nike Hydraulik, Eskilstuna, Sweden

Filed June 28, 1976, Ser. No. 700,261
Int. Cl.² G01B *5/25*; **G01C** *15/08*; **G01B** *11/26*
U.S. Cl. 33—288 **3 Claims**



1. A scale for use in measuring and straightening damaged vehicles in a so-called vehicle alignment apparatus, especially when the measuring is made by using a laser beam, said scale including a fastening means for freely depending fastening of the scale at certain locations on the vehicle, a scale body having a graduated scale, and a line cross that is adjustable to a selected position in relation to the fastening means, the graduated scale indicating the distance of the line cross from a predetermined reference point, characterized in that the scale body and the graduated scale both have a circular shape with the line cross arranged in the center of the scale body, and in that an annular groove is cut in the scale body along the scale, a flexible band extending substantially radially from the scale body and which at its free end is connected to the fastening means and at its other end is provided with an index means said groove receiving said flexible band so that said flexible band so that said index means registers with said scale, the distance of the line cross from the reference point.

4,031,634

TEACHING DEVICE

Edwin Stastny, Santa Ana; Keith Rauch, Los Angeles, and Ronald Young, Simi Valley, all of Calif., assignors to Calfiope International, Inc., Los Angeles, Calif.

Filed Nov. 24, 1975, Ser. No. 634,493
Int. Cl.² G09B *5/04*; **G11B** *5/55*, *25/04*
U.S. Cl. 35—8 A **17 Claims**

1. A teaching device employing cards, each card including printed indicia and a magnetic strip thereon comprising

a chassis;

a card path extending across said chassis;

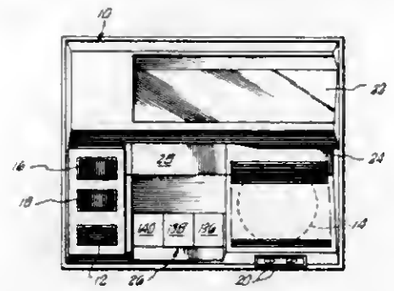
a magnetic recording and reproducing head assembly mounted on said chassis and selectively extending to said card path;

sound recording and reproducing means associated with said head assembly for recording on the magnetic strip and for reproducing that which has been recorded on the magnetic strip, including selector switch means for selecting from recording and reproducing modes;

means for moving the card along said card path for both advancing and retracting the card past said head assembly, said means for moving the card being activated to drive the card forward across said head assembly by insertion of the card in said card path;

track selection means for actuating said head assembly to select a track on the magnetic strip;

main control means for controlling said track selection means and said means for moving the card in said selector switch means, said main control means including first control means for actuating said means for moving the card to return the card to a starting position in said card



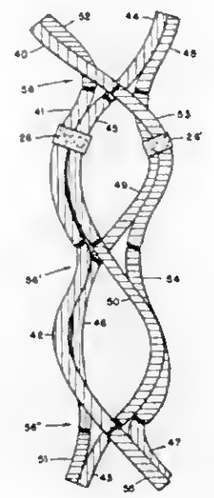
path, for actuating said track selection means to select a first track on the magnetic strip and for actuating said selector switch means to select the reproducing mode, second control means for actuating said means for moving the card to return the card to a starting position in said card path, for actuating said track selection means to select a second track on the magnetic strip and for actuating said selector switch means to select the reproducing mode, and third control means for actuating said means for moving the card to return the card to a starting position in said card path, for actuating said track selection means to select the second track on the magnetic strip and for actuating said selector switch means to select the recording mode.

4,031,635

MANIPULATIVE CHROMOSOMAL MODEL

Edward E. Brandt, and Margaret K. Brandt, both of 208 Doak Drive, Greeneville, Tenn. 37743

Continuation-in-part of Ser. No. 568,024, April 14, 1975, abandoned. This application Aug. 20, 1976, Ser. No. 716,279
Int. Cl.² G09B *23/36*
U.S. Cl. 35—20 **6 Claims**



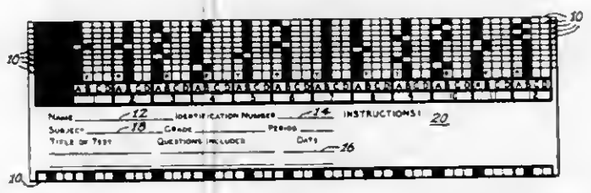
1. A manipulative chromosome model to be placed on a flat surface for the study of chromosomal changes and processes which comprises: from two to four limp generally cylindrical subunits representing chromosome segments, each subunit having a length of about 4 to about 8 inches and a diameter of about ¼ to ⅜ inch; a first half of a contact sensitive reusable fastener affixed to one end of each subunit substantially perpendicular to the length of the subunit; and a second half of the fastener affixed to the second end of each subunit substantially perpendicular to the length of the subunit whereby the subunits may be placed on the flat surface and serially joined to form a simulated chromosome.

4,031,636

CARD GRADING SYSTEM

John M. Hurt, Jr., P.O. Box 126, Smyrna, Tenn. 37167

Filed Nov. 28, 1975, Ser. No. 635,864
Int. Cl.² G09B *3/08*
U.S. Cl. 35—48 A **9 Claims**



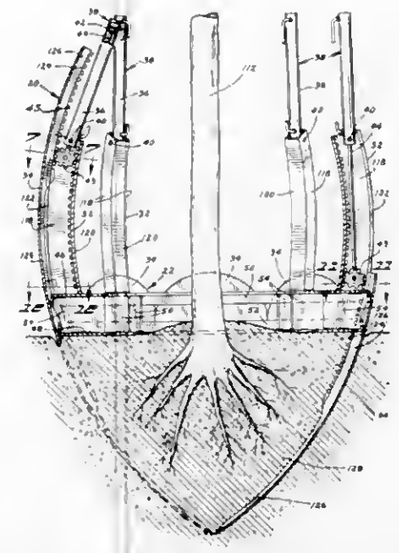
1. An answer card bearing at least one lengthwise column of true-false/multiple-choice answer spaces having lines thereon for marking between to indicate answers to a plurality of questions, said card being adapted to be folded along the length of said answer spaces so as to present, when viewed from above, a top rim edge which will offer a visible mark thereon when folded and compacted together in a stack with a plurality of said cards after said lines have been marked between and a key card at least one end of the stack with lines marked between to indicate correct answers.

4,031,637

TREE TRANSPLANTING MACHINE

Walbert A. Stocker, Jordan, Minn. 55352

Filed July 14, 1976, Ser. No. 705,095
Int. Cl.² A01B *13/00*
U.S. Cl. 37—2 R **11 Claims**



1. A machine for digging trees from the earth, said machine including:

A. a ring stand;

B. means for situating said stand in encircling relation to a tree to be transplanted;

C. a plurality of stanchions extending upwardly from said stand;

D. a plurality of digging spoons, each mounted for guided, sliding movement with respect to one of said stanchions and with respect to said stand between an upper position situated substantially out of the earth in parallel alignment with its stanchion, and a lower position wherein its lowermost portion meets with the lowermost portions of the other spoons when in said lower position;

E. said spoons when all in said lower position together isolating and separating the roots of said tree and the earth encompassing the roots and situated inside said spoons from the rest of the earth thus to define a tree ball;

F. power digging means for selectively moving each spoon between said upper and lower positions;

G. power lifting means for lifting said machine and tree and tree ball from the earth;

H. said power digging means includes a linear digging motor adapted to be anchored to an upper portion of each stanchion and having a powered linearly movable rod extending downwardly therefrom;

I. at least one generally cylindrical actuator rotatably mounted on the downward end of said motor rod; and

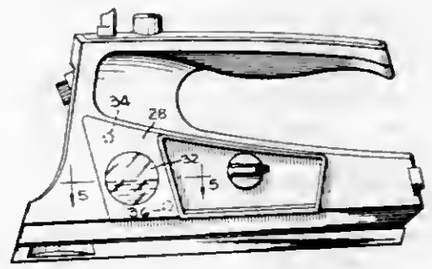
J. means operably assembled with said stanchion, said actuator and its digging spoon for causing said spoon to be moved at least twice the distance of movement of said actuator in response to movement of the actuator in the same direction.

4,031,638

STEAM IRON WATER GAUGE

William D. Ryckman, Jr., and Lester D. Little, both of Asheboro, N.C., assignors to General Electric Company, Bridgeport, Conn.

Filed Aug. 20, 1976, Ser. No. 716,103
Int. Cl.² D06F *75/06*
U.S. Cl. 38—77.2 **9 Claims**



1. An iron comprising:

a soleplate,

exterior wall means positioned above said soleplate in a fixed position relative to said soleplate, a selected wall portion of said exterior wall means having a vertical portion when the iron is positioned both horizontally and vertically,

a water reservoir within said exterior wall means at least partially defined by said selected wall portion, and

cover means secured and peripherally sealed to the outer surface of said selected wall portion and defining therewith a chamber intermediate said cover means and said selected wall portion, at least a portion of said cover means being transparent to permit said chamber to be viewed through said cover means,

said selected wall portion having at least two relatively small spaced-apart openings therein providing direct communication between said chamber and said water reservoir,

each opening being disposed out of view through said transparent portion,

one of said openings communicating with a relatively low portion of said water reservoir and another of said openings communicating with a relatively high portion of said water reservoir

when said soleplate is disposed horizontally or vertically, whereby a range of water levels within said water reservoir may be determined by observing the water level in said chamber through said cover means when the iron is disposed both horizontally and vertically.

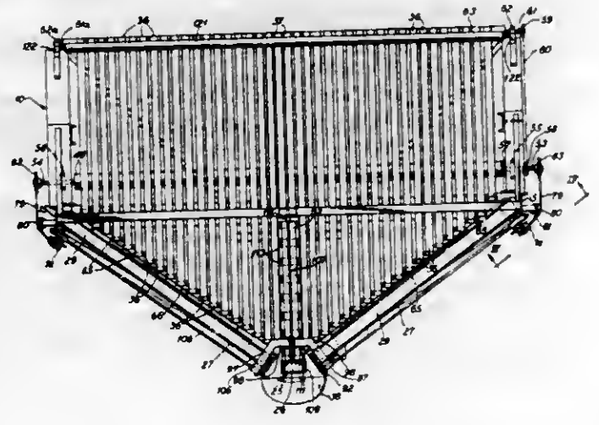
SPREADER-FEEDER FOR FLATWORK IRONER

Logan D. McCabe, Rte. 4, Box 8, Lubbock, Tex. 79413, and Stanley G. McCabe, 5302 11th, No. 146, Lubbock, Tex. 79416

Filed Oct. 26, 1976, Ser. No. 735,257
Int. Cl.² D06F 67/04
U.S. Cl. 38—143 29 Claims



1. In an apparatus for spreading and feeding flat laundered articles for ironing and like operations,

a main frame,

a pair of vertically spaced upper and lower power-driven central conveying belts supported on said main frame and extending along the central portion thereof,

means supporting the upper of said belts to establish a pressure nip between said belts,

spreader means mounted on said main frame on opposite sides of said upper and lower central belts and diverging therefrom as extending therealong,

a plurality of equally spaced power-driven carry-out belts extending from said spreader means at opposite sides of said central belts, and extending parallel to said central belts to the discharge end of the apparatus, and providing a substantially continuous article carrying surface for the length of the apparatus,

said spreader means including a pair of vertically spaced power-driven belts on each side of said central belts and extending in angular relation with respect to said central belts at equal angles with respect to said central belts, and

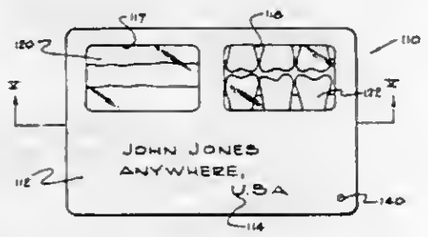
means maintaining pressure nips between said angularly extending belts for spreading and maintaining the laundered articles square with respect to said central belts as carried along the apparatus by said central belts.

4,031,640

IDENTIFICATION SYSTEM

Charles B. Hanna, Jr., 113-B Willow Run, Fayetteville, N.C. 28301, and William W. Coleman, 1646 Colony Road, Rock Hill, S.C. 29730

Filed Dec. 8, 1975, Ser. No. 638,466
Int. Cl.² G09F 3/02
U.S. Cl. 40—2.2 5 Claims



1. An improved identification system comprising:

a. a base of a predetermined thickness, said base having at least one radiograph receiving area therein and a personal data receiving area thereon;

b. at least one dental radiograph received in said at least one radiograph receiving area, said at least one dental radiograph having a thickness approximating that of said base;

c. a first sheet of transparent thermoplastic film disposed on one side of said base and radiograph and extending beyond the edges of same, said film being thermally bonded to said radiograph;

d. a second sheet of transparent thermoplastic film disposed on an opposite side of said base and said radiograph and extending beyond the edges of same, said second sheet of film being thermally bonded to said opposite side of said radiograph and to exposed surfaces of said first sheet of film to totally enclose said base and said radiograph, said thermal bonding between said sheets of film and said sides of said radiograph being sufficient to destroy said radiograph upon delamination of said film; and

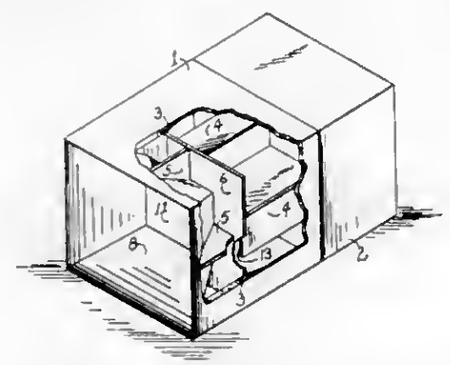
e. tactile orientation means on one of said sheets of film.

4,031,641

COMBINED CONTAINER AND VIEWER PACKAGE FOR FILM TRANSPARENCIES

Jordan Ross Kaiser, Burying Hill Farm, Burrying Hill Road, Greenwich, Conn. 06830

Continuation of Ser. No. 611,175, Sept. 8, 1975, abandoned.
This application July 6, 1976, Ser. No. 703,063
Int. Cl.² G09F 11/30
U.S. Cl. 40—63 A 9 Claims



1. A mailable combined container and view package for film transparencies comprising: a substantially rectangular shaped holder for holding a stack of film transparencies and forming one part of said package; a substantially rectangular shaped viewer part provided with an open back end and having a framed opening behind which a single film transparency is located, and means on said holder part for holding said single film transparency in said framed opening when said holder is inserted through the open back end of said viewer part.

4,031,642

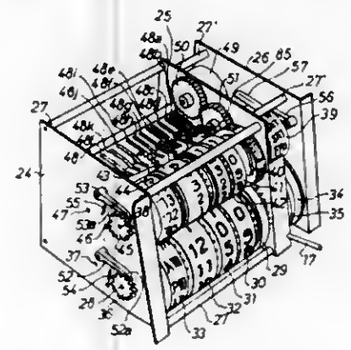
AUTOMATIC CALENDAR

Motomu Aoki, Atsugi, and Akira Isbikawa, Tokyo, both of Japan, assigoors to Motomu Aoki, Japao

Filed Apr. 11, 1974, Ser. No. 460,182
Claims priority, application Japan, Apr. 14, 1973, 48-42438; Dec. 26, 1973, 49-339; Jan. 28, 1974, 49-10963
Int. Cl.² G09D 3/06
U.S. Cl. 40—111 5 Claims

1. A calendar comprising a units display drum having a periphery and displaying a plurality of spaced numerals in the sequence 0,1,1,2,3,4,5,6,7,8, and 9 at equal intervals on the periphery of the units display drum, a tens display drum having a periphery and displaying a plurality of spaced numerals in the sequence 0, 1, 1, 2, 2, and 3 at equal intervals on the periphery of the tens display drum, a calendar main shaft for concentrically supporting the units display drum and the ten's

display drum adjacent each other, support means for supporting said shaft, said support means having index means adjacent said drums for indicating a single numeral on each of said drums, stepping means coupling the units display drum to the tens display drum for advancing the tens display drum relative to the index means once when the numeral of the units display



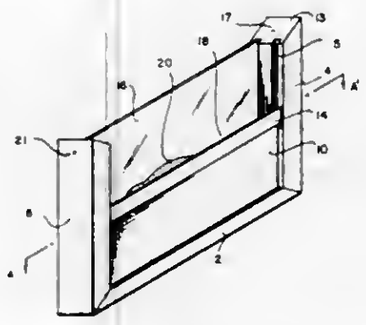
drum appearing at the index means changes from 9 to 0 once when the numeral of the units display drum appearing at the index means changes from 1 to 1, and rotating means for rotating the units display drum to move a numeral past the index means each day so as to display the days of a month in sequence.

4,031,643

SAND PICTURE FRAME

Charles P. Templetoo, 104 Cleveland Road, Rossville, Ga. 30741

Filed May 14, 1976, Ser. No. 686,313
Int. Cl.² G09F 19/00
U.S. Cl. 40—160 8 Claims



1. An Apparatus for creating a sand painting, comprising:

a frame comprised of a horizontally disposed bottom member and two vertically disposed side members connected to said bottom member at opposite ends thereof, said side members each having a first vertical groove;

a first backing plate which is mounted in said first grooves of said side members, having a vertical dimension of approximately one half the magnitude of the vertical dimension of said side members;

a transparent plate which is mounted in a second vertical groove in each of said side members, forward of said first vertical grooves, forming a lower portion of a cavity with said frame and said first backing plate, which is accessible from the top edge of said first backing plate for the introduction of sand therein,

a second backing plate which slidably engages said first grooves of said side members with a lower edge supported by said top edge of said first backing plate, having a vertical dimension of approximately one half that of said side members, for forming an upper portion of said cavity which is accessible from the top edge of said second backing plate for the introduction of said therein;

a horizontally disposed top member having opposite ends connected to the top ends of said vertical side members, and slidably engaging the top edge of said second backing plate and the top edge of said transparent plate, for sealing said sand within said cavity.

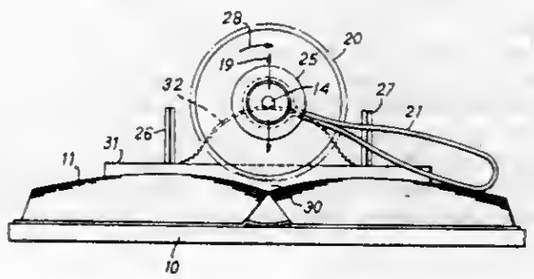
whereby designs may be conveniently formed by said sand in said lower portion of said cavity from the relatively close proximity of said top edge of said first backing plate.

4,031,644

PAGE-TURNERS

Peter Rogers, Addlestone, England, assigoor to Possom Controls Limited, Aylesbury, England

Filed Apr. 12, 1976, Ser. No. 675,758
Claims priority, application United Kingdom, Apr. 18, 1975, 16174/75
Int. Cl.² G09F 11/00
U.S. Cl. 40—104 A 4 Claims



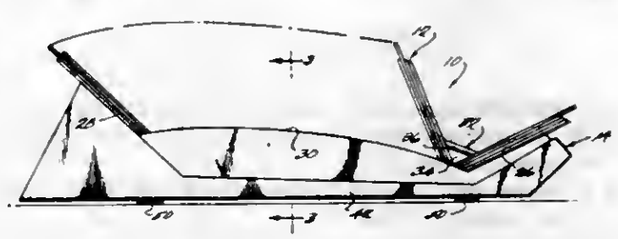
1. Apparatus whereby the pages of a book can be turned by remote control, comprising a mounting board for supporting a book and having a reversible electric motor mounted thereon, the motor having an output shaft extending therefrom over and generally parallel to the mounting board and being pivotally mounted for swinging movement of the output shaft through limited angles across and perpendicular to the mounting board, the output shaft having affixed thereto a friction-wheel for rolling across the pages of a book resting on the mounting board when the wheel is driven by the motor to thereby turn said pages, and a radial finger adjacent the wheel and coupled to the shaft through a slipping clutch whereby when the shaft reaches a limit of swing across a book the wheel can continue its rotation with the finger held against rotation by engagement with the mounting board.

4,031,645

TRAY TYPE CARD FILE

Lloyd E. Rose, North Smithfield, and Joseph P. Maruca, Coventry, both of R.I., assignors to Textron, Inc., Providence, R.I.

Filed Sept. 18, 1973, Ser. No. 398,439
Int. Cl.² G09F 11/06
U.S. Cl. 40—68.6 12 Claims



1. Apparatus for supporting a multiplicity of cards of the type having a pair of parallel T-shaped slots formed along one edge thereof, each of which defines a pair of opposed flexible edge tabs, said apparatus comprising a unitary one piece structure molded of plastic material arranged to be supported on a horizontal surface, said structure including front and rear card supporting walls spaced apart to receive a multiplicity of cards therebetween in row formation, said front wall having rearwardly and upwardly facing surface means for supporting

a forwardmost card of the row along the forward face thereof in a forwardly and upwardly inclined position, said rear wall having forwardly and upwardly facing surface means for supporting a rearwardmost card of the row along the rearward face thereof in a rearwardly and upwardly inclined position, a pair of transversely spaced card supporting walls extending between the lower portions of said front and rear walls, said transversely spaced walls having upwardly facing surfaces disposed in a common plane for supporting the entire row of cards along the portions of the slotted edges thereof extending outwardly from the T-shaped slots therein, a lower rail section extending vertically upwardly along the inner portion of each of said transversely spaced walls between said front and rear walls, an upper rail section formed along the upper portion of each lower rail section and extending transversely outwardly therefrom in both directions, said rail sections having surface means facing in both lateral directions for engaging the slot defining edges of the cards to prevent transverse movement thereof out of the row formation, said upper rail sections having downwardly facing surface means on opposite sides of each lower rail section for engaging corresponding opposed flexible tabs of the cards to normally prevent upward movement of the cards out of the row but permitting such movement through flexure of the tabs, said structure being devoid of material in the space disposed vertically beneath and between the opposed portions of the said upper rail sections extending transversely inwardly of the associated lower rail sections.

4,031,646

SUSPENDIBLE FILING FOLDER

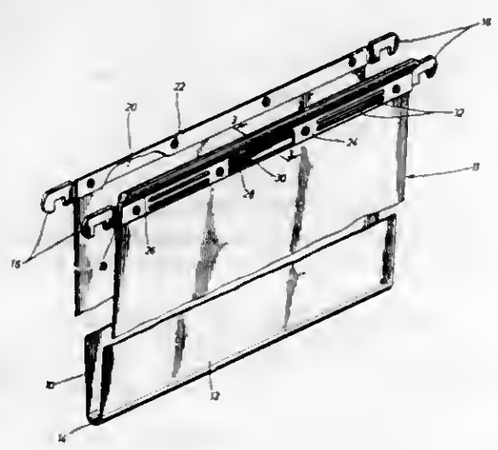
Chantal de Nouël, Paris, France, assignor to Societe d'Exploitation de la S.A. Henri Malsert, Lyon, France

Filed Oct. 21, 1975, Ser. No. 624,395

Claims priority, application France, Oct. 21, 1974, 74.35241

Int. Cl.² B42F *21/00*

U.S. Cl. 40—359 **7 Claims**



1. A vertically suspendable filing folder comprising:
a pair of suspension bars having means at the ends thereof to engage a support;
an envelope with a closed bottom affixed at its upper ends to said suspension bars;
a non-magnetizeable housing attached to one of said suspension bars for mounting a magnetic element thereto;
a permanent magnet disposed within said non-magnetizeable housing and surrounded thereby so as to have a surface thereof facing outwardly from said one of said suspension bars; and,
a region of ferromagnetic material disposed facing outwardly on the other of said suspension bar in opposing position to said magnet for magnetically engaging the magnet of an adjacent folder.

4,031,647

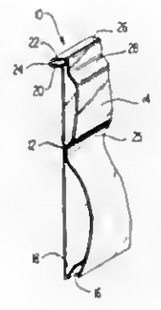
TITLE PROTECTOR

Reta Greenough Thomas, 101 S. Whiting St., No. 407, Alexandria, Va. 22304

Filed Feb. 10, 1976, Ser. No. 656,922

Int. Cl.² B42F *21/00*; **B65D** *27/00*

U.S. Cl. 40—359 **1 Claim**



1. A transparent folder for a document to be filed comprising:
a single sheet of transparent plastic including a front planar portion having an upper edge and a bottom edge,
a back planar portion coextensive and integral with said front planar portion and having an upper edge joined to said first-mentioned upper edge by a fold and both said front and said back planar portions having free bottom edges,
a title display tab extending outwardly from said front panel and formed by sections of said front planar and rear planar portions adjacent to said fold,
said back planar portion having a shallow groove parallel to and spaced from said upper edge a distance equal to the vertical distance the outer edge of said title display tab is spaced from said upper edge.
whereby when two or more of said folders are juxtaposed in front-to-back alignment with each other said groove of the frontmost of said folders will receive said outer edge of said tab of the folder located immediately therebehind,
a return lip formed on the bottom edge of said front planar portion to receive a bottom edge of said document and the bottom edge of said back planar portion, said document comprises a foldable sheet having a title bearing portion thereon, which title bearing portion may be folded and inserted in said title display tab, and
a second groove formed in said back planar portion such that said first and second grooves are in contact with the rear face of said front planar portion.

4,031,648

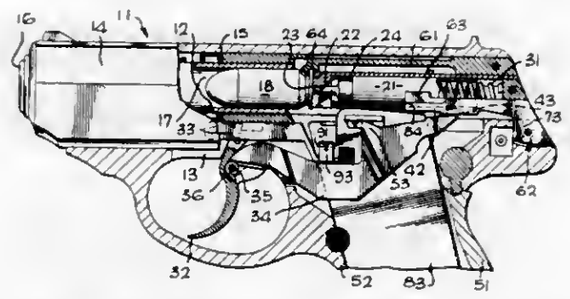
MAGAZINE SAFETY AND EJECTOR

Frank S. Thomas, 835 S. Cajon, West Covina, Calif. 91790

Filed Dec. 29, 1975, Ser. No. 644,437

Int. Cl.² F41C *17/08*

U.S. Cl. 42—70 A **9 Claims**



1. A magazine safety for a semi-automatic double action firearm having a magazine receiver, a cartridge magazine removeably fitted therein, and a cartridge extractor and wherein a firing pin is cocked and released for firing by a trigger bar pivotably connected to a trigger and resiliently urged into releasable engagement with said firing pin, said magazine safety comprising:
camming means comprising an elongated arm pivotably attached at one of its ends to the frame of said firearm and engaging said trigger bar at a point intermediate the ends of said arm for movement of said trigger bar out of engagement with said firing pin;
resilient means operatively connected between said frame and said camming means and rotating said camming means about its axis of rotation thereby holding said trigger normally out of engagement with said firing pin; and
restraining means comprising a lip positioned on said magazine to engage the end of said arm remote from its said attached end and thereby restrain said camming means from disengaging said trigger bar and said firing pin, when said magazine is seated in its operational position in said magazine receiver.

4,031,649

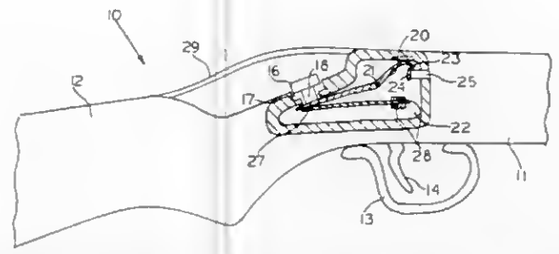
AUTOMATIC SAFETY LOCK FOR FIREARMS

Walter B. Brock, 1101 Titus Towers, Ithaca, N.Y. 14850

Filed July 23, 1976, Ser. No. 707,934

Int. Cl.² F41C *17/04*, *17/02*

U.S. Cl. 42—70 F **2 Claims**



1. In a firearm having a hand grip portion and a gun stock projecting rearwardly therefrom, an automatic safety lock comprising
a button mounted to reciprocate in an opening in said stock adjacent the forward end thereof, and positioned to register with the underside of the thumb on the underside of the thumb on the trigger hand of the operator of the firearm,
an operating member on said firearm movable from an inactive to a firing position to effect the discharge of a projectile from the firearm,
movable locking means interposed between said button and said operating member normally to hold said operating member releasably in its inactive position, and
resilient means urging said button and said locking means into first positions in which said button projects from said opening in said stock and said locking means is engaged with said operating member releasably to hold it in its inactive position,
said button being operative, upon being moved downwardly in said opening by the operator's thumb, to move said locking means to a second position against the resistance of said resilient means, thereby to release said operating member for movement to its firing position,
said locking means being a lever pivoted intermediate its ends for movement by said button from said first position, in which one end of said lever is engaged with said operating member to hold the latter in its inactive position, to a second position in which said one end of the lever is disengaged from said operating member,
said operating member being a reciprocable firing pin, having a circumferential flange forming a rim on one end thereof, and
said lever having a hook on said one end thereof engageable over said rim to hold said pin in its inactive position when said button is in its first position.

4,031,650

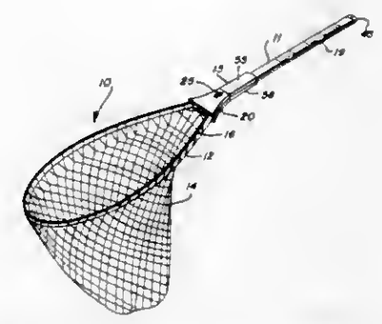
RETRACTABLE NET

Samuel Joseph Popeil, Chicago, Ill., assignor to Popeil Brothers, Inc., Chicago, Ill.

Filed Jan. 9, 1976, Ser. No. 647,805

Int. Cl.² A01K *77/00*

U.S. Cl. 43—12 **16 Claims**



1. A retractable net comprising, in combination,
a handle,
a mesh net at one end of the handle,
a continuous flexible band reversibly flexed thereby forming a net hoop,
said band having ends along the handle,
means at the end of the handle adjacent the net to engage the band and shape the same when passed therethrough,
said net having means for securing the same to the band,
and means for advancing and retracting at least one end of the flexible band,
said means for advancing and retracting at least one end of the flexible band comprising a hollow member proportioned to slide along the handle,
said hollow member comprising separable members,
said band ends being locked in place when said members are secured together,
and means for securing said members together,
whereby a net hoop of increasing and decreasing opening is formed by advancing and retracting the flexible band, and whereby the band may be released to replace the netting by separating the hollow member.

4,031,651

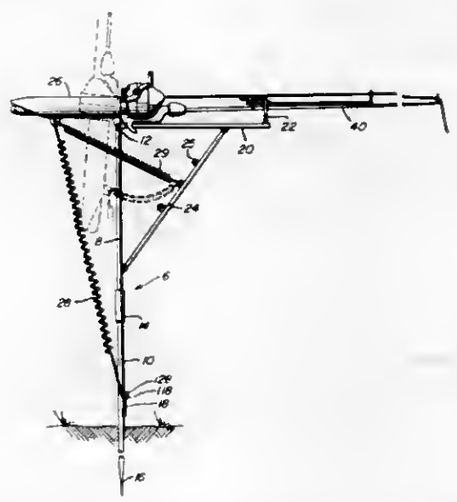
FISHING ROD HOLDER WITH AUTOMATIC HOOK SETTER

Paul O. Titze, R.R. No. 2, Mitchell, S. Dak. 57301

Filed Mar. 30, 1976, Ser. No. 672,001

Int. Cl.² A01K *97/00*

U.S. Cl. 43—15 **5 Claims**



1. A fishing pole holder and hook setter comprising a vertical support post for insertion in the ground, a tubular sleeve

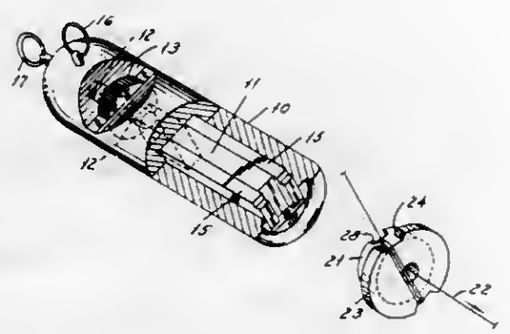
holder for the reception of the butt end of a fishing pole, said holder pivoted to the top of the vertical support post to rotate from a horizontal position to a vertical position, a horizontal linear support rod attached to the top of the vertical post and extending in a direction opposite to said sleeve holder's horizontal position, spring means extending between the free end of the sleeve holder and the support system, a U-shaped support mounted at the free end of the horizontal support rod for the reception of the intermediate portion of the fishing pole and line, a trigger mechanism mounted on said U-shaped support having a positive hook means to engage the fishing line, a brace connecting said vertical support post and said horizontal support rod, the spring means to bias the sleeve holder comprising a main spring connected between the free end of the sleeve holder and the lower post section of the vertical post, and a second lighter spring is connected between the brace and the free end of the sleeve which second spring may be used alone or in conjunction with said main spring.

4,031,652

FISHING LINE RELEASE MECHANISM

C. Evan Johnson, Onekama, Mich., assignor to Hitachi Magnetics Corporation, Edmore, Mich.

Filed Mar. 15, 1976, Ser. No. 667,097
Int. Cl.² A01K 91/00
U.S. Cl. 43—43.12 **5 Claims**



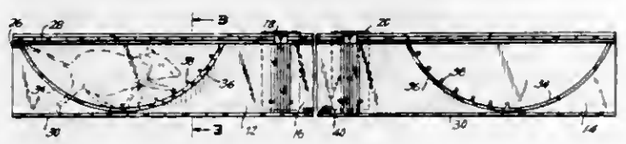
1. A fishing line release mechanism comprising: a housing defining an elongated passageway having an open end; a permanent magnet positioned within said passageway having a pole facing said open end; manually adjustable means whereby the magnet is fixedly positionable in different axial positions within said passageway; and a release plate composed of magnetic material positionable within the open end of said passageway, said release plate being attracted to said magnet when positioned within said passageway, said release plate being threadable on a fishline and being movable to a position free of attraction by said magnet when the pull of said fishline is sufficient to overcome the attraction of said magnet for said release plate.

4,031,653

BAITING ARRANGEMENT FOR RODENTS

Carmel T. Jordan, 1040 Grandview Ave., Union, N.J. 07083

Continuation-in-part of Ser. No. 466,149, May 2, 1974, Pat. No. 3,965,609. This application Apr. 12, 1976, Ser. No. 676,361
Int. Cl.² A01M 23/20
U.S. Cl. 43—61 **10 Claims**



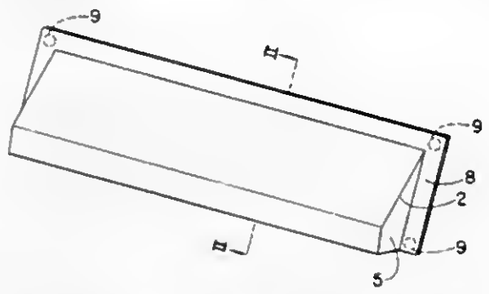
1. A bait feeding arrangement for rodents comprising, in combination, a modular entrance and exit housing with an opening through which a rodent may enter and leave; said housing having side walls with curved grooves formed therein; a curved closure member slidable within said grooves in said side walls; and a modular feeding housing connected to said entrance and exit housing and containing feed for said rodent, said curved closure member being in a first position closing said opening prior to entry into said entrance and exit housing by said rodent, said rodent entering said entrance and exit housing by moving on said curved closure member, said curved closure member sliding in said grooves toward a second position closing said opening when said rodent moves on said curved closure member, said rodent having a free passage into said entrance and exit housing after leaving said curved closure member in said second position, said rodent moving on said curved closure member to leave said entrance and exit housing, said curved closure member sliding in said grooves from said second position to said first position when said rodent leaves the interior of said entrance and exit housing.

4,031,654

INSECT TRAP

James R. Gray, P.O. Box 5094, Little Rock, Ark. 72205

Filed Jan. 26, 1976, Ser. No. 652,383
Int. Cl.² A01M 1/14
U.S. Cl. 43—114 **16 Claims**



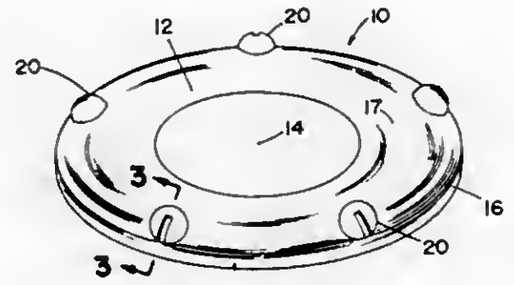
1. A trap for insects or other pests comprising: a panel having an adhesive surface, means supporting an edge of said panel away from a supporting surface so that said panel is disposed over and converges toward the supporting surface, and attractant in proximity to the portions of said panel nearest the supporting surface for means luring insects or pests to move under said panel and toward contact with said adhesive surface.

4,031,655

AERODYNAMIC SOUND-EMITTING AMUSEMENT DEVICE

Jose Ponciano, 1294 Southgate Ave., Daly City, Calif. 94015, and Thomas S. Bautista, 1730 Silliman St., San Francisco, Calif. 94134

Filed Jan. 30, 1976, Ser. No. 653,817
Int. Cl.² A63H 33/18
U.S. Cl. 46—52 **8 Claims**



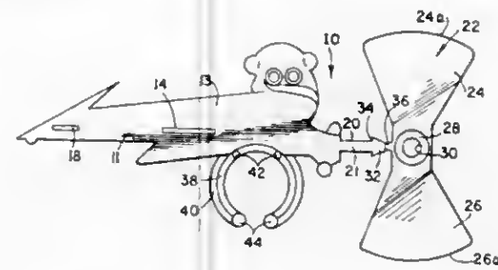
1. An aerodynamic amusement device, comprising:
a circular body provided with an outer surface, a central portion, a central axis, and a rim circumscribing the central portion and curving downward therefrom, said body adapted to be thrown and to sail through the air after being thrown and to spin about the central axis as the body sails through the air; and
a plurality of whistle means for producing a sound symmetrically positioned upon the body a predetermined distance from the central axis, each whistle means having a chamber defined by side walls symmetrically arranged about a chamber axis that is positioned substantially normal to the body surface, a closed end and an opposite end portion forming a single aperture that communicates with the chamber, the aperture being positioned with respect to and above the outer surface of the body to allow air to pass across the aperture as the device sails through the air spinning about its central axis after being thrown.

4,031,656

PLASTIC TOY INTEGRALLY FORMED AND MOLDED WITH A PROPELLER AND MEANS FOR ATTACHING THE TOY TO A SUPPORT MEMBER

Sam Kupperman, Chicago, and Dennis I. Kupperman, Glenview, both of Ill., assignors to R B Toy Development Co., Skokie, Ill.

Filed Apr. 19, 1976, Ser. No. 677,919
Int. Cl.² A63H 33/40
U.S. Cl. 46—53 **10 Claims**



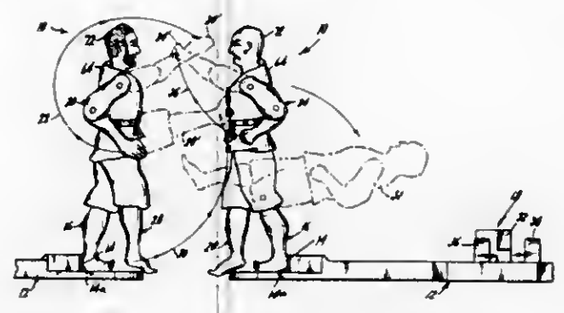
1. A toy integrally molded of a plastic material and comprising a body portion, an extension at one end of said body portion and a propeller all molded as an integral unit, said propeller adapted to be detached from said unit and manually mounted on said extension for rotation on said extension, a ring-like member molded as part of the body portion and extending below said body portion to permit attachment of said toy to a support and the like.

4,031,657

ACTION FIGURE

Dorland L. Crosman, Glen Ridge, N.J., and Charles M. Diker, New York, N.Y., assignors to Aurora Products Corporation, New York, N.Y.

Filed Feb. 5, 1976, Ser. No. 655,564
Int. Cl.² A63H 13/06
U.S. Cl. 46—142 **20 Claims**



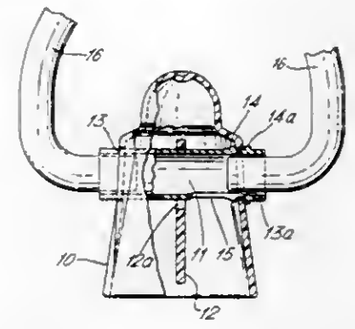
1. In a human-like figure actuable to simulate various movements of the human being; said figure including a head, a body, a pair of arms depending from opposite sides of said body, and a pair of legs depending from opposite sides of said body; at least one means for moving a leg and simultaneously producing movement of the body of said figure comprising:
body mounting means for supporting said body for movement about a first axis;
leg mounting means for moving said leg relative to said body about a second axis; and
motion-transmitting means coupled to said leg mounting means and responsive to an applied force for rotating said leg about the second axis and displacing said leg with respect to said body mounting means, and simultaneously pivoting said body about the first axis to simulate the movement of a human being.

4,031,658

CHILD'S RATTLE

David William Chisnall, Thirlestane, Stadhampton, Oxfordshire, England

Filed June 7, 1976, Ser. No. 693,556
Claims priority, application United Kingdom, June 11, 1975, 25088/75
Int. Cl.² A63H 5/00
U.S. Cl. 46—191 **4 Claims**



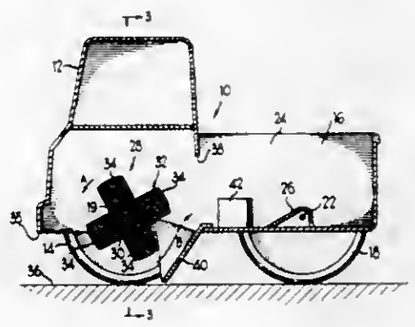
1. A child's rattle comprising a bell-like member, two oppositely disposed apertures through the wall thereof on a common axial line near to its closed end, a tubular shaft passing through said apertures and member, means at an end of said shaft lockingly engaging the member at one aperture, and a clapper having an eye through which said shaft passes within the member.

4,031,659

TOY PICK-UP VEHICLE

Albert G. Keller, Chicago; Donald F. Nix, Hanover Park, and Howard J. Morrison, Deerfield, all of Ill., assignors to Marvin Glass & Associates, Chicago, Ill.

Filed Nov. 10, 1975, Ser. No. 630,719
Int. Cl.² A63H 17/00
U.S. Cl. 46—204 **4 Claims**



1. A toy vehicle for picking up playing objects from a supporting surface, comprising:
a vehicle body having a lower object inlet means generally at the front thereof;

front and rear wheel means on the vehicle for supporting the vehicle for movement over the supporting surface;

a paddle wheel rotatably mounted on the vehicle body for conjoint rotation with said front wheel means for engagement with objects on the supporting surface and moving the objects therewith;

a rear receptacle disposed behind said paddle wheel and generally above said rear wheel means; and

conduit means between said paddle wheel and said receptacle including a direct opening in the vehicle body between the paddle wheel and the rear receptacle and a lower deflector member extending beneath said opening in proximity with the surface;

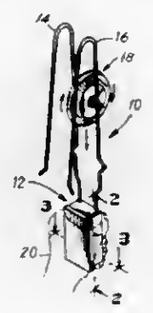
said paddle wheel being fabricated substantially of resilient, soft spongy material to provide friction and yieldability as the paddle wheel rotates to engage the objects for movement upwardly through said opening into said rear receptacle.

4,031,660

ILLUMINATED ACTION TOY

Tommy Chen, 10 Manwan Road 3 A, Kowloon, Hong Kong

Filed Oct. 12, 1976, Ser. No. 731,800
Int. Cl.² A63H *33/26*
U.S. Cl. 46—228 **15 Claims**



1. An illuminated action toy comprising a pair of substantially parallel rails made of magnetic and electrically conductive material, each of said rails having two outwardly flaired sections facing two outwardly flaired sections in the other rail, a moving element having an axle whose ends are magnetized and electrically conductive for rotating and moving along said rails and for reversing direction at the flaired sections thereof, and battery pack means secured to said rails for spacing said rails from each other to accommodate said axle therebetween and for applying a potential difference to said rails, said moving element including bulb means connected between the two ends of said axle whereby said axle controls both attraction of the moving element to the rails and the flow of current from one rail through the bulb to the other rail.

4,031,661

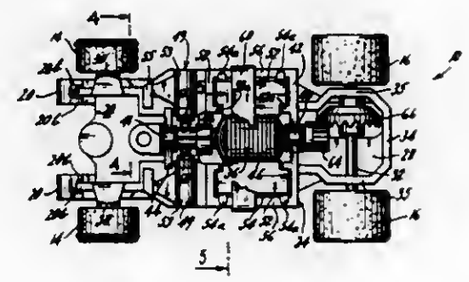
MINIATURE VEHICLE WITH MAGNETIC ENHANCEMENT OF TRACTION

Robert B. Bernhard, Port Washington, N.Y., assignor to Aurora Products Corporation, West Hempstead, N.Y.

Filed Jan. 19, 1976, Ser. No. 650,426
Int. Cl.² A63H *29/12, 18/12*
U.S. Cl. 46—249 **20 Claims**

1. In a miniature vehicle of the type having a supporting chassis, at least one driving wheel mounted to the chassis, and a pair of electrical pick-up shoes, said driving wheel adapted to engage a track including electric power means therein made of a magnetic material engageable with said pick-up shoes, the combination of:

an electric motor mounted in said chassis for powering said at least one driving wheel, including a rotatably mounted drive shaft extending axially along the length of said vehicle and coupled to said at least one driving wheel, an armature coaxially mounted on said drive shaft having a plurality of windings, a pair of magnet assemblies mounted in said chassis on opposite sides of said armature and forming the stationery magnetic component of said motor, each of said magnet assemblies including a magnet mounted in said chassis with no portion of said chassis between the bottom of said magnet assemblies and the electric power means of said track; and



means for coupling said armature to said pick-up shoes for providing electric power to said motor;

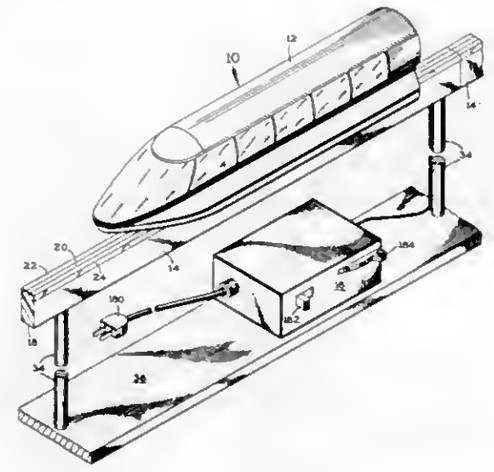
said magnet assemblies and said electric power means cooperating when said miniature vehicle is in said track to provide a magnetic force holding said vehicle to said track, thereby increasing the traction of said at least one driving wheel on said track.

4,031,662

MONORAIL TRAIN AND TRACK

Alan S. Beshany, P.O. Box 15065, Plantation, Fla. 33318

Filed July 21, 1976, Ser. No. 707,272
Int. Cl.² A63H *19/10, 21/04*
U.S. Cl. 46—257 **10 Claims**



1. In a model monorail train including an engine having an electric motor, conductive wheels, a drive train coupled between said motor and said wheels for driving said wheels, electrical connection means connected between said motor and said wheels for supplying current to said motor, and a track for conducting current, the improvement wherein:

said wheels have rims with vertical flanges on one side thereof and are arranged in pairs to straddle said track;

said flanges are positioned on the outsides of said track when said engine is on said track;

said track comprises monorail means for receiving said wheels;

said monorail means has an insulating upper surface and two L-shaped conductor means forming outside corners of said upper surface for engaging both said rims and said flanges of said wheels; and

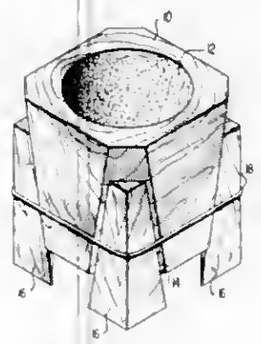
said L-shaped conductor means each have a horizontal leg for engaging the rims of corresponding wheels and a vertical leg for engaging the flanges of corresponding wheels.

4,031,663

WOODEN BLOCK PLANTER WITH SUPPORTING LEGS

Ronald M. Brunk, Rte. 1 Box 192, Greenwood, Va. 22943

Filed May 24, 1976, Ser. No. 689,629
Int. Cl.² A01G *9/02*; **B65D** *1/00*
U.S. Cl. 47—66 **3 Claims**



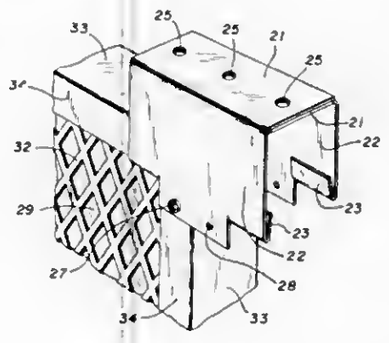
1. A wooden planter comprising initially a substantially solid rectilinear block of wood having a recess in the upper surface thereof for the reception of a plant and leg means formed from said block, said leg means comprising substantially identical wedges having a triangular cross-section which are cut from each corner of said block along a downwardly and inwardly inclined plane extending diagonally across each corner of the block, the cutting forming associated pairs of inclined planar surfaces, each pair of inclined surfaces comprising one inclined surface on each leg and one inclined surface on the associated corner of said block, and means for securing said legs along each associated pair of inclined planar surfaces in downwardly depending offset relationship to said block.

4,031,664

SUSPENSION SYSTEM FOR SOUND ABSORPTION PANELS

Alan C. Wendt, Barrington, Ill., assignor to United States Gypsum Company, Chicago, Ill.

Filed Jan. 20, 1976, Ser. No. 650,632
Int. Cl.² E05D *13/02*
U.S. Cl. 49—409 **13 Claims**



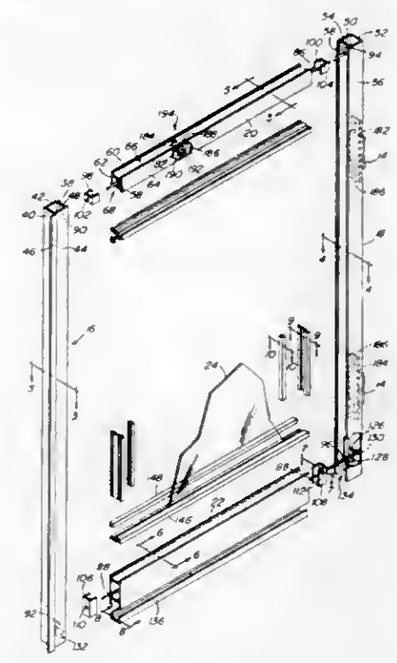
1. A horizontally movable sound absorption wall comprising one or more sound absorption panels supported by a top frame member; a hanger attached to the top frame member; a supported track; guiding means for guiding movement along the track; and connecting means for attaching the hanger and the guiding means to enable the panels to be moved in a path along the track; wherein the panel frame member has one or more depending lip portions; and wherein the hanger has a horizontal portion, one or more vertically depending connection portions depending vertically downward from the horizontal portion with said vertically depending connection portions having one or more support portions comprising inwardly and upwardly formed portions of the connection portion.

4,031,665

ADJUSTABLE ENTRANCE DOOR

Harold B. Abramson, 30 Stearns Road, Brookline, Mass. 02146

Filed Dec. 8, 1975, Ser. No. 638,370
Int. Cl.² E06B *1/04, 3/00*
U.S. Cl. 49—501 **10 Claims**



1. An adjustable entrance door comprising:

a. a plurality of extruded sections including a lead edge stile, a hinge stile, a top rail and a bottom rail;

b. means for interconnecting said sections, said interconnecting means including a pair of tie rods, one of said tie rods connecting said lead edge stile, said hinge stile and said top rail, said other tie rod connecting said lead edge stile, said hinge stile and said bottom rail, said connected sections defining a substantially rectangular open frame;

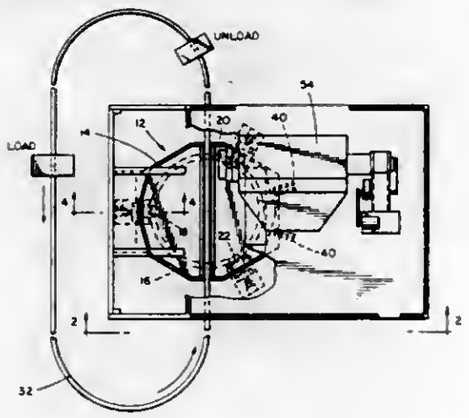
c. a substantially rectangular panel configured to be received within said frame;

d. means for mounting said panel to said frame, said mounting means including a first pair of shims and a second pair of shims, one shim of said first pair disposed between one of said stiles and said panel adjacent a first corner of said frame, the other shim of said first pair disposed between one of said rails and said panel adjacent said first corner, one shim of said second pair disposed between the other of said stiles and said panel adjacent a second corner of said frame, the other shim of said second pair disposed between said other of said rails and said panel adjacent said second corner, said first corner diagonally opposite said second corner, said first and second pairs of shims positioned so that said panel is mounted oblique to the inner faces of said rectangular frame;

e. first adjusting means mounted to said top rail in engagement with a top edge of said glass panel, said first adjusting means operative to cause relative vertical movement between said lead edge stile and said hinge stile; and

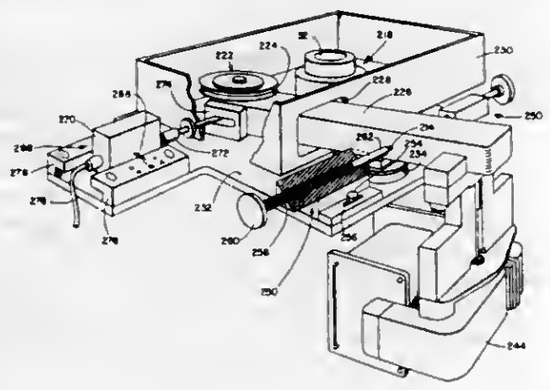
f. second adjusting means mounted to said bottom rail, said second adjusting means constrained against free movement relative to said bottom rail and constrained for forced movement relative to said bottom rail, said second adjusting means operative to vary the height of said door when moved relative to said bottom rail.

4,031,666
ROTARY DOOR BLAST CHAMBER
Curtis C. West, Mishawaka, Ind., assignor to Wheelabrator-Frye, Inc., Mishawaka, Ind.
Filed Aug. 30, 1976, Ser. No. 718,616
Int. Cl.² B24C *3/14*
U.S. Cl. 51—419 **8 Claims**



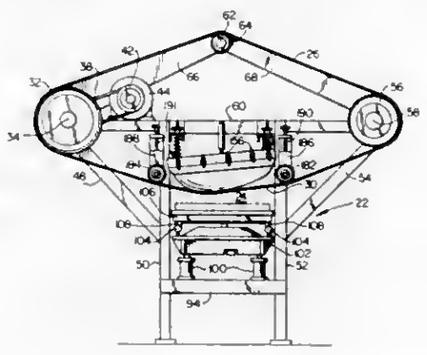
1. A sealable chamber for blast cleaning parts with particulate comprising:
a. an enclosed housing having a pair of aligned openings therethrough to permit entry and exit of said parts;
b. a hollow cylinder disposed within said housing having a pair of openings therethrough corresponding to the openings in said housing;
c. means for supporting and rotating said cylinder between a first position in which said housing and cylinder openings are aligned to permit entry and exit of parts from said chamber and a second position in which said housing and cylinder openings are misaligned to seal the chamber against the escape of said particulate.

4,031,667
APPARATUS FOR CONTOURING EDGE OF SEMICONDUCTOR WAFERS
William H. Sehestedt, Santa Clara, Calif., assignor to Macronetics, Inc., Sunnyvale, Calif.
Filed Mar. 29, 1976, Ser. No. 671,392
Int. Cl.² B24B *9/00*
U.S. Cl. 51—105 R **10 Claims**



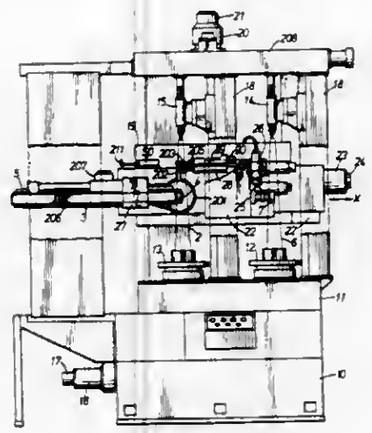
1. Apparatus for contouring the edge of a semiconductor wafer, comprising
rotatable holding means for receiving and releasably holding one side of said wafer while leaving the edge of said wafer free from obstruction, and rotating said wafer generally about its center,
contouring means for removing sharp corners from the edge of said wafer, said contouring means comprising a rotating grinding wheel which is axially parallel to said rotating holding means and is mounted for movement toward and away from said holding means and a wafer held thereupon, said grinding wheel having a generally V-shaped, radially inwardly extending circumferential groove, whereby engagement between the edge of the rotating workpiece and the grinding wheel groove may serve to bevel or round any sharp corners adjacent the edge of the workpiece,
biasing means resiliently urging said contouring means against said wafer edge with a preselected and adjustable force such that said grinding wheel will be maintained in grinding engagement with said wafer edge during the entire rotation of said wafer, said resilient biasing means comprising a pair of coil springs each having one end connected to said contouring means and the other end connected to a mount which is adjustably movable longitudinally of its respective coil spring, said coil springs and mounts opposing one another, whereby said opposed springs and mounts may serve to urge said contouring means to an adjustable predetermined position and to exert an adjustable, predetermined force against displacement of said contouring means either side of said predetermined position.

4,031,668
SANDING MACHINE FOR ANATOMICALLY CONTOURED WOODEN CHAIR SEATS AND THE LIKE
Robert A. Lasko, deceased, late of Winsted, Conn. (by Ruth Lasko, administratrix), and Claud T. Miller, Statesville, N.C., assignors to Hitchcock Chair Company, Riverton, Conn.
Filed Feb. 19, 1974, Ser. No. 659,322
Int. Cl.² B24B *21/06, 21/16*
U.S. Cl. 51—137 **10 Claims**



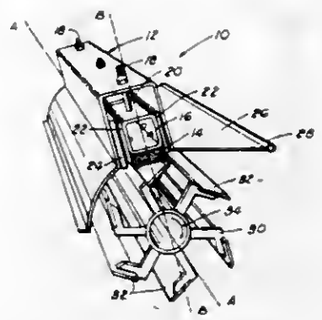
1. In a machine for belt sanding anatomically contoured chair seats and the like having generally concave depressions therein with arcuate surfaces viewed along each of two perpendicular axes, the combination comprising a work station, a sanding belt having at least one abrasive side and which follows a closed loop path with a longitudinal pass adjacent the work station, pulley and associated drive means for supporting the belt at spaced locations internally of the loop and for driving the same through its said path, means for supporting a chair seat with its anatomically contoured surface to be sanded facing toward an abrasive side of the belt at said work station and with one of said axes in substantial alignment with said longitudinal belt pass, said chair seat support means being movable toward and away from and generally perpendicular to the plane of said longitudinal belt pass to cause a chair seat thereon to selectively engage the belt, and said support means also being movable laterally with respect to and generally parallel to the plane of said longitudinal belt pass along the other of said axes whereby the chair seat can be progressively sanded in movement across the belt, a pneumatically inflatable generally pillow-like resilient back-up member having a generally convex pressure surface with both lower side and end edge portions having a rounded configuration, said member being disposed at said work station on a side of said belt opposite said chair seat, a regulable source of air under pressure in communication with the interior of said resilient member and serving to inflate the same, said member when inflated being resilient along each of said axes and serving to slidably engage the belt and urge the same toward the seat thereby causing the belt to conform to and sand said contoured seat along the arcuate surfaces of each of said axes, and at least one guide roller disposed adjacent the sanding belt on the same side as said resilient back-up member but spaced longidutinally from said member, said roller being mounted for adjustment toward and away from the belt whereby to vary the belt angle relative to both the resilient member and a chair seat being sanded and thus to control belt engagement with the seat and sanding thereof in an area adjacent the area of engagement between the resilient member and the belt.

4,031,669
AUTOMATIC PROFILING MACHINE
Sakae Kolde, Tokyo, and Shigeo Aoki, Habikino, both of Japan, assignors to Tahara-Shoyei Engineering Co., Ltd., Osaka, Japan
Filed Nov. 13, 1975, Ser. No. 631,550
Claims priority, application Japan, Nov. 19, 1974, 49-133365
Int. Cl.² B24B *17/00, 19/14, 21/16*
U.S. Cl. 51—142 **14 Claims**



1. An automatic profiling machine comprising means for rotating a model, means for rotating a workpiece in synchronism with the rotation of the model, a stylus capable of relative movement with respect to the model in a direction perpendicular to the axis of rotation of the model and adapted for contact therewith, means for detecting a displacement of the stylus from its neutral point as it contacts the model, means for detecting a distance between the center of the stylus and the center of rotation of the model, means for controlling the rotational speed of the model and the speed of relative movement between the model and the stylus in accordance with the detected values of said displacement and distance so that the point of contact between the stylus and the model moves along the contour of the model with a given speed, a tool for machining the workpiece, the tool being disposed n the same positional relationship as that between the model and the stylus, means for causing a relative movement between the tool and the workpiece in a manner similar to the relative movement between the stylus and the model, means for rotatably holding a contact segment of the stylus against the model so that the segment is in exact conformity to the surface thereof, means for detecting a rotation of the contact segment, and means for causing a skew of the tool in accordance with the detection of the rotation.

4,031,670
ADJUSTABLE SHARPENER FOR SELF-SHARPENING FEED CHOPPING KNIVES
C. J. Murphy, Rte. 1, Abilene, Kans. 67410
Filed Dec. 29, 1975, Ser. No. 644,925
Int. Cl.² B24B *3/36*
U.S. Cl. 51—250 **7 Claims**



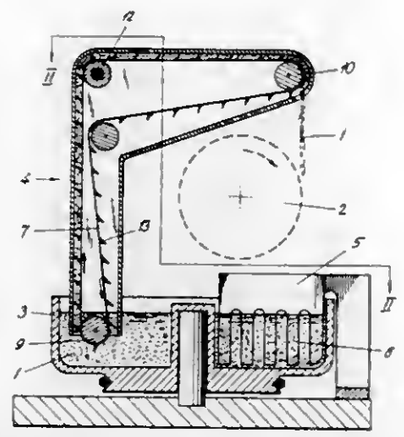
1. An adjustable sharpener for self-sharpening feed chopping knives, the knives mounted on a rotating cutter head, the knives used in cutting crops, forage, ensilage, or the like, the sharpener comprising:
a stone housing disposed adjacent the length of the cutter head;
an elongated sharpening stone mounted in said housing, said stone disposed adjacent the length of the cutting edge of the knives and tangent thereto, said stone laterally secured in said housing to prevent lateral movement of said stone as the cutting edges of the knives rotate thereby;
adjusting means attached to said housing for manually adjusting said stone in a direction toward the axis of the cutter head;
biasing means attached to said housing and disposed against said adjusting means for biasing said adjusting means so that said stone is kept in adjustment; and
an elongated cutter bar mounted in said housing and disposed adjacent said stone, an edge of said cutter bar disposed adjacent the length of the cutting edge of the knives and tangent thereto;
said adjusting means and said biasing means allowing movement of said stone in a direction away from the axis of the cutter head when a foreign object becomes trapped between said stone and the cutting edge of the knives.

4,031,671
APPARATUS FOR DELIVERING FLUID GRINDING MATERIAL
Henryk N. Frosz, 54 Tranumparken, Broendby Strand, Denmark
Filed Feb. 9, 1976, Ser. No. 656,363
Int. Cl.² B24B *57/00*
U.S. Cl. 51—263 **6 Claims**

1. A grinding or polishing apparatus, comprising:
a rotatable grinding or polishing element;
a cup disposed beneath said rotatable element and including a bottom wall and a generally vertical peripheral wall, said cup being mounted for rotation about a generally vertical axis passing centrally therethrough, and being adapted to contain fluid grinding material, and to receive fluid grinding material falling from said rotatable element;
drive motor means connected with said cup for effecting rotation thereof about said axis;
a comb-like member fixedly mounted to extend generally radially across the top of said rotatable cup, said member extending over at least a major portion of the radial distance from said peripheral wall to said axis, and carrying a plurality of spaced, downwardly projecting teeth arranged to effect mixing of fluid grinding material disposed

in said cup during rotation of said cup relative to said member;

shield means mounted to extend generally above and over said rotatable element, and including a discharge point disposed above said element and positioned to correctly



deposit fluid grinding material falling therefrom for the operation of said element; and

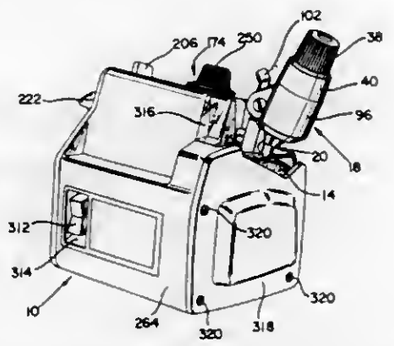
conveyor means of variable capacity mounted with one end thereof in said cup for collecting fluid grinding material therefrom, the other end of said conveyor means leading to said discharge point of said shield means.

4,031,672

SHARPEN TWIST DRILLS OR THE LIKE

Robert Gordon Moores, Jr., Cockeysville, and Richard Eugene Walton, II, Baltimore, both of Md., assignors to The Black and Decker Manufacturing Company, Towson, Md.

Division of Ser. No. 456,946, April 1, 1974, Pat. No. 3,930,342. This application Sept. 12, 1975, Ser. No. 612,912
Int. Cl.² B24B *1/00*
U.S. Cl. 51—288 **5 Claims**



I. A method of grinding the leading end of twist drills or the like having a plurality of flutes, said method comprising the following steps:

A. rotating a grinding wheel about its axis;

B. advancing a twist drill or the like toward a surface of the grinding wheel to dispose the leading end of one of the flutes in a position suitable for grinding; and

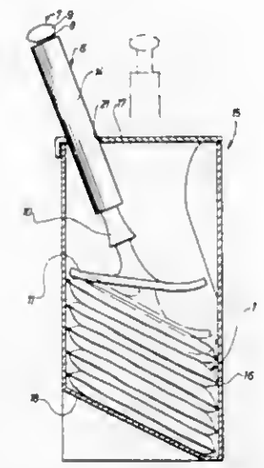
C. spirally rotating the twist drill about an axis transverse to the longitudinal dimension of said twist drill and generally parallel to the grinding surface of the grinding wheel to cause the leading end of one of the flutes of the twist drill to move laterally across the grinding surface of the grinding wheel to be ground thereby whereby a more even wear distribution of the grinding wheel is obtained.

4,031,673

CLEANING DEVICE PREFERABLY FOR WATER CLOSETS

Anders Torvald Sverker Hagelberg, Molnlycke, Sweden, assignor to Bengt Petersson New Products Investment AB, Goteborg, Sweden

Filed Apr. 19, 1976, Ser. No. 678,208
Int. Cl.² B24D *15/04*; **A46B** *17/02*
U.S. Cl. 51—385 **9 Claims**



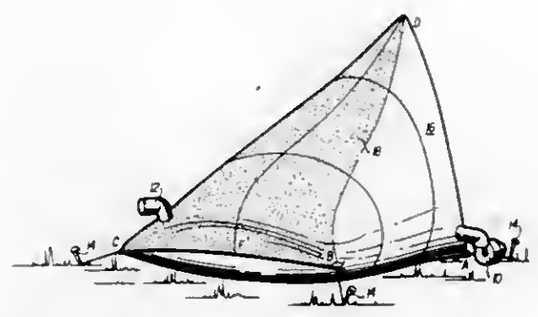
1. A cleaning device particularly for cleaning water closets, comprising: a holder stick device including a handle portion arranged at one end thereof and clamping means arranged at the opposite end thereof, said clamping means being actuated by manual operation of said handle portion between a clamping position for operably clamping therein a cleaning pad, and a release position for releasing said cleaning pad; a receptacle defining a space configured to store therein a plurality of cleaning pads stacked in a vertical pile one upon another; and a plurality of cleaning pads vertically stacked in a pile in said receptacle, said cleaning pads including a cleaning compound, being adapted for disposal thereof after use in a single cleaning operation, and being made of a material which effects disintegration of said pad in water; said receptacle including a supporting part for supporting said holder stick device in said receptacle by engagement with said handle portion and with said clamping means in a position to facilitate clamping therein of the top cleaning pad in said pile of pads stored in said receptacle to enable withdrawal of said holder stick device from said receptacle with a pad operatively engaged therein for use in a cleaning operation.

4,031,674

INFLATABLE TENT

J. Patrick Rand, 2357 Onyx St., Eugene, Oreg. 97403

Filed Jan. 19, 1976, Ser. No. 650,328
Int. Cl.² E04B *1/345*
U.S. Cl. 52—2 **2 Claims**



1. A camping tent comprising a flexible tent membrane and a separate tent support means, said tent membrane having the shape of a non-planar irregular tetrahedron when supported

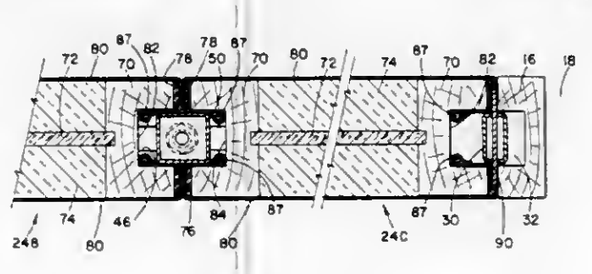
by said support means, said tent being formed from a substantially rectangular sheet, first and second opposed edges of said sheet being joined along a first seam, a third edge of said sheet being joined with itself along a second seam substantially perpendicular to said first seam, and a fourth edge of said sheet being joined with itself along a third seam substantially perpendicular to both said first and second seams, at least one of said second and third seams comprising a zipper, said support means comprising a blower communicating with said tent membrane for blowing air into said tent membrane and a vent, said vent cooperating with said blower to replace air in said inflatable membrane and to regulate internal pressure.

4,031,675

FREE STANDING REDECORATABLE VERTICAL WALL OR DIVIDER

Raymond P. Roberts, 5909 E. 58th Place, and Sven Arthur John Nilson, Jr., 5328 S. Toledo, both of Tulsa, Okla. 74135

Continuation-in-part of Ser. No. 581,740, May 29, 1975, abandoned. This application Feb. 26, 1976, Ser. No. 661,736
Int. Cl.² E04B *2/74*
U.S. Cl. 52—36 **28 Claims**



20. A free-standing vertical divider wall comprising:

a quadrilateral frame of desired thickness having upper and lower horizontal frame members attached to right and left vertical frame members;

first vertical supports each of thickness than the thickness of said frame retained within recesses along each of the inside vertical members of said frame and horizontally movable from said recess to a position inside said frame exposing a frontal width X;

said first supports include a plurality of vertically spaced apertures along their frontal width, keeper means, of length less than the thickness of said frame and insertable into said apertures between said panel and said right and left vertical frame members;

at least one second vertical support of thickness less than the thickness of said frame and of frontal width no greater than 2X, said second support vertically positioned to substantially divide the space horizontally between said first vertical supports, said second support being movable horizontally either side of said division line a distance equal to the width of said second support; and

a plurality of panels to substantially fill each horizontally divided space inside said frame, each of said panels having grooves hidden between front and back sides of said panel along each vertical edge, said grooves of thickness slightly larger than the thickness of said support members and of frontal width no less than the frontal width of said second supports.

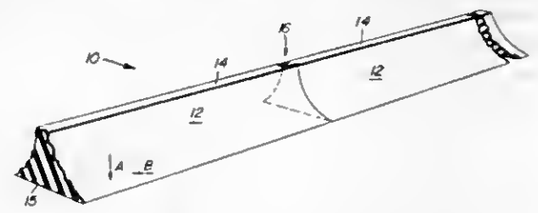
4,031,676

WATER BLOCKING DEVICE

Don A. Daily, P.O. Box 181, Pillager, Minn. 56473

Filed Mar. 29, 1976, Ser. No. 671,361
Int. Cl.² E02D *27/00*
U.S. Cl. 52—102 **8 Claims**

1. A surface water blocking device comprising; a self-supporting longitudinally extending section member having, first means for connection to another such section member in interlocking fashion to present a continuous barrier to the flow of surface water, second means for removably fastening each member to the surface on which they rest in a water-tight semi-permanent fashion, the first means for connecting one



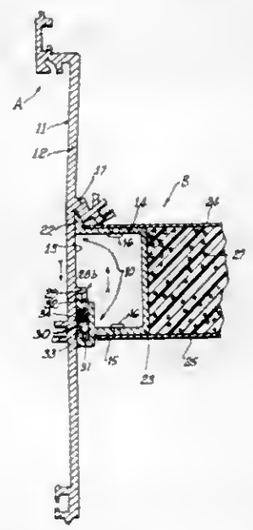
section member to another section member includes a tongue and groove joint, and the second means for removably fastening each section member to the surface includes suction cup type recesses provided in each section member.

4,031,677

FLOOR SLAB TO SIDE WALL JOINT STRUCTURE FOR TRANSIT VEHICLE

Keith W. Tantlinger, Coronado, Calif., assignor to Rhor Industries, Inc., Chula Vista, Calif.

Filed Apr. 21, 1976, Ser. No. 678,732
Int. Cl.² E04C *1/10*; **F16B** *1/00*
U.S. Cl. 52—262 **4 Claims**



1. In a transit vehicle having a floor slab, two side walls, and a roof, floor-to-side wall joint joining each side wall substantially perpendicularly to a side of the floor slab, each joint structure comprising:

an extrusion comprising a lower structural element of each vehicle side wall and having a laterally inwardly exposed joint surface formed therealong,

a pair of vertically spaced, laterally outwardly extending flanges substantially integral with, and extending along each side of the floor slab, the laterally outward edge portions of each pair of said flanges being contact with their respective said side wall joint surface,

means integral with each of said side wall extrusions forming a vertically open, bead-receiving recess extending along each such joint surface,

a locking bead formed integrally with, and extending upwardly along the laterally outward edge portion of one of said side flanges of each pair thereof, each locking bead being shaped and located to fit into the locking bead recess of its respective side wall upon a selected movement of the floor slab relative to such side wall,

a first half of a plastic key interlock joint comprising a laterally outwardly open channel formed along, and comprising the laterally outward edge portion of the other of said side flanges of each pair thereof, an interlock projection extending along each side of each of said channels,

both of the projections of each pair thereof extending in the same direction as the locking bead on said one flange of their respecting pair thereof,

a second half of each plastic interlock joint comprising a pair of recess defining means integral with each side wall, and extending lengthwise along the joint surface thereof in parallel, spaced relation to their respective bead receiving recesses, and to each other, each of the latter recess defining means being shaped and located to define a recess shaped and positioned to receive one of said interlock projections in fitted relation therein upon such selected, relative movement of the floor slab and side wall, one of the latter recess defining means of each pair thereof being located within each of side channels, of a height to extend substantially to the bottom of its respective channel, and of a width for limited movement transversely therein, whereby such selected, relative movement of the floor slab and side wall opens up a key forming passage lengthwise within each joint for the reception of flowable, solidifiable, key forming compound for retaining said beads and said interlock projections in their respective recesses, thereby completing the joint structure.

4,031,678

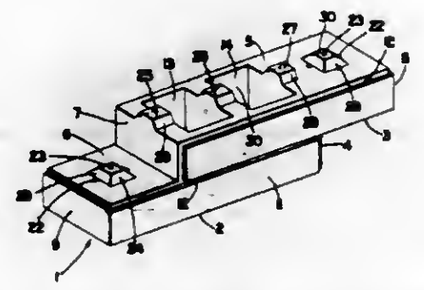
INTERLOCKING BUILDING BLOCK CONSTRUCTION

James A. Schuriag, 352 Saratoga Ave., Canton, Ohio 44708

Filed Nov. 20, 1975, Ser. No. 633,574

Int. Cl.² E04B *1/02*; E04C *1/08*

U.S. Cl. 52—285 **3 Claims**



1. A rectangulsr building structure formed entlrely of a plurality of similar interlocking building blocks, each block including:

a. a longitudinelly extending, rectangular, upper surface terminating at one end in a lower stepped end surface;

b. a longitudinally extending, rectangular, lower surface terminating at one end in an upper stepped end surface;

c. said stepped and surfaces lying in a common horizontal plane and located at opposite ends of the building block;

d. a plurality of generally truncated pyramid-shaped recess means formed in the upper rectangular surface and a corresponding number of complementary generally turncated pyramid-shaped lug means formed on the lower rectangular surface, said lug means being aligned vertically with the recess means;

e. a single recess formed in the center of the lower stepped end surface and a single lug formed on the center of the upper stepped end surface, said lug and recess each having a truncated pyramid configuration complementary to each other;

f. the stepped end surfaces having a square planar configuration with the longitudinal lengths of the stepped end surfaces being equal to each other, and equal to the width of the upper and lower surfaces;

g. a first pair of spaced, parallel, vertically estending smooth end surfaces connecting the stepped end surfaces to their respective longitudinally extending rectangular surfaces;

h. a second pair of spaced, parallel, vertically extending smooth end faces connecting the upper surface with the upper stepped end surface and connecting the lower surface with the lower stepped end surfaces, respectively;

i. a pair of spaced, parallel, vertical, generally smooth side surfaces extending between the upper and lower rectangular surfaces, and between the pairs of spaced end surfaces;

j. the upper stepped end surfaces of the blocks being in abutting, overlapping relationship with lower stepped end surfaces of horizontally adjacent blocks with the single lugs of the upper stepped end surfaces being interlockingly engaged in the single recesses of the overlapped lower stepped end surfaces, with the lower rectangular surfaces being in abutting relationship with the upper rectangular surfaces of lower vertically adjacent blocks with the lug means of the lower surfaces being interlockingly engaged in the complementary recesses of the upper surfaces; and with the side surfaces of said horizontally and vertically adjacent blocks forming smooth continuous longitudinally extending wall surfaces, and with the side surfaces of adjacent blocks placed at right angles to each other forming smooth continuous right-angled corner surfaces;

k. opening means formed in and extending vertically through each block and communicating with the upper and lower rectangular surfaces, with said opening means of vertically adjacent blocks forming vertically extending passages in the building walls for receiving utility supply lines;

l. holes formed in the stepped end surfaces single lugs and recesses and vertically aligned with each other; and

m. pin means mounted in the aligned recess and lug holes and extending between a pair of vertically adjacent blocks mechanically interconnecting said adjacent blocks.

4,031,679

SPHERICAL STORAGE TANK FOR GASES AND LIQUIDS AND SUPPORTING BASE THEREFOR

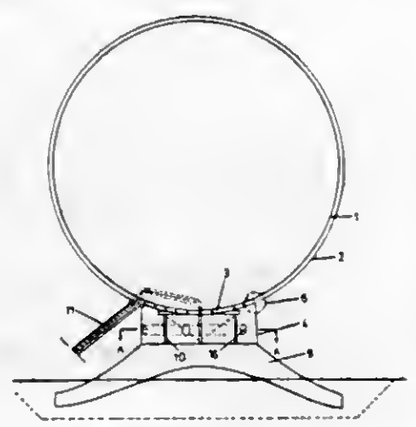
Peter Feuerlein, Prattein, Switzerland, assignor to Buss Aktiengesellschaft, Basel, Switzerland

Filed Oct. 8, 1976, Ser. No. 730,862

Claims priority, application Switzerland, Nov. 5, 1975, 14466/75

Int. Cl.² E02D *27/32*

U.S. Cl. 52—294 **5 Claims**



1. In combination, a spherical tank for gases and liquids, a rigid load-bearing concrete foundation in the region of the vertical axis of said spherical tank, and a mounting interposed between said foundation and the underside of said spherical tank, said mounting having generally elastomeric properties and being solidly bonded to the underside of said spherical tank and to said foundation, said mounting consisting essentially of a plurality of rigid support elements in spaced array within a matris of foamed heat insulation material, the upper and the lower surface of said plurality of said rigid support elements being covered by elastic layers of a material remaining elastic even at very low temperatures, a load bearing steel shell interposed between said concrete foundation and the lower of said elastic layers, and a first adhesive bonding layer between the underside of said spherical tank and the top of the upper of said elastic layers, a second adhesive bonding layer between the bottom of the upper of said elastic layers and the top of said plurality of rigid support elements, a third adhesive bonding layer between the bottom of said plurality of rigid support elements and the top of the lower of said elastic layers, and a fourth adhesive bonding layer between the bottom of the lower of said elastic layers and the top of said steel shell, said mounting assuring orthotropic transmission of the load of said tank to the foundation and insulating the tank from the foundation to prevent heat losses.

4,031,680

STRUCTURAL ASSEMBLIES

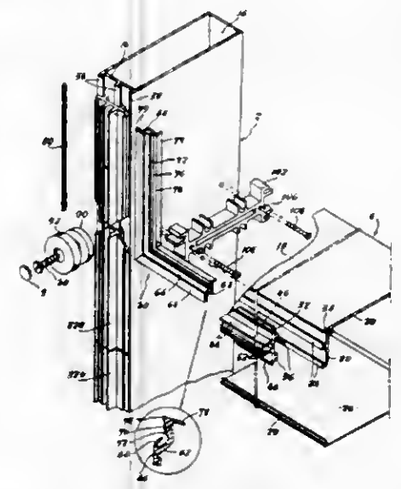
Richard Lewis Stoakes, "Clouds" Northdown Road, Woldingham, Surrey, England

Filed May 20, 1975, Ser. No. 579,214

Claims priority, application United Kingdom, May 29, 1974, 23832/74

Int. Cl.² E04B *1/62*

U.S. Cl. 52—400 **11 Claims**



1. A structural assembly comprising, in combination, as series of interconnected elongate members, a frame structure formed by said interconnected members, at least two contiguous cells or spaces being defined in said structure by said members, panes or panels mounted on or adjacent an outer face of said structure and providing infill members for said cells or spaces, sealing means engaging the infill members both at edges thereof and at portions of inner faces thereof adjacent said edges, said sealing means having a front face substantially coplanar with the outer faces of the infill members, and being contoured, at portions thereof engaging said edges of the infill members, to provide local resilient deformability, securing means engaging outer faces of the infill members adjacent said edges to apply a sealing pressure between the sealing means and said portions of the inner faces, said securing means comprising a series of devices that are disposed at intervals along the edges of the infill members, and means fixing said devices individually in position on the frame structure.

4,031,681

WALL CONSTRUCTION

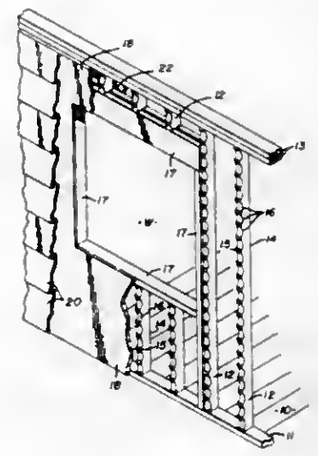
Joseph Charniga, P.O. Box 5037, Poland, Ohio 44514

Filed Feb. 4, 1976, Ser. No. 655,266

Int. Cl.² E04B *2/02*; E04C *2/80*

U.S. Cl. 52—408 **4 Claims**

1. An exterior load bearing wall construction comprising an inner wall portion, studding supporting said inner wall portion in continuous contact therewith, a plurality of closely spaced scallops formed in the outer surfaces of each of said studding so as to form narrow transverse areas therebetween, an outer wall portion positioned against said narrow transverse areas of said studding and secured thereto in limited contact therewith and exterior surfacing material on said outer wall portion, said



inner wall portion comprising dry wall or the like and said outer wall portion comprising insulating board and siding or the like, upper and lower plates positioned on the upper and lower ends of said studding, the outer surfaces of said plates being smooth, said insulating board of said outer wall portion being positioned against said smooth surfaces of said plates in substantially weather-tight relation.

4,031,682

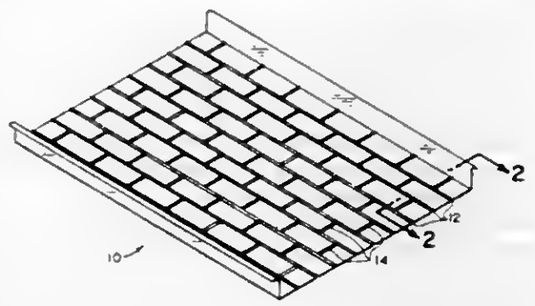
PREFABRICATED BUILDING PANEL AND METHOD OF MAKING

J. Steven Renkert, Canton, Ohio, assignor to Metropolitan Industries, Canton, Ohio

Division of Ser. No. 569,276, April 14, 1975, Pat. No. 3,965,635. This application June 22, 1976, Ser. No. 698,309

Int. Cl.² E04B *2/00*, *1/00*

U.S. Cl. 52—434 **8 Claims**



1. A wall panel including a plurality of ceramic, masonary or the like facing bricks spaced apart but bonded together by a first cementitious mixture deposited and hardened in the spaces separating the bricks, the cementitious mixture covering a rear portion of some of the bricks but none of the front portion,

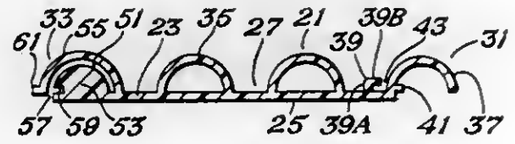
a lattice work of beams and shafts joined to both the back portions of at least some of the bricks by the bond of said cementitious mixture and to each other by welding,

at least some of the beams and shafts being of a cross-sectional shape other than round, thereby providing a more rigid composite panel,

a layer of a second cementitious mixture at least partially covering the exposed surface of the lattice work, bricks and the first cementitious mixture, said layer helping to join the lattice work to the facing bricks,

said second cementitious mixture including hydrated cement and glass fibers,
said layer having a thickness not substantially greater than ¼ inch.

4,031,683
PANEL INTERLOCK
Ray R. Walker, 6209 N. Hill Lane, Fort Worth, Tex. 76135
Filed June 18, 1975, Ser. No. 587,997
Int. Cl.² E04D 1/08
U.S. Cl. 52—536 5 Claims



1. A panel for use for construction purposes and having opposite edges to be interlocked with adjacent panels, comprising:
a base portion having an inner side and an outer side,
one of said edges having an arcuate interlock member extending along the length of said one edge,
said arcuate member as seen in a cross-section through the width of said panel extends outward beyond said base portion and away from said other edge and has a free edge spaced from said base portion,
the other edge of said panel having an arcuate slot extending along the length of said other edge,
said arcuate slot as seen in a cross-section through the width of said panel has an opening along said other edge,
said arcuate slot extends from said opening outward beyond said base portion and toward said one edge,
a L-shaped member extending along the length of said panel from the outer edge of said base portion and located at a position near but spaced inward from said arcuate member,
said L-shaped member as seen in a cross-section through the width of said panel comprising a first portion extending outward from said base portion at a position spaced inward from said arcuate member and a second portion extending towards said arcuate member defining an L-shaped slot between said L-shaped member, said arcuate member, and said base portion,
a ridge extending along the length of said panel from the inner side of said arcuate member near the level of said base portion,
said ridge being generally parallel with base portion and extending in a direction away from said other edge of said panel,
said arcuate slot being defined by:
structure extending outward from said base portion and having an arcuate outward facing surface, and
a second arcuate member spaced outward from said structure and following said arcuate outward facing surface of said structure,
said second arcuate member extending from said panel away from said one edge and having a free end defining said opening between said free end and said structure,
said structure defining said arcuate slot having a slot formed therein along its length near said opening and extending generally parallel with said base portion,
said second arcuate member having a ridge formed at its free end along its length and extending generally parallel with said base portion in a direction away from said one edge.

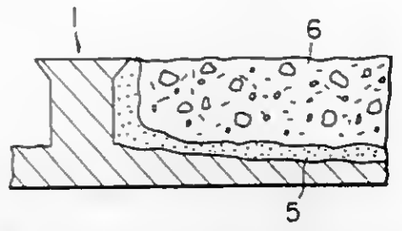
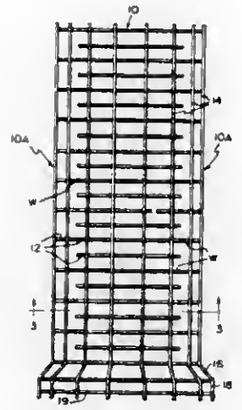
DECORATIVE PRECAST CONCRETE BOARDS AND PROCESS FOR PRODUCING THE SAME
Tokuhito Shibata, 1 Nishi Koike-cho, Toyohashi, Aichi, Japan
Continuation-in-part of Ser. No. 482,303, June 24, 1974, abandoned. This application Nov. 11, 1975, Ser. No. 630,865
Claims priority, application Japan, Mar. 15, 1974, 49-029213
Int. Cl.² E04B 5/04
U.S. Cl. 52—612 6 Claims



1. A decorative precast concrete board comprising at least one surface layer and a core layer, the four edges of which recede or are indented toward the back side, said surface layer being made of an inorganic cement mortar containing non-expanded shirasu at least in an amount that said sand occupies at least 30% by weight of the total amount of the dry ingredients, and said core layer being made from an inorganic concrete mortar containing fine hollow spherical expanded shirasu in an amount that said expanded sand occupies 10 – 70% by weight of the total amount of the dry ingredients.

4,031,685
REINFORCING CAGE CONSTRUCTION
Robert F. Heinz, 3910 Pratt Lake Road, Gladwin, Mich. 48624
Continuation of Ser. No. 517,489, Oct. 24, 1974, abandoned. This application Feb. 13, 1976, Ser. No. 657,992
Int. Cl.² E04H 12/12; E04C 5/03
U.S. Cl. 52—653 11 Claims

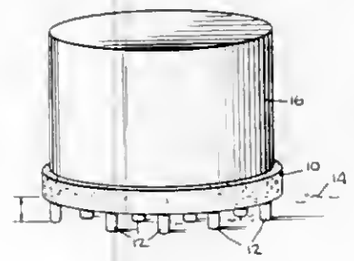


1. A prefabricated cage section for constructing a tubular wire mesh reinforcing cage for concrete pipe or like structures; said section comprising a plurality of arcuate wire members and a plurality of axially extending wire members fixedly secured to said arcuate members at one of the concave and convex sides thereof to define an arcuate grid structure conformed to constitute a full length quadrant segment of less than 120° arcuate extent of a tubular wire reinforcing cage, and stacking elements fixedly mounted at spaced locations on one of the concave and convex sides of said grid structure and projecting radially from said one of said sides by a distance such that a curved surface containing those points of said arcuate grid lying at a minimum radial distance from the axis of arcuateness at the concave side of said grid is congruent with a curved surface containing those points of said arcuate grid lying at a maximum radial distance from said axis at the convex side thereof whereby like sections can be stacked in concave to convex side nested relationship with each section the next adjacent section at at least three peripherally spaced support locations.

4,031,686
COMBINATION WOOD AND METAL TRUSS STRUCTURE
Arthur Carol Sanford, 2308 Bay Drive, Pompano Beach, Fla. 33062
Filed Jan. 13, 1977, Ser. No. 759,072
Int. Cl.² E04C 3/17, 3/292
U.S. Cl. 52—693 8 Claims

1. A combination wood and metal truss structure comprising wood chord members and a series of diagonal compression and tension web members therebetween, said compression members being wood members oppositely inclined to said tension members, toothed metal plates connecting the ends of all said web members to the sides of said chord members, the opposed inner surfaces of said chord members having notches abuttingly receiving the ends of said compression web members, the connector plates for the compression web members overlying said notches on one side of said chord members, and the connector plates for the tension web members overlying said notches on the other side of said chord members, whereby movement of the compression web members laterally of said chord members is prevented.

4,031,687
FORMATION OF ELEVATED STRUCTURES
Howard W. Kuntz, Miami, Fla., assignor to Raymond International Inc., Houston, Tex.
Filed Aug. 2, 1976, Ser. No. 710,470
Int. Cl.² E04B 1/00; E02D 27/00
U.S. Cl. 52—742 16 Claims

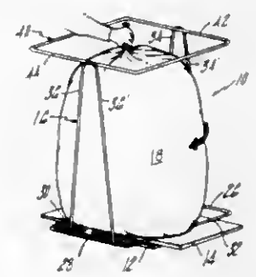


1. A method of constructing an elevated platform, said method comprising the steps of providing a blanket of sand on the earth, installing a plurality of spaced apart support elements to extend from a bearing region in the earth beneath the sand blanket and up to a location near the top of said sand blanket, embedding water jet nozzles in said sand blanket with water conduits extending from outside said sand blanket to said nozzles, forming a mold surrounding said plurality of support elements at their upper end, with the upper surface of said sand blanket forming the bottom of said mold, pouring concrete into said mold and allowing it to solidify in contact with the upper ends of said support elements and to form a platform supported by the support elements, and thereafter washing out the sand from between said support elements under the platform by pumping water through said conduits and causing jets of water to be directed from said nozzles.

4,031,688
TECHNIQUE FOR PRESSURIZING A SEALED ARTICLE
George J. Wasserman, 110 Babcock St., Brookline, Mass. 02146
Filed Sept. 4, 1975, Ser. No. 610,128
Int. Cl.² B65B 31/08
U.S. Cl. 53—7 23 Claims

22. In a method of inflating a tennis ball the step of coring a cylindrical segment from the wall of said ball with said segment having a diameter in the order of one millimeter, removing the core from the wall, introducing air into said ball through the hole formed in the wall and thereafter sealing the hole formed by the removal of said core.

4,031,689
FLEXIBLE BAG SUPPORTING DEVICE
Philip E. Sullivan, c/o Columbia Poly Pak Company, 83 Meadow St., Hartford, Conn. 06114
Filed Sept. 18, 1975, Ser. No. 614,515
Int. Cl.² B65B 7/12, 51/00, 67/12
U.S. Cl. 53—370 2 Claims



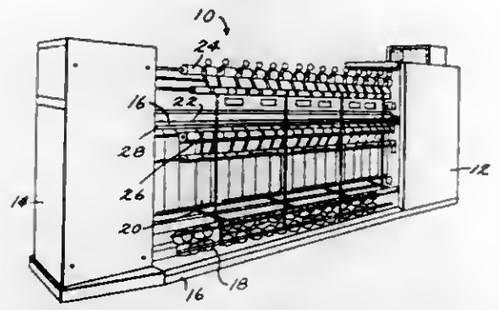
1. For use with a flexible bag having a bottom closed end and an upper open end, a bag supporting device comprising a base, a support platform mounted for rotation on the base for supporting the closed end of the bag, a stand of an open wirelike frame construction having a bag mounting rim, a bottom member and upright legs connecting opposite sides of the bottom member to the bag mounting rim of the stand to locate the bag mounting rim in elevated relation to the platform at a height less than the height of the bag to be supported such that the upper end of the bag may be reversely folded over the rim with the bag open and extended for loading, and mounting means for securing the bottom member of the stand in fixed relation to the support platform, the support platform and the stand being rotatable in unison relative to the base such that upon spinning the bag and stand on the support platform while holding the upper end of the bag fixed, its upper end may be formed into a tightly twisted closure and handle for efficient removal and lifting of the bag, the platform having a face scored with a plurality of slots conforming to the configuration of the open wirelike bottom member of the stand for receiving the same in a stabilized assembly, the mounting means removably securing the bottom member of the stand in the slots of the support platform.

4,031,690

NOISE SUPPRESSION APPARATUS AND METHOD FOR FALSE-TWIST TEXTURING MACHINES

Lorimer Phillip Thomas, and Robert Harold Walker, both of Greensboro, N.C., assignors to Burlington Industries, Inc., Greensboro, N.C.

Filed Oct. 2, 1975, Ser. No. 618,969
Int. Cl.² D02G 1/02; G10K 11/00
U.S. Cl. 57—1 R 11 Claims



1. Noise abatement apparatus for a yarn texturing machine of the type having a frame extending between a gear housing and a motor housing, a plurality of rotatable devices spaced longitudinally along said frame, a plurality of pulley means mounted on said frame and spaced longitudinally therealong, an endless drive belt extending from within said motor housing along said frame and into said gear housing and in driving engagement with a portion of each said pulley means, a plurality of idler pulleys, means for mounting said idler pulleys along said frame in engagement with said endless drive belt, an endless driven belt extending along said pulley means and in engagement with another portion of each said pulley means and in driving engagement with each of said rotatable devices, said texturing machine further including yarn transport means and heater means mounted on said frame, said noise abatement apparatus comprising:

a. means for enclosing a said pulley means located adjacent to said gear housing, said enclosing means including pairs of openings for said endless drive belt and said endless driven belt,

b. means for isolating vibrations of said idler pulleys' mounting means from said frame,

c. means for reducing sound generation from said idler pulleys and simultaneously reducing the rotational velocity of said idler pulleys when said idler pulleys are being rotated by said endless drive belt.

9. A noise abatement method for a yarn texturing machine of the type having a motor housing at one end of the machine, a gear housing at the other end thereof, a frame extending between said housings, a plurality of rotatable spindles spaced along said frame, a plurality of pulleys mounted on said frame and spaced longitudinally therealong, an endless drive belt extending from said motor housing, along said frame and into said gear housing with said drive belt being in driving engagement with a portion of each said pulley means, a plurality of idler pulleys, means for mounting said idler pulleys along said frame in engagement with said endless drive belt, an endless driven belt extending along said pulley means and in engagement with another portion of each said pulley means so as to be driven thereby, said endless driven belt being in driving engagement with said rotatable spindles, said yarn texturing machine further including yarn transport means and heater means mounted on said frame, said method comprising the steps of:

a. enclosing the pulley located adjacent to said gear housing with enclosure walls lined with sound absorbing material,

b. providing, with said enclosure walls, tunnels for said endless drive belt and lining said tunnels with sound absorbing material,

c. providing cushioning means for said mounting means for said idler pulleys, and

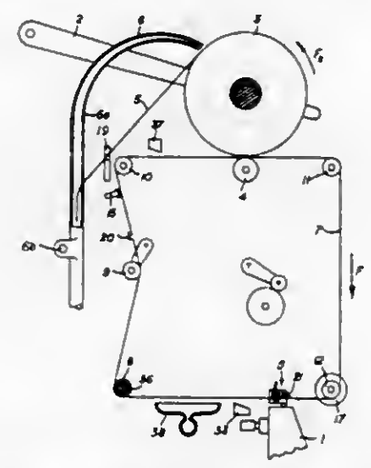
d. providing sound reducing means on the rotatable portion of each idler pulley.

4,031,691

DEVICE FOR REINSERTING THE BROKEN YARN IN AN OPEN END SPINNING UNIT

Christian Roehrich, Chaillevette, France, assignor to Nuova San Giorgio S.p.A., Genoa-Sestri, Italy

Filed Aug. 13, 1976, Ser. No. 714,114
Claims priority, application Switzerland, Aug. 20, 1975, 10807/75; Nov. 28, 1975, 15462/75
Int. Cl.² D01H 15/00, 1/12
U.S. Cl. 57—34 R 17 Claims



1. A device for reinserting the broken yarn in a spinning unit of an open end type of spinning frame, comprising a disengaging or releasing member between the winding up bobbin and associated driving shaft, means for extracting the broken end of yarn from the bobbin yarn, a yarn gripping element, a device for reinserting the yarn in the spinning unit, means for transferring said gripping element from a yarn gripping position to said reinserting device and a thread cutter adjacent said reinserting device, said transfer means comprising an endless belt having said gripping element secured thereto, guide means for said endless belt to form a loop passing in front of said yarn gripping position and said reinserting device, driving means for said belt to move said gripping element from said yarn gripping position to said reinserting device, and means for stopping said belt at least at a determined position of the path of said gripping element.

4,031,692

NOVEL HOSIERY YARN

F. Holmes Simons, and Michael P. Taylor, both of Charlotte, N.C., assignors to Fiber Industries, Inc., Charlotte, N.C.

Continuation of Ser. No. 275,390, July 26, 1972, abandoned, and a continuation-in-part of Ser. No. 166,580, July 27, 1971, abandoned. This application Jan. 7, 1976, Ser. No. 647,235
Int. Cl.² D02G 3/24, 3/26, 1/02
U.S. Cl. 57—140 R 11 Claims

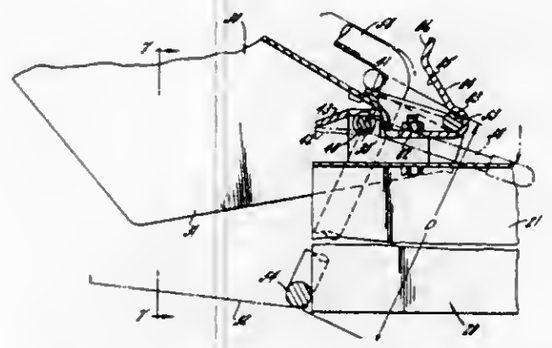
1. Pick resistant hosiery comprising twist lively yarn comprising at least 50% polyester, said polyester being essentially 100% poly(tetramethylene terephthalate), said yarn having an available torque ratio of 1 to 3, a sum of initial twist and developed twist less than 55 t.p.i., a percent developed crimp of at least about 12 percent, and from 1 to 50 filaments.

4,031,693

ELECTRONIC DIGITAL CLOCKS

Albrecht Haag, Dauchingen, and Helmut Stechmann, Schwenningen, both of Germany, assignors to Kienzle Uhrenfabriken GmbH, Schwenningen, Germany

Filed Dec. 23, 1975, Ser. No. 643,878
Claims priority, application Germany, Dec. 27, 1974, 2461563; Feb. 25, 1975, 2508037
Int. Cl.² G04C 13/06
U.S. Cl. 58—33 32 Claims



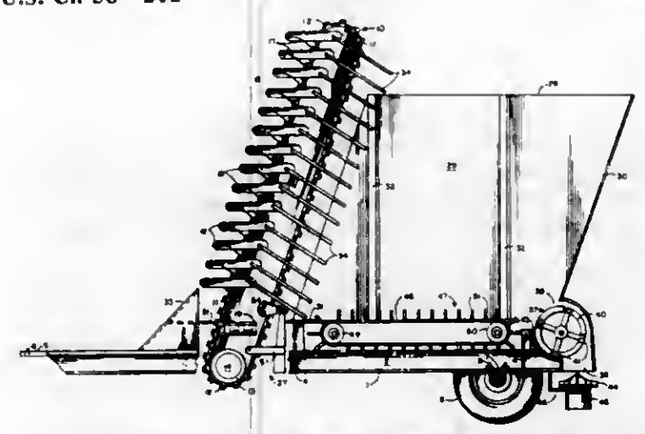
1. An electronic digital clock having at least one time-programmed electrical output for triggering switching functions, the clock comprising a digital electrical time display, a clock circuit for producing and applying to said display coded signals representing time, a multiplexer, at least one coded fixed-value store, a sampling logic circuit and a comparator circuit, wherein coded values stored in the fixed-value store are sampled under the control of the multiplexer by the sampling logic circuit and are compared in the comparator circuit with said coded signals representing time, and wherein the event of coincidence between the sampled values and the coded signals representing time an output signal is produced at said time-programmed electrical output.

4,031,694

MOWER ASSEMBLY WITH CATCHER SECUREMENT

Donald L. Gobin, Savannah, Ga., assignor to Roper Corporation, Kankakee, Ill.

Filed May 17, 1976, Ser. No. 686,888
Int. Cl.² A01D 55/22
U.S. Cl. 56—202 11 Claims



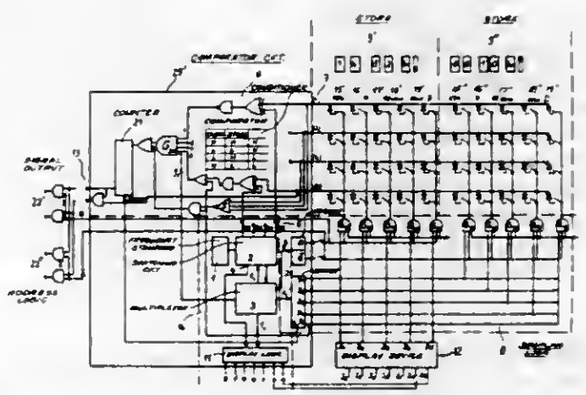
1. A mower assembly with catcher securement comprising, in combination, a rotary mower structure including a housing having a discharge chute of inverted U cross section formed of side walls and a top wall and defining an opening for outward discharge of a stream of clippings, a guard of inverted U cross section having sides and a top wall superimposed on the discharge chute and extending beyond it, means for pivoting the guard to the discharge chute along an axis located at the top wall of the chute adjacent the discharge opening, means for biasing the guard downwardly about its pivot axis, a stop in the path of downward movement of the guard for defining a normal downwardly-angled guarding position for interception of missiles in the stream, the sides of the guard including projections extending inwardly of the pivot axis and having upwardly facing notches at the inner ends thereof defining vertical obstructing edges, means on the top wall of the chute defining a horizontally facing groove spaced inwardly of the pivot axis and parallel thereto and so located as to be in register with the notches when the guard is tilted to a horizontal freely discharging position, a catcher having a frame and a bag supported thereby, the frame defining a throat registering with the end of the chute and enclosing the guard, the frame including a horizontal supporting rod at the upper edge of the throat, an upstanding guide member mounted on the discharge chute adjacent the groove and so angled that when the horizontal supporting rod of the catcher is positioned against the guide member and pressed downwardly against the projections on the guard, the guard is swung upwardly to a position slightly beyond the horizontal position for entry of the supporting rod into the groove followed by slight downward movement of the guard under the force of bias into horizontal position in which the obstructing edges of the notches hold the rod captive in the groove.

4,031,695

TREE HEDGING ARRANGEMENT

Richard E. Diggs, P.O. Box 776 South 12A Road, Carthage, Mo. 64836

Filed Oct. 28, 1975, Ser. No. 626,449
Int. Cl.² A01D 55/24
U.S. Cl. 56—237 14 Claims



1. A hedging apparatus comprising:

a. a wheeled vehicle which rolls over the ground;

b. a powered chain saw on said vehicle, said saw having a chain bar with a rotatively movable cutter chain thereon and being oriented to sever the branches of trees which the vehicle rolls past during a hedging operation; said cutter chain moving about said chain bar in a cutting direction;

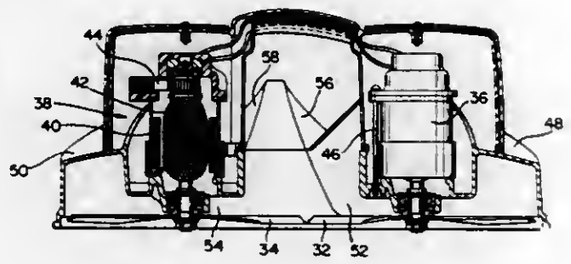
a plurality of guide bars attached to the chain bar and extending forwardly therefrom beyond the cutter chain; the guide bars being spaced apart from each other along the length of the chain bar; and

d. said guide bars each having a first surface thereof engaging selected branches and restraining the same from motion relative to said cutter chain in the cutting direction; said first surface being blunt from a forwardmost point thereof to a point disposed adjacent to said cutter chain for non-cutting abutment with said selected branches, whereby the selected branches are severed by a chopping, non-sharing motion of said cutting chain.

4,031,696
BLADE CONFIGURATION FOR CORDLESS LAWNMOWER

Donald Earl Fleigle, Frostburg, Md., assignor to The Black and Decker Manufacturing Company, Towson, Md.

Filed Aug. 8, 1975, Ser. No. 603,251
Int. Cl.² A01D *55/18*
U.S. Cl. 56—295 **1 Claim**



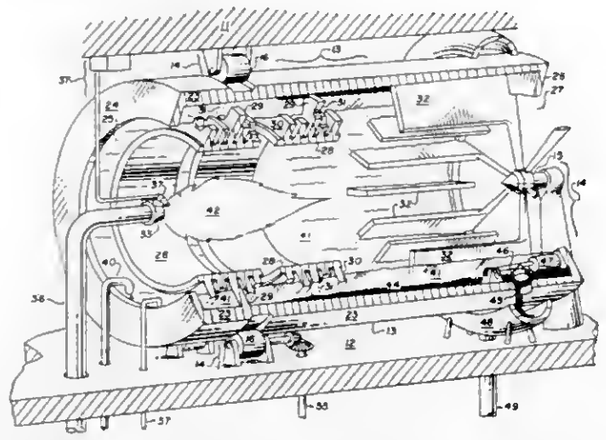
1. In a cordless electric lawnmower of the type comprising a housing, a battery supported on said housing, a handle mounted on said housing, a switch supported on said handle, an electric motor mounted on said housing and connected to be energized from said battery via said switch, a blade adapted to be rotated in a horizontal plane within said housing by said motor, and a helical discharge path defined by said housing for receiving air and grass clippings propelled by said blade without causing substantial recutting of said clippings, the improvement comprising an improved configuration for said blade to provide maximum cutting and air propelling efficiency so that said grass clippings tend to remain entrained from the time of severing the clipping to the point of discharge from the mower housing, said configuration comprising an air foil cross section along the full length of said blade, said cross section comprising a generally flat central width section and two converging end sections, said central width section comprising approximately 60% of the width of said blade; said configuration including two lifting regions wherein said cross sectional shape is disposed at an angle to the cutting plane of said mower and a central length region parallel to said cutting plane, said lifting regions lying below the upper surface of said central length region, said configuration providing a recess between the cutting plane of said mower and the lower surface of said central length region for location of mounting means for said blade therein.

4,031,697
COMBINATION STEAM-GAS GENERATOR ENGINE

Joseph Bryan Adair, 2103 Vanderbilt Lane, Austin, Tex. 78723

Filed Apr. 18, 1976, Ser. No. 675,071
Int. Cl.² F02C *7/00*
U.S. Cl. 60—39.55 **17 Claims**

1. A combination steam-gas generator engine comprising
A. a ground base support structure;
B. an engine bed frame supported by a conventional means at a spaced-apart distance from the ground base support structure with means for rotatably supporting a rotary can burner;
C. an input air compressor;
D. a compressed air transmission duct routed between the compressed air supply end of said input compressor and the input end of a rotary can burner;
E. a generally horizontally positioned rotatably mounted hollow tubular can burner structure having
1. a cylindrical wall,
2. an appropriate fuel injection nozzle with associated means of igniting fuel injected into the burner can,
3. a cylindrical wall of vaporizable liquid fluid forming a liquid liner on the interior wall of the burner can and held against said interior wall of the burner can by centrifugal force resulting from high speed rotation of the burner can,
4. at least one rotatable flame protecting flame gallery liner of a thermally conductive material concentrically mounted to and within the burner can near the fluid input end of the can and supported at a spaced-apart distance from the burner can wall, with the space between the outer portions of the flame gallery liner and the burner can wall being partially occupied by said cylindrical wall of vaporizable liquid fluid,
5. a fluid input means at one end of the burner can, and
6. a fluid output means at the opposite end of the burner can;
F. means of providing rotary drive motion to rotate the burner can;

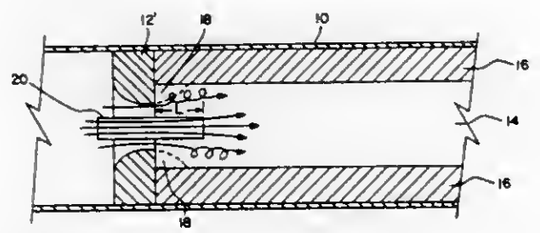


G. an auxiliary power turbine gas inlet duct coupled to the downstream output end of the rotatable burner can;
H. a driven auxiliary power turbine wheel rotatably mounted in such position as to be driven by the gasseous fluid flowing from the rotatable burner can through the auxiliary power turbine gas inlet duct;
I. means of coupling rotative energy developed by the auxiliary power turbine wheel to auxiliary and accessory equipment;
J. a generated gas directive duct; coupled to
K. a useful load device;
L. means for controlling the supply and flow of vaporizable liquid fluid into the burner can;
M. means for controlling the supply and flow of fuel to the fuel injection nozzle in the burner can.

4,031,698
SPLIT FLOW INJECTOR FOR SOLID FUEL RAMJETS

John M. Humphrey, San Jose, and Allen L. Holzman, Palo Alto, both of Calif., assignors to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Aug. 6, 1976, Ser. No. 712,421
Int. Cl.² F02K *9/04*
U.S. Cl. 60—251 **5 Claims**

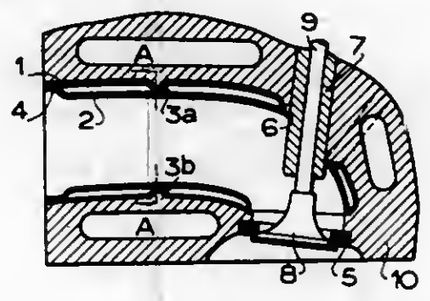


1. In a solid fuel ramjet, having a casing with an injector port and a fuel port with a recirculation region adjacent to and downstream from said injector port, the improvement comprising:
an inner tube situated centrally in said injector port and extending into said fuel port to divide an airflow through said injector port into a primary and secondary airstream, said primary airstream being injected into said recirculation region to stabilize combustion and said secondary airstream being injected into said fuel port downstream from said recirculation region to smooth said airflow.

4,031,699
PORT LINER ASSEMBLY

Yoshiyuki Suga, Tokyo; Tsutomu Kita, Kawasaki, and Ryusuke Harada, Tokyo, all of Japan, assignors to Fuji Jukogyo Kabushiki Kaisha, Tokyo, Japan

Filed Aug. 20, 1975, Ser. No. 606,238
Claims priority, application Japan, Oct. 25, 1974, 49-129185
Int. Cl.² F01N *3/10*
U.S. Cl. 60—282 **6 Claims**



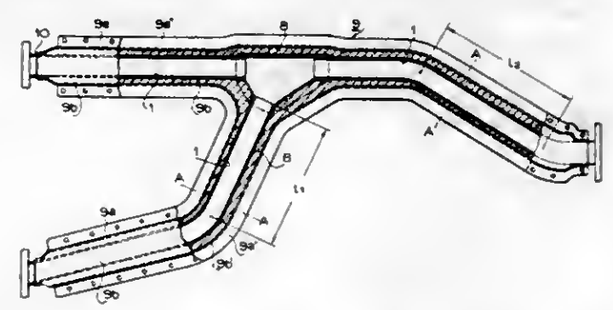
1. A port liner assembly for internal combustion engines having at least one exhaust valve seat, comprising,
a cylinder head block,
an exhaust port having an inner wall provided in said cylinder head block communicating with at least one exhaust valve seat,
a tubular liner provided in said exhaust port comprising an outer tube and an inner tube engaged with each other forming a hollow structure,
said tubular liner having means for sliding an outer end of said inner tube relative to said outer tube, said inner tube constituting a floating tube,
said inner and outer tubes having inner ends adjacent the exhaust valve seat, and
said inner ends being secured together.

4,031,700
HEAT INSULATING APPARATUS FOR EXHAUST PIPE OF AN INTERNAL COMBUSTION ENGINE

Nobuo Yamazaki, Gunma; Takeshi Ito, Ohta; Tetsuro Katsurada, Ohta, and Yasuhiko Habara, Ohta, all of Japan, assignors to Fuji Jukogyo Kabushiki Kaisha, Tokyo, Japan

Filed Nov. 24, 1975, Ser. No. 634,786
Claims priority, application Japan, Nov. 26, 1974, 49-143649[U]; Nov. 26, 1974, 49-143651[U]
Int. Cl.² F01N *7/00*
U.S. Cl. 60—322 **7 Claims**

1. An exhaust pipe system for internal combustion engines comprising
an exhaust pipe comprising first straight portions and bending portions and second straight portions positioned after the bending portions which are alternately arranged and continuously connected with each other,
a heat insulating layer disposed on said exhaust pipe,
a cover covering said heat insulating layer,
said heat insulating layer on the second straight portions positioned after each said bending portion having an eccentric cross-sectional thickness having a stretching side and a diametrically opposite side, in which the thickness of the stretching side thereof is greater than that of the diametrically opposite side and being adapted to absorb a thermal expansion of a preceding said first straight portions, said cover on said second straight portions after each said bending portion being eccentrically

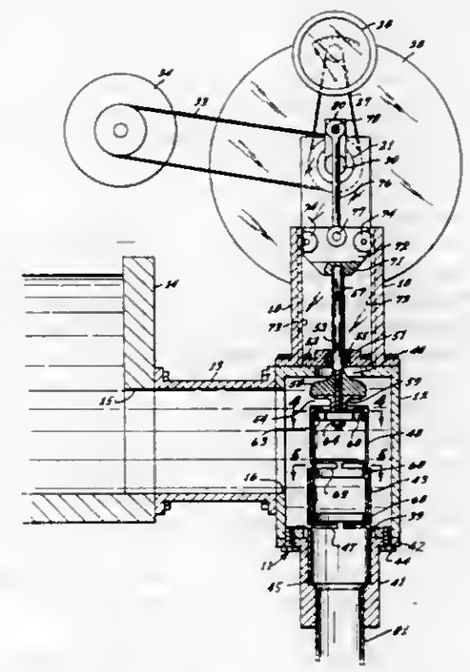


offset relative a longitudinal axis of said second straight portions, and
one end of said cover being secured to said exhaust pipe and the other end of said cover slidably engaging with said exhaust pipe.

4,031,701
WATER MOTOR

Carl H. Upton, 12831 Clark Ave., Downey, Calif. 90242

Filed Mar. 30, 1976, Ser. No. 671,840
Int. Cl.² F15B *1/06*
U.S. Cl. 60—325 **10 Claims**



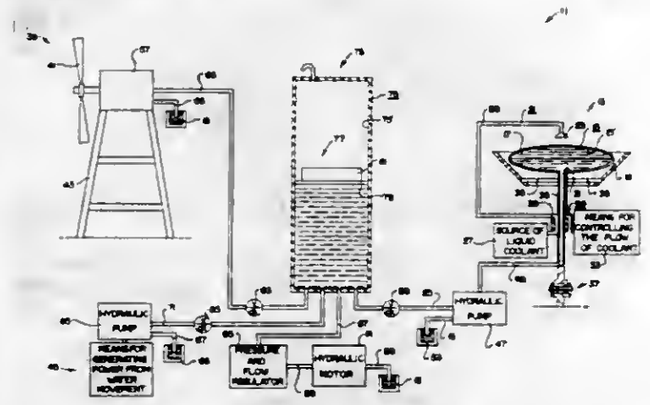
1. A water motor unit comprising:
a cylinder having a port on the sidewall thereof,
an outlet conduit extending from the lower end of said cylinder,
a piston means including a piston rod, said piston means reciprocatingly movable in said cylinder and having a port on the sidewall thereof, and
a container providing a supply of water immersing said cylinder and said piston means,
whereby when said piston means is in its uppermost position relative to said cylinder the ports of said cylinder and said piston means are open to enable water to flow from the container into the cylinder to fill the outlet conduit with a continuous column of flowing water, and
whereby when said piston means moves downwardly into said cylinder the ports in each are closed resulting in the column of water in the outlet conduit exerting a downward pulling action on the piston means until the ports of each mate and provide an opening thereby permitting

water to flow from the container into the cylinder and terminate the pulling action on the piston means.

4,031,702
MEANS FOR ACTIVATING HYDRAULIC MOTORS

James T. Burnett, River Bank Road, Batesville, Ark. 72501, and Arnold P. Hendrix, Rte. 1, Box 775, Atoka, Tenn. 38004

Filed Apr. 14, 1976, Ser. No. 677,018
Int. Cl.² F15B 1/02, 18/00
U.S. Cl. 60—398 2 Claims



1. Means for activating hydraulic motors, said means comprising:

a. at least one power generating means for generating power from sunlight, said power generating means including a solar heat absorbing means having a hollow interior, including a quantity of heat absorbing expandable gas within said hollow interior of said solar heat absorbing means, including reflector means for allowing sunlight to be directed against substantially all portions of said solar heat absorbing means, including coolant spray means for spraying a liquid coolant over said solar heat absorbing means when the temperature of said quantity of heat absorbing expandable gas within said hollow interior of said solar heat absorbing means is above a set amount, including support means for supporting said solar heat absorbing means and said reflector means, and including a thermostat device for sensing the temperature of said quantity of heat absorbing expandable gas within said hollow interior of said solar heat absorbing means and for controlling the flow of liquid coolant through said coolant spray means, said support means including a gimbal-like device for allowing said solar heat absorbing means and said reflector means to be positioned so as to receive the maximum effect of the sun's rays;

b. hydraulic pump means connected to said power generating means for using the power generated by said power generated means to pump hydraulic fluid;

c. tank means connected to said hydraulic pump means for receiving and storing the hydraulic fluid pumped by said hydraulic pump means, said tank means including means for maintaining the hydraulic fluid under a constant pressure; and

d. means for allowing the hydraulic fluid stored within said tank means to selectively pass to a hydraulic motor whereby the hydraulic motor is activated.

4,031,703
SPHERICAL STIRLING ENGINE

Charles G. Redshaw, 15001 SE. 44th Place, Bellevue, Wash. 98006

Continuation-in-part of Ser. No. 602,923, Aug. 7, 1975, Pat. No. 3,984,981. This application June 18, 1976, Ser. No. 697,624
Int. Cl.² F02G 1/04
U.S. Cl. 60—519 10 Claims

1. A spherical Stirling cycle engine having means for internal heat transfer comprising:

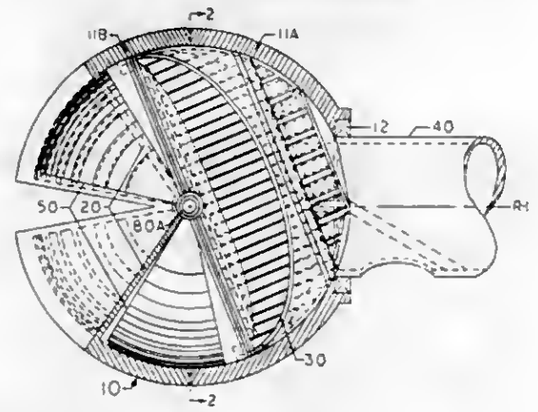
a housing fixed against rotation comprising;

two substantially hemispherical members having means for joining and sealing around their common diametrical plane forming an essentially spherical cavity, said members each having a circular aperture located diametrically opposite each other;

a circular disk located within said cavity and engaged with said housing by sealing means to divide said cavity into two substantially equal first and second sections, said disk having a first axis with a journal segment extending diametrically across the disk in said first section, and a second axis positioned perpendicular to said first axis with a journal segment extending diametrically across the disk in said second section;

substantially similar first and second spherical-sector shaped heat exchangers located in said first and second sections respectively, and pivotally mounted about said first and second axis to form a universal coupling between them, with the wedge apex engaged by seal means to said journal segments and the wedge lune juxtapose and engaged by seal means to said housing, dividing each of said sections into two chambers, said heat exchangers having ports located on the wedge lune in communication with said apertures for the circulation of heat transfer fluids through heat exchanger fin assemblies comprising;

a plurality of hollow sector shaped fins arranged symmetrically to form a spherical-sector shape with openings on common manifolds connected to said ports;



atachment means to prevent movement of said first heat exchanger, located in said first section, relative to said housing;

connective means for drivingly engaging said second heat exchanger for nutative movement, said movement providing an oscillating motion to said second heat exchanger about said second axis varying the effective volume of said chambers in said second section, and an oscillating motion to said disk about said first axis varying the effective volume of said chambers in said first section;

substantially similar spherical-sector shaped heat regenerators located within each said chamber by attachment means to said disk, and connected by passages through said disk between said first and second sections to form two interconnected pair of chambers, said regenerators comprising;

a plurality of sector shaped fins arranged for interspacing with said heat exchanger fin assemblies, and mounted on a common manifold to form a spherical-sector shape, said fins providing fluid passage in heat exchange relationship with a working fluid circulated between said interconnected chambers through said manifolds and passages;

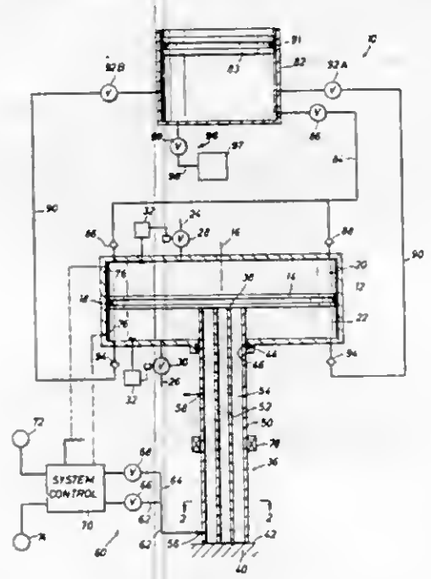
means for supplying heat to said first heat exchanger;

means for removing heat from said second heat exchanger.

4,031,704
THERMAL ENGINE SYSTEM

Marvin L. Moore, 16204 Diana Lane, Apt. 323A, Houston, Tex. 77062, and William M. Moore, 8820 Mountain Path Circle, Austin, Tex. 78750

Filed Aug. 16, 1976, Ser. No. 714,300
Int. Cl.² F03G 7/06
U.S. Cl. 60—325 10 Claims



1. A thermal engine comprising:

a cylinder having a working fluid therein;

a piston reciprocally movable in first and a second direction within said cylinder and dividing said cylinder into a first and second region;

an expansible member operatively associated with said piston and responsive to the temperature of a driving fluid to move said piston reciprocally within said cylinder to alternatively pressurize working fluid in said first and second regions; and,

means for introducing driving fluid of a predetermined temperature into a heat exchange relationship with said expansible member.

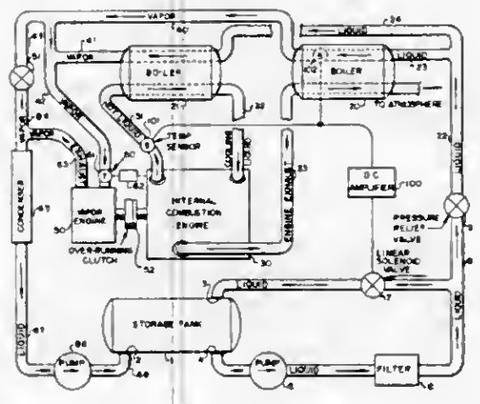
AUXILIARY POWER SYSTEM AND APPARATUS

John W. Berg, 1111 Morse Ave., Space No. 35, Sunnyvale, Calif. 94086

Continuation-in-part of Ser. No. 524,262, Nov. 15, 1974, abandoned. This application Nov. 10, 1975, Ser. No. 630,415
Int. Cl.² F01K 23/10
U.S. Cl. 60—615 37 Claims



1. Apparatus for providing mechanical power from normally wasted heat energy, comprising:

primary engine means for generating primary power and heat not used for said primary power.

fluid having a boiling point well below that of water,

heat exchange means connected to said engine for heating said fluid from a liquid state to a vapor by employing heat normally wasted by said primary engine means,

auxiliary vapor-operated engine means for generating power from the energy supplied by said vapor, and

control means for automatically controlling the flow of said fluid to said heat exchange means in accordance with the temperature of said primary engine, including temperature-sensitive means for providing an output signal as a function of temperature, and valve means connected to said temperature-sensitive means for controlling said fluid flow as a function of said output signal.

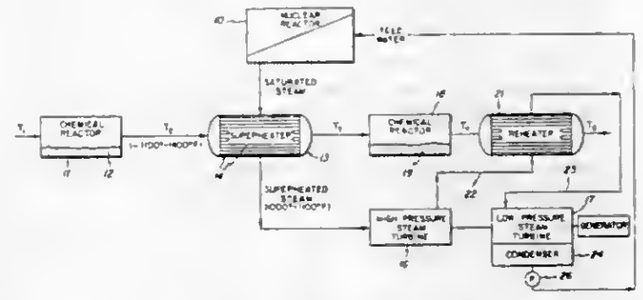
SUPERHEATING STEAM FROM LIGHT WATER NUCLEAR REACTORS

Himanshu B. Vakil, Schenectady, and Dale H. Brown, Scotia, both of N.Y., assignors to General Electric Company, Schenectady, N.Y.

Filed Dec. 18, 1975, Ser. No. 641,835
Int. Cl.² F01K 21/00
U.S. Cl. 60—644 10 Claims



1. In a process for heating the pressurized steam product stream produced by heat generated in a light water nuclear reactor wherein the steam product stream is brought into heat exchange relationship with a high temperature source in a heat exchange device and the temperature of the steam product stream is increased to at least about 650° F. after which the superheated steam so produced is used to operate a steam turbine-generator set, the improvement comprising using a combustion-less exothermic chemical reaction for the generation of heat utilized for the heating step, said exothermic chemical reaction having a maximum attainable temperature limited by thermodynamic considerations to a value below the design capability of any component of said heat exchange device exposed thereto.

4,031,707
CRYOTHERMAL MANIPULATION OF PETROLEUM SPILLS ON WATER

Sigmund Lance Ross, deceased, late of 1 Cornell St., Scarsdale, N.Y., by Rose Shuffman, executive, Scarsdale, N.Y., and Oscar Shuffman, 2761 Sedgwick Ave., New York, N.Y., assignors to Rose Shuffman, Executrix, Scarsdale, N.Y.

Filed Apr. 24, 1972, Ser. No. 246,960
Int. Cl.² E02B 3/00
U.S. Cl. 61—1 F 8 Claims

1. A method for recovering a body of petroleum constituting an oil spill on a large body of water comprising the steps of:

providing a plurality of elongated booms each comprising material at a cryothermal temperature corresponding to the freezing point of water at sea level or lower, which cryothermal temperature is lower than the temperature of said body of petroleum, each of said elongated booms being disposed in adjacent end-to-end pivotally connected relationship;

floating said elongated booms in the body of water with said material facing and adjacent the periphery of said body of

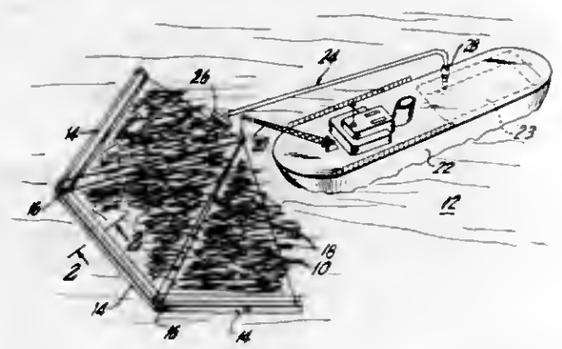
petroleum so as to increase the surface tension of said body of petroleum that is adjacent thereto and cause it to move away therefrom into a more restricted area; and

removing said body of petroleum from the water.

4. Apparatus for recovering a body of petroleum constituting an oil spill on a large body of water comprising:

an oil collection vessel;

a floatable boom assembly including at least two pivotally connected, elongated booms, each boom carrying, at the level of the water, an elongated block of material at a



cryothermal temperature corresponding to the freezing point of water at sea level or lower, which cryothermal temperature is lower than the temperature of said body of petroleum so as to increase the surface tension thereof when said elongated block of material is positioned adjacent said body of petroleum;

a guide wire assembly interconnecting said floatable guide assembly to said oil collection vessel; and

suction apparatus for removing the petroleum from said body of water and conveying same to the vessel for collection.

4,031,708

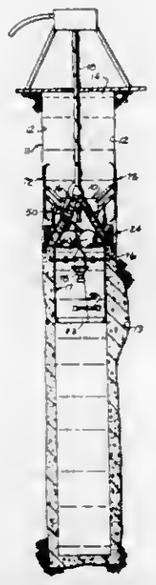
SLIPFORMING METHOD AND APPARATUS FOR IN SITU LINING OF AN UPWARDLY OPEN SHAFT WITH MONOLITHIC CONCRETE

Raymond A. Hanson, c/o R. A. Hanson Co., P.O. Box 7400, Spokane, Wash. 99207

Filed Sept. 20, 1976, Ser. No. 725,007

Int. Cl.² E21D *5/00*

U.S. Cl. 61—41 R **15 Claims**



1. A slipform for forming a monolithic concrete lining in an upwardly open vertical walled shaft filled with a liquid such as drilling mud, comprising:

an outer downwardly open form member having a lower peripheral edge of complementary configuration to the shaft cross section;

an upwardly closed inner core form member mounted to the outer form member and spaced inwardly therefrom;

an upright core wall parallel to and spaced inwardly from the shaft wall for forming the inside wall of the lining;

means for delivering concrete in a plastic state between the outer and inner form members to fill the gap between the shaft wall and core wall;

seal means on the outer form for providing a movable hydraulic seal between the outer form member and shaft wall; and

pump means for pumping liquid within the shaft from above the outer form member to pressurize the area within the shaft below the inner core member and thereby force the form members upwardly within the shaft as concrete is simultaneously received and formed against the shaft wall.

4,031,709

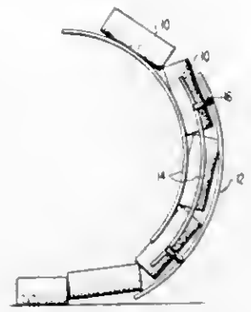
TILE DEGAPPER

John D. Blankemeyer, R.R. No. 3, Ottawa, Ohio 45875

Filed Feb. 19, 1976, Ser. No. 659,195

Int. Cl.² B65G *11/00*; **F16L** *1/00*

U.S. Cl. 61—106 **6 Claims**



1. An apparatus for detecting and correcting misaligned tiles in an automated tile laying system wherein tiles, having a cylindrical shape, open at both ends, are fed into a semicircular distribution chute in the vertical plane such that the tiles progress around and down the chute, the front edge of each tile is lapped over the rear edge of a preceding tile when in proper alignment, and no gaps occur between the tiles being placed on the ground, and when improperly aligned the front edge of a tile is lapped under the rear edge of a preceding tile causing the front edge of the tile to strike the ground a distance away from the rear of the preceding tile causing a gap in the line of tiles, said apparatus comprising:

sensing means for detecting said misaligned tile in the chute;

delaying means responsive to said sensing means for momentarily stopping the misaligned tile from progressing further down the distribution chute; and

readjustment means for positioning the misaligned tile such that when released by said delaying means said tile drops to the preceding tile with its forward edge lapped over the rear edge of the preceding tile as it is deposited on the ground.

4,031,710

EMERGENCY COOLING SYSTEM FOR AIR-CONDITIONED VEHICLES

Marvin Rideout, 8 E. 83rd St., New York, N.Y. 10028

Filed Mar. 10, 1976, Ser. No. 665,580

Int. Cl.² F28D *3/00*; **G01K** *13/00*; **B60H** *3/04*; **F28D** *5/00*

U.S. Cl. 62—171 **3 Claims**

1. Emergency cooling apparatus for a condensor of an air conditioning system of a motor vehicle comprising:

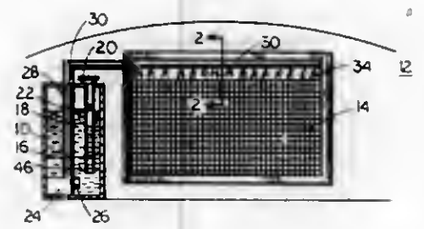
a coolant tank;

manifold means connected to said tank for spraying coolant from said tank on a condensor of an air conditioning system of a motor vehicle;

pump means within said tank for supplying coolant from said tank to said manifold means;

control means within said tank for rendering said pump means inoperative in response to the coolant in said tank being depleted below a predetermined level, and

electric circuit means having a source of electric power and a first switch adapted to be mounted in a motor vehicle



for activating said pump means in electrical series with said power source;

said electric circuit means further including

a second normally closed switch in electrical series with said first switch; and

said control means including a float in said tank; and

said second normally closed switch being mounted in said tank so as to be opened by said float when said float reaches said predetermined level in said tank.

4,031,711

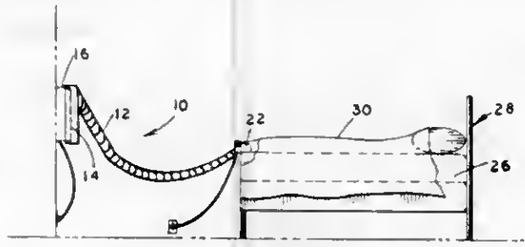
COLD AIR BLAST WAKE-UP APPARATUS

Peter MacNeil, 3680 Mountain St., Montreal, Quebec, Canada

Filed May 24, 1976, Ser. No. 689,562

Int. Cl.² F25D *23/12*; **E06B** *7/02*

U.S. Cl. 62—261 **2 Claims**



1. Wake-up apparatus for use in conjunction with means for air conditioning a room including a cold air outlet into said room, and a mattress located in said room, said apparatus comprising: a flexible elongated duct; coupling means at one end of said duct for attachment to said cold air outlet for enabling cold air to be fed into said duct; outlet means on the other end of said duct configured to rest on said mattress, said outlet means having a horizontally elongated outlet aperture lying in a vertical plane when said outlet means rests on said mattress for directing said cold air in a stream along the top of said mattress; an electrically controlled valve means in series with said duct having open and closed alternative positions for selectively allowing or blocking air flow through said duct, said valve means being normally in said closed position; and electrical timer means coupled to said valve means for placing said valve means in said open position at some preset time.

4,031,712

COMBINED ABSORPTION AND VAPOR-COMPRESSION REFRIGERATION SYSTEM

Frederick Alexander Costello, Herndon, Va., assignor to The University of Delaware, Newark, Del.

Filed Dec. 4, 1975, Ser. No. 637,839

Int. Cl.² F25B *15/00*

U.S. Cl. 62—483 **6 Claims**

1. In a closed cyclic absorption-refrigeration system using in combination

a. means for absorbing a vapor refrigerant in an absorbent

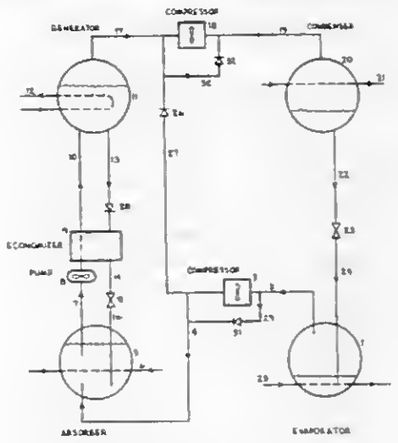
b. means for increasing the pressure on the absorbent containing the refrigerant

c. means for heating the absorbent-refrigerant mixture to drive off the refrigerant as a vapor

d. means for cooling said refrigerant vapor to condense same to a liquid

e. means for reducing the pressure on said liquid to permit same to evaporate

f. heat exchange means for cooling fluids outside the system by the evaporation of the refrigerant and



g. means for recycling the refrigerant vapor to the said absorbing means

the improvement which comprises a compressor for increasing the vapor pressure of the refrigerant vapor after it leaves the heat exchange means and before it is recycled to said absorbing means, and a compressor for increasing the vapor pressure of the refrigerant vapor after it is driven off from the absorbent-refrigerant mixture and before it enters the means for cooling to condense the refrigerant vapor.

4,031,713

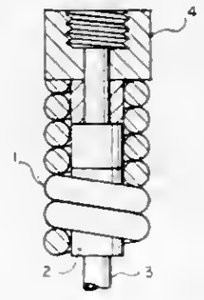
FLEXIBLE DRILL PIPE

W. B. Driver, 19 Sheridan Road, Arnold, Md. 21012

Continuation-in-part of Ser. No. 465,500, April 30, 1974, abandoned. This application Nov. 25, 1975, Ser. No. 635,136

Int. Cl.² F16C *1/02*

U.S. Cl. 64—2 P **2 Claims**



1. A flexible drill pipe for operating around the radius of bend of a curved hole or deflecting tool and the flexible drill pipe comprises, a closed pitch cylindrical spiral coil of wire rod, a female tool joint rigidly secured to one end portion of said rod, a male tool joint rigidly secured to the opposite end portion of said rod, a plurality of tube sections positioned end to end in contact within said coil or wire rod and having complete circumferential contact with said rod, said tube sections extending the full length of said coil of wire rod and contacting said tool joints at each end of said rod, flexible structure formed by said tube sections supports said coil or wire rod under high torsion loads and keeps said coil of wire rod from collapsing, all said tube sections constructed the

same permitting an even distribution of flexing moments over the length of said coil of wire rod, said tube sections each having an axial length not more than twice the diameter of said rod and not less than the diameter of said rod for support and maximum flexibility of said coil of wire rod, ends of said tube sections being blunt so the length around the inside radius of bend of the said structure formed by said tube sections will not be reduced when bent or flexed, a thin wall hose extending through said tube sections and secured to said joints at its opposite ends permit drilling fluids to be pumped through said drill pipe.

4,031,714

FLEXIBLE COUPLING AND TORQUE-TRANSMITTING MEMBER THEREFOR

Werner Faust, Unna-Billmerich, Germany, assignor to Maschinenfabrik Stromag GmbH, Unna, Germany

Filed Feb. 24, 1976, Ser. No. 661,451

Claims priority, application Germany, Mar. 8, 1975, 2510197; Apr. 14, 1975, 2516238

Int. Cl.² F16D 3/58

U.S. Cl. 64—12 22 Claims

1. A flexible coupling including a pair of coaxially arranged coupling members, a plurality of torque-transmitting members of a reinforced elastomer arranged in a circular pattern around the common axis of said pair of coupling members, each of said plurality of torque-transmitting members defining a pair of parallel stud-receiving passageways, a plurality of pairs of studs, each pair of said plurality of pairs of studs projecting through a pair of said stud-receiving passageways of one of said plurality of torque-transmitting members, one of each of said plurality of pairs of studs being supported by one of said pair of coupling members and the other of each of said plurality of pairs of studs being supported by the other of said pair of coupling members, and a woven reinforcement strip substantially spirally wound around said stud-receiving passageway wherein the improvement comprises in that said torque-transmitting members (3) are pre-stressed under compression, so as to preclude any relative movement between each of said plurality of pairs of studs (4,5, 4', 5') and one of said plurality of torque-transmitting members (3', 3') mounted thereon.

4,031,715

FLEXIBLE COUPLING ASSEMBLY

Hiriyur V. Shekar, Louisville, Ky., assignor to General Electric Company, Louisville, Ky.

Filed Dec. 12, 1975, Ser. No. 639,992

Int. Cl.² F16D 3/52

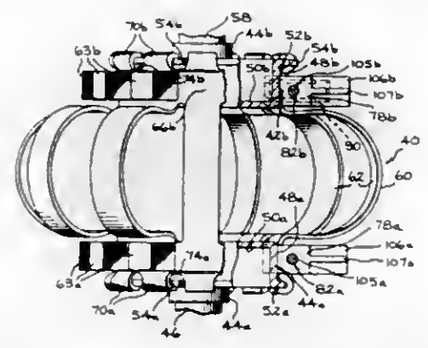
U.S. Cl. 64—15 B 6 Claims

1. A flexible coupling assembly for connecting a driving member to a driven member comprising:

a. a first circular end plate for attachment to the driving member for rotation therewith,

b. a second circular end plate spaced from the first end plate for attachment to the driven member for rotation therewith, said first and second end plates each having a circular flat surface and at least one lug extending beyond the flat surface,

c. a one-piece flexible plastic molded body having (*i*) a collar portion at each end engaging the circular flat surface of the first and second end plates respectively, said collar portions each having two bosses for receiving fastening means to secure the collars to the first and second end plates respectively, (*ii*) a notched area to receive the



respective lugs, and (*iii*) a plurality of spaced outwardly bowed ribs interconnecting the collar portions and spanning the space between the first and second end plates,

d. fastening means holding the two bosses of each collar portion together to thereby secure the molded body to the first and second end plates,

the improvement comprising one of the two bosses on each collar portion having a pocket to receive a reinforcing fastening member.

4,031,716

AUTOMATIC SEQUENTIAL DUAL ACTION SEALING SYSTEM

Clarence John Zabcik, 414 W. Cowan Drive, Houston, Tex. 77007

Division of Ser. No. 554,453, March 3, 1975. This application Dec. 29, 1975, Ser. No. 644,531

Int. Cl.² E21B 17/00

U.S. Cl. 64—23 1 Claim

1. In a shock absorbing subassembly including a body, a mandrel slidably and non-rotatively received in the body, means for providing limited relative longitudinal movement therebetween, dampening means between the mandrel and body for absorbing and dampening vibrations and impact loads applied to the body, upper seal means for providing a fluid tight seal between the body and the mandrel above the dampening means, and floating seal means for providing a flulid tight seal between the body and the mandrel below the dampening means, the improvement comprising

said body having a radial fluid outlet slightly below the floating seal means;

primary annular seal means for providing a fluid tight seal between the body and mandrel below the floating seal means; and

secondary annular seal means positioned between the body and mandrel and the floating seal means and said primary seal means, said secondary seal means comprising

an annular piston slidably positioned between the body and the mandrel and said radial fluid outlet and said primary seal means, said annular piston being slidable between first and second positions proximate and remote from said primary annular seal means,

inner and outer annular seals positioned between said annular piston and the mandrel and the body, respectively,

said annular piston being provided with an orifice to facilitate low fluid flow rates through said piston and said radial fluid outlet without causing said piston to move from said first position to said second position, and

orifice seal means for sealing said orifice when said piston is in said second position.

4,031,717

PATTERNING APPARATUS FOR KNITTING MACHINES, PARTICULARLY FOR MANUFACTURING PATTERNED KNITTED PILE FABRICS ON CROCHETTING MACHINES

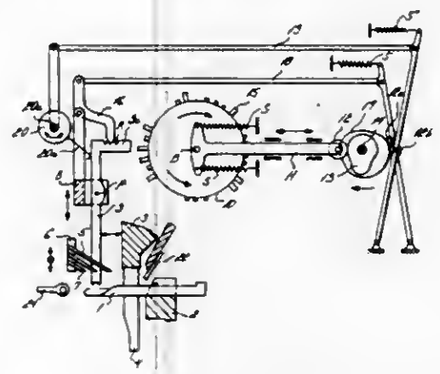
Heinz Lindner, Geyer, Erzg., Germany, assignor to VEB Wirkmaschinenbau, Karl-Marx-Stadt, Germany

Filed Apr. 19, 1976, Ser. No. 678,333

Claims priority, application Germany, May 12, 1975, 0418595

Int. Cl.² D04B 23/06, 23/08, 23/10, 23/12

U.S. Cl. 66—84 R 10 Claims



1. In a pattern-making device for a pile knitting machine for manufacturing patterned knitted pile fabrics, the knitting machine being of the type having a row of needles which move fore and aft and multiple pile thread guides movable between the needles, thread selecting sinkers controlled according to the desired pattern by patterning means, the thread exit openings of said multiple pile thread guide being disposed in a plane substantially parallel to the longitudinal axes of the needles, the improvement comprising means mounting the thread selecting sinkers for vertical movement perpendicular to the longitudinal axes of the needles, said mounting means including means for pivotal movement of the thread selecting sinkers intermediate the ends thereof about axes parallel to the row of needles, varying pattern spacer means positioned adjacent the upper ends of the thread selecting sinkers and constituting means for moving said thread selecting sinkers about their pivotal mounting means and for positioning the lower ends of said thread selecting sinkers adjacent any selected one thread exit opening of the multiple pile thread guide, and means for locking the thread selecting sinkers in a respective selected position relative to the corresponding exit openings of the multiple pile thread guides.

4,031,718

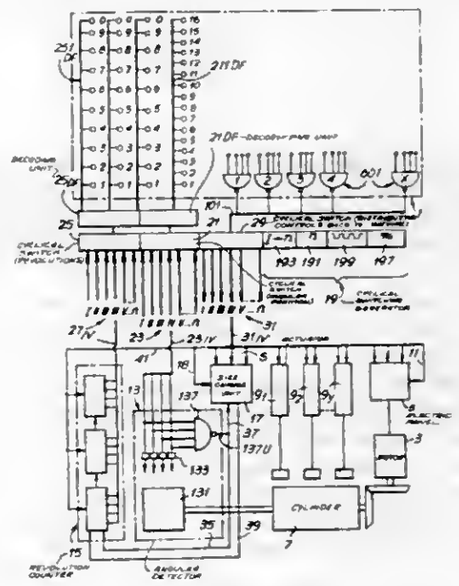
ELECTRONIC SYSTEM FOR CENTRALLY CONTROLLING A PLURALITY OF KNITTING MACHINES

Claus-Peter Luth, Florence, Italy, assignor to Macchine Tessili Circolari MATEC S.p.A. of Roma, Italy

Continuation-in-part of Ser. No. 387,514, Aug. 10, 1973, abandoned. This application June 12, 1975, Ser. No. 586,157

Int. Cl.² D04B 15/66, 15/78

U.S. Cl. 66—154 A 5 Claims



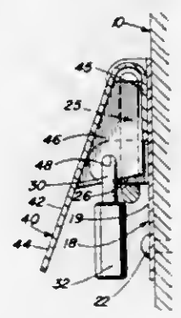
1. Electronic equipment for the control of a plurality of circular hosiery knitting machines of the type having a needle cylinder and a plurality of control members, each machine being designed to operate independently of the others, said equipment including for each machine an angular detector of the respective needle cylinder, a main revolutions counter means to count the revolutions completed by the cylinder and adapted to the zero set at the end of a cycle, a plurality of actuators including signal amplifiers, a central control unit with a signal program common for all the machines and having a input of the angular position information, an input of the revolutions number information and an output for the control information for the actuators, a quick switching assembly to temporarily and cyclically enable the central unit to receive the information from each of the machines successively and to supply the control information to the actuators of each machine in relation to the position wherein it is instantaneously located, and a size-change device for each machine and including means for receiving count pulses from the revolutions counter and the control unit, said size-change device including partial counter actuable by the counting pulses, a decoder means connected to each partial counter, a plurality of swtiches connected to each partial counter forming a plurality of pairs of swtiches, each switch of a pair having an input from one of said partial counters, the output of each corresponding pair of switches forming a coincidence circuit leading to a bistable switch, said bistable switches so connected into the system as to enable the main counter to progressively count and to interrupt the count respectively by means of a polarity inverter upon the reaching of a predetermined count and simultaneously to zero set the partial counters and respectively activate them to count during the interruption of the main counter, said switches determining the count interruption of the main counter and tus the dimensions of a corresponding portion of the hosiery are vaired.

4,031,719

LOCK-PROTECTIVE DEVICE

Lawrence R. Klingler, 124 - 20th St., Huntington Beach, Calif. 92648, and Daniel E. Shook, 2543 Orange St., Costa Mesa, Calif. 92626

Filed Oct. 8, 1976, Ser. No. 730,733
Int. Cl.² E05B 67/38; E05C 5/02
U.S. Cl. 70—56 4 Claims



1. A lock-protective device for garage-door locking units and similar locking units having a mounting plate, a slidable locking bolt, and locking ear, and including the use of various styles of padlocks having a locking arm, wherein the device comprises:

an elongated cover plate having a front cover wall and a rear wall wherein each wall is interconnected along its upper portion;

a support keeper fromed by said rear wall, said keeper being arranged to be received over said sliding bolt, and disposed between said sliding bolt and said mounting plate of said locking unit; and

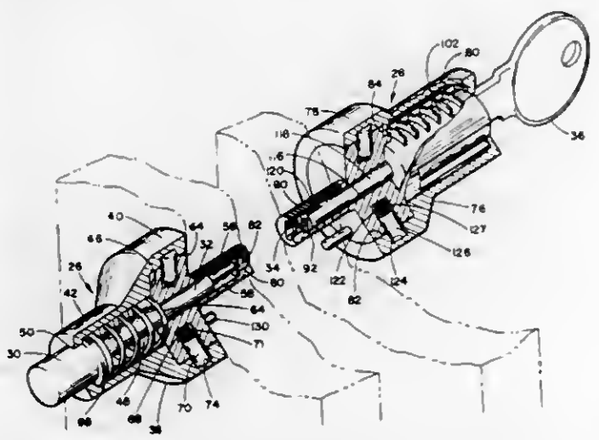
a strut member positioned between said front and rear wall and secured thereto, said strut having an aperture therein to receive said locking arm of said padlock.

4,031,720

LOCKING DEVICE FOR SECURING SKIS

Mauricio V. Avalusini, 1038 S. 317th St., Federal Way, Wash.

Filed Nov. 24, 1975, Ser. No. 634,403
Int. Cl.² E05B 73/00; A63C 11/00
U.S. Cl. 70—58 4 Claims



1. Apparatus for locking a pair of skis together with their lower surfaces in juxtaposition, comprising:

a first attachment mountable onto an upper surface portion of one of said skis, comprising a lock bolt including a head portion having a non-circular cross-sectional configuration and axially inwardly directed lock surface means mounting means supporting said lock bolt for axial movement between a retracted position in which the head portion of said lock bolt is at least substantially flush with the underside of its ski, and an extended position in which the head of said lock bolt is positioned substantially beyond the underside of its ski,

a second attachment mountable onto a corresponding upper surface portion of the second ski, including means defining an orifice having a cross-sectional shape which complements but is slightly larger than the cross-sectional shape of the head portion of the lock bolt, and lock surface means immediately inwardly bounding said orifice,

said first attachment including means for moving said lock bolt axially from its retracted to its extended position, so that when said two attachments are on two skis whose lower surfaces are juxtposed and the head portion of said lock bolt is aligned with said orifice, said head portion can be moved axially through said orifice, and

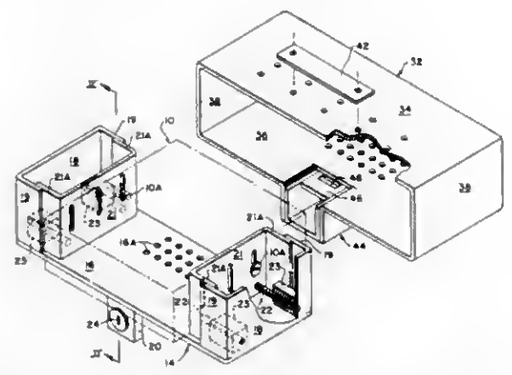
said second attachment including lock bolt rotation means for rotating said lock bolt in position after it has been extended through said orifice, to in that manner move the lock surface means on the head portion of said lock bolt angularly into a position of engagement with the lock surface means which inwardly bounds said orifice, whereby the engagement of the two lock surface means will prevent disengagement of said first and second attachments and in turn will prevent disengagement of the two skis, and for rotation of said lock bolt means back into a position in which its head portion is in pass-through alignment with said orifice, permitting separation of the two attachments and hence separation of the two skis, said lock bolt rotation means including a rotatable shaft having wrench means on an end thereof directed towards said orifice and sized to engage the head portion of said lock bolt, and key-controlled lock means connected to said shaft for controlling rotation of said shaft by operation of a key.

4,031,721

COMBINED ANTI-THEFT AND ADJUSTABLE MOUNTING ASSEMBLY FOR A CB RADIO DEVICE

Lyle V. Anderson, 122 Carriage Drive, Pittsburgh, Pa. 15237

Filed July 12, 1976, Ser. No. 704,525
Int. Cl.² E05B 73/00; F16B 41/00
U.S. Cl. 70—58 14 Claims



1. A combined anti-theft and adjustable mounting assembly for the casing of a CB radio receiver and transmitter of the type adapted for attachment to and opearable within a vehicle such as an automobile or the like, the combination comprising:

a frame including spaced-apart, upstanding side members adapted to support said casing while forming a nested relation between the side members of the frame,

spacer members adapted for attachment to the opposite sides of said casing for extending into an interlocking engagement with said side members at the opposite sides of said frame,

means to position at least one of said spacer members relative to a side member,

a housing forming an open-ended compartment to receive and support said frame together with said casing, said housing including a wall to carry fastening means for support by the vehicle at a desired location,

a lock box having walls secured to said housing, and

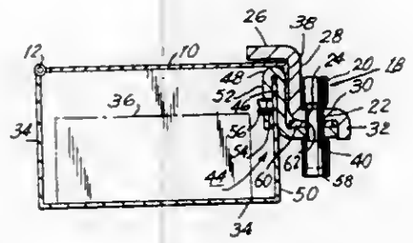
lock means carried by said frame to project into said lock box for interlocking said housing and said frame.

4,031,722

TAMPER-PROOF LOCKING DEVICE

Lionel S. Michelman, Pomona; Samuel M. Michelman; David L. Michelman, both of Queens, and Milton Michelman, Long Beach, all of N.Y., assignors to Michelman Iron Works Corporation, Brooklyn, N.Y.

Filed June 7, 1976, Ser. No. 693,293
Int. Cl.² E05B 65/52
U.S. Cl. 70—63 11 Claims



1. A tamper-proof locking device mountable on a lidded container or the like comprising a first member and a second member, said first member comprising a generally zig-zag strip having three substantially right-angled bends, so that said first member is divided into four sections, with none of said sections being directly opposite to another section, an inner one of said sections being provided with at least one opening, said second member comprising a strip having a generally U-shaped section and a projecting section, said U-shaped section having a first leg and a second leg, said projecting section extending laterally outwards from and substantially perpendicular to the lower end of the first leg of said U-shaped section and being provided with at least one opening, the second leg of said U-shaped section being provided with a threaded bore, and screw means extending through the bore in said second leg, so that the locking device is mountable on a lidded container by placing the U-shaped section of the second member on a wall of a container with said legs straddling said wall and with said second leg and said screw means within the container, turning said screw means until the tip of said screw means contacts and presses against the wall of the container, closing the lid of the container so that the edge of the lid rests on the base of said U-shaped section, and mounting said first member on both the edge of the lid and the projecting section of the second member with one end section of the first member extending over the edge of the lid, one inner section of the first member overlying the first leg of the U-shaped section, the other inner section of the first member overylying the projecting member and the other end section of the first member extending over the tip of the projecting section of the second member, so that said members are attachable to each other by lock means having a shackle extending through the opening in said inner one of said sections of said first member and the opening in said projecting section of said second member.

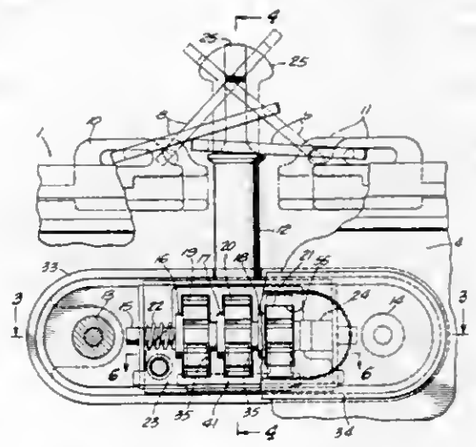
4,031,723

LOCKABLE ZIPPER CLOSURE

Clair A. Samhammer, Dana Point, and James Patrick Sullivan, Tustin, both of Calif., assignors to Samsonite Corporation, Denver, Colo.

Filed Mar. 31, 1976, Ser. No. 672,517
Int. Cl.² E05B 67/38
U.S. Cl. 70—68 13 Claims

1. A lockable zipper closure which comprises at least one slider with slider pulling means having an opening therein, and means for securing said zipper closure in at least partially closed position, said securing means comprising column means comprising a portion that is longer than at least one dimension of the opening in said slider pulling means adapted



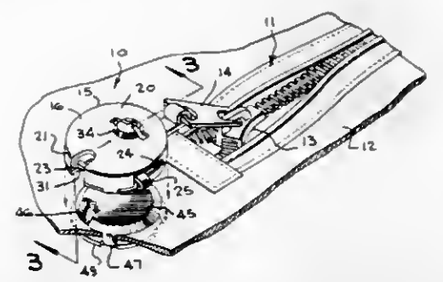
to pass through said opening in said pulling means, said column means being movable to a locking position in which said column means cannot pass completely through said opening, and means for locking said column means in said locking position.

4,031,724

KEY CONTROLLED LOCK MECHANISMS FOR ZIPPER FASTENERS

Wallace E. Atkinson, Petersburg, Va., assignor to Long Manufacturing Co., Inc., Petersburg, Va.

Filed Oct. 20, 1976, Ser. No. 734,119
Int. Cl.² E05B 65/32
U.S. Cl. 70—68 18 Claims



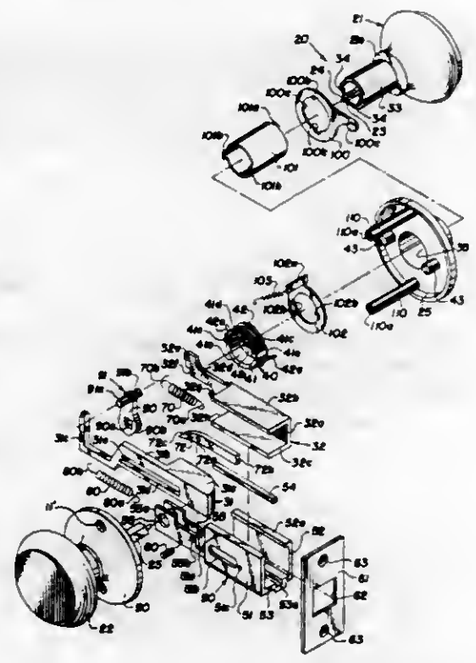
1. A key controlled lock mechanism for locking in closed position the zipper slider of a separable zipper-type fastener, comprising a lock member formed in the shape of a thick circular disc-like lock body of small axial thickness relative to its diameter, the disc-like lock body including a cup shaped casing forming a thin walled casing shell of generally cylindrical configuration having a circular front wall bounded by a rearwardly projecting annular rim flange and including a circular backing plate fastened thereto at the rearmost rear portions of said rim flange to define a cylindrical lock chamber between said backing plate and front wall, a circular latch plate having a diameter approximating the diamter of said chamber supported by sliding peripheral contact with the outwardly surrounding rim flange for rotary angular movement about the center axis of the lock body between latching and release positions and having a radially outwardly projecting finger piece extending beyond the rim flange forming a manually operable shifting tab for movement of the latch plate toward the release position, the circular latch plate having a peripheral cut-out shaped to define a circumferentially extending latch tongue adjacent its periphery and having a shaped intermediate recess near and eccentric of its center shaped to coact with a key-operable locking disc, a locking disc journaled at a fixed station in the casing for rotation in

said recess about an eccentric axis offset from said center axis having a key slot for rotation of the locking disc by a key inserted therein and having a locking surface extending in a generally circular path confronting the boundary surfaces of the intermediate recess to restrain the latch plate against rotation from said latching position and to free the same for rotation to release position at locking and unlocking positions respectively of the locking disc, means defining a keeper formation insertable into the casing for securing the slider in the closing position, and said casing having recesses for accommodating circumferential movement of said finger piece and for admitting the keeper formation into the casing into latched coupling engagement with said latch tongue.

4,031,725
DOOR LOCK

Floyd F. Reid, 603 W. Rochelle, No. 1073, Irving, Tex. 75062

Filed Aug. 11, 1975, Ser. No. 603,618
Int. Cl.² E05B 59/00; E05C 1/12
U.S. Cl. 70—107 7 Claims

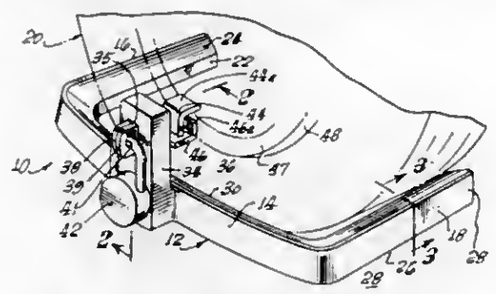


1. A door lock adapted to be mounted on a door and operated by first and second doorknobs mounted on opposite sides of said door comprising: a keyed lock associated with said first and second doorknobs, said first doorknobs being operable to activate said keyed lock by depressing and turning said doorknob and said second doorknob being operable by means of a key; a latch; means for moving said latch between a retracted unlocked position and an extended locked position; a dead bolt sleeve fitting in sliding relationship around said latch for movement between a retracted unlocked position, said latch and said dead bolt sleeve occupying a common recess in a doorjamb adjacent to said door when said latch and said dead bolt sleeve are extended to locked positions; lever means for extending said dead bolt sleeve by rotation of at least said first doorknob, said lever means being mounted on a shaft connected between and rotatable by said first and second doorknobs and being engageable with said latch responsive to rotation of either of said doorknobs in one direction to retract said latch and being engageable with said dead bolt sleeve responsive to rotation of said door knobs in an opposite direction; means for releasably locking said dead bolt sleeve at said extended locked position; means for releasing said dead bolt sleeve for movement from said extended locked position back to said retracted unlocked position by rotation of either of said first and second doorknobs; said lever means including an operator surface engageable with said means for releasing said dead bolt sleeve to release said dead bolt sleeve from said extended locked position by rotation of either of said doorknobs in said direction which retracts said latch; and means for moving said dead bolt sleeve from said first retracted position to said second extended position from the side of said door on which said second doorknob is mounted and independently of said second doorknob.

4,031,726
AIRCRAFT ANTI-THEFT CHOCK DEVICE

Garry De Jager, 6660 Riverside Drive, Chino, Calif. 91710

Filed Mar. 19, 1976, Ser. No. 668,435
Int. Cl.² B60F 3/00; B60T 3/00
U.S. Cl. 70—226 14 Claims

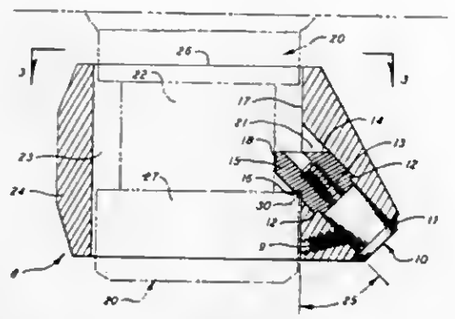


1. An aircraft anti-theft device in combination with an aircraft wheel assembly having a wheel thereon comprising:
- a bifurcated chock means arranged to receive the wheel of the wheel assembly between the bifurcated portion thereof and including a forward main body base member and a pair of spaced apart laterally extending arm members at opposite ends of said base member arranged to be positioned forward and aft of said wheel assembly when arranged therewith;
- securing means having a vertical securing bar formed with said base member of said bifurcated chock means; and
- securing connection means for releasable engagement between said securing bar and said wheel assembly.

4,031,727
KING PIN LOCK

Philip M. De Groat, 823 Pine St., Endicott, N.Y. 13760, and Robert A. Lewis, R.D. No. 1, Box 70, Port Crane, N.Y. 13833

Filed May 12, 1976, Ser. No. 685,643
Int. Cl.² E05B 65/12; B60R 25/00
U.S. Cl. 70—232 7 Claims

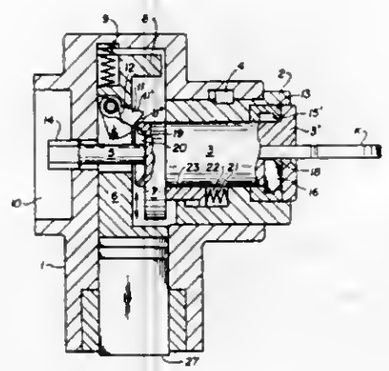


1. A locking mechanism, comprising;
- a housing, for surrounding a device to be protected by said locking mechanism, said housing being freely rotatable about said device whether said locking mechanism is in the locked or unlocked condition;
- a lock bar mounted at an acute angle within said housing;
- said lock bar having a bearing surface said bearing surface being cut at a second angle to prevent removal of said locking mechanism in the locked condition and to allow removal of said locking mechanism in the unlocked condition; and
- a key lock mechanism for rotating said lock bar to the locked or unlocked condition.

4,031,728
STEERING COLUMN AND IGNITION LOCK FOR MOTOR VEHICLE

Rudolf Eichenauer, Hollbergstrasse 1, Frankfurt am Main, Germany (D-6000)

Filed May 17, 1976, Ser. No. 687,009
Claims priority, application Germany, Feb. 25, 1976, 2607609
Int. Cl.² B60R 25/02
U.S. Cl. 70—252 10 Claims

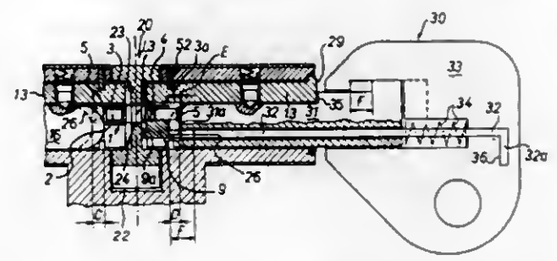


1. A lock arrangement for a motor vehicle having a steering column which comprises
1. a housing defining an axial bore and a cross bore intersecting therewith,
2. a key controlled lock cylinder mounted in the axial bore of the housing for axial displacement between an inwardly and an outwardly displaced position, and for rotation about the axis of the bore in the inwardly displaced position into selected operating positions,
3. a lock bolt mounted in the cross bore for displacement between a retracted position and a locking position, the bolt having a keeper engaging the steering column in the locking position,
4. actuating means arranged to displace the lock bolt between the retracted and locking positions, the bolt actuating means including
   a. an operating spring biassed to displace the lock bolt into the locking position and
   b. a driving member operated by the rotation of the lock cylinder to displace the bolt against the bias of the operating spring into the retracted position to disengage the keeper from the steering column, and
5. latch means mounted on the lock bolt for pivoting in the direction of the keeper, the latch means including
   a. a latch having a wedge face,
   b. a soft spring biasing the latch in a direction opposite to the pivoting direction, and
   c. the lock cylinder having an end rim adjacent the bolt, and the latch being arranged to cause the operating spring to wedge the wedge face thereof firmly against the lock cylinder rim when the bolt is in the retracted position and the lock cylinder is in the inwardly displaced position whereby the bolt is securely maintained in the retracted position, the firm wedge being removed on withdrawal of the key from the lock cylinder and the operating spring displacing the lock bolt and correspondingly driving the wedge face of the latch over the end rim to cause outward displacement of the lock cylinder.

4,031,729
EMERGENCY KEY MECHANISM ON A CYLINDER LOCK WITH A DOUBLE LOCKING CYLINDER

Heinrich Gretler, Hinwil, Switzerland, assignor to Bauer Kaba AG., Wetzikon, Switzerland

Filed Sept. 16, 1975, Ser. No. 613,897
Claims priority, application Switzerland, Sept. 26, 1974, 012999/74
Int. Cl.² E05B 17/04
U.S. Cl. 70—380 10 Claims



1. In a cylinder lock of the type having two coaxial locking cylinders each having a stator portion and a rotor portion with a key slot, a lock bolt, and a lock bolt driver rotatably mounted between the rotor portions to operate the lock bolt when rotated, the lock bolt driver having a transverse web with means defining an opening therethrough, an improved emergency key operatable mechanism comprising
- a locking coupling including
- an axially displaceable coupling spindle having enlarged stop portions at the opposite ends thereof;
- first and second coupling members mounted on said spindle,
- said members being rotatably and axially movable relative to each other and to said spindle,
- each of said members further being operatively associated with one of said rotor portions, each member being rotatable with and axially movable relative to its associated rotor portion,
- each of said members having a protruding portion thereof engageable with said opening in said lock bolt driver when said member and said spindle are axially displaced by insertion of a normal key of predetermined blade length in the key slot of its associated rotor portion; and
- compression spring means mounted on said spindle for urging said coupling members axially outwardly toward said enlarged portions on said spindle; and
- an emergency key insertable into the key slot of one of said rotor portions, said emergency key having
- a blade having a length shorter than said predetermined length of said normal key, and
- an operating pin extendable beyond the distal end of said blade when said emergency key is fully inserted in said slot;
- the one of said coupling members operatively associated with said one of said rotor portions having a radially protruding portion engageable with said pin,
- said pin being operative to axially displace said one of said coupling members into engagement with said driver whereby said rotor and said driver can be rotated by said emergency key to operate the lock without axially displacing said spindle.

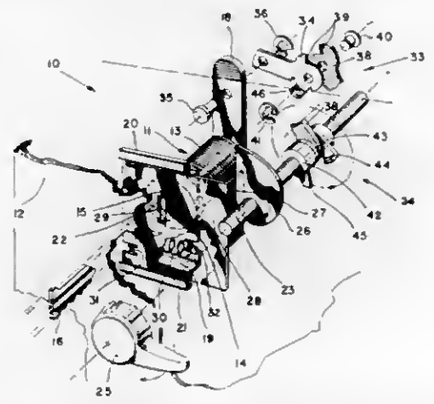
4,031,730
TAMPERPROOF LOCK AND METHOD

Michael F. Kern, 4304 Janwood, Copley, Ohio 44321

Filed Feb. 4, 1976, Ser. No. 655,096
Int. Cl.² E05B 17/14
U.S. Cl. 70—419 12 Claims

1. Apparatus to prevent tampering with a locking mechanism having an accessible keyway therein and normally rotat-

able when a key is in the keyway comprising, means normally holding the locking mechanism to prevent rotation thereof even when the key is in the keyway; blocking plate means having a slot therein normally aligned with the keyway; cam means to move said blocking plate means so that said slot and keyway are misaligned; means to release said means normally



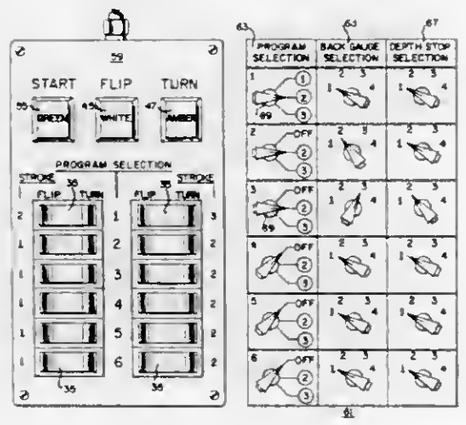
holding the locking mechanism; and movable means carrying said means normally holding the locking mechanism, said cam means, and said means to release so that movement of said movable means sequentially moves said blocking plate means to block access to the keyway, operates said means to release, and rotates said locking mechanism.

4,031,731

ALERT MEANS FOR A PROGRAMMING SYSTEM FOR PRESS BRAKES OR THE LIKE

Rolland A. Richardson, Alameda, Calif., assignor to Canron, Inc., Oakland, Calif.

Filed Mar. 26, 1973, Ser. No. 344,870
Int. Cl.² B21D *5/02*
U.S. Cl. 72—37 **7 Claims**



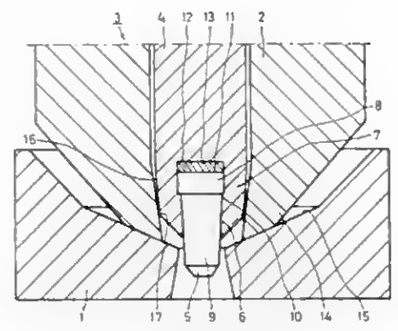
1. For use in combination with a system for programming a press brake or like machines in producing a sequence of operations on work, during which, the work must be flipped or turned in preparation for certain of said operations, means for alerting an operator as to the necessity for flipping or turning the work, and means for coordinating said alerting means with said programming system to function at the proper stages in such sequence of operations to activitate said alerting means.

4,031,732

METHOD FOR HYDROSTATIC EXTRUSION OF TUBES

Hans Larker; Erik Lundblad; Bertil Lundback, and Jan Nilsson, all of Robertsfors, Sweden, assignors to ASEA, Vasteras, Sweden

Filed May 22, 1975, Ser. No. 580,463
Claims priority, application Sweden, June 7, 1974, 7407507
Int. Cl.² B21C *25/04*
U.S. Cl. 72—60 **3 Claims**



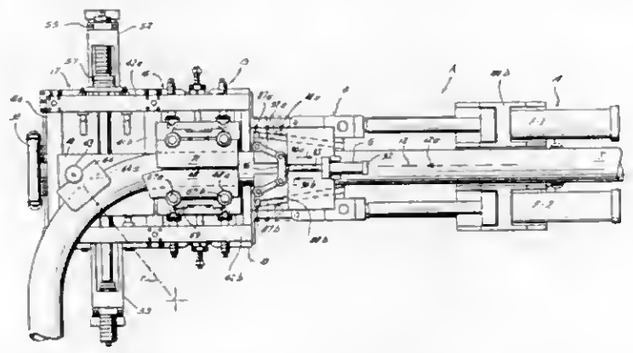
1. Method for hydrostatic extrusion of tubes in a press with a pressure chamber containing a high pressure cylinder, a pressure generating punch insertable into the cylinder, a die arranged in the cylinder and a mandrel axially fixed in relation to the die and composed of a carrier and a separate tip mounted in the carrier, which tip together with an opening in the die forms a gap in which a tubular billet having a hole therein is shaped into a tube when the billet is subjected to an all-sided hydrostatic pressure in a surrounding pressure medium, which comprises, in connection with the insertion of the tubular billet (2), producing the initial sealing between the mandrel (3) and the hole of the tubular billet (2) by contact between the front part (7) of the mandrel carrier (4) and the hollow wall of the tubular billet (2):

4,031,733

APPARATUS FOR BENDING TUBULAR MEMBERS

John L. Coody, 5514 Aldine-Bender, Rte. 16, Houston, Tex. 77032

Filed Oct. 15, 1976, Ser. No. 732,756
Int. Cl.² B21C *7/04, 7/12*
U.S. Cl. 72—166 **22 Claims**



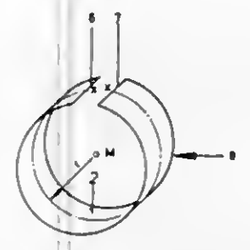
1. Apparatus for bending tubular members such as pipe, comprising:
- a frame;
- gripping means for gripping said tubular member, said gripping means being mounted on said frame for movement between an initial and final position in a longitudinal direction;
- feed means mounted with said frame and attached to said gripping means for moving said gripping means between said initial and final positions;
- bending means for bending said tubular member as said feed means moves said gripping means gripping said tubular member from said initial to said advanced position, said bending means including:
  - a set of bending dies for receiving and bending a tubular member and bending die mount means mounting said bending dies with said frame for adjustable movement in a direction transverse to said longitudinal axis; and
  - a radius setting assembly and radius mount means mounting said radius setting assembly for movement between an initial and a radius applying position in a direction transverse to said longitudinal axis, said radius setting assembly and bending dies cooperating to engage and bend a tubular member to a desired radius with said feed means moving said gripping means from said initial to said final position; and
- power control means controlling movement of said gripping means, feed means, bending dies and radius setting assembly, said power control means including means for synchronizing movement of said radius setting assembly with movement of said gripping means and said feed means.

4,031,734

METHOD FOR THE PRODUCTION OF CONCENTRIC MACHINE ELEMENTS

Helmut Imme, Friedberg, and Werner Moser, Augsburg, both of Germany, assignors to SKF Industrial Trading and Development Company B.V., Nieuwegein, Netherlands

Division of Ser. No. 524,490, Nov. 18, 1974, Pat. No. 3,950,044. This application Sept. 9, 1975, Ser. No. 611,683
Claims priority, application Germany, Dec. 22, 1973, 2364223
Int. Cl.² B21D *53/10*
U.S. Cl. 72—368 **2 Claims**



1. A method for forming a bearing shell comprising forming a flat strip of elastic material to be permanently bent to have an arcuate cross-section, with a longitudinally extending convex surface on one side and a longitudinally extending concave surface on the other side thereof, and then bending the ends of said permanently bent strip around an axis transverse of the longitudinal axis of said strip and spaced from said first side of said strip to form an arcuate casing that retains its arcuate shape.

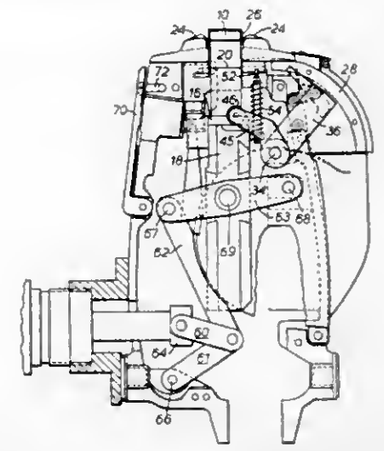
4,031,735

APPARATUS FOR JOINING WIRES

John Patrick Harding, Bushey; David Sydney Butler, Hassocks, and Graham Keith Whitehead, Harefield, Uxbridge, all of England, assignors to The Post Office, London, England

Filed Feb. 24, 1976, Ser. No. 660,979
Claims priority, application United Kingdom, Feb. 27, 1975, 8270/75
Int. Cl.² B21D *7/06*
U.S. Cl. 72—394 **5 Claims**

1. Apparatus for joining together a pair of wires by deforming a crimping clip to grip and thereby join the wires, the apparatus including crimping jaws which are movable into a crimping position to deform the crimping clip; a support member which is adapted to carry the clip and is also movable into a crimping position to co-operate with the jaws in the deformation of the clip, and a toggle linkage for moving the crimping jaws and support member, the toggle linkage being operable to develop an output force which varies with the condition of the toggle and increases as the jaws and support member move towards the crimping position, said toggle linkage comprising a driving link; two linkage members each pivotally



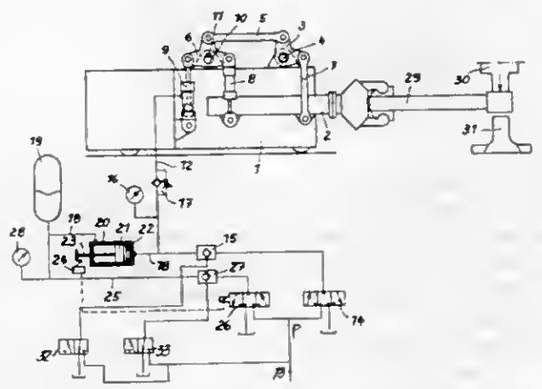
coupled at one end to the driving link, the other end of one of the linkage members being fixed; and an actuating link which is pivotally coupled at one end to the other end of the second linkage member, the actuating link being fixed at its other end and being connected to move the jaws and support member.

4,031,736

WORKPIECE MANIPULATOR FOR USE IN A FORGING PRESS

Heinrich Kutz, Neuss, Germany, assignor to Schloemann-Siemag Aktiengesellschaft, Germany

Filed July 14, 1976, Ser. No. 705,016
Claims priority, application Germany, July 24, 1975, 2533055
Int. Cl.² B21D *43/10*; **B21J** *13/10*
U.S. Cl. 72—422 **3 Claims**



1. A workpiece manipulator for use with a forging press, the manipulator comprising:
- a mobile chassis;
- a pair of tongs for gripping a workpiece;
- a tongs holder to which the tongs are attached;
- a parallel motion linkage connecting the tongs holder to the chassis;
- a hydraulic piston/cylinder actuating unit for actuating the linkage to cause the tongs holder to be moved with a parallel motion;
- a hydraulic circuit connected to said actuating unit;
- a second piston/cylinder unit in said circuit, the piston of which is biassed on one side by hydraulic fluid from said actuating unit; and
- a pressure reservoir in said circuit, which contains hydraulic

fluid which biasses the other side of the piston of said second unit,

whereby an increase in pressure in said actuating unit causes the piston of the second unit to move against the pressure from the pressure reservoir to allow movement of the actuating unit piston to move the tongs holder.

4,031,737

MACHINE TOOL APRON GUIDING SYSTEM

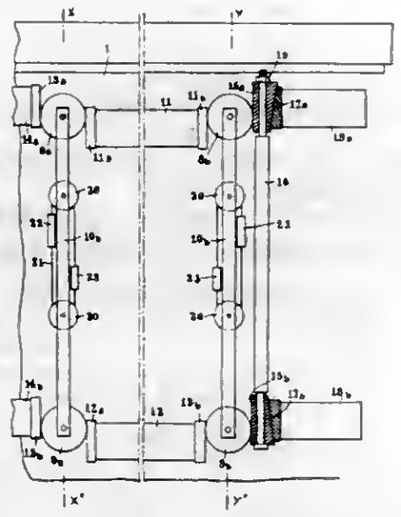
Paul Cailloux, La Varenne Saint Hilaire, France, assignor to Promecam Sisson-Lehmann, Saint-Denis, France

Filed Jan. 14, 1976, Ser. No. 649,098

Claims priority, application France, Jan. 24, 1975, 75.02255

Int. Cl.² B21J *13/04*

U.S. Cl. 72—456 10 Claims



1. In a machine tool such as a press or a shear, comprising a vertical apron movable in the vertical direction in relation to the fixed frame structure of the machine, means for guiding said apron in the longitudinal direction during its vertical movements, said means comprising on each face of said movable apron:

two pairs of vertical races rigid with said fixed frame structure and extending at right angles to the corresponding face of said movable apron, the two races of one of said pairs registering with two races of one of two pairs of races carried by said movable apron to form a first group of races, said other two races carried by said movable apron forming with said two races of said other pair of races rigid with said fixed frame a second group of races;

two pairs of rollers disposed in two spaced vertical planes respectively between the races of said first and second groups which are in part rigid with the movable apron and in part rigid with said fixed frame structure, respectively, and

tightening means adapted to produce a horizontal pressure for clamping at least some of said vertical races against the corresponding rollers, said tightening means being associated with the races formed on one side of one of said pairs of rollers.

4,031,738

PLUG FOR PLUG ROLLING

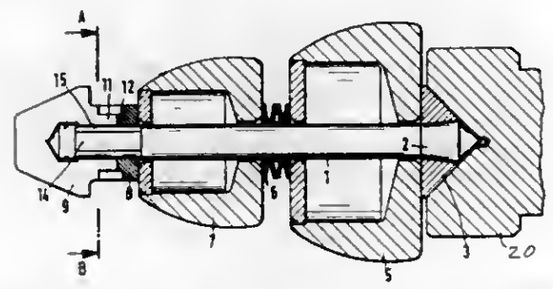
Wolfram Schönfeld, Meerbusch-Osterrath; Armin Phillpps, and Fritz Runkel, both of Dusseldorf, all of Germany, assignors to Mannesmannrohren-Werke AG., Mannesmann-Hochhaus, Germany

Filed Aug. 21, 1975, Ser. No. 606,367

Claims priority, application Germany, Aug. 22, 1974, 286649

Int. Cl.² B21B *25/00*

U.S. Cl. 72—478 3 Claims



1. Plug for plug rolling mills to be connected to a mandrel and having

a first plug element, being the primary working plug in abutment with the mandrel, an intermediate plug element, and a guiding plug element, the improvement comprising:

a tie rod threadedly received with one end by the guiding plug element and having a cone for connection to a mandrel insert on the other end, the first and intermediate plug elements being traversed by the tie rod;

resilient means interpositioned between the first and intermediate plug elements through which the latter urges the former against the mandrel insert;

a spacer interposed and in abutment with the intermediate and the guiding plug elements;

first means for preventing relative angular displacement between the guiding and the intermediate plug elements; and

second means for preventing angular displacement of the guiding plug element relative to the tie rod, so that by operation of the first and second means the guiding element is prevented from unscrewing.

4,031,739

AUTORANGING METHOD AND SYSTEM FOR TESTING THE SPEEDS OF A CAMERA SHUTTER

Barry R. Springer, 35 Northwood Drive, Nashua, N.H. 03060

Filed July 22, 1976, Ser. No. 707,573

Int. Cl.² G03B *43/02*

U.S. Cl. 73—5 14 Claims

1. A method for measuring shutter speed in the camera comprising:

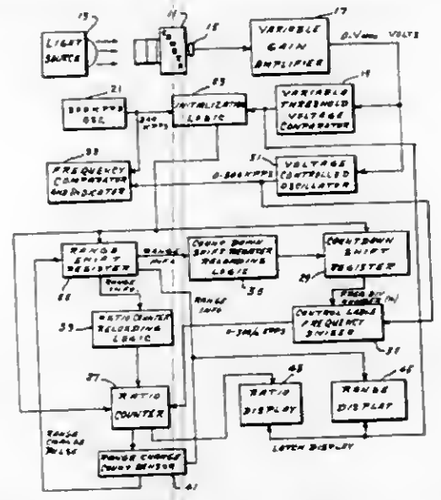
a. positioning the shutter adjacent to a light source;

b. activating the shutter causing a pulse of light to pass therethrough;

c. sensing the intensity and duration of the light pulse;

d. automatically displaying a standard shutter speed which

most accurately represents the effective speed of the tested shutter; and



e. displaying an error ratio relating the effective speed of the shutter tested to the standard speed display.

4,031,740

APPARATUS FOR THERMOANALYTICAL INVESTIGATIONS

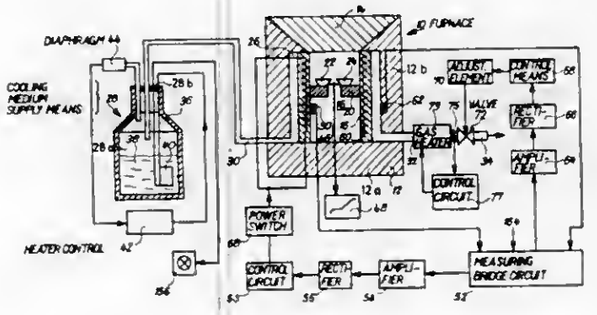
Heinz Achermann, Uster, Switzerland, assignor to Mettler Instrumente AG, Zurich, Switzerland

Filed May 12, 1975, Ser. No. 576,668

Claims priority, application Switzerland, June 25, 1974, 8666/74

Int. Cl.² G01K *17/00*

U.S. Cl. 73—15 B 13 Claims



1. An apparatus for thermoanalytical investigations at low temperatures, comprising:

a. a furnace having a furnace chamber for receiving an article to be investigated;

b. means for ascertaining the temperature of the article or a parameter of the article that characterizes the temperature of the article;

c. means for controlling the temperature in the furnace chamber to a desired value following a predetermined temperature versus time program, said controlling means including

1. means for pre-setting said desired value;

2. means for heating the furnace chamber; and

3. a sensor cooperating with the furnace for measuring the temperature in the furnace chamber;

d. a hollow cooling medium chamber having an inlet and an outlet through which flows a cooling medium, said cooling medium chamber being separated from the furnace chamber but being disposed adjacent thereto and adjacent to said heating means;

e. supply means connected to the cooling medium chamber for supplying cooling medium thereto; and

f. means for controlling the temperature of the cooling medium near said outlet to a desired value following a predetermined temperature versus time program, said controlling means including

1. means for pre-setting said desired value;

2. a sensor cooperating with the cooling medium chamber for measuring the temperature of the cooling medium near said outlet; and

3. means for quantitatively controlling the throughflow of cooling medium through the cooling medium chamber.

4,031,741

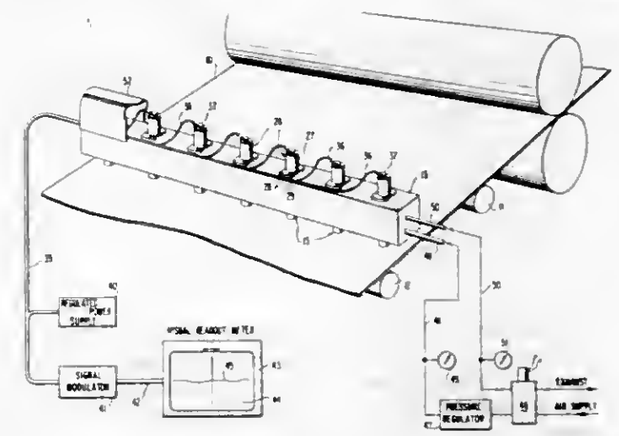
FLATNESS MONITORING SYSTEM FOR STRIP MATERIAL

Edward Schaming, P.O. Box 1070, Butler, Pa. 16001

Filed July 14, 1976, Ser. No. 705,175

Int. Cl.² G01B *13/22*

U.S. Cl. 73—37.7 7 Claims



1. An apparatus for monitoring flatness in a moving strip product comprising a manifold spanning substantially the width of the moving product and mounted in spaced relation to one face thereof, plural spaced pneumatic sensing probes on the manifold having pneumatic discharge passages for directing pneumatic streams against the opposing face of the product without physical contact between the probes and product, the probes floating on the back pressures of said pneumatic streams and maintaining uniform gaps between their tips and said opposing face of the product, coacting electrical signal transmitters connected with the probes and responding to movements thereof and producing signals representative of flatness irregularities in the product, and visual electrical display means connected with said signal transmitters to constantly display a representation of product flatness or lack of flatness, said manifold having a main pneumatic passage in intersecting relationship to said probes, the probes having pneumatic inlet means in communication with said main pneumatic passage and also in communication with said discharge passage of each probe, said manifold additionally having a separate secondary pneumatic passage in intersecting relation to said probes, and a piston means on each probe communicating with said secondary pneumatic passageway whereby pneumatic pressure therein at selected times can cause retraction of the probes into the body of the manifold.

4,031,742

LEAK DETECTOR USING MASS CONCENTRATION GAUGE

Gerald C. Michael, 5946 Linton Lane, Indianapolis, Ind. 46220, and Murvyn M. McDowell, 721 Coleman Ave., Fairmont, W. Va. 26554

Continuation-in-part of Ser. No. 469,966, May 13, 1974, abandoned, which is a continuation of Ser. No. 295,913, Oct. 10, 1972, abandoned. This application Feb. 11, 1975, Ser. No. 549,093

Int. Cl.² G01M *3/04*

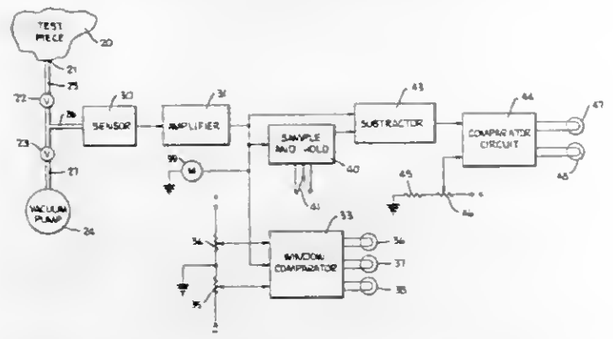
U.S. Cl. 73—40.7 38 Claims

1. A device useful for detecting leaks which comprises:

a. means for measuring the mass concentration of a gas

essentially independently of the temperature of the gas, said means including:

1. a chamber,
2. two electrodes spaced apart from each other, the space between them being within said chamber,
3. a radioactive source placed near said electrodes to ionize any gases which may exist between said electrodes,
4. impedance measuring means for applying a voltage across said two electrodes and for detecting current flowing between said two electrodes when voltage is applied across said two electrodes;



b. a test piece to be tested for leaks, said test piece having an interior and surfaces surrounding the interior;

c. connecting means for providing communication between the interior of said chamber and the interior of said test piece;

d. a valve; and

e. pressure means communicating with said test piece through said valve for creating a pressure differential between the interior and the exterior of said test piece, whereby after closure of the valve a subsequent change of mass concentration within said test piece is indicative of a leak.

4,031,743

ULTRASONIC ECHOGRAM DISPLAY

George Kossoff, Northbridge, and David Errol Robinson, Avalon Beach, both of Australia, assignors to The Commonwealth of Australia, c/o Dept. of Health, Phillip, Australia

Continuation-in-part of Ser. No. 466,791, May 3, 1974, abandoned. This application Jan. 15, 1976, Ser. No. 649,347

Claims priority, application Australia, May 3, 1973, 3195/73

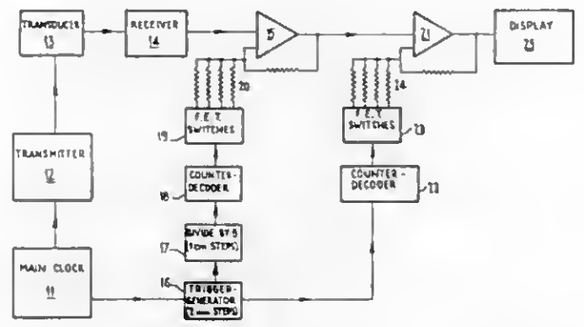
Int. Cl.² G01S 9/66; G01N 29/04

U.S. Cl. 73—67.8 R **6 Claims**

1. In a method of ultrasonic examination of an object comprising the steps of transmitting pulses of ultrasonic energy into the object, and receiving by receiver means echoes of said pulses of ultrasonic energy reflected by acoustic impedance discontinuites within the object, the improvement comprising:

progressively increasing the gain of said receiver means in predetermined steps during the time between transmitter pulses to compensate for attenuation of said echoes within the object; and

cyclically altering the gain of said receiver means during each of said predetermined steps by stepping the receiver



gain through a cycle of discrete steps superimposed upon each of said predetermined steps.

4,031,744

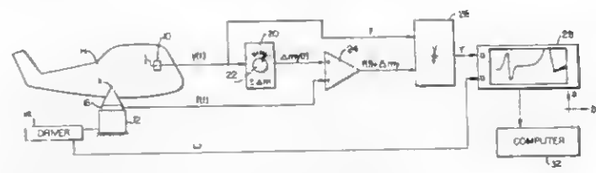
METHOD AND APPARATUS FOR ANALYZING A DAMPED STRUCTURAL SPECIMEN

William G. Flannelly, South Windsor, Conn., assignor to Kaman Aerospace Corporation, Bloomfield, Conn.

Filed Apr. 25, 1975, Ser. No. 571,636

Int. Cl.² G01N 29/00

U.S. Cl. 73—67.2 **34 Claims**



1. A method of determining an undamped physical response characteristic from a damped specimen comprising:

exciting the damped specimen to produce physical responses over a range of forcing frequencies of interest;

producing two signals representing respectively the excitation and the corresponding physical responses produced;

combining with one of the produced signals a signal proportional to the other of the produced signals by a known constant of proportionality to thereby produce a third signal;

dividing the third signal into said other of the signals to obtain a fourth signal representative of a modified response characteristic of the damped specimen over the range of forcing frequencies of interest;

determining the frequencies at which the modified response characteristic indicates a resonant condition; and

determining from the known constant of proportionality an undamped value of the response characteristic at the frequencies indicating the resonant condition.

4,031,745

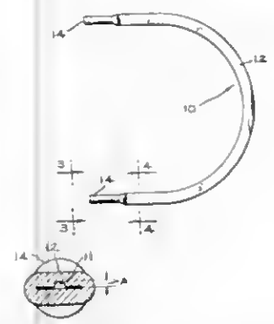
METHOD OF FORMING CONSTRICTION IN TUBING

William J. McCarty, Louisville, Ky., assignor to General Electric Company, Louisville, Ky.

Filed Feb. 20, 1976, Ser. No. 659,768

Int. Cl.² B21D 31/06

U.S. Cl. 72—367 **3 Claims**



1. The method of forming a capillary tube for connection into a refrigeration system which comprises:

forming at least one longitudinally disposed groove in the internal wall of a length of tubing;

forming said length of tubing longitudinally into a preselected configuration so that the free ends thereof are arranged to connect with said refrigeration system, including at least one portion intermediate said ends being in a single plane;

placing said portion of said tubing intermediate said free ends in a forming means;

connecting at least one of said free ends to a source of constant pressure through a control means having means for measuring said pressure passing through said tubing;

squeezing said portion of the tubing in the forming means at a first speed until the tubing reaches an intermediate predetermined restriction; then

squeezing said portion of tubing at a second slower speed so that substantially all of the medium passing through said tubing travels through said groove, and continuing said slower speed squeezing until the groove restriction causes the medium passing therethrough to reach a final predetermined pressure; and

terminating said second squeezing operation when said measuring means indicates said predetermined pressure.

4,031,746

AUTOMATIC TENSILE TEST APPARATUS

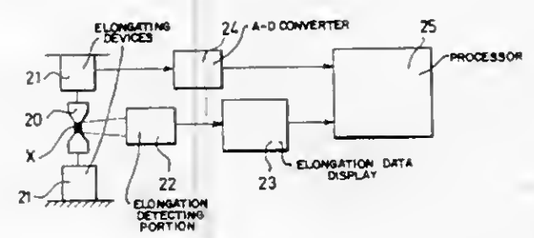
Isao Furuta, Suzuka; Shinsuke Iwamoto, Kyoto; Hironari Kuga, Muko, and Yoshishige Chikatsu, Yokkaichi, all of Japan, assignors to Japan Synthetic Rubber Co., Ltd., Tokyo and Iwamoto Seisakusho Company Limited, Kyoto, both of, Japan

Filed Apr. 29, 1976, Ser. No. 681,758

Claims priority, application Japan, Aug. 26, 1975, 50-103351

Int. Cl.² G01N 3/08

U.S. Cl. 73—95 **10 Claims**



1. Automatic tensile test apparatus comprising a portion for detecting an elongational strain of a test specimen, said portion including sensors which optically detect movements in elongating directions of both boundary marking lines between said specimen and a light reflecting substance applied thereon and a follow-up device which cooperates with said sensors; means to detect a tension exerted on said specimen; means to detect break of said specimen in cooperation with the elongation strain detecting portion; and a data processor which continuously calculates and processes the detected elongation and tension of said specimen.

4,031,747

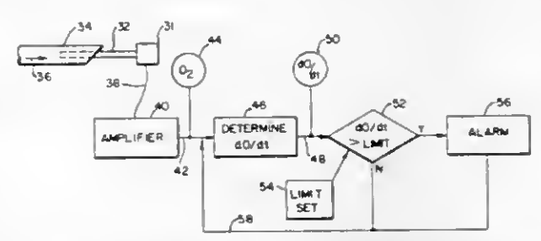
MISFIRE MONITOR FOR ENGINE ANALYSIS HAVING AUTOMATIC RESCALING

John David Blanke, Fullertoo, Calif., assignor to Beckman Instruments, Inc., Fullerton, Calif.

Filed Aug. 16, 1976, Ser. No. 714,143

Int. Cl.² G01M 15/00

U.S. Cl. 73—116 **7 Claims**



1. In engine exhaust gas analysis apparatus having:

means for sampling the exhaust gases including means for generating a first signal indicating the amount of a component present in the exhaust gases;

differentiating means connected to said sampling means and including means responsive to said first signal for generating a second signal indicating the rate of change of said first signal with respect to time;

means connected to said differentiating means for comparing said second signal to a limit; and,

means connected to said comparing means for indicating when said second signal exceeds said limit, the improvement comprising:

means for causing the values of said second signal and said limit to be normalized to a standard range before said comparing is done whereby the exceeding of said limit by said second signal will have substantially the same meaning regardless of the engine being analyzed.

4,031,748

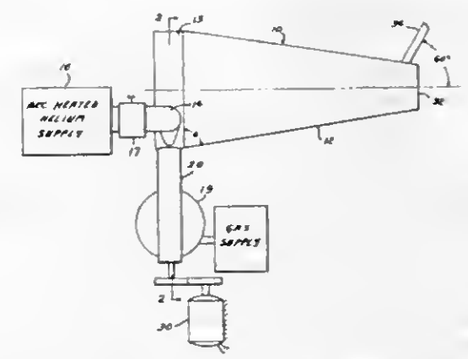
VORTEX FLOW PARTICLE ACCELERATOR

Kenneth R. Cramer, Dayton, Ohio, assignor to The United States of America as represented by the Secretary of the Air Force, Washington, D.C.

Filed May 11, 1976, Ser. No. 685,247

Int. Cl.² G01M 9/00

U.S. Cl. 73—147 **4 Claims**



1. A particle accelerator comprising: a substantially frusto

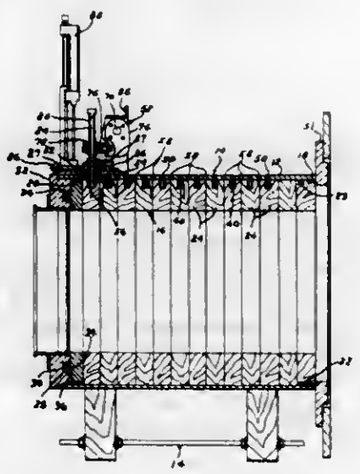
conically shaped flow chamber; said flow chamber having a zero taper entrance portion at the larger end of said flow chamber; an axial exit at the end of said flow chamber remote from said zero taper section; means for supplying a high pressure low molecular weight gas tangentially to the zero taper section of said flow chamber to thereby provide a vortex gas flow within said flow chamber; means for supplying small solid particles into the gas flow within said flow chamber at the zero taper section of said flow chamber and means for removing said particles from said chamber substantially along the maximum flow velocity vector of said particles within said flow chamber.

4,031,749

PROBE SYSTEM FOR WIND TUNNEL TEST SECTION

Buryl L. McFadden, Jr., Green County, Ohio, assignor to The United States of America as represented by the Secretary of the Air Force, Washington, D.C.

Filed June 15, 1976, Ser. No. 696,342
Int. Cl.² G01M 9/00
U.S. Cl. 73—147 **3 Claims**



1. A wind tunnel test section, comprising: an outer cylindrical shell member; a cylindrical inner liner positioned within said shell member; a pair of bearing members at opposite ends of said liner member, between the liner member and the outer shell member; a plurality of probe retainer plugs in said liner member, adapted to support a test probe within the test section; a plurality of elongated circumferentially positioned slots in said outer shell member positioned adjacent said probe retainer plugs; means for rotating said inner liner member within said outer shell member, to thereby move said probe retainer plugs along the slots in said outer shell member.

4,031,750

APPARATUS FOR LOGGING INCLINED EARTH BOREHOLES

Arthur H. Youmans, and Heinz D. Lichtenberg, both of Houston, Tex., assignors to Dresser Industries, Inc., Dallas, Tex.

Filed Sept. 2, 1976, Ser. No. 719,749
Int. Cl.² E21B 47/00
U.S. Cl. 73—151 **7 Claims**

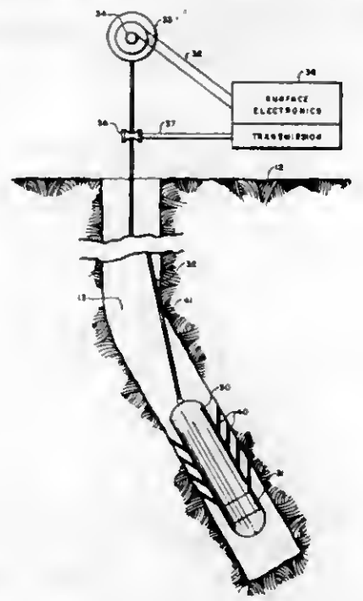
4. Apparatus for traversing an inclined earth borehole, comprising:

an elongated instrument adapted to traverse an earth borehole, said instrument including a longitudinal support mandrel;

a sliding sleeve encircling said support mandrel;

at least one vane attached to said sleeve and having a given angle with respect to said sleeve; and

means to reciprocate said sleeve with respect to said mandrel and thereby impart motion to the instrument in a



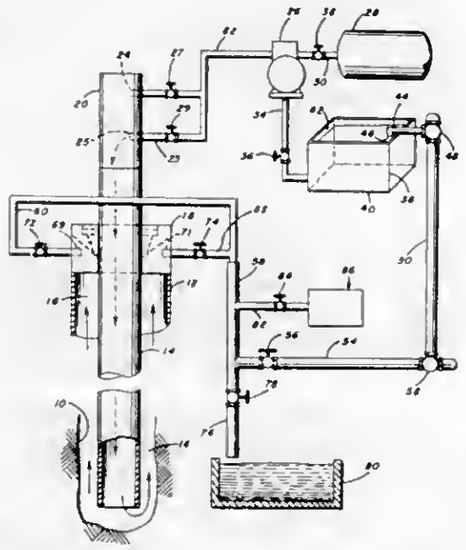
direction away from the angled slant of said at least one vane.

4,031,751

CLOSED SYSTEM FOR TESTING THE CONDITION OF WELL BORE FORMATIONS

Richard Y. Haddad, Pittsburgh, Pa., assignor to Haddad and Brooks, Inc., Upper St. Clair, Pa.

Filed Sept. 22, 1976, Ser. No. 725,635
Int. Cl.² E21B 47/00
U.S. Cl. 73—155 **11 Claims**



1. Method for testing the condition of well bore formations in a closed system for cementing a casing in the well bore comprising,

introducing a testing fluid having a preselected density from a source into the well bore,

circulating said fluid through the well bore,

displacing drilling fluid and other materials from the well bore by the flow of said testing fluid therethrough,

conveying said testing fluid and the drilling fluid and other materials from the well bore, and

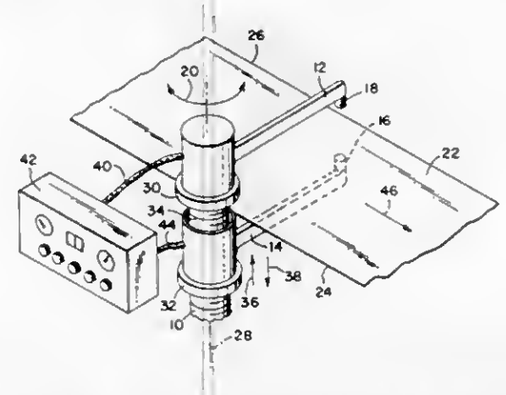
monitoring samples of the flow from the well bore for the presence of gas emitted from formations surrounding the well bore.

4,031,752

WEB PROCESS CONTROL APPARATUS

Art Sanders, 230 Harvie Road, East, R.R. No. 5, Barrie, Ontario, Canada

Filed July 19, 1976, Ser. No. 706,226
Int. Cl.² G01N 33/34
U.S. Cl. 73—159 **4 Claims**



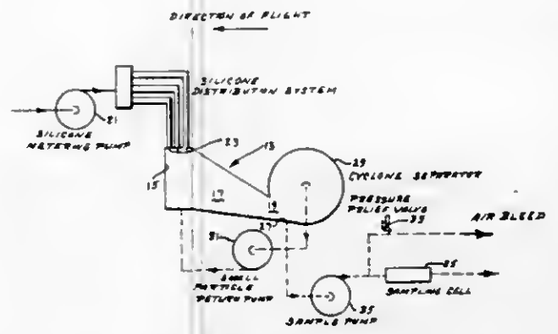
1. A process control and measuring apparatus comprising a pair of parallel arms disposed in spaced apart relationship, a web travelling between said arms, said arms commonly pivotably secured to a shaft, said shaft having the longitudinal axis thereof disposed perpendicular to the surface of said plane, said arms describing substantially a ninety degree arc at the free ends thereof, said arc passing about the surfaces of said web, measuring means fixedly secured to a free end of one of said arms, coupling means for coupling the signal generated by said measuring means to a point remote from said shaft post.

4,031,753

TOTAL WATER CONTENT INSTRUMENT

Richard G. Hooper, La Crescenta, Calif., assignor to The United States of America as represented by the Secretary of the Air Force, Washington, D.C.

Filed Aug. 20, 1976, Ser. No. 716,304
Int. Cl.² G01N 1/00
U.S. Cl. 73—170 R **4 Claims**



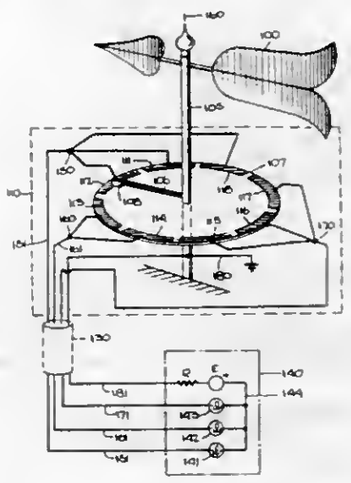
1. An instrument for sampling both solid and liquid water particles in the atmosphere and continuously producing an electrical signal directly equivalent to the total percentage water content of the atmosphere sampled, said instrument comprising an air sampling scoop of substantially funnel shaped configuration, a fixed intake aperture at the forward end of said air scoop, a narrowing area downstream said intake aperture, a throat area downstream said narrowing area, a suction port located in the throat area, a sample pump in operative communication with said suction port for drawing the water particles from the atmosphere sample therefrom, a sampling capacitor in operative communication with said sample pump for receiving the output therefrom and producing an electrical signal proportional to the water content of the atmosphere sample, and means at the throat of said air scoop for spinning out water particles which are swept past said suction port and returning the spun out water particles to the intake aperture of said air scoop.

4,031,754

APPARATUS FOR WEATHER PREDICTION

James Charles Bedard, 22 Foster Lane, Westbury, N.Y. 11590

Filed Jan. 19, 1976, Ser. No. 650,051
Int. Cl.² G01W 1/00
U.S. Cl. 73—188 **7 Claims**



1. Apparatus for predicting weather conditions solely on the basis of present wind direction comprising:

means for producing a physical indication of the present wind direction,

means responsive to said physical indication of the present wind direction for generating a plurality of signals, each of said signals corresponding to a particular wind direction, and

means for converting said signals into visual indications of future weather conditions comprising

means for selectively combining said signals to yield a set of three signals, and

means responsive to each of said three signals for generating visual indications of weather conditions corresponding to fair, changing or unsettled conditions.

4,031,755

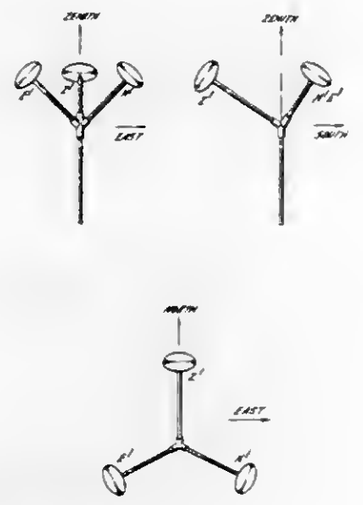
TRI DIMENSIONAL FLUID FLOW SENSING DEVICE

Pierre Ravussin, Lausanne, Switzerland, assignor to Alcyon Electronique et Physique S.A., Renens, Switzerland

Filed June 30, 1976, Ser. No. 701,454
Int. Cl.² G01W 1/02
U.S. Cl. 73—189 **6 Claims**

1. An instrument for sensing the components of a vector repesenting fluid flow comprising a first, a second and a third arm each bearing fluid flow sensing propeller means, said arms

extending from a common origin in directions each of which is at the same angle of inclination from the direction nominally



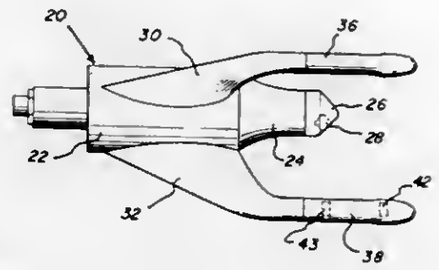
orthogonal to the fluid flow direction and means for measuring said vecotr components.

4,031,756

ULTRASONIC AIR MOVEMENT AND TEMPERATURE MEASURING APPARATUS

Donald Jack Rotier, St. Paul, and Frank J. Ferrin, Wayzata, both of Minn., assignors to Honeywell Inc., Minneapolis, Minn.

Filed Aug. 2, 1976, Ser. No. 710,980
Int. Cl.² G01F *1/66*
U.S. Cl. 73—189 **10 Claims**



6. A gaseous movement and temperature sensing apparatus comprising:

an ultrasonic wave transmitting transducer means comprising a common support element having a conical outer surface with three transmitting transducer elements mounted in the conical surface and displaced relative to each other by approximately 120°, three separte ultrasonic receiver transducer means spatially positioned about said transmitting transducer means and each aligned with one each of said transmitting transducer elements along a line extending perpendicular from said conical surface; and a fourth receiver transducer spatially positioned from one of the transmitting transducers at a position displaced from a lone perpendicular from said conical surface;

an ultrasonic wave energy source connected to said transmitting transducer means to activate said transmitting transducer means to project ultrasonic wave energy from each of said transducer elements toward said receiver transducer means;

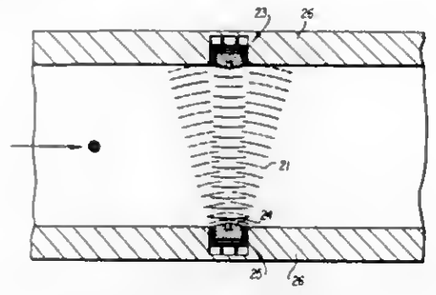
and means connected to said receiver transducer to measure the time difference in the received signals received by said four receiving transducer means and thereby the relative movement and temperature of a gaseous medium passing said sensing apparatus.

4,031,757

SONIC TRANSDUCER SURFACES

Russell F. Colton, Cedar Rapids, Iowa, assignor to J-Tec Associates, Incorporated, Cedar Rapids, Iowa

Filed Dec. 8, 1975, Ser. No. 638,356
Int. Cl.² G01F *1/32*
U.S. Cl. 73—194 VS **5 Claims**



1. In a sonic velocity sensor system of the type comprising a vortex generating strut, a sonic signal transmitting transducer, and a sonic signal receiving transducer, the improvement wherein:

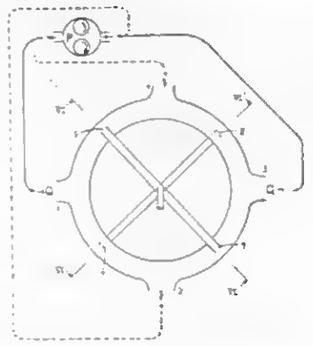
at least one of said sonic signal transducers is formed of a single integral crystal which has a conically-shaped faced surface.

4,031,758

MASS FLOWMETER

Nobuo Doi, Kanan-cho Daigatsuka 60, Minamikawachi, Osaka, Japan (585)

Filed Dec. 29, 1975, Ser. No. 645,231
Int. Cl.² G01F *1/34*
U.S. Cl. 73—205 D **3 Claims**



1. In a mass flowmeter with an endless annular pipe path for passing fluid therein, having four junctions each with a spur pipe path connected thereto, to be designated as first, second, third and fourth junction in circulatory order in any direction along the annulus, defining four pipe path sections therebetween to be designated as first pipe path section between the first and second junction, second pipe path sections between the second and third junctions, third pipe path section between the third and fourth junctions, and fourth pipe path section between the fourth and first junctions; the first junction serving as inlet of the fluid to be measured and the third junction as outlet thereof, while the second junction serving as inlet of the fluid recirculated at constant volumetric flow rate by recirculation means provided outside of said annular path and the fourth junction as outlet of the recirculation flow for returning to the recirculation means; the improvement comprising:

a. a static fluid pressure sensing portion provided in an intermediate portion of each of the pipe path sections;

b. the annular pipe path, including the shape and configuration of the static fluid pressure sensing portions, being constructed in mirror-image symmetry with respect both to a plane including a line connecting center axis of the first junction and center axis of the third junction, and partitioning the second and fourth junctions on either side thereof, and to a plane including a line connecting center axis of the second junction and center axis of the fourth junction, and partitioning the first and third junctions on either side thereof; and

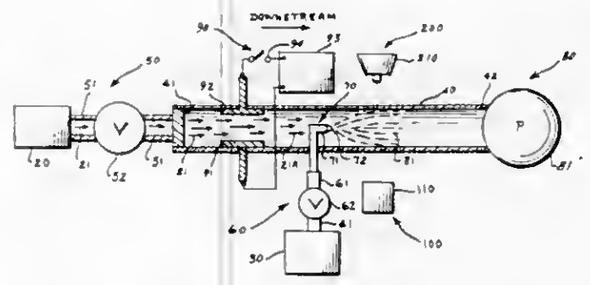
c. transducer means for transducing pressure difference between the average of the static fluid pressure at the sensing portion in the first pipe path section and the static fluid pressure at the sensing portion in the third pipe path section and average of the static fluid pressure at the sensing portion in the second pipe path section and the static fluid pressure at the sensing portion in the fourth pipe path section, into an indication of the mass flow rate of the fluid to be measured.

4,031,759

METHOD OF, AND APPARATUS FOR, MAKING VISIBLE THE FLOW PATTERN OF A GAS

Claude R. Jones, Los Alamos, N. Mex., assignor to The United States of America as represented by the Secretary of the Air Force, Washington, D.C.

Filed Aug. 12, 1976, Ser. No. 713,748
Int. Cl.² G01M *13/00*; **G01F** *15/00*
U.S. Cl. 73—432 R **10 Claims**



1. An apparatus for making visible the geometry of the flow pattern of a second gas introduced into a first gas which is capable of producing metastable molecules and atoms, comprising:

a. a source of said first gas;

b. a source of said second gas;

c. a translucent reservoir capable of containing said first gas and said second gas;

d. means for controlling flow of said first gas, with said flow control means for said first gas interposed between, and connected to, said source of said first gas and said reservoir;

e. means for controlling flow of said second gas, with said flow control means for said second gas interposed between, and connected to, said source of said second gas and said reservoir;

f. means for introducing said second gas into the flow of said first gas, within said reservoir, with said second gas introduction means connected to said reservoir;

g. means for promoting flow of said first gas and of said second gas into and within said reservoir, with said flow promoting means connected to said reservoir;

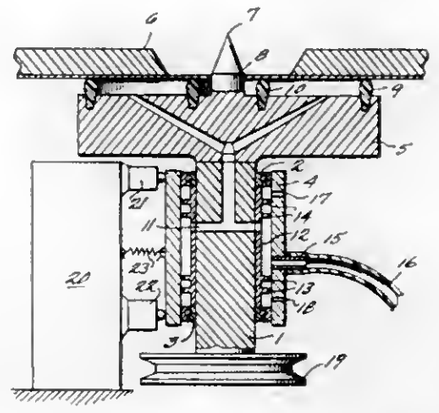
h. and, means for producing metastable molecules and atoms of said first gas, within said reservoir, with said production means connected to said reservoir; whereby, when metastable molecules and atoms of said first gas are produced in said reservoir, they transfer their energy to said second gas, thereby causing said second gas to emit visible light, and thereby making visible the geometry of the flow pattern of said second gas.

4,031,760

APPARATUS FOR BALANCING MACHINES FOR CHUCKING AND CENTERING OF ANAXIAL BODIES OF ROTATION

Richard Muller, Lynchburg, Va., assignor to Gebr. Hofmann KG, Darmstadt, Germany

Filed Apr. 14, 1976, Ser. No. 676,674
Claims priority, application Germany, May 20, 1975, 2522260
Int. Cl.² G01M *1/04*
U.S. Cl. 73—460 **3 Claims**



1. An apparatus for clamping and centering bodies during rotation for balancing comprising:

a body receiving plate having an upper extending surface and a plurality of channels extending therethrough into a chamber,

a spindle coupled to said plate for rotating the same and having a passage extending therethrough between said channels and an enclosed space,

a bearing housing enclosing said spindle,

a plurality of bearings disposed between said housing and said spindle,

a first flexible ring attached to and extending upward from said surface,

a second flexible ring attached to and extending upward from said surface and extending about said first ring to form said chamber which is sealed by a body resting on said rings,

means for producing a vacuum in said chamber by removing air from said chamber via said channels, said passage and said enclosed space to clamp said body to said upper extending surface, and

a centering cone extending upward from said surface within said first ring.

4,031,761

ENGINE POWER TAKE-OFF SYSTEM WITH SINGLE BELT DRIVE

David G. Fisher, and Robert G. Gladden, both of Springfield, Mo., assignors to Dayco Corporation, Dayton, Ohio

Continuation of Ser. No. 551,477, Feb. 20, 1975, Pat. No. 3,951,006, which is a continuation of Ser. No. 390,448, Aug. 22, 1973, abandoned. This application Apr. 16, 1976, Ser. No. 677,860
The portion of the term of this patent subsequent to Apr. 20, 1993, has been disclaimed.
Int. Cl.² F16H *7/02*; **F16G** *5/08, 5/20*
U.S. Cl. 74—15.63 **5 Claims**

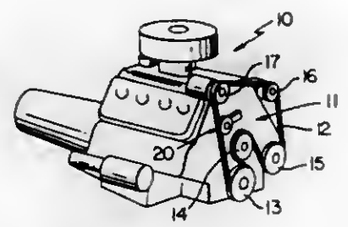
1. An improved automotive belt drive system comprising:

an automotive engine having a driving sheave coupled thereto for rotation;

at least three accessory devices each having a driven sheave coupled thereto, wherein each drive sheave is adapted to supply power to its respective accessory device, said driving sheave and at least two of said driven sheaves

each having a plurality of annular circumferential grooves therein, at least another of said driven sheaves having a cylindrical surface free of said grooves, and all of said driven sheaves being disposed in a common plane with said driving sheave; and,

an endless power transmission belt disposed about said sheaves and defining a serpentine path in said common plane, said belt having a flat driving portion and an oppositely arranged driving portion provided with a plurality of spaced longitudinal projections, said flat driving portion operatively engaging said cylindrical surface of said



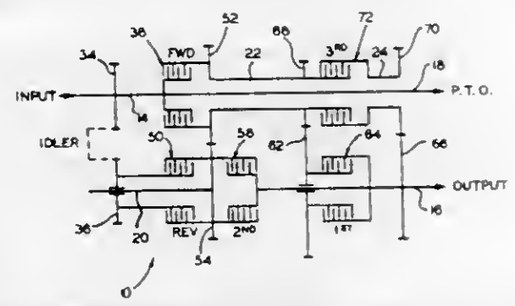
other driven sheave through a substantial arc of at least about 180°, and said projections of said oppositely arranged driving portion being received in said grooves of said grooved sheaves, said belt having a comparatively thin cross section for increasing belt life by reducing hysteresis, for reducing belt weight which reduces centrifugal tension loss, for allowing easy flexing around said sheaves, and for allowing backside bending enabling easy engagement of said flat driving portion against said cylindrical surface through said substantial arc to assure the driven sheave having said cylindrical surface is driven in a non-slipping manner.

4,031,762

MULTI-SPEED POWERSHIFT TRANSMISSIONS

James E. Shellberg, Jackson, Mich., assignor to Clark Equipment Company, Buchanan, Mich.

Filed July 30, 1975, Ser. No. 600,254
Int. Cl.² F16H *3/08, 37/06*
U.S. Cl. 74—15.63 1 Claim



1. In an in-line multi-speed constant-mesh-gear reversible powershift transmission of the type utilizing bidirectionally engageable multiple-disc fluid-pressure-actuated clutches, comprising in combination: an input shaft; a first gear fixed to said input shaft; a first shaft; a second gear journalled for rotation on said first shaft and drivingly connected with said first gear so as to rotate in the same direction therewith; a second shaft axially aligned with said input shaft; first clutch means for connecting said input shaft with said second shaft; second clutch means for connecting said second gear to said first shaft for conjoint rotation therewith; a third gear fixed to said second shaft; a fourth gear fixed to said first shaft and in mesh with said third gear; a third shaft axially aligned with said first shaft; third clutch means for connecting said third shaft with said first shaft; a fifth gear journalled for rotation on said third shaft; fourth clutch means for connecting said fifth gear to said third shaft; a sixth gear fixed to said third shaft, said fifth gear being located intermediate said third clutch means and said sixth gear; an output shaft axially aligned with said input shaft; a seventh gear fixed to said output shaft and in mesh with said sixth gear; an eighth gear fixed to said second shaft and in mesh with said fifth gear and fifth clutch means for connecting said second shaft to said output shaft for conjoint rotation therewith; a method for both modifying said in-line transmission to a transmission having a vertically offset output shaft, with respect to said input shaft, and adding an accessory drive shaft coaxial with said input shaft, said method comprising:

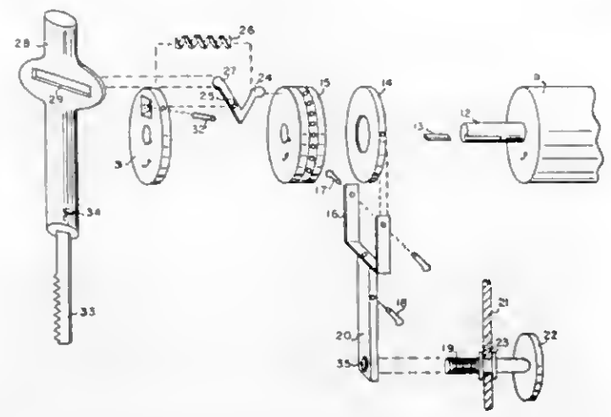
a. exchanging said third shaft for an output shaft that is vertically displaced relative to said input shaft;
b. exchanging said output shaft that is axially aligned with said input shaft for a first sleeve shaft concentric with said input shaft;
c. exchanging said second shaft for a second sleeve shaft, said second sleeve shaft being axially aligned with said first sleeve shaft; and
d. adding an accessory drive shaft, said accessory drive shaft being axially aligned with and operatively connected with said input shaft for conjoint rotation therewith and coaxial with said first and second sleeve shafts, whereby exchanging said third shift, said axially aligned output shaft and said second shaft, as well as adding said accessory drive shaft, produces a transmission having a vertically offset output shaft with respect to said input shaft and permits the coaxial interposition of said accessory drive shaft through said first and second sleeve shafts.

4,031,763

ADJUSTABLE STROKE LENGTH, RECIPROCATING TOOLS

Robert M. Eisenberg, Woodbine, Md., assignor to The Singer Company, Binghamton, N.Y.

Filed Sept. 15, 1975, Ser. No. 613,631
Int. Cl.² F16H *21/18*
U.S. Cl. 74—50 3 Claims



1. In a reciprocating power tool, mechanism for modifying the length of the stroke of the tool, said mechanism comprising:

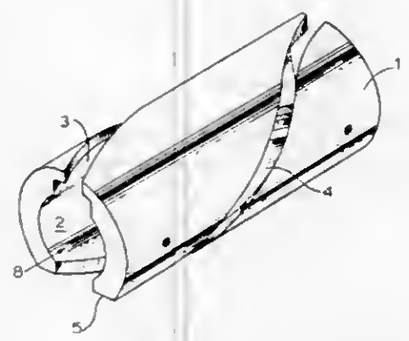
a. a housing;
b. a power source having a rotating shaft, said source being mounted in said housing;
c. means for converting the rotating motion of said shaft to reciprocating motion, said means comprising at least a lever member having an offset from said rotating shaft and a part mounted in said housing for reciprocal movement and driven by said member; and
d. means for changing the distance of said offset from the center line of said shaft, said changing means comprising a first pressure device slidably supported on said shaft and longitudinally movable along said shaft to bear against one end of said lever member whereby the position of the other end of said lever member is modified.

4,031,764

DEVICES FOR ROTATING ARTICLES

Sidney Curtis, Cottingham, England, assignor to Thomas Hill Engineering Co. (Hull) Ltd., Hull, England

Filed Jan. 26, 1976, Ser. No. 652,531
Int. Cl.² F16H *25/12*
U.S. Cl. 74—57 8 Claims



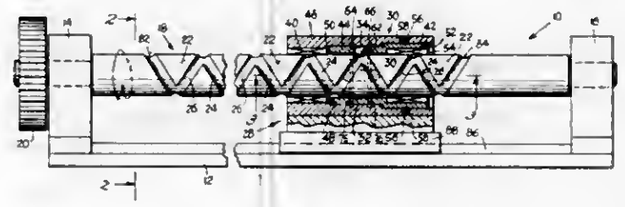
1. A longitudinal device of a predetermined length for rotating a plurality of articles, wherein each of the articles has base and top portions, respectively, said device being formed with two separate half-portions held together by a substantially cylindrical yoke, said device a substantially cylindrical longitudinal passage having an internal surface, two helical paths being defined in said device along said internal surface, said helical paths being located on said internal surface diametrically opposite one another along the entire length of said device, the width of one of said paths being substantially equal to the width of said base portion, and the width of the other of said paths being substantially equal to the width of said top portion.

4,031,765

REVERSING NUT FOR DIAMOND THREAD SCREW

Joseph R. Metz, Georgetown, Conn., assignor to Norco, Inc., Ridgefield, Conn.

Filed Mar. 31, 1975, Ser. No. 563,793
Int. Cl.² F16H *25/12*
U.S. Cl. 74—57 20 Claims



1. A reversing nut for use with a diamond thread screw having threads defining criss-crossed grooves, comprising in combination:

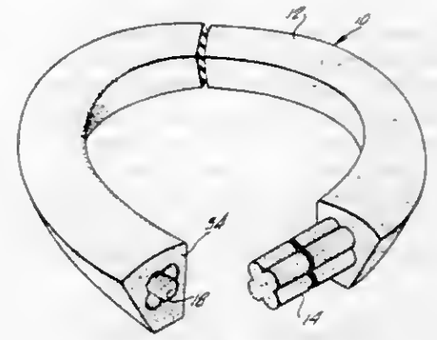
a. a nut body having a through opening to receive the screw,
b. a ball engaging a wall of one groove of the screw,
c. means mounting the ball against lateral movement thereof on the body, said ball extending into the body opening for said groove wall engagement,
d. a laterally movable ball carried by the body, said ball extending into the opening thereof for engagement with a wall of a groove of the screw,
e. means providing a slot in the body in which the movable ball is disposed, for enabling said movable ball to be translationally shifted in directions along the body axis whereby, while guided and directly engaged by the slot walls it can transfer from direct engagement with one groove wall of the screw and simultaneous direct engagement with one slot end, to direct engagement with another groove wall of the screw and simultaneous direct engagement with the other slot end, thereby to effect a change in the axial direction of travel of the nut with respect to the screw, and
f. springs for directly engaging the movable ball to yieldably hold it against either one slot end or else the other slot end.

4,031,766

ADJUSTABLE ENDLESS BELT OF UNITARY CONSTRUCTION

Paul Beck, 1100 N. Alta Loma, Los Angeles, Calif. 90069

Filed Apr. 2, 1976, Ser. No. 673,200
Int. Cl.² F16G *1/00*
U.S. Cl. 74—231 J 11 Claims



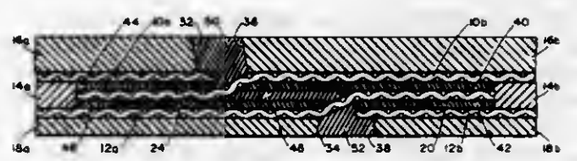
1. A continuously adjustable endless belt of unitary construction for use in power transmission comprising a length of flexible tear-resistant material, one end thereof being of reduced diameter and defining an extended male end portion, the other end of said length having a longitudinal channel therein adapted to receive said male portion, said channel and said male portion being of equal lengths such that upon disposing said male portion within said channel a continuous endless solid belt is defined.

4,031,767

SPLICED BELTING

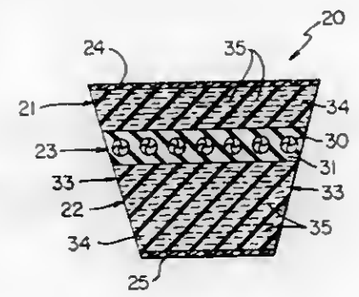
Nathan E. Guyer, Stoneham, Mass., assignor to American Biltrite Inc., Cambridge, Mass.

Filed Jan. 23, 1976, Ser. No. 651,859
Int. Cl.² F16G *1/00, 5/00;* B65G *15/30*
U.S. Cl. 74—231 J 10 Claims



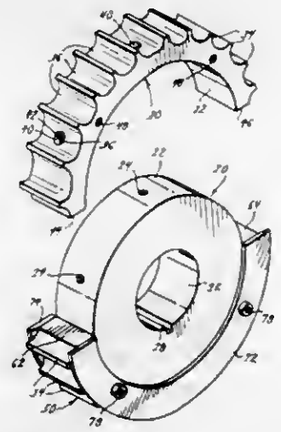
5. In conveyor belting comprising at least two carcass plies, an elastomeric ply intermediate said carcass plies, and outer plies of rubbery compound; a spliced area in which all carcass plies are severed, the severed locations being spaced apart longitudinally of the belting, terminal portions of each carcass ply overlapping each other, overlapping carcass ply surfaces being coated with tie gum.

4,031,768
ENDLESS POWER TRANSMISSION BELT STRUCTURE
Dewey D. Henderson; Jerry W. Rogers, and Gerald C. Hollaway, Jr., all of Springfield, Mo., assignors to Dayco Corporation, Dayton, Ohio
Filed June 18, 1976, Ser. No. 697,801
Int. Cl.² F16G 5/00, 5/16
U.S. Cl. 74—233 7 Claims



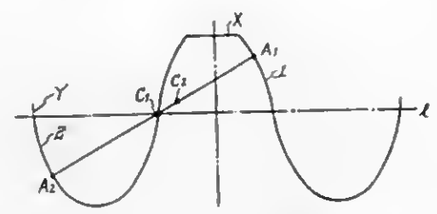
1. An endless substantially trapezoidal power transmission belt structure having reduced coefficient of friction raw-edged non-parallel sides comprising, a tension section, a compression section, and load-carrying means disposed between said sections, each of said sections being made of an elastomeric compound comprising a polymer and graphite, said compound having anti-friction properties which reduce the coefficient of friction of said sides, said graphie comprising 15–90 parts by weight for each 100 parts by weight of said polymer.

4,031,769
SEGMENTED SPROCKET
Milton O. Kassing, St. Louis, Mo., assignor to Semmelmeyer-Corby Co., St. Louis, Mo.
Filed Feb. 6, 1976, Ser. No. 656,193
Int. Cl.² F16H 55/12
U.S. Cl. 74—243 DR 2 Claims



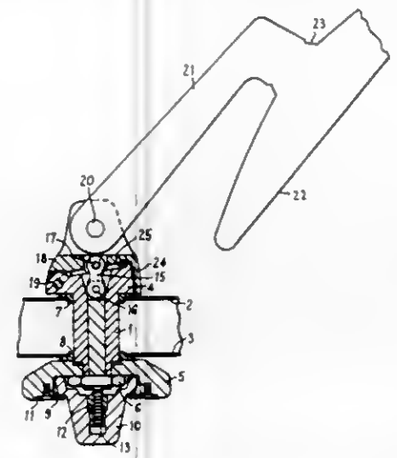
1. A sprocket for tabletop chain which comprises a hub plus a plurality of segments that intimately encircle said hub, said hub having a central opening therethrough to accommodate a shaft and having a wide, machined, convex, outer surface thereon and having a plurality of radially-directed, circumferentially-spaced, threaded sockets therein which are spaced outwardly from said central opening and which open to said outer surface, each of said segments being arcuate in side elevation and having a wide, machined, concave, inner surface thereon and having a plurality of sprocket teeth at the outer periphery thereof and having a plurality of radially-directed, circumferentially-spaced, shouldered passages extending all the way therethrough, said sprocket teeth and the portions of said segments which are intermediate the roots of said sprocket teeth defining spaces between adjacent sprocket teeth, said radially-directed, circumferentially-spaced shouldered passages in said segments being formed so they are permanently in register with some of said spaces between adjacent sprocket teeth, said some of said spaces between adjacent sprocket teeth and said radially-directed, circumferentially-spaced shouldered passages in said segments being disposed in register with said radially-directed, circumferentially-spaced threaded sockets in said hub, the shoulders of said radially-directed, circumferentially-spaced shouldered passages in said segments opening to said some of said spaces between adjacent sprocket teeth, the width of each of said segments and of each sprocket tooth thereon being substantially equal to the width of said outer surface of said hub, the length of each of said some spaces between said adjacent sprocket teeth being greater, in a direction parallel to the geometric axis of said hub, than the diameter of the shoulder of the radially-directed, circumferentially-spaced, shouldered passage which opens to said some space, said shoulders of said radially-directed, circumferentially-spaced shouldered passages in said segments being spaced substantial distances inwardly from the ends of said spaces between adjacent sprocket teeth to assure full strength for those portions of said segments which are intermediate said shoulders of said radially-directed, circumferentially-spaced shouldered passages in said segments and said ends of said some spaces between adjacent sprocket teeth, the width of each of said segments being at least as great as the pitch of said sprocket teeth, and fasteners, which have the heads thereof telescoped into said shoulders of said radially-directed, circumferentially-spaced shouldered passages in said some spaces between said sprocket teeth to be clear of all parts of said tabletop chain and which have the shanks thereof telescoped into said radially-directed, circumferentially-spaced, threaded sockets in said hub.

4,031,770
DUAL TOOTH CONTACT TYPE W-N GEAR
Shoichi Ishikawa, Yokohama, Japan, assignor to Kabushiki Kaisha Hasegawa Haguruma, Tokyo, Japan
Filed Apr. 5, 1976, Ser. No. 673,896
Claims priority, application Japan, Apr. 7, 1975, 50-41200
Int. Cl.² F16H 55/06
U.S. Cl. 74—462 2 Claims



1. A dual tooth contact type W-N gearing including a pair of helical gears of which the basic rack tooth profile, as taken in a transverse or normal-to-teeth reference plane, is composed of addendum convex circular arcs and dedendum concave circular arcs, characterized in that the basic rack tooth profile is so defined that the addendum convex circular arc on one side of a tooth and the dedendum concave circular arc on the same side of another tooth neighboring said tooth on the other side thereof have both a point of meshing contact set on the circular arc so as to have at the respective points of meshing contact lines of radius lying on one and the same straight line.

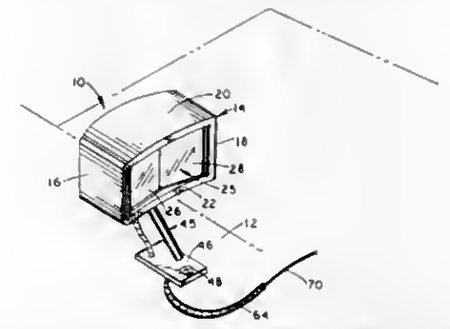
4,031,771
VEHICLE REAR-VIEW MOUNTING ARRANGEMENT
Daniel Daly, Chertsey; Kenneth Paul Davis, Harlington, and Charles Arthur Boughtflower, Bourne End, all of England, assignors to Magnatex Limited, Heathrow, England
Filed Oct. 28, 1975, Ser. No. 626,124
Claims priority, application United Kingdom, Nov. 4, 1974, 47698/74
Int. Cl.² F16D 11/00; A47G 1/24
U.S. Cl. 74—479 6 Claims



1. A mounting arrangement for mounting a vehicle rear-view mirror on the outside of a part of a vehicle body, comprising:
a. a tubular bearing member adapted to be mounted to extend through and be turnable in the body part and having an outer and an inner end and defining a passage extending therethrough,
b. a mirror support member,
c. hinge means having an axis extending transversely to the axis of said bearing member and connecting said mirror support member to the outer end of said bearing member for hinging about the axis of the hinge means,
d. a first rotatable control member connected to the inner end of the bearing member, for turning the bearing member about its axis,
e. a push member axially movable in the passage in said bearing member, said push member comprising a rod which is flexible for at least a part of its length, said rod being screw-threaded at its inner end and having its outer end rigid with the mirror support member,
f. a second rotatable control member,
g. screw-thread means coupling the inner end of said push member to said second control member,
h. means holding said second control member axially captive with the inner end of said bearing member, and
i. means operative in response to axial movement of said push member to cause the mirror support member to hinge about said hinge means.

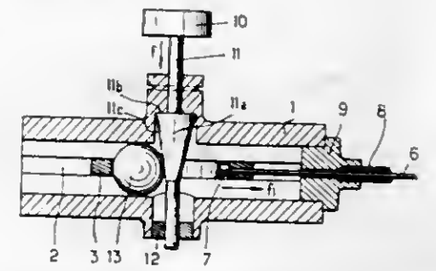
4,031,772
NIGHT/DAY REARSIDE VIEW MIRROR
Glenn DeCastri, 32 Circle Drive, Glen Cove, N.Y. 11542
Filed June 22, 1976, Ser. No. 698,706
Int. Cl.² F16C 1/10
U.S. Cl. 74—501 M 8 Claims

1. A rear vision mirror assembly for use on a vehicle, comprising:
A. a housing open at one end,
B. a vertically disposed mirror including a pair of mirror panels angularly positioned relative to each other and having reflective faces of different values of intensity,
C. means for rotatably supporting said mirror with said mirror panels facing the open end of said housing for rotation about an upright axis between a first position in which one of said mirror panels is brought into reflective position for use to a second position in which the other of said mirror panels is brought into reflective position for use, said supporting means including:
i. a pivot member extending vertically in said housing, and
ii. a first arm secured to said mirror at one end thereof and rotatably mounted relative to said pivot member at the opposite end thereof,
D. stop means mounted within said housing to limit the path of travel of said mirror between the first and second positions,
E. means for mounting said housing in fixed position relative to the vehicle associated therewith, and



F. means for controlling the movement of said mirror between said first and second positions from within the vehicle, said controlling means includes,
i. a bracket extending between said mirror and said pivot member adjacent said arm,
ii. a flexible tubular sheath secured to said bracket at one end thereof and having its opposite end extending within the vehicle, and
iii. a flexible cable positioned within said sheath and secured at one end thereof to said arm between said mirror and said pivot member, and having its opposite end terminating within the vehicle, such that linear movement of said cable within said sheath applies a force to effect angular displacement of said arm for movement between said first and second positions.

4,031,773
DEVICE FOR ACTUATING A SHEATHED CONTROL CABLE
Robert René Marechal, Paris, France, assignor to SICMA Societe Industrielle et Commerciale de Materiel Aeronautique, Issoudun, France
Filed July 14, 1976, Ser. No. 705,108
Claims priority, application France, Feb. 13, 1976, 76.04672
Int. Cl.² F16C 1/22
U.S. Cl. 74—501.5 R 8 Claims



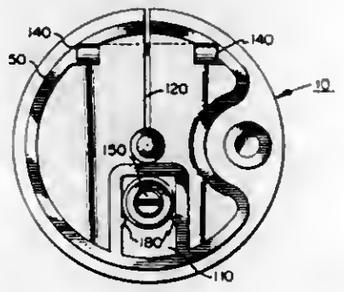
1. A device for actuating a sheathed control cable, said device comprising a casing, push button means actuable to exert a tension on the cable, said push button means being slidable in the casing, means defining an inclined surface rigid with the push button means, a traction member slidably mounted in the casing, the cable being fixed to the traction

member, and ball means interposed between the inclined surface and the traction member.

4,031,774
MOLDED MEMBER FOR USE IN WINDING MECHANISMS

Robert A. Bennett, Easton, Conn., assignor to Waterbury Lock & Specialty Company

Filed Mar. 19, 1976, Ser. No. 668,459
Int. Cl.² G05G 1/00
U.S. Cl. 74—547 **4 Claims**

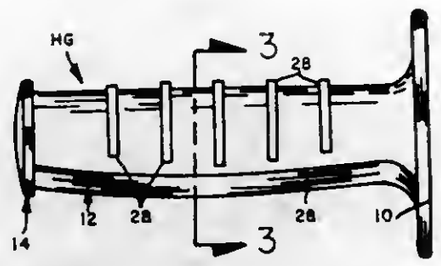


1. A device for use in winding mechanism comprising:
a member with a downwardly extending cylindrical wall and a top with a circular periphery, the top having an elongated channel with a flat bottom extending along one of its diameters and dividing it into two like raised portions, each of these portions having a bore extending from the periphery of the top to the edge of the channel with the axes of the top being horizontally coincident and perpendicular to the axis of the channel and being located above its bottom and near one of its ends, the member further having a central vertical slit extending downwardly through the top and the wall along an imaginary line which begins at a point along the bottom of the wall, then runs vertically upwardly along the wall to a point of intersecion of the end of the channel axis adjacent the bores and the periphery of the top, and then runs along the channel axis between the bores and through the center of the top to terminate at a point between the center of the top and the end of the channel axis remote from the bores.

4,031,775
HAND GRIP

Preston L. Petty, 403 N. Main, Newberg, Oreg. 97132

Filed Feb. 9, 1976, Ser. No. 656,729
Int. Cl.² B62K 21/26
U.S. Cl. 74—551.9 **5 Claims**



1. A hand grip for a handlebar comprising:
a hand-gripping section;
means at each end of said hand-gripping section to maintain an operator's hand in position on said hand-gripping section;
said hand-gripping section having a finger-engaging area and a palm-engaging area, said finger-engaging area defining a plurality of flat surfaces therealong which are disposed substantially parallel with respect to a longitudinal axis of said hand grip and said flat surfaces are joined thereby defining a slightly curved linear ridge the length of said hand gripping section so that said plurality of flat surfaces and ridge define in cross-section at least a V-shape configuration conforming to the jointed formation of finger joints of an operator's hand when engaging said hand-gripping section, said palm-engaging area defining a semi-circular surface having rib means disposed therealong at spaced intervals conforming to the palm area of the operator's hand when engaging said palm-engaging area and being truncated at their ends short of said flat surfaces

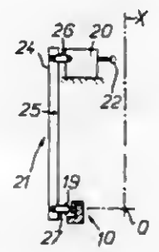
4,031,776
CAMS SUITABLE FOR USE IN MOTION TRANSMITTING MECHANISM AND MOTION TRANSMITTING MECHANISM INCORPORATING SUCH CAMS

William Leone, Gagny, France, assignor to Essilor International Geoerale d'Optique, Joinville-le-Pont, France

Filed Mar. 31, 1975, Ser. No. 563,659
Claims priority, application France, Apr. 11, 1974, 74.12725
Int. Cl.² F16H 53/00
U.S. Cl. 74—567 **8 Claims**



1. A motion transmitting mechanism comprising a cam assembly comprising a fixed base, a rigid one-piece cam member having a generally J-shaped cam surface including a part circular portion and a planar portion tangent to and continuous with said part circular portion, and means adjustably mounting said cam member on said base for angular displacement about the axis of the said part circular portion, a feeler, means for maintaining said feeler in contact with said cam surface, a work block mounted for translatory movement perpendicular to said cam surface, and motion transmitting means connecting said work block to said feeler for transmitting movement, said motion transmitting means transforming movements of said feeler away from said axis of the part-circular cam surface into movements of the work block toward said axis, and vice versa.

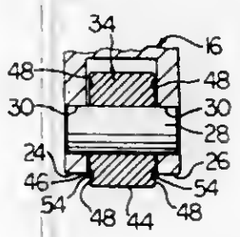
4,031,777
LOW STRESS CAM ROLLER

John H. Parks, Peoria, Ill., assignor to Caterpillar Tractor Co., Peoria, Ill.

Filed Feb. 11, 1976, Ser. No. 657,127
Int. Cl.² F16H 53/06
U.S. Cl. 74—569 **4 Claims**

1. In a cam follower mechanism, a rotary cam having a straight follower lifting cam surface, a reciprocally guided follower, a follower roller rotatably supported by said follower for engagement with same cam surface, said roller being a generally cylindrical member having a peripheral contact surface and a pair of opposite, radially directed sidewalls,

wherein the improvement comprises means on said roller for relieving stress, said means on said roller comprising an annu-

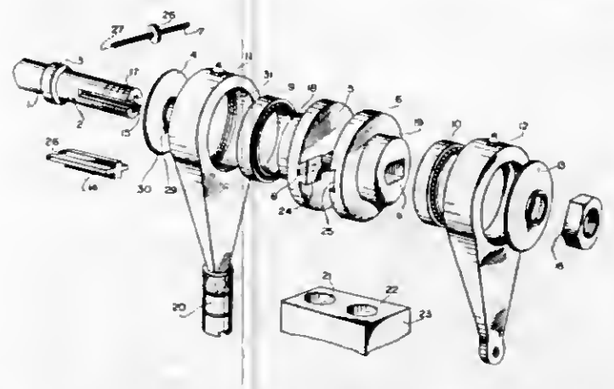


lar groove in each of said radially directed sidewalls, said annular groove being arcuate in cross-section.

4,031,778
DRIVE SYSTEM

David Stephen Fazekas, Oakville, Canada, assignor to The International Nickel Company, Inc., New York, N.Y.

Filed July 11, 1975, Ser. No. 595,300
Claims priority, application Canada, Aug. 28, 1974, 208027
Int. Cl.² G05G 5/04; F15B 15/24
U.S. Cl. 74—571 L **4 Claims**



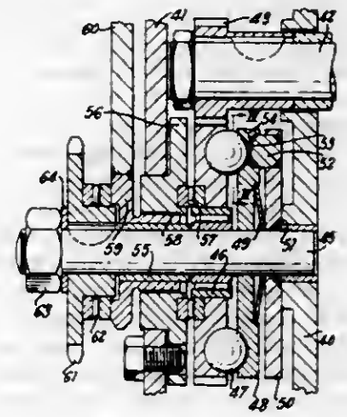
1. A double-eccentric variable drive system comprising a drive shaft, two eccentrics mounted on said drive shaft to be driven thereby, and means for varying the eccentricity of both of said eccentrics simultaneously, said means comprising a spindle having left-hand screw-threads on one end thereof and right-hand screw-threads on the other end thereof, said spindle having an enlarged central portion rotatably mounted in said shaft but radially fixed relative thereto, said eccentrics each having an annular surface carrying a bearing which in turn carries a connecting rod and said eccentrics each having a radial bore therethrough tapped to correspond with and receive the threads of said spindle, said bores being aligned on opposite sides of said shaft, each eccentric having an axial bore larger than the diameter of the shaft at least in a direction parallel to said spindle to allow for sliding movement of the eccentrics with respect to each other radially of the shaft, means for rotating said spindle in one direction to simultaneously increase the eccentricity of both of said eccentrics relative to said shaft and for rotating said spindle in the other direction to simultaneously decrease the eccentricity of both of said eccentrics relative to said shaft.

4,031,779
ROTARY DRIVES

Rudi Helmut Braune, Griffin Hill, Tbrupp, Stroud, Gloucestershire, England

Filed Oct. 16, 1975, Ser. No. 623,093
Int. Cl.² F16H 35/04
U.S. Cl. 74—650 **20 Claims**

1. A mechanical rotary coupling comprising a driving member, a driven member coaxial therewith, a contact member having a bearing surface abutting opposing faces of said driving and driven members, said members being connected together by said contact member, means for applying variable axial thrust between said driving and driven members so as to

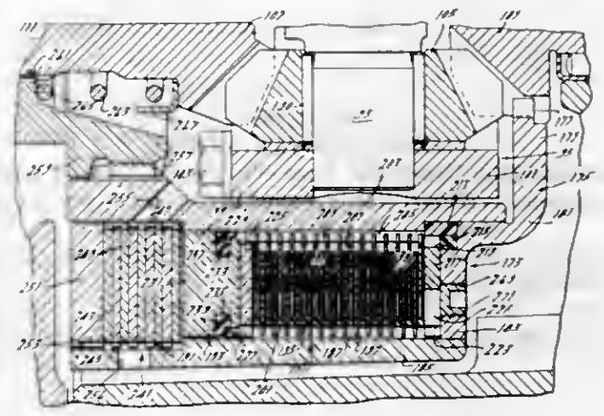


vary the torque transmitted therebetween, and means arranged to vary said axial thrust during operation of the coupling.

4,031,780
COUPLING APPARATUS FOR FULL TIME FOUR WHEEL DRIVE

Courtney F. Dolan, Syracuse, and Thurman O. Ruettinger, Skaneateles, both of, NY, assignors to Chrysler Corporation, Highland Park, Mich.

Filed Nov. 29, 1974, Ser. No. 528,244
Int. Cl.² F16H 1/44; F16D 43/00, 31/00
U.S. Cl. 74—711 **6 Claims**

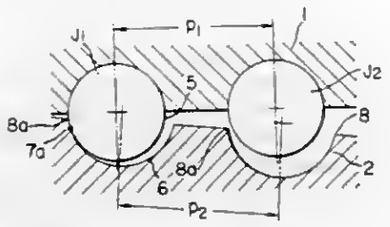


1. Coupling apparatus for power drive systems comprising first and second rotatable elements adapted to be coupled together, a first coupling device comprising a viscous coupling chamber, a first set of viscous coupling members in said chamber drivingly connected to one rotatable element, and a second set of viscous coupling members in said chamber, interleaved with said first set of viscous coupling members and drivingly connected to the other rotatable element, viscous fluid in said chamber adapted to be sheared when said members are rotated relative to one another, said fluid transmitting torque from one set of coupling members to the other and increasing in temperature as a result of shearing action, said fluid expanding as its temperature increases, and a second coupling device adapted to be actuated by the expansion of fluid in said first coupling device, said second coupling device comprising a second chamber closed at one end, a first set of friction coupling members in said second chamber drivingly connected to one rotatable element, a second set of friction coupling members in said second chamber drivingly connected to the other rotatable element, and a piston at the other end of said second chamber and adjacent said viscous coupling chamber, said viscous fluid applying pressure on said piston to move the same toward and apply pressure on said

friction coupling members in response to the expansion of said viscous fluid in said viscous coupling chamber.

4. Coupling apparatus for power drive systems comprising a differential including first and second side gear members, an annular carrier member, pinion shafts connected to said carrier member and extending radially inward, means drivingly connected to said pinion shafts for rotating said carrier member pinions carried on said pinion shafts and meshing with said side gear members, a viscous coupling connected to two of said members for transmitting torque therebetween, said viscous coupling including a viscous fluid adapted to increase the temperature and expand during torque transmission thereby in said viscous coupling, a friction clutch connected to two of said members for transmitting torque therebetween, and means movable in response to the expansion of said viscous fluid for actuating said friction clutch, said viscous coupling and said friction clutch including an inner drum and an outer drum, said inner drum surrounding said carrier member and connected to one of said members, said outer drum surrounding said inner drum and having a diameter greater than the diameter of said inner drum to provide space therebetween, a plurality of first viscous coupling plates drivingly connected to one of said drums and located in said space, a plurality of second viscous coupling plates interleaved with said first viscous coupling plates and drivingly connected to the other drum, said viscous fluid being located between said viscous coupling plates, a first set of friction clutch plates drivingly connected to said one drum and a second set of friction clutch plates interleaved with said first set of friction clutch plates and drivingly connected to said other drum, said means for actuating said friction clutch comprising a piston in said space, said piston being adapted to apply pressure on said friction clutch plates in response to pressure applied thereto by said expanding viscous fluid.

4,031,781
SPEED REDUCTION GEAR
Yoshihisa Iida, Kyoto, and Yozo Oike, Osaka, both of Japan, assignors to Shinpo Kogyo Kabushiki Kaisha, Kyoto, Japan
Filed Dec. 15, 1975, Ser. No. 640,944
Claims priority, application Japan, Dec. 16, 1974, 49-144220; Sept. 9, 1975, 50-109329
Int. Cl.² F16H *1/06, 1/20, 1/28*
U.S. Cl. 74—804 **2 Claims**



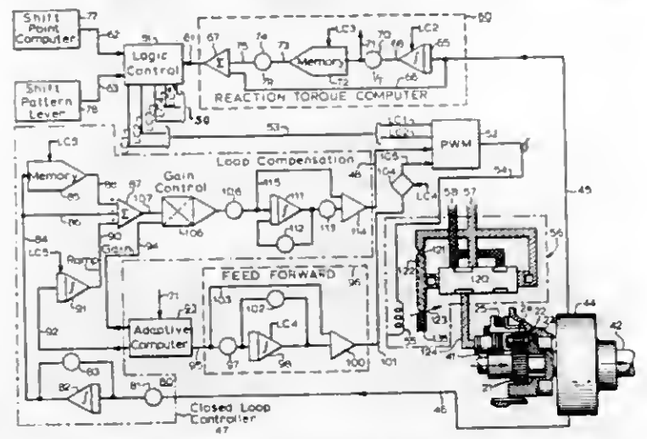
1. A speed reduction gear wherein a stationary internal gear and an external gear meshing with the internal gear are provided, and wherein a differential rotation due to difference in the number of teeth between the above said gears is transmitted to an output shaft characterized in that:

A. the teeth of the internal gear are provided with a circular convex profile, and the teeth of the external gear are provided with a circular concave profile the radius of which is larger than that of the above said circular convex profile, in that:

B. the mesbing of the above said gears moves reciprocally between two points on the concave profile, and in that:

C. the range defined by the above said two points does not include any edge of the concave profile.

4,031,782
METHOD AND APPARATUS FOR A TRANSMISSION CONTROL SYSTEM
Alan Leonard Miller, Mount Prospect, Ill., and John Saxon Ivey, Bloomfield Hills, Mich., assignors to Borg-Warner Corporation, Chicago, Ill.
Filed Feb. 27, 1976, Ser. No. 661,896
Int. Cl.² B60K *41/18;* **G05G** *21/00*
U.S. Cl. 74—866 **18 Claims**



1. A control system for controlling the change of gear ratio in a gear set receiving drive from an engine and having an output drive connection for supplying drive torque to a load, comprising:

a control unit for the gear set to control the change of gear ratio;

sensor means operatively associated with the drive connection for providing an output torque signal which varies as a function of said drive torque; and

means connecting the sensor means and the control unit, whereby the control unit will control the change of gear ratio in response to said drive torque.

17. The method of regulating gear ratio change in a gear set coupled between an automotive engine and an output mechanical drive connection, comprising the steps of:

sensing the output torque provided by the gear set;

providing a feedback signal which varies as a function of the output torque;

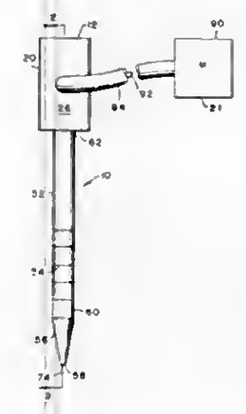
establishing a reference signal;

continually comparing the feedback signal with the reference signal to determine the proper time for effecting the gear ratio change; and

modifying the control of the gear ratio change as a function of changes in the feedback signal indicating the output torque.

4,031,783
TATTOO ETCHING MACHINE
Stanley C. Paul, and Shelby J. Russell, both of 9912 Woodside, Detroit, Mich. 48204
Filed Apr. 7, 1975, Ser. No. 565,342
Int. Cl.² B26F *1/24*
U.S. Cl. 81—9.22 **1 Claim**

1. A tattoo etching machine comprising a U-shaped body member having a top leg portion and a bottom leg portion, each connected at one end to a connecting portion, which body member has a threaded opening in the connecting portion extending in the direction of the leg portions, a non-threaded opening in the bottom leg portion extending transversely of the leg portions and in the direction of the connecting portion, and a threaded opening extending from the free end of the bottom leg portion in the direction of the bottom leg portion into the non-threaded opening therethrough, an externally threaded bearing member positioned within the threaded opening in the connecting portion of the body member having a cylindrical opening extending axially thereof, a drive shaft having a head on one end thereof extending through the opening in the bearing member for rotation therein, means for connecting a drive cable to the one end of the drive shaft exteriorly of the body member, a hollow cylinder having a radially extending threaded opening extending transversely therethrough sleeved over the other end of the drive shaft within the body member between the leg portions thereof for rotation with the drive shaft, a set screw extending through the radial opening in the hollow cylinder rigidly securing the cylinder to the drive shaft, a pin extending axially of the drive shaft from the hollow cylindrical member and offset from the axis of rotation of the hollow cylindrical member and the drive shaft, a hollow cylindrical barrel one end of which extends through the unthreaded opening in the bottom leg portion of the body member transversely of the bottom leg portion and in the direction of the connecting portion of the body member, a barrel tip secured to the other end of the barrel having an opening therethrough extending axially of the barrel, needle means extending through the barrel, one end of which is adapted to extend through the opening in the barrel



tip in one position of the needle means and the other end of which includes an opening therethrough through which the pin on the cylinder secured to the drive shaft passes, whereby on rotation of the drive shaft the needle means is reciprocated into and out of the opening in the barrel tip a controlled distance, a threaded set screw extending through the opening in the bottom leg portion of the body member and into contact with the one end of the barrel for securing the barrel to the body member in axially adjusted positions of the barrel with respect to the body member, and a cover for the body member enclosing the area between the top and bottom leg portions of the body member, which cover is a U-shaped member constructed of resilient material having a connecting portion and a pair of leg portions, which leg portions converge slightly toward each other with the cover not assembled on the body portion, whereby on assembly of the cover with the body portion the leg portions are spread apart and the resiliency of the cover material holds the cover on the body member.

4,031,784
DEVICE FOR UNLOCKING FROZEN VALVES
George H. Cobbe, Jr., 3411 S. Camino Seco No. 46, Tucson, Ariz. 85730
Filed Mar. 8, 1976, Ser. No. 664,899
Int. Cl.² B25B *13/04, 13/50*
U.S. Cl. 81—57.39 **10 Claims**

1. A tool for freeing locked and frozen valves which applies only torque forces about the longitudinal axis of the valve intermediate the valve stem and the valve body, said tool comprising in combination:

a. a first apertured collar for circumscribingly engaging the valve body, said collar including restraining means for inhibiting rotation of said first collar about the longitudinal axis of the valve body;

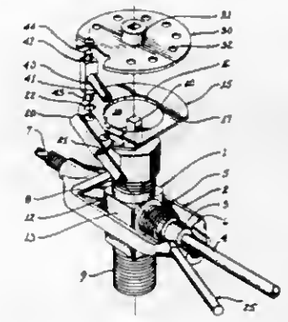
b. a first lever extending generally tangentially from said first collar;

c. an aperture disposed in said first collar in proximity to the point of attachment of said first lever;

d. a second collar for non-rotatably engaging the valve stem,

said second collar including a plurality of apertures spaced about the periphery of said second collar; and

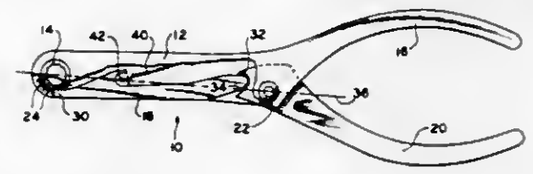
e. a second lever positionable in general vertical alignment with said first lever for inducing relative rotational movement between said first and said second collars, said second lever including a first stud for engaging said aperture within said first collar and a second stud for engaging



one of said plurality of apertures within said second collar;

whereby, on urging angular displacement of said second lever toward said first lever, said first and second studs generate only a torque force acting through said first and second collars upon the valve body and valve stem, respectively, to unlock and unfreeze the valve stem.

4,031,785
SQUEEZE ACTUATED WRENCH
Charles J. Wheeler, 2346 Haines, Madison, Ohio 44057
Filed Sept. 2, 1975, Ser. No. 609,399
Int. Cl.² B25B *13/46*
U.S. Cl. 81—57.39 **13 Claims**



1. A squeeze actuated ratchet wrench comprising a rotatable socket means having an annular toothed outer peripheral surface, a driver member having one end thereof engaging with said toothed peripheral surface of said socket means and defining a first pivot point about which said driver member pivots relative to said socket means upon rotation of said socket means by said driver member and an opposite end, a body for supporting said socket means at one end portion thereof for rotation about an axis of rotation and having a handle portion at the opposite end thereof, an actuating handle having one end thereof adapted to be gripped by the user's hand and the other end thereof engaging with said opposite end of said driver member and defining a second pivot point about which said actuating handle and said driver member rotate relative to each other upon rotation of said socket means, said actuating handle being pivotably connected intermediate said end portions of said actuating handle to said body at a third pivot point for rotation relative to said body, said third pivot point and the axis of rotation of said socket means defining a path through which a longitudinal axis of the wrench passes with said first pivot point being located on one side of said longitudinal axis and said second pivot point being located on the opposite side of said longitudinal axis, said actuating handle and said handle portion of said body being adapted to be simultaneously gripped by the hand of the user and squeezed to rotate said one end of said actuating handle toward said body to rock and move said driver toward said socket means and effect rotation of said socket means and wherein the distance between said third pivot point and said

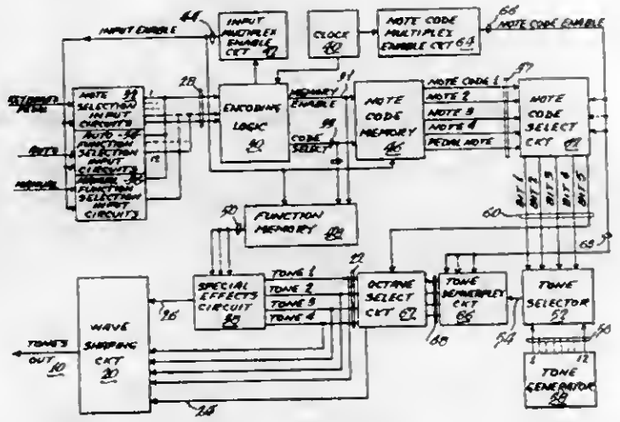
second pivot point decreases upon movement of said one end of said actuating handle toward said body to increase the force transferable between said actuating handle and said driver member by increasing the mechanical advantage of the lever arrangement defined by said actuating handle and said driver member.

4,031,786

TONE SELECTOR CIRCUIT WITH MULTIPLEXED TONE DATA TRANSFER

Howard B. Kaplan, Lynnwood, Wash., assignor to Warwick Electronics Inc., Chicago, Ill.

Filed Aug. 11, 1975, Ser. No. 603,860
Int. Cl.² G10F 1/00
U.S. Cl. 84—1.03 **19 Claims**



1. In a musical instrument having means for generating tone signals and means for providing information representative of a plurality of selected ones of said tone signals, a circuit for producing selected ones of said plurality of tone signals in accordance with said information, comprising:

tone selector means connected with said tone signal generating means and said information providing means for producing a selected one of the tone signals on an output thereof when information representative of a selected tone signal is received on an input thereof;

multiplexing means connected with said information providing means for transferring the information provided thereby to an input of the tone selector means on a time division multiplexing basis, said tone selector selectively producing time division multiplexed tone signals on an output thereof in accordance with said information; and

means connected with the output of the tone selector means for demultiplexing the selected multiplexed tone signals.

4,031,787

PUNCH AND STRIPPER ASSEMBLY

Percy Luther Cady, Darien Center, N.Y., assignor to Houdaille Industries, Inc., Buffalo, N.Y.

Filed July 28, 1976, Ser. No. 709,338
Int. Cl.² B26F 1/14
U.S. Cl. 83—140 **10 Claims**

1. A punch and stripper assembly for use with a die on a workpiece beneath the ram of a punch press, comprising:

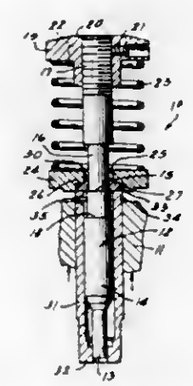
a. a punch having means at one end thereof for coacting with said die, an intermediate body portion, a shoulder facing away from said one end, and a threaded end portion at the opposite end;

b. an enlarged head adjustably carried on said threaded end portion for being engaged by the ram;

c. a compression spring surrounding said opposite end of said punch, and at one end engaging said head;

d. a washer surrounding said punch and engaging the opposite end of said spring;

e. a retainer acting between said punch shoulder and said washer, and held in engagement therewith by said spring; and



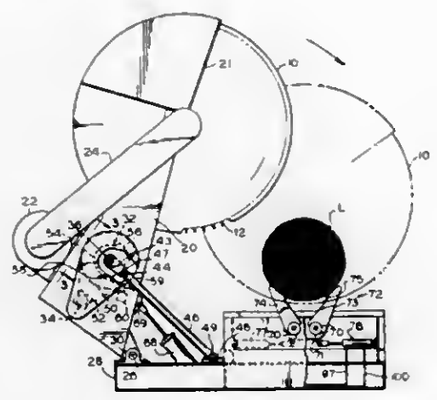
f. a stripper sleeve surrounding said body portion of said punch for transferring a reactive force from the workpiece to said retainer during a power stroke of the punch press to store energy in said spring.

4,031,788

CHOP SAW

Dallas F. Boge, 7145 SW. Sylvan Court, Portland, Oreg. 97225, and Roderick Olsen, Jr., 13500 SW. Hazel, Beaverton, Oreg. 97005

Division of Ser. No. 556,796, March 10, 1975. This application Oct. 1, 1975, Ser. No. 618,699
Int. Cl.² B27B 7/00
U.S. Cl. 83—380 **10 Claims**



1. A chop saw comprising:

a powered saw blade,

a saw carriage means supporting said saw blade and mounted for moving said blade toward and away from a workpiece,

carriage drive means for moving said carriage means to feed said saw blade toward and away from and in a cutting stroke through said workpiece,

and position-responsive speed control means responsive to the position of said carriage means with respect to said workpiece for reducing the feed speed of said carriage means during the cutting stroke of said saw blade,

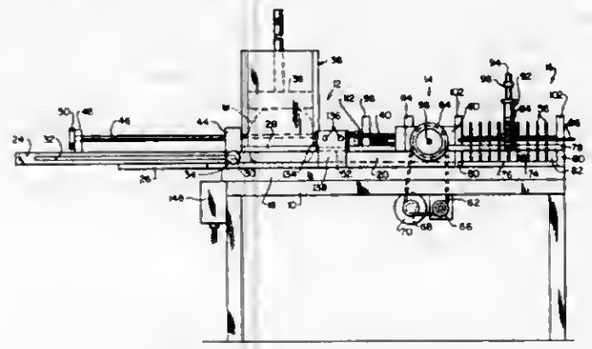
a pair of clamping arm means for gripping opposite sides of a generally cylindrical workpiece during the cutting stroke of said saw blade, a pair of separate and independent hydraulic motors, one for operating each said clamping arm means, each said hydraulic motor being in a separate hydraulic control circuit, each said control circuit including a three-position control valve having a first spring-centered flow-blocking position, a second position for directing flow to said hydraulic motor in a direction to apply said clamp arm means and a third position for directing flow to said hydraulic motor in a direction to release said clamp arm means, and valve-operating means operable sequentially first during movement of said saw blade toward a workpiece to shift said control valve from said first position to said second position to apply said clamping arm means to the workpiece prior to commencement of said cutting stroke, second to shift said control valve from said second position back to said first position to block flow and thereby lock said clamp arm means on the workpiece during said cutting stroke and third to shift said control valve from said first position to said third position to release said workpiece after completion of said cutting stroke.

4,031,789

MEAT CUBING MACHINE

Arnold Soodalter, University Park Apts., Apt. M-1, Eastbampton Road, Holyoke, Mass. 01040

Continuation-in-part of Ser. No. 602,269, Aug. 6, 1975, Pat. No. 3,990,336. This application July 29, 1976, Ser. No. 709,940
Int. Cl.² B26D 3/18
U.S. Cl. 83—404.2 **5 Claims**



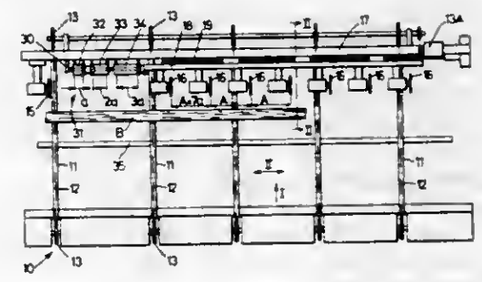
1. Apparatus for cubing frozen meat comprising, first cutting means for cutting a slab from a piece of meat, second cutting means for cutting the slab longitudinally into strips, and third cutting means for cutting the strips transversely into cubes, wherein the first cutting means is a horizontally reciprocable cutting blade having a cutting edge comprised of a plurality of equi-spaced teeth alternately offset upwardly or downwardly relative to the plane of the cutting blade, and wherein the second and third cutting means each comprise a plurality of upright annular rotatable saw tooth cutting blades, the first and second cutting means being disposed in a horizontally disposed first meat channel, and the third cutting means being disposed in a horizontally disposed second meat channel normal to the first meat channel, a first meat ram slidable in the first meat channel, a second meat ram slidable in the second meat channel, a meat hopper linked to and slidable with the first meat ram, and a strip guide having a plurality of partitions in the second meat channel for guiding strips of meat, and handle means for effecting vertical movement of the strip guide for clearing the partitions from the second meat channel, whereby manual inward sliding movement of the first meat ram first causes a slab to be cut from meat within the hopper by the first cutting means with meat dust being reclaimed as the cutting blade of the first cutting means reciprocates, second causes the so-cut slab to be sliced into strips by the second cutting means, with meat dust produced as the so-sliced strips are cut by the second cutting means being reclaimed, and third causes the so-sliced strips to be moved into the second meat channel between the partitions of the strip guide for retaining the strips in alignment, with manual vertical upward movement of the strip guide moving the partitions out of the second meat channel whereby manual inward sliding movement of the second meat ram causes the aligned strips to be moved to the third cutting means for cubing, with meat dust produced as the strips are cubed by the third cutting means being reclaimed.

4,031,790

LUMBER TRIMMER

Bengt Arvidsson, Sibbhult, Sweden, assignor to A & B Constructors AB, Markaryd, Sweden

Filed Mar. 18, 1976, Ser. No. 667,953
Claims priority, application Sweden, Mar. 21, 1975, 7503286
Int. Cl.² B27B 5/02
U.S. Cl. 83—425.4 **4 Claims**



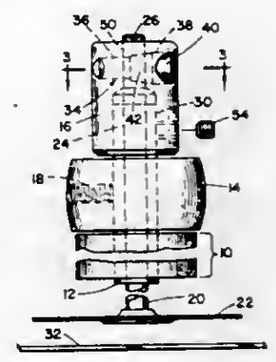
1. Lumber trimmer, comprising a saw table having a lumber conveyor for moving lumber pieces in a first direction across the saw table with the lumber pieces oriented in a second direction perpendicular to the first direction; a first end cutting device on the saw table, including a cutter for cross-cutting one end of the lumber pieces at a first cutting position; a second end cutting device on the saw table, including a common cutter support displaceable in the second direction and a plurality of cutters selectively operable for cross-cutting the other end of the lumber pieces at a selected one of a plurality of second cutting positions spaced-apart in the second direction, the cutters of the second end cutting device being evenly spaced apart in the second direction on said support; and a power operated linear positioner for selectively positioning the cutter support at discrete positions spaced apart in said second direction, said positioner being connected between a stationary holder on said saw table and said cutter support and including first and second double-acting fluid pressure cylinders connected with one another in additive relation, the length of stroke of one of said cylinders being one unit of distance and the length of stroke of the other cylinder being two units of distance, and the spacing of adjacent cutters on said cutter support being a multiple of said unit of distance.

4,031,791

KNIFE MOUNTING UNIT FOR ROLL SLICING MACHINE

Dale S. Lecrone, 4447 Bonnymede, Jackson, Mich. 49201

Filed Sept. 16, 1976, Ser. No. 723,917
Int. Cl.² B26D 3/08, 4/76
U.S. Cl. 83—508.2 **9 Claims**



1. A disc blade mounting and driving unit for a roll slicing machine comprising in combination, a normally vertical driving sleeve supported for rotation about the axis thereof within bearing means, a drive pulley fixed to the upper end of said sleeve, a knife shaft coaxial with said sleeve and extending respectively at the opposite ends thereof beyond the opposite

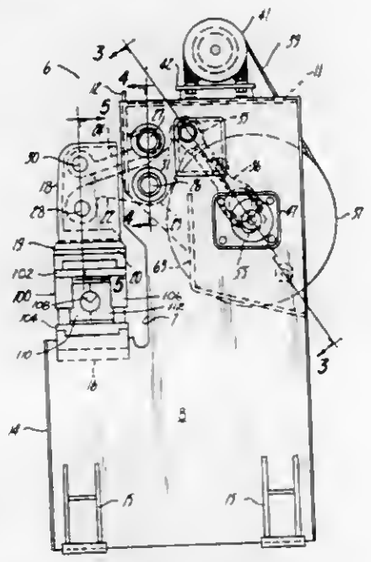
ends of said sleeve and a disc knife fixed to the lower end of said shaft; the improvement comprising a chuck unit comprising a head having a first bore in one end to receive the upper end of said driving sleeve coaxially, means to firmly secure said head to said upper end of said driving sleeve, the opposite end of said head having a second bore coaxial with said first bore and of a diameter complementary to that of said knife shaft and receiving the upper end of said shaft, said shaft having an arcuate notch in one side thereof adjacent the upper end and extending transversely to the axis of said shaft and said notch being wider at one end than the other, said head having a bore extending transversely thereof in the upper end portion thereof substantially coaxial with the axis around which said notch is generated, a latching plug mounted within said transverse bore for axial movement and having a frustoconical section complementary to the surface of said notch and adapted to wedgingly engage said notch when said plug is moved in one direction to secure said shaft to said driving sleeve for rotation of said disc knife thereby, and means operable to move said latching plug into wedging engagement with said notch in said shaft.

4,031,792

HAMMER RAM PRESS

Alexander Borzym, Dearborn, and John J. Borzym, Birmingham, both of Mich., assignors to Alpha Industries, Inc., Detroit, Mich.

Filed July 12, 1976, Ser. No. 704,344
Int. Cl.² B26D *5/14*
U.S. Cl. 83—601 **4 Claims**



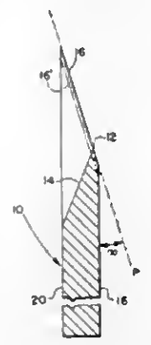
1. A press comprising, in combination, a rigid frame including a portion adapted to support a first member of a die set; a ram adapted to support a second member of the die set and traverse the second member relative to the first member; a parallelogram linkage connecting the ram to the frame including a link and a rocker arm pivotally connected to the frame for rotation about first and second axes and pivotally connected directly to the ram at third and fourth axes, the said four axes being parallel and passing through the vertices of a parallelogram; a power-driven crankshaft rotatably mounted on the frame including a crank throw; and a connecting rod coupling the crank throw to the rocker arm so that the rocker arm and link are oscillated upon rotation of the crankshaft to move the ram and second die member.

4,031,793

BAND KNIFE TOOTH SHAPE

Leonard Miaskoff, Easton, Pa., assignor to Harris Corporation, Cleveland, Ohio

Filed May 3, 1976, Ser. No. 682,624
Int. Cl.² B26D *1/46;* **B23D** *61/12;* **B27B** *33/06*
U.S. Cl. 83—788 **2 Claims**



1. Apparatus for cutting sheet material comprising a cutting blade, first means for longitudinally moving said cutting blade across workpiece so as to produce a cutting action, and second means for transversely moving said blade and said workpiece relative to one another so as to sever said workpiece along a cutting plane, and wherein said cutting blade has substantially parallel first and second sides, a back edge and a cuttting edge, said cutting edge being formed along a beveled surface being inclined with respect to said sides so as to join said first side at an obtuse angle and said second side at an acute angle, said beveled surface being generally serrated by scallops disposed at an acute angle to said beveled surface and an obtuse angle to said second side such that the cutting edge formed at the intersection of said beveled surface with said scallops lies entirely within the plane of said beveled surface, said second means for transversely moving said blade and said workpiece relative to one another being adapted to move said blade and said workpiece so that said cutting plane including said serrated cutting edge is substantially coincident with said beveled surface.

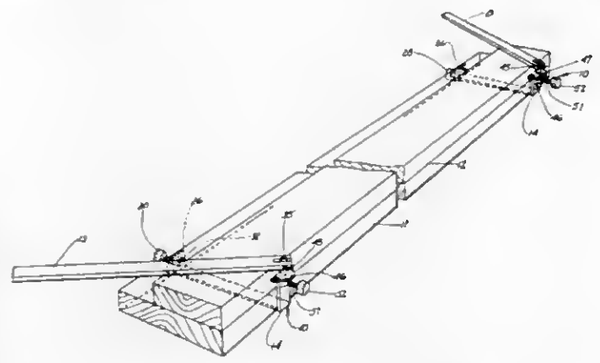
PORTABLE JIG FOR RAFTER CUTS AND OTHER ANGLE CUTS

Joseph Q. Leihgeber, Rte. No. 1, Box 164A, Fayetteville, Ohio 45118

Filed June 25, 1976, Ser. No. 699,694
Int. Cl.² B27G *9/04*
U.S. Cl. 83—829 **8 Claims**



1. A portable saw guide for a hand operable saw, said saw guide comprising:

a. a base member including means for clamping said base member to an elongated horizontally disposed work piece supporting surface wherein said base member includes a first portion extending transversely of and underlying said supporting surface and a second portion disposed to one side of said supporting surface, said second portion of said base member comprising a first section extending vertically upward from said first portion adjacent said work piece supporting surface and a second portion extending horizontally from said first section and in a direction away from said work piece supporting surface, said second section including an aperture extending vertically therethrough;

b. a vertically disposed pin mounted in said vertical aperature of said second portion of said base member for rotation about its axis, said vertically disposed pin including a head section overlying said second portion and a shoulder having a cross sectional dimension greater than the cross sectional dimension of said aperture for seating said head section on said base member second section overlying said aperture, said vertically disposed pin having a cylindrical extension depending from said shoulder rotatively through said aperture, said cylindrical extension including an annular depression extending at least partially thereabout;

c. an elongated guide blade pivotally secured at one end to said head section and swingable between a position vertically disposed from said work piece and a substantially horizontal position overlying said work piece, said guide blade being rotatable with said pin so as to overlie said work piece at any selected angle relative thereto; and

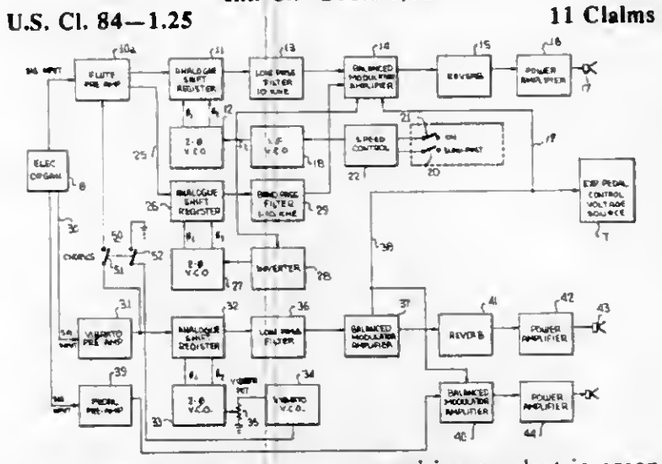
d. means for locking said pin for maintaining said guide blade at said selected angle comprising a brake pad cooperatively associated with said annular depression and means for selectively urging said brake pad into and out of frictional engagement with said annular depression.

4,031,795

TONE SIGNAL MODULATION SYSTEM

David A. Bunger, Cincinnati, Ohio, assignor to D. H. Baldwin Company, Cincinnati, Ohio

Filed June 20, 1975, Ser. No. 588,627
Int. Cl.² G10H *1/02*
U.S. Cl. 84—1.25 **11 Claims**



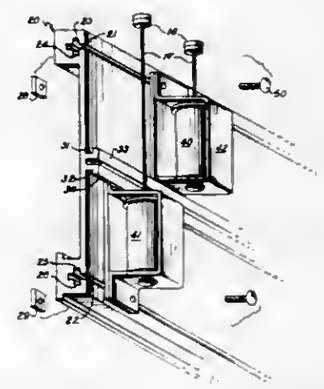
1. An electric organ system, comprising an electric organ having a flute signal output lead and a heterosignal output lead, means including a first analogue shift register means for modulating the frequency of said flute signal, amplitude modulation means in cascade with said analogue shift register, oscillator means providing modulating signal to said analogue first shift register means and to said amplitude modulator means, a first loudspeaker responsive to the output of said amplitude modulator means, means including a further analogue shift register for modulating the frequency of said heterosignal, said heterosignal being exclusive of said flute signal, a second loudspeaker connected in cascade with said further analogue shift register, and switch means operable for transferring signal from said heterosignal output lead to the input of said first analogue shift register means, said first and second loudspeakers being spatially separated sufficiently to represent distinct acoustic sources.

4,031,796

SOLENOID MOUNTING ASSEMBLY FOR MUSICAL KEYBOARD

Thomas Jewel Wilkes, Lewisburg, Tenn., assignor to Teledyne, Inc., Los Angeles, Calif.

Filed Apr. 28, 1976, Ser. No. 681,095
Int. Cl.² G10C *3/20*
U.S. Cl. 84—20 **7 Claims**



1. In a keyboard musical instrument, a solenoid mounting member for a plurality of solenoid operated key actuating assemblies, each key actuating assembly having a mounting bracket which includes a back plate, said solenoid mounting member being constituted by an extruded plate member,

said extruded plate member having at least one elongated channel in a surface thereof, said at least one elongated channel having side walls and means in said side walls for threadably receiving a threaded fastener member passing through an end of said back plate, and

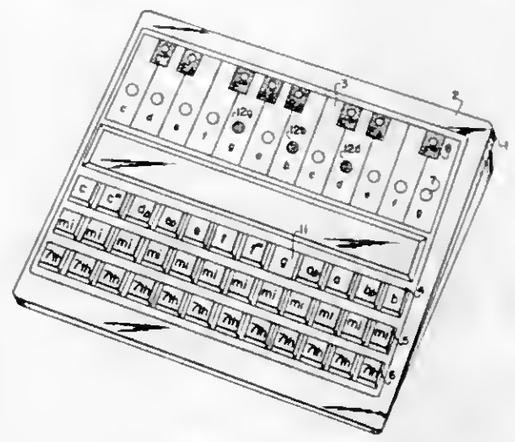
an elongated rib on said plate member and projecting from said plate, said rib having a groove formed in said rib projection and opening in a direction transverse to the direction of said channel, said groove adapted to receive a flange projecting from an end of said back plate.

4,031,797

POCKET-SIZE MUSICAL CHORD STUDY AID

Arthur R. Schmoyer, The Cedars, Rte. 16, Woolford, Md. 21677

Continuation-in-part of Ser. No. 578,032, May 16, 1975, Pat. No. 3,954,040. This application Feb. 20, 1976, Ser. No. 659,978
Int. Cl.² G09B *15/00*
U.S. Cl. 84—470 **9 Claims**



1. A study aid for use in self instruction in the make-up of musical chord triads, said study aid comprising a self-contained unit including a relatively flat casing dimensioned appropriately for carrying in a pocket, said casing having

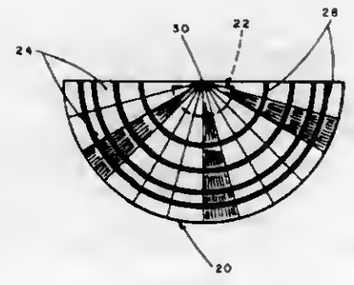
A. a face surface including

A. a display panel in a format representative of keys of a musical instrument keyboard and including
   a. indicia of the respective notes represented by said format of keys,
   b. light indicators respectively associated with said note representations
B. a series of push-buttons representative of notes by which chords are identified,

said study aid further including

C. means responsive to the depression of a selected push-button to provide a signal,
D. means responsive to said signal to activate a certain plurality of said light indicators which correspond to the notes of the chord identified by said depressed push-button, said plurality including one indicator for the note representation which corresponds to said key, and
E. latch means effective to retain said certain plurality of chord note indicators in said activated state.

4,031,798
SOUNDBOARD FOR STRINGED MUSICAL INSTRUMENTS
Arthur E. Snider, 158 North Hazel, St. Paul, Minn. 55133
Filed Oct. 31, 1975, Ser. No. 627,390
Int. Cl.² G10D *3/02*
U.S. Cl. 84—291 **9 Claims**

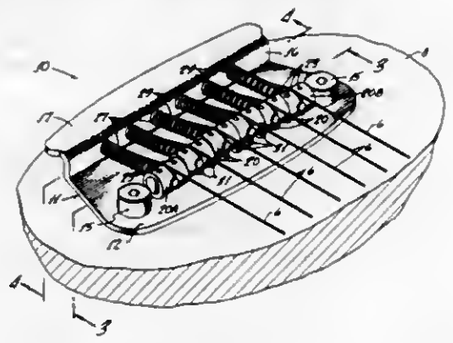


1. A soundboard for stringed musical instruments comprising a solid sheet which is radially/circumferentially anisotropic and which comprises a plurality of longitudinally-grained, wooden sections radiating from the focal point of the sheet and wherein said sheet includes a plurality of curved braces concentric about the focal point of said sheet.

3. A plucked-string musical instrument comprising tensioned strings, a soundboard, and means coupling said strings to said soundboard wherein the improvement comprises a soundboard which is a radially/circumferentially anisotropic sheet comprising stiff fibers in a matrix, said fibers running substantially radially from a focal point of said sheet, said soundboard including a plurality of braces concentric about said focal point and wherein means coupling said strings to said soundboard is a bridge attached near said focal point.

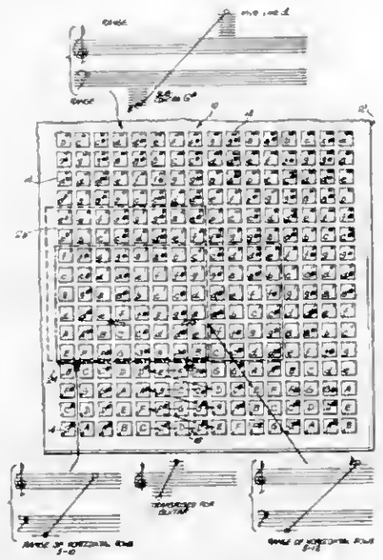
4,031,799
BRIDGE FOR STRINGED INSTRUMENTS
C. Leo Fender, 2851 Rolling Hills Drive Sp. 33, Fullerton, Calif. 92635
Filed Jan. 26, 1976, Ser. No. 652,408
Int. Cl.² G10D *3/04, 3/00*
U.S. Cl. 84—307 **6 Claims**

1. A bridge for a stringed instrument including a body and a neck comprising:
   a base member rigidly connectable to said body of said instrument;
   a plurality of drums;
   means connecting said drums to said base member in end-to-end relationship for independent lateral movement in two orthogonal directions to separately adjust the length of each string and the height of each string relative to said neck;
   a fixed post connected to said base member, adjacent one end of the first one of said drums; and



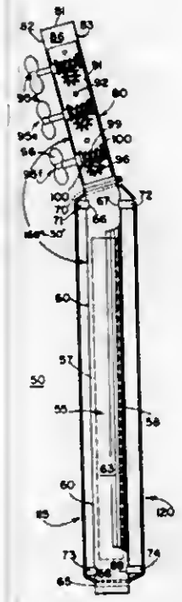
means operatively positioned adjacent said drums for conducting said strings into engagement with said drums connecting means and said drums so as to apply an axial force to each of said drums and to urge all of said drums axially into contact with each other and said first drum into contact with said post.

4,031,800
KEYBOARD FOR A MUSICAL INSTRUMENT
Geary S. Thompson, 700 Schons Place, Wenatchee, Wash. 98801
Filed July 16, 1976, Ser. No. 705,789
Int. Cl.² G10C *3/12*
U.S. Cl. 84—423 **8 Claims**



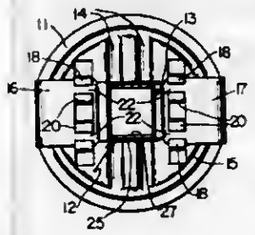
1. A keyboard for a musical instrument of a type which includes means for producing musical tones when the keys are touched, wherein each key of the keyboard represents a particular tone, said keyboard comprising a two-dimensional pattern of at least six horizontal rows of keys and at least six perpendicular vertical rows of keys, wherein the tones represented by the keys are arranged horizontally from left to right in ascending half-steps and are stacked vertically in ascending perfect fourths, and wherein the cener-to-center spacing of the keys, both horizontally and vertically, is no greater than about one inch.

4,031,801
STRINGED MUSICAL INSTRUMENT
Jack Cecchini, 5344 N. Magnolia, Chicago, Ill. 60640
Filed May 17, 1976, Ser. No. 687,145
Int. Cl.² G09B *15/06*
U.S. Cl. 84—465 **10 Claims**



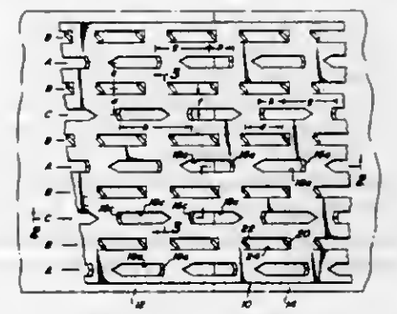
10. A practice device, comprising a longitudinally extending member having dimensions similar to the neck of a stringed instrument, spaced apart frets extending transversely of said member on one surface thereof, means on said member for holding a plurality of longitudinally extending and transversely spaced apart strings over said frets above said one surface and over and above the surface opposed to said one surface, and means for maintaining one set of tensions in strings held by said holding means extending over said one surface and for maintaining another set of tensions in strings held by said holding means extending over said opposed surface, whereby strings held by said holding means extending over said frets and said one surface are useful for practicing fingering of chords and strings held by said holding means and maintained in tension by said tension means extending over said opposed surface are useful for practicing strumming and plucking.

4,031,802
HOLLOW SHEET METAL NAIL
Robert L. Hallock, Boca Raton, Fla., assignor to E. S. Products, New Rochelle, N.Y.
Filed Jun. 12, 1976, Ser. No. 648,211
Int. Cl.² E01B *9/12;* **F16B** *15/04*
U.S. Cl. 85—11 **1 Claim**



1. A one-piece hollow sheet metal nail for attaching a non-woven covering material to a lightweight insulating base material comprising a head, a pair of connecting strips integrally connected to opposite sides of said head and being bent to a position underlying the same, the other ends of said strips being attached to one end of a pair of interfitting generally U-shaped legs, each of said legs including a pair of generally parallel sides connected by a bight portion, the sides of one of said legs being nested within the sides of the other leg and defining a hollow enclosure before being driven, the ends of the sides of one of said legs being bent away from the sides of the other leg adjacent to said head to facilitate the nesting together of said legs, the other end of said legs being of substantially the same dimension as said one end and defining a penetrating portion, the bight portion of at least one of said legs being curved toward the other leg intermediate the ends for deflecting at least one of said legs outwardly when said nail is driven into the base material, the penetrating portion of each of said legs including a cutting edge along said bight portion and an upwardly inclined shearing edge along each of said sides, said upwardly inclined shearing edges being disposed at an angle of at least 20° and not more than 45° from a plane normal to the axis of said legs for cutting a plug from said covering material, a first pair of ears struck downwardly from said head beside each of said connecting strips and bent inwardly toward each other to a position underlying each of said connecting strips, a second pair of ears struck downwardly from said head through openings in each of said connecting strips and bent outwardly away from each other to a position underlying said strips connecting said other ends of said strips to said head, whereby when said nail is driven said cutting and shearing edges sever a plug from said covering material and thereafter said means for deflecting said legs causes said legs to spread apart.

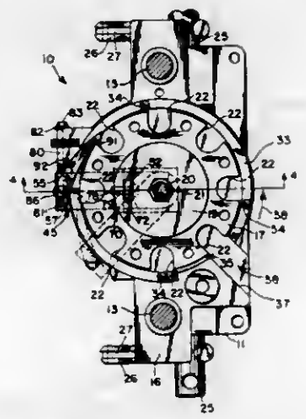
4,031,803
CONNECTOR PLATE
John Calvin Jurelt, Coral Gables, and Benjamin H. Kushner, Miami, both of Fla., assignors to Automated Building Components, Inc., Miami, Fla.
Filed Apr. 30, 1976, Ser. No. 681,839
Int. Cl.² F16B *15/00*
U.S. Cl. 85—13 **2 Claims**



1. A connector plate for joining members in abutting relationship comprising: an elongated plate, a plurality of elongated projecting nail-like teeth struck from said plate thereby leaving a plurality of slots in said plate, said teeth projecting from one side of said plate, said teeth being struck in longitudinally extending generally parallel rows, the teeth in first alternate rows being struck such that the slots left thereby in said plate extend from the teeth in like longitudinal directions, the teeth in second alternate rows being struck such that the slots left thereby in the plate extend from the teeth in opposed direction to said slots formed in said first alternate rows, a row of teeth between each of said first and second alternate rows with the teeth therein being struck to form a plurality of sets of longitudinally spaced pairs of teeth, the teeth in each set being struck such that a continuous slot is left in said plate between said teeth in each set with the portions of the slot left by each tooth of each set extending therefrom toward the opposite tooth of each set, successive teeth in said first alternate rows thereof being spaced longitudinally and relative to said sets of teeth in next adjacent rows such that each successive tooth lies between each successive set of teeth, and successive teeth in said second alternate row thereof being spaced longitudinally and relative to said sets of teeth in next

adjacent rows such that each successive tooth lies between said pairs of teeth forming said set.

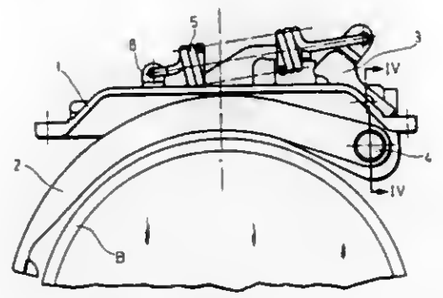
4,031,804
ROTARY SHOT SHELL RELOADER
Richard C. Boschi, Euclid, Ohio, assignor to Pacific Gunsight Company, Grand Island, Nebr.
Filed June 16, 1975, Ser. No. 586,962
Int. Cl.² F42B 33/00
U.S. Cl. 86—23 10 Claims



1. In a shot shell reloader of the type including a base structure, an elevatable carriage supported on the base structure, a positioning mechanism for raising and lowering the carriage relative to the base structure, a plurality of tools supported above the carriage and defining a plurality of operating stations spaced circumferentially about an imaginary circle having a substantially vertical axis, a shotshell support supported by the carriage for rotation about such axis, and a plurality of spaced formations on each support, each of such formations being adapted to receive a separate shot shell and to position such received shot shells simultaneously in different ones of the operating stations, the improvement of a drive mechanism engageable with the shotshell support for rotating the shotshell support to position shot shells received in such support formations sequentially in each of the operating stations, comprising:

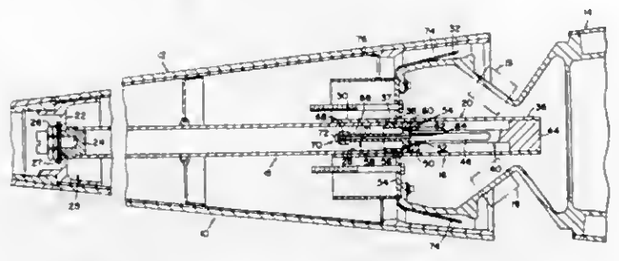
a. first cam means including a curvilinear cam surface;
b. second cam means including a cam follower for engaging said cam surface;
c. an arm supported on the elevatable carriage and being pivotally movable about such axis between first and second positions;
d. one of said cam means being supported on said arm, and the other of said cam means being supported on the base structure;
e. biasing means operably connected to said arm to bias said cam follower and said cam surface relatively toward engagement with each other;
f. said first and second cam means and said biasing means being operable, in response to raising of the carriage by the positioning mechanism to pivot said arm in a forward direction about such axis from said first position to said second position, and in response to lowering of the carriage by the positioning mechanism to pivot said arm in a reverse direction about such axis from said second position to said first position; and
g. pawl means carried by said arm for drivingly engaging the rotatable shotshell support when said arm is pivoted in a selected one of said forward and reverse directions to rotate such support and to move such received shot shells between adjacent operating stations.

4,031,805
APPARATUS FOR EJECTING A TRANSPORT AND LAUNCHING CONTAINER FROM A MISSILE LAUNCHER
Dietmar Puttinger, Munich, and Manfred Fischer, Ottobrunn, both of Germany, assignors to Messerschmitt-Boelkow-Blohm GmbH, Munich, Germany
Filed Nov. 1, 1976, Ser. No. 737,561
Claims priority, application Germany, Nov. 11, 1975, 2550587
Int. Cl.² F41F 5/00
U.S. Cl. 89—1.5 G 6 Claims



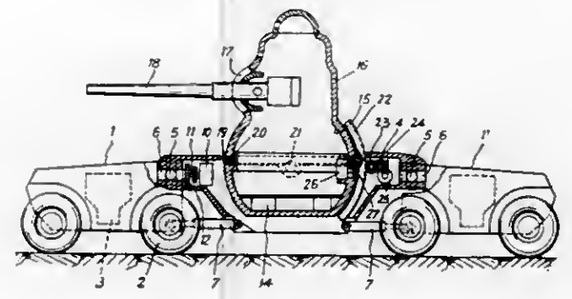
1. In an apparatus for ejecting a missile container from a missile launcher, including a pivoted ejector lever means movable between a first, ready to operate position and a second operated position; the improvement comprising movable anchor means, first spring means coupled between said movable anchor means and said ejector lever means, actuating means comprising means for moving said anchor means to load said first spring means and thereby apply a first torque to said ejector lever means in the direction to move said ejector lever means to said second position thereof for ejecting said container, first catch means coupled to said anchor means for holding said first spring means in a loaded state, second catch means for holding said ejector lever means at said first position thereof, said actuating means further comprising means for releasing said second catch means for movement from said first position to said second position, means responsive to movement of said ejector lever means to said second position for releasing said first catch means, and second spring means coupled to apply a second torque to said ejector lever means in a direction to move said ejector lever means to said first position thereof, said second torque being smaller than said first torque, whereby said second spring means move said ejector lever means to said first position only in response to release of said first catch means.

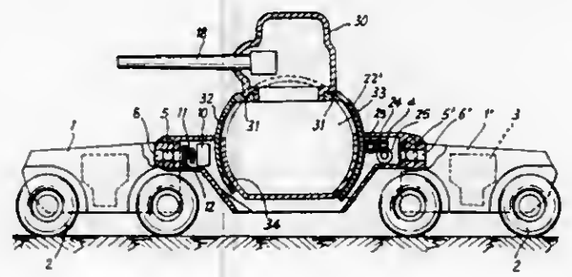
4,031,806
INTERNAL UMBILICAL CONNECTOR FOR MISSILES
Sidney Stark, and Fred T. Sumner, both of Orlando, Fla., assignors to The United States of America as represented by the Secretary of the Army, Washington, D.C.
Filed Sept. 1, 1976, Ser. No. 719,499
Int. Cl.² F41F 3/04
U.S. Cl. 89—1.811 5 Claims

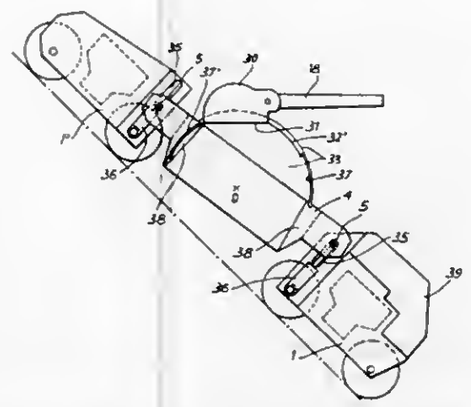


1. A missile having a movable nose cone, a body section, and internal umbilical connectors carried in said body section, means for retention of said nose cone and said body section in spaced relation to give access to said internal umbilical connectors and for controlling the impact velocity of said nose cone and body section during closure thereof responsive to predetermined acceleration forces acting on said nose cone.

4,031,807
ARMOURED ASSAULT CAR
Jean-Jacques Boyer, Montchauvet, France, assignor to Societe Anonyme Secmafer, Buchelay, Mantes, France
Filed Sept. 8, 1975, Ser. No. 611,334
Claims priority, application France, Sept. 20, 1974, 74.31830
Int. Cl.² F41H 7/02
U.S. Cl. 89—36 K 10 Claims

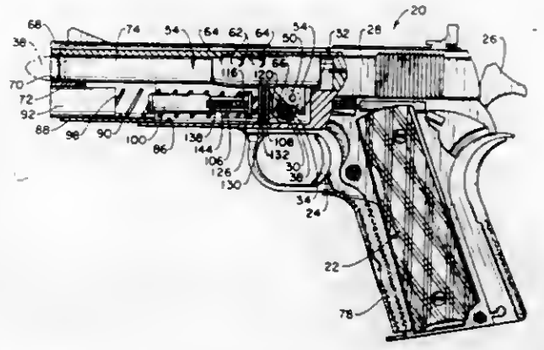






1. An armoured assault car comprising a central chassis articulated at each of its two ends on a bogie chassis by a transverse shaft and a longitudinal shaft, with at least one monitoring device acting between the central chassis and the chassis of one of the bogies for controlling the relative transverse slope of the central chassis relatively to the bogie chassis, in which at least the gun turret of the armoured assault car is mounted on the central chassis whilst being articulated to pivot about an axis which is transverse to the longitudinal axis of the central chassis and fixed relative to the central chassis, with means for monitoring the relative longitudinal slope between the gun turret and the central chassis.

4,031,808
HANDGUN APPARATUS
Clarence A. Raville, P.O. Box 377, Thousand Oaks, Calif. 91360
Division of Ser. No. 343,560, March 21, 1973, Pat. No. 3,901,125. This application Aug. 7, 1975, Ser. No. 602,566
Int. Cl.² F41D 11/06
U.S. Cl. 89—163 6 Claims



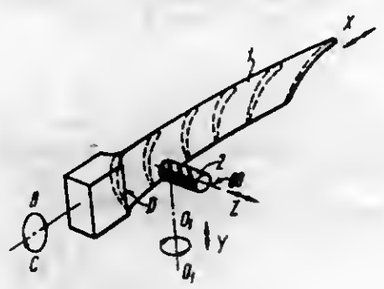
1. In combination with a semi-automatic handgun which has a barrel mounted within a slide, said barrel terminating in a firing chamber at its inner end, a link pivotally connected by a first pivot pin to said barrel at said inner end, said slide mounted for longitudinal movement upon a handgrip housing, said slide being movable between a cartridge firing position and a cartridge ejecting position, with said slide in said cartridge firing position said barrel having a locking lug assembly which cooperates within a locking recess assembly formed within said slide, said link being pivotally connected by a second pivot pin to said handgrip housing, a trigger connected to said handgrip housing, said trigger to be capable of causing firing of a cartridge located within said firing chamber, the improvement comprising:

a protuberance formed upon said link, a means under a constant biasing force being in continuous contact with said protuberance, with said slide in said cartridge firing position the biasing force of said means being transferred through said protuberance so as to apply a torque in respect to said link tending to maintain said locking lug assembly of said barrel into full cooperation with said locking recess assembly formed within said slide, with said slide in said cartridge ejecting position the biasing force of said means being transferred through said protuberance into said link so as to exert a torque about said link tending to maintain said locking lug assembly disassociated from said locking recess assembly.

4,031,809
METHOD OF MACHINING CURVILINEAR SURFACES
Evgenia Isaevna Shralman; Isai Benlaminovich Shralman, both of ulitsa Saltykova-Schedrina, 23, kv. 10; Eduard Iosifovich Tsesevich, Liteiny prospekt, 34, kv. 17; Viktor Leonidovich Dobroslavsky, ulitsa Varshavskaya, 110, kv. 5; Nikolai Ivanovich Ivanov, prospekt Kultury, 15, korpus 2, kv. 64, and Pavel Pavlovich Lebedev, prospekt Morisa Toreza, 80, kv. 99, all of Leningrad, U.S.S.R.
Filed Oct. 10, 1975, Ser. No. 621,616
Claims priority, application U.S.S.R., Oct. 14, 1974, 2079351
Int. Cl.² B23C 3/04
U.S. Cl. 90—11 C 9 Claims

1. A method for machining curvilinear surfaces of workpieces of the type of turbine blades by circular milling comprising: rotating a blank and mill and applying thereto a profile generation displacement with respect to the rotational axis of the blank imparting to the blank and mill a relative displacement along the rotational axis of the blank and the profile generation displacement during rotation of the blank and mill, the direction of said profile generation displacement being at

an angle from substantially 45° to 135° with respect to the rotational axis of the blank, said relative displacement being imparted at an angle substantially smaller than a right angle with respect to the rotational axis of the blank and to the direction of said profile generation displacement; positioning



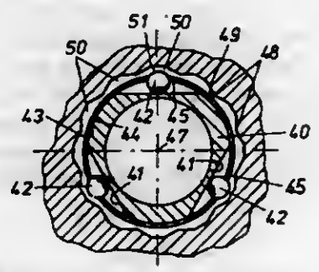
the mill relative to the surface being machined so that an angle between the mill axis and a line normal to each profiled point of the surface is substantially smaller than a right angle; and shaping the curvilinear surface of said blank with the end face of the mill.

4,031,810

ROTATING SPINDLE AND TOOL UNIT

Fritz Nattefort, Leichlingen, Germany, assignor to The Precise Corporation, Racine, Wis.

Filed July 26, 1976, Ser. No. 708,610
Claims priority, application Germany, Oct. 3, 1975, 2544558
Int. Cl.² B23C 5/26
U.S. Cl. 90—11 A 9 Claims



1. In combination:

a spindle rotatable about a longitudinal axis and for use in supporting a tool unit for rotation about said longitudinal axis, said spindle having an end including a cavity therein co-axial with said axis, said cavity including a surface having a plurality of circumferentially spaced recesses; and

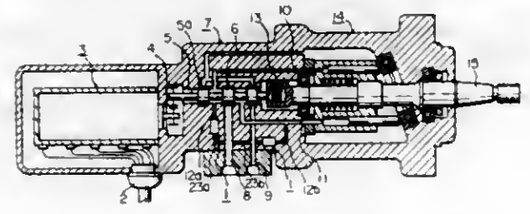
a tool unit for supporting a tool and axially receivable within said cavity for rotation about said longitudinal axis with said spindle, said tool unit including a neck portion having a plurality of radially outwardly projecting balls spaced apart around its circumference, said outwardly projecting balls being radially shiftable and receivable within said recesses when said tool unit is received in said cavity, and for shifting said balls radially outwardly upon initial relative rotational motion between said tool unit and said spindle for preventing further relative rotation of said tool unit and said spindle and providing a rotational driving connection therebetween.

4,031,811

ELECTRO-HYDRAULIC PULSE MOTOR

Seiuemon Inaba; Kanryo Shimizu, both of Kawasaki; Kohei Ito, Fujisawa; Youichi Amemiya, and Gotaro Gamo, both of Tokyo, all of Japan, assignors to Fujitsu Ltd., Japan

Filed Jan. 19, 1972, Ser. No. 219,087
Claims priority, application Japan, Jan. 29, 1971, 46-3337[U]
The portion of the term of this patent subsequent to May 28, 1992, has been disclaimed.
Int. Cl.² F15B 9/10; F01B 3/10
U.S. Cl. 91—39 2 Claims



1. An electro-hydraulic pulse motor comprising

an electric pulse motor,

a rotary pilot valve including a sleeve and a spool, said spool disposed in said sleeve for rotary and slidable movement,

an hydraulic motor having an output shaft,

hydraulic path means including an oil supply path for supplying pressurized oil to said rotary pilot valve, an oil return path for exhausting return oil from said rotary pilot valve,

a pair of hydraulic circuits for leading said pressurized oil from said oil supply path to said hydraulic motor through said rotary pilot valve and for leading said return oil from said hydraulic motor to said oil return path through said rotary pilot valve, the oil pressure in said hydraulic circuits being normally lower than that in said oil supply path,

feedback means coupled between said output shaft and said spool for feeding back an axial displacement of said spool when said displacement is produced by said electric pulse motor by rotation of said output shaft, and

a first and a second safety valve disposed within said sleeve, said first safety valve being connected between a first of said pair of hydraulic circuits and said oil supply path, said second safety valve being connected between a second of said pair of hydraulic circuits and said oil supply path,

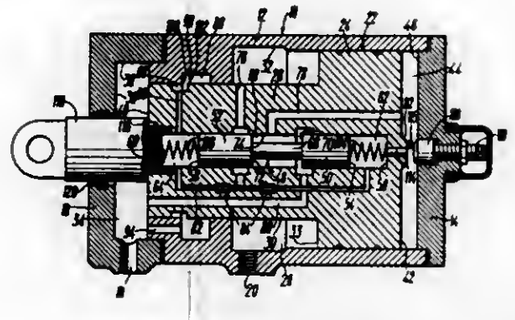
each of said safety valves including a cylinder provided with a cylinder bore having a wall, one end of each said cylinder bore connected to said oil supply path, the other end of each said cylinder bore connected to a respective hydraulic circuit, for each said safety valve an oil-type piston slidably fitted in said cylinder bore and having first and second end surfaces respectively facing said one end and said other end of said cylinder bore whereby said pressurized oil is applied to said first end surface and the normally lower pressure of the oil in a respective hydraulic circuit is applied to said second end surface, a spring disposed in each said cylinder bore for supplying a spring force to said piston first end surface thereby providing a biasing force in addition to the pressure of said pressurized oil for biasing said piston toward said other end of said cylinder bore to a normal initial position, an hydraulic bypass circuit for each cylinder having an inlet and an outlet both formed in said wall of said cylinder bore for fluidly connecting a respective hydraulic circuit to said oil supply path only when said piston is displaced from said initial position by a predetermined rise in the oil pressure in the respective hydraulic circuit.

4,031,812

HYDRAULIC VIBRATOR FOR ACTUATOR DRIVE

Nikolai Vasilievich Koshelev, ulitsa Gagarina, 56, kv. 10, Kulbyshev, U.S.S.R.

Continuation-in-part of Ser. No. 449,281, March 8, 1974, abandoned. This application Apr. 19, 1976, Ser. No. 678,458
Int. Cl.² F01L 21/04; F01B 7/18
U.S. Cl. 91—224 4 Claims



1. A hydraulic vibrator for the drive of actuators in metal-cutting machines, comprising: a casing; a differential piston arranged in said casing and moving reciprocally therein, said differential piston having a first pressure surface and a second pressure surface, the second pressure surface of the piston being larger than the first pressure surface; a spring-balanced slide valve having a plurality of plungers which are arranged coaxially in said differential piston and which move reciprocally therein; said differential piston and said casing being positioned so that they define at least one inlet chamber, one pressurized chamber and one discharge chamber, said inlet chamber being defined at least partially by the first pressure surface of said piston and by said casing, said pressurized chamber being defined by the second pressure surface of said piston and at least partially by said casing, and said discharge chamber being defined at least partially by said casing and by an end of said piston; said spring-balanced slide valve ensuring successive communication of said pressurized chamber with said discharge and inlet chambers; said slide valve defines by its plungers, together with said piston, a plurality of compensating chambers; throttles of constant section providing communication between said inlet chamber and said compensating chambers, said throttles of constant section ensuring a drop in the pressure, as a result of which the pressure in the compensating chambers is less than the pressure in the inlet chamber; and throttles of variable section controlling communication between the compensating chambers and said discharge chamber; whereby said differential piston performs reciprocating displacements smoothly and noiselessly.

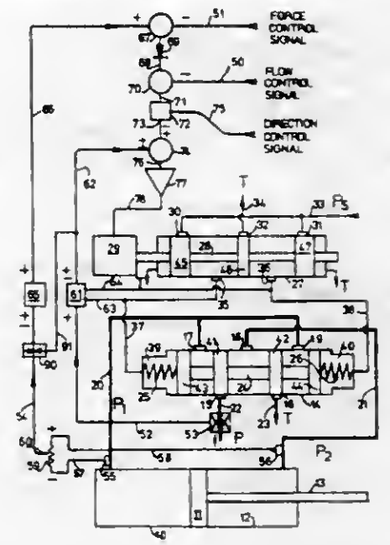
4,031,813

HYDRAULIC ACTUATOR CONTROLS

Ronald Bernard Walters, Wembley; Peter Michael Hamey, Emsworth; John Anthony Gordon Hammond, Guildford, and Thomas Derek Linden, Ashtead, all of England, assignors to Sperry Rand Limited, London, England

Filed Oct. 3, 1974, Ser. No. 511,739
Claims priority, application United Kingdom, Oct. 10, 1973, 47213/73
Int. Cl.² F15B 11/10, 13/043
U.S. Cl. 91—433 25 Claims

1. In combination with hydraulic actuator means, a device for controlling the flow of fluid to said hydraulic actuator means, said device comprising a fluid pressure operated main valve for regulating the fluid flow to the actuator means; via service lines a pilot valve for controlling the main valve, via control lines said pilot valve including electrical operating means; electrical input means for an electrical input signal; flow sensing means for producing an electrical feedback signal dependent on the rate of fluid flow to the actuator means, said flow sensing means including a pivoted movable element displaceable from a closed flow blocking position in accordance with the fluid flow to be sensed and biased into said position by spring means and mechanical/electrical transducer means for converting such displacement into said feedback



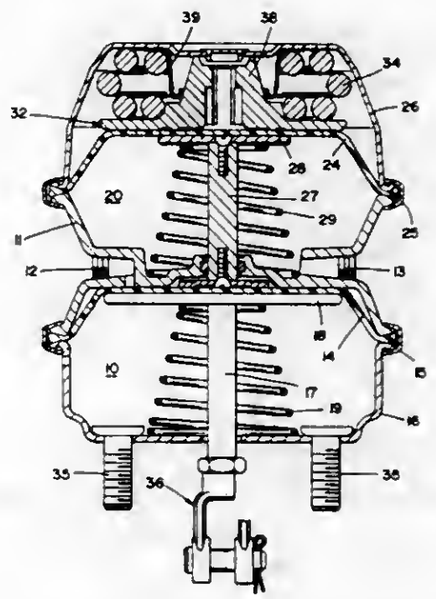
signal; and means for comparing said feedback signal with said input signal to produce an electrical error signal for said electrical operating means to operate said pilot valve in accordance with such comparison.

4,031,814

SELF-CENTERING SPRING ACTUATED AUXILIARY BRAKE MECHANISM

Robert T. Lukens, Plymouth, and Stanley Jaksim, Detroit, both of Mich., assignors to Indian Head Inc., New York, N.Y.

Filed Feb. 2, 1976, Ser. No. 654,033
Int. Cl.² F01B 7/00
U.S. Cl. 92—63 9 Claims



1. A brake actuating mechanism comprising a service brake chamber and a spring actuated auxiliary brake chamber, said spring actuated auxiliary brake chamber comprising:

a. a generally cylindrical cup-like head made of a first metal;

b. an emergency piston made of said first metal received within said head for axial movement therewithin, said piston providing a first flat surface facing the open end of said cup-like head and extending in a plane substantially perpendicular to the axis of said cup-like head and a second surface opposite said first surface providing a boss

of generally circlar cross-section extending along a substantial portion of said axis of said cup-like head and having its minimum external diameter at the free end thereof;

c. a helical compression spring received about said boss and between said second surface of said piston and the bottom of said cup-like head, one end of said helical compression spring bearing on said second surface of said piston and the other end of said helical compression spring bearing on the interior of said bottom of said cup-like head; and

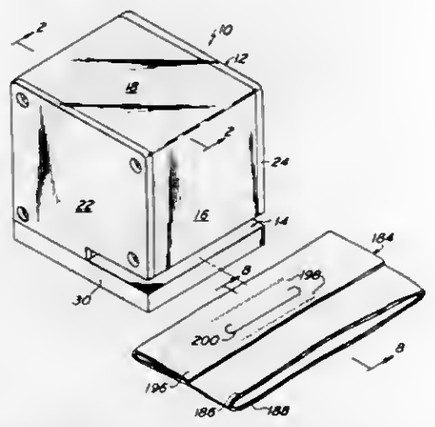
d. a thin-walled guide member made of a metal dissimilar from said first metal having a tubular portion of generally circular cross-section received within said helical compression spring coaxially of said cup-like head, said tubular portion of said guide member having internal dimensions adapted to receive a substantial portion of the length of said boss of said piston, said guide member having one end thereof adapted to abut the interior of said bottom of said cup-like head and extending to an open free end spaced a substantial distance from said bottom of said cup-like member whereby said boss of said piston is received within said guide member when said helical compression spring is compressed, at least one of said cross-section of said boss and said cross-section of said tubular portion of said guide member changing in diameter along the axial length thereof at a greater rate than the cross-section of the other.

4,031,815

HANDLE FORMING APPARATUS

Henry Verbeke, Tannersbrook Road, Chester, N.J. 07930

Filed Apr. 28, 1975, Ser. No. 572,363
Int. Cl.² B31B *1/64*
U.S. Cl. 93—33 H **7 Claims**



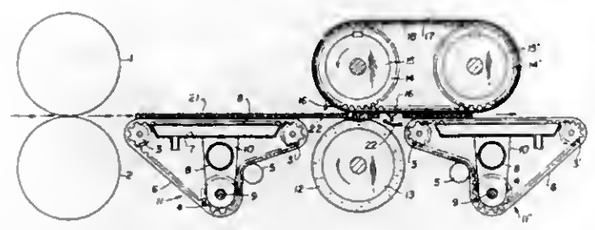
1. An apparatus for forming a handle on a plastic bag comprising a housing, a mouth formed in said housing into which the top of said plastic bag can be inserted, means within said housing for cutting an opening in the top of said plastic bag and heat sealing the walls of said plastic bag together at said cut opening, and means for reciprocating said cutting and heat sealing means, said cutting and heat sealing means comprising a flat wire, with the edge of said wire contacting said plastic bag during reciprocation.

4,031,816

APPARATUS FOR TRIMMING ADHERING SCRAP FROM A PUNCHED CARDBOARD BLANK

Masaharu Matsuo, No. 3-17, 3-Chome, Higashi Komagata, Sumida,Tokyo, Japan

Filed May 19, 1976, Ser. No. 687,687
Claims priority, application Japan, July 14, 1975, 50-85339
Int. Cl.² B26F *3/02*
U.S. Cl. 93—36 A **8 Claims**



1. Apparatus for trimming adhering scrap from a punched cardboard blank comprising:

a. two conveyors having respective driven surface portions defining successive parts of a path of travel for said punched blank and spaced from each other in the direction of said travel;

b. a roller mounted between said conveyors for rotation about an axis and having a resilient surface layer, said path being substantially tangential to said layer;

c. a first pulley separated from said roller by said path;

d. a second pulley offset from said first pulley in said direction along said path, said pulleys being mounted for rotation about respective axes;

e. a carrier trained over said pulleys in a closed loop and bounding said path in a direction transversely away from one of said surface portions;

f. a plurality of ejector members mounted on said carrier projecting therefrom into said path; and

g. drive means operatively connected to said conveyors, said roller, and one of said pulleys for simultaneously moving said surface portions, said surface layer, and said carrier at the same speed in the same direction along said path.

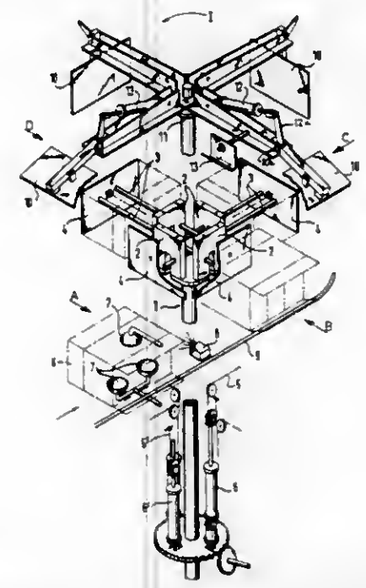
4,031,817

CARTON HANDLING APPARATUS

Josef Raschke, Sommerhausstrasse 11, 8011 Gelting, Germany

Filed July 29, 1975, Ser. No. 600,126
Int. Cl.² B31B *1/32*
U.S. Cl. 93—44.1 R **8 Claims**

1. Apparatus for the unfolding of cartons and closing the flaps of the bottoms or tops thereof, comprising: at least two diametrically opposite holders (4), means for moving said holders continuously together along a circular path, holder control means connected to said two holders comprising at least one control rod common to said holders and means moving said control means towards and away from the axis of said circular path whereby each holder moves alternately into a carton to be folded to fix and carry the carton along said circular path and out of the folded carton while the opposite holder moves synchronously out of and into a carton.

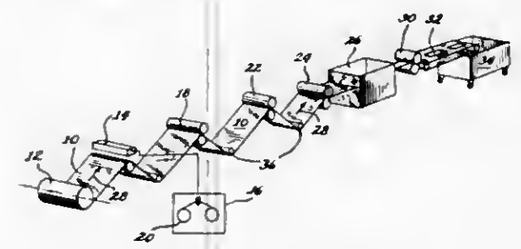


4,031,818

APPARATUS FOR PREPARING SEALED ENVELOPE UNITS WITH MESSAGES

James W. Kehoe, Shelby, Ohio, assignor to GAF Corporation, New York, N.Y.

Division of Ser. No. 515,428, Oct. 16, 1974, abandoned. This application Dec. 4, 1975, Ser. No. 637,694
Int. Cl.² B31B *19/00*
U.S. Cl. 93—63 R **7 Claims**



1. Apparatus for forming pre-printed, cut, and folded message units comprising:

means for receiving and holding a single roll of paper adapted to supply to said apparatus a single-thickness paper web having a grain running parallel to the longitudinal axis of said web;

friction roller advancing means, adapted to advance said single-thickness web off of a roll of paper held by said receiving and holding means;

means for continuously printing predetermined messages on said single web by forming characters of said messages in a direction parallel to the longitudinal axis of said paper web as said web is continuously advanced in a longitudinal direction;

means connected to said printing means for directing said printing means to print individual and different subject matter along various segments of said web as the web is moved through said continuous printing means;

means for applying adhesive to said single web in predetermined locations as said web is advanced;

means for folding said web into a desired message unit configuration, said folding means being positioned to receive said web after the web has passed through said continuous printing means and said adhesive applying means; and

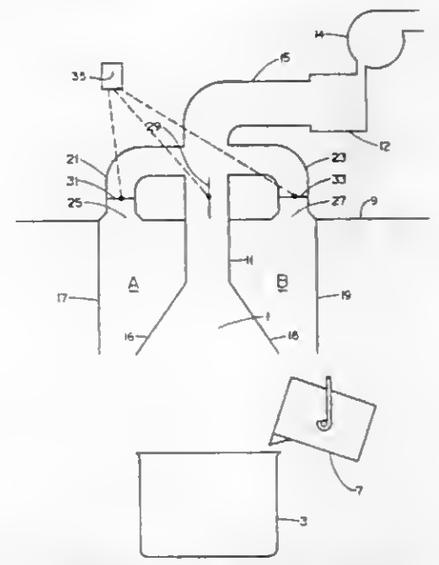
means for cutting said web into individual segments to form individual message units.

4,031,819

APPARATUS FOR COLLECTING AND CONVEYING OF FUMES FROM A FURNACE

Grant D. Applewhite, Louisville, Ky., assignor to Americao Air Filter Company, Inc., Louisville, Ky.

Filed Jan. 7, 1976, Ser. No. 647,059
Int. Cl.² F23J *11/00*
U.S. Cl. 98—115 R **6 Claims**



1. In combination with a furnace having an opening therein, an apparatus for the collecting and conveying of fumes from said furnace comprising: a fume hood spaced from and disposed in communication with the opening in a furnace; a housing spaced from said fume hood, the spacing between said housing and said fume hood defining a fume collecting reservoir; and, exhaust means in flow communication with said fume hood and said fume collecting reservoir with flow control means therein to selectively control the flow of fumes from said fume hood and said fume collecting reservoir, said flow control means including first damper means controlling flow through said fume collecting reservoir; and second damper means controlling flow through said fume hood and, means for moving said first damper means to one position while moving said second damper means to an opposed position whereby said positions determined whether said fume hood is in flow communication with said exhaust means or said fume collecting reservoir is in flow communication with said exhaust means.

4,031,820

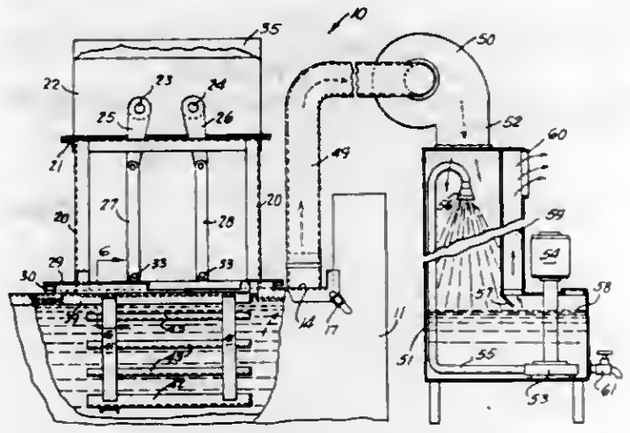
AUTOMATIC LIFTING AND LOWERING MECHANISM FOR DEEP FRYERS

Buckley R. Reed, Jeffersontown, Ky., assignor to Reed & Associates, Inc., Jeffersontown, Ky.

Filed Feb. 13, 1976, Ser. No. 657,846
Int. Cl.² A47J *37/12*
U.S. Cl. 99—336 **6 Claims**

1. An automatic lifting and lowering mechanism for attachment to deep fryers of the type having an open top comprising a detachable cover for the open top of the deep fryer, a generally rectangular central opening formed in said cover, a generally rectangular horizontal frame arranged in upwardly spaced relation to said opening in said cover, a plurality of legs extending upwardly from said cover supporting said frame, a movable cover for closing the opening in said first named cover, a food support suspended below said movable cover, means on said frame for raising and lowering said movable cover and the food support suspended therebeneath vertically

to simultaneously immerse food on said food support in said deep fryer and covering the opening in said first named cover,



and means for automatically raising said movable cover and said food support at the expiration of a predetermined time.

4,031,821

FOOD PROCESSING MACHINERY

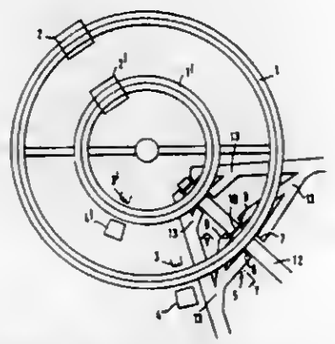
Peter William Loose, and Martyn Ridley Tamkin, both of Chelmsford, England, assignors to Gardenia Limited, St. Peter's Port, Guernsey, Guernsey (Channel Is.)

Filed Apr. 21, 1976, Ser. No. 678,801

Claims priority, application United Kingdom, Apr. 29, 1975, 17819/75

Int. Cl.² A23N *15/02*

U.S. Cl. 99—643 **10 Claims**



1. In a machine for cutting off the heads of carrots which comprises a cutting station, a conveyor for carrying carrots with random head first or tail first orientation to the cutting station and apparatus operative to sense the orientation of each carrot for controlling the cutting station such as to remove the head of the carrot, the improvement wherein said apparatus operative to sense the direction of orientation of each carrot comprises light sensitive means, a light source for projecting an image of the object on the light sensitive means, means for detecting the leading and trailing edge of each carrot, a circuit connected to the light sensitive means for producing an electrical output signal representative of the proportion of the area of the light sensitive means occupied by the image of the object and means for determining the sense of variation in said electrical output signal as the object is moved past the light sensitive means by the conveyor.

4,031,822

PRINTING PRESS

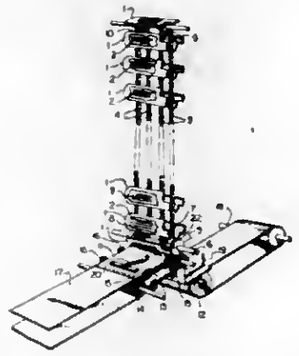
Roy P. Wilson, 84 Cambridge St. North, Lindsay, Ontario, Canada

Filed Mar. 29, 1976, Ser. No. 671,133

Claims priority, application Canada, May 20, 1975, 227318

Int. Cl.² B41L *45/08*

U.S. Cl. 101—53 **5 Claims**



1. A printing press comprising:

a. a multiplicity of drum segments, having similar radii or curvature, for carrying printing type on their convex surfaces,

b. a pressure wheel comprised of two spaced coaxial cylindrical portions, each having a similar radius of curvature as each of the drum segments, at least one cylindrical portion containing a slot which accommodates a sequential count changing and printing apparatus, each of the drum segments containing a gap to accommodate the protrusion of type from said count changing and printing apparatus,

c. a pressure plate located adjacent the pressure wheel,

d. a pair of spaced sprocket wheels having a smaller diameter than the diameter of said pressure wheel portions mounted with their axes coaxial with the axis of the pressure wheel between the cylindrical portions,

e. a pair of chains disposed orthogonal and around the respective sprocket wheels, each having sprocket holes integrated with the respective sprocket wheels, the width across the outside of the chains through a diameter of the sprocket wheels being less than the diameter of the pressure wheel,

f. means mounting the drum segments to both chains, the axes of the drum segments being parallel to the pressure wheel axis, whereby, upon rotation of the sprocket wheels, the chains are progressively drawn around the axis of the pressure wheel in unison, and the drum segments are sequentially drawn around and bear upon part of the pressure wheel between the pressure wheel and the pressure plate to imprint stock passing therethrough, while the sequential count changing and printing apparatus simultaneously imprints and further indexes.

4,031,823

SCREEN PRINTER WITH ADJUSTABLE SCREEN SUPPORT AND MAGNETIC SQUEEGEE MEANS

George S. McGee, 2311 E. 28th St., Chattanooga, Tenn. 37407

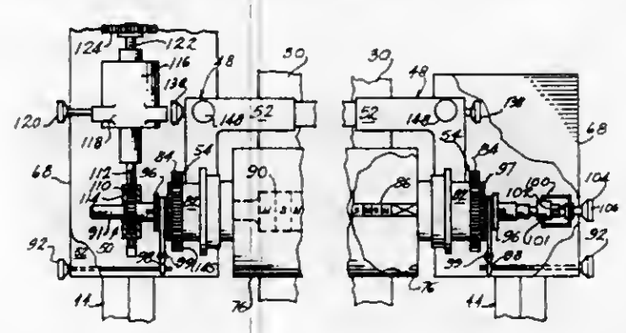
Continuation of Ser. No. 391,980, Aug. 27, 1973, abandoned. This application May 23, 1975, Ser. No. 580,408

Int. Cl.³ B41F *15/44*, *15/38*

U.S. Cl. 101—120 **14 Claims**

1. In a variable pressure device for applying pressure to a continuously moving material: an elongated magnetic roller having both North and South magnetic poles along the length thereof, an elongated magnetic member extending coextensively with said elongated magnetic roller and having both North and South magnetic poles along the length thereof, said North and South poles on the magnetic roller being located in opposed relation with the North and South magnetic poles on the magnetic member and within sufficient distance whereby the magnetic forces on the magnetic roller are affected by the magnetic forces on the magnetic member, said magnetic roller and said magnetic member being selectively relatively movable coextensively along respective longitudinal axes so as to vary magnetic attraction therebetween by selectively placing opposite magnetic poles in closer alignment to increase pressure between said magnetic roller and said magnetic member or to decrease the pressure between said magnetic roller and said magnetic member by placing like magnetic poles in closer alignment, whereby the pressure between said magnetic roller and said magnetic member may be selectively varied by means of relative motion therebetween.

8. A multi-head rotary screen printer for printing on continuously conveyed material a succession of repeated lengths of a composite pattern created by the total of a succession of lengths of individual pattern repeats printed in succession on the material as it advances from one pattern repeat to the next until the composite pattern is achieved and wherein the length of the composite pattern can be changed by changing the distance between the pattern repeats:



an elongated frame having conveyor means thereon for conveying a continuous length of material to receive the composite pattern printed thereon, opposed sides on the top of the elongate frame each comprising an elongated head support on each side of said frame, a plurality of printer head assemblies each having two ends and having screen printing means thereon for screen printing each of said pattern repeats and;

means for changing the length of said composite pattern comprising means for adjustably mounting each of said ends of said assemblies on the respective head support, means for selectively locking each of said printer head assemblies in selected positions on said head supports and means for selectively driving said screen printing means in each of said selected positions, whereby each of said printer head assemblies may be repositioned with respect to the other printer head assemblies longitudinally of the frame either in the direction of or opposite to the direction of movement of the material to adjust the distance between head assemblies and thereby change the composite pattern.

4,031,824

SHEET FEED AND TAKEOFF ASSEMBLY FOR PRINTERS

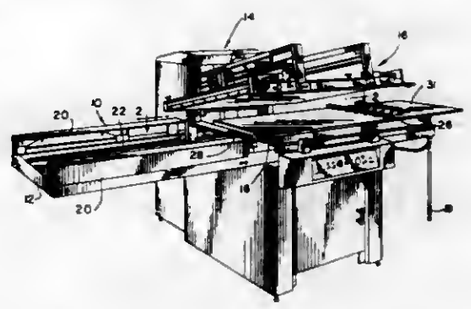
Henry J. Bubley, Deerfield, and John R. Krutsch, Glenview, both of Ill., assignors to American Screen Printing Equipment Company, Chicago, Ill.

Filed Nov. 3, 1975, Ser. No. 628,151

Int. Cl.² B41F *15/20*, *15/22*

U.S. Cl. 101—126 **5 Claims**

1. A feed and take off assembly particularly for use in conjunction with a printing press to automatically transfer sheet stock, from a first position, where said stock may be registered, through a second position under a printing head, where said stock may be printed on, and to a third position, including a frame, a first gripper means for contacting and feeding a single sheet of stock from said first position to said second position while maintaining registration of said sheet of stock, second gripper means for removing and delivering said single sheet of stock from said second position to said third position, said first gripper means and said second gripper means being mounted near opposite ends of a transfer carriage, said transfer carriage having a plurality of rollers mounted thereon which engage said frame to facilitate movement of said transfer carriage therealong, said transfer carriage maintaining said first gripper means and said second gripper means in fixed spaced relationship relative to one another during movement, a motor means for driving said transfer carriage, said transfer carriage being driven by a drive crank assembly having one end thereof connected to said motor means and an opposite end thereof connected to said transfer carriage, said drive crank assembly having means for translating angular motion



produced by said motor means into linear motion of said transfer carriage bearing said first gripper means and said second gripper means, said motor means being in communication with a control means to determine the rate of movement of said transfer carriage relative to said frame, said control means including circuit selecting cams rotatable about a central axis by said motor means, and circuit controlling switches engaged and activated by said circuit selecting cams to select, at a desired time, a predetermined circuit controlling the speed of the motor means to thereby vary the rate of movement of said transfer carriage relative to said frame thereby providing a single, reliable, unitarily moveable unit for feeding and delivering stock during a printing operation.

4,031,825

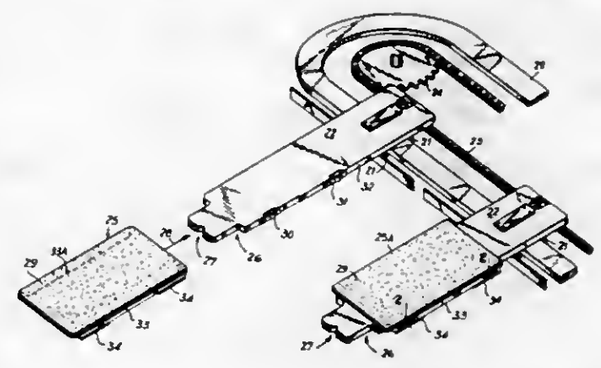
PALLET MOUNTING APPARATUS FOR SCREEN PRINTING MACHINES

David Jaffa, Fairlawn, N.J., assignor to Precision Screen Machines Inc., Hawthorne, N.J.

Filed Feb. 13, 1976, Ser. No. 657,872

Int. Cl.³ B41F *15/26*

U.S. Cl. 101—126 **10 Claims**



1. A pallet locating apparatus comprising a pallet supporting plate,

said pallet support plate being affixed to the indexing mechanism of a screen printing machine,

means for supporting said pallet on said pallet support plate,

said pallet supporting plate having a first marginal edge extending outwardly from said indexing mechanism,

detenting means for releasably engaging said pallet with respect to said pallet supporting plate,

said pallet including a first longitudinally extending side rail, and

locating means for positioning said first side rail in touching engagement with said first marginal edge of said pallet supporting plate.

4,031,826

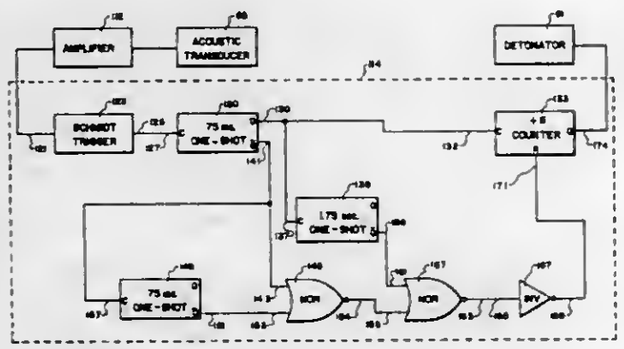
DETONATION SYSTEM AND METHOD

Frank S. Gemmell, and Mark A. Fried, both of Scottsdale, Ariz., assignors to Motorola, Inc., Schaumburg, Ill.

Division of Ser. No. 512,651, Oct. 7, 1974, Pat. No. 3,971,317. This application Dec. 22, 1975, Ser. No. 642,879

Int. Cl.² E21B *43/26*

U.S. Cl. 102—20 **9 Claims**



1. A trigger system for actuating a detonator situated at a remote position, comprising:

conduit means being capable of providing acoustic wave propagation;

transmitting means for sending a predetermined coded acoustic wave signal through said conduit means; said transmitter means further comprising:

encoding means for modulating said transmitter means with a predetermined aperiodic coded electrical signal;

transducer means for converting said predetermined aperiodic coded electrical signal into said aperiodic coded acoustic wave signal for propagation through said conduit means;

receiving means including means for converting said aperiodic coded acoustic wave signal into an output electrical signal; and

output means responsive to the output electrical signal for triggering the detonator.

4,031,827

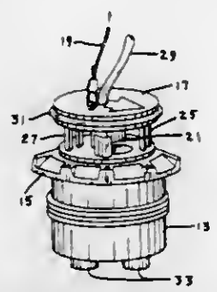
POP-UP COVER FOR SLIPSTREAM GENERATOR

David M. Collier, Santa Barbara, Calif., assignor to The United States of America as represented by the Secretary of the Air Force, Washington, D.C.

Filed Mar. 4, 1976, Ser. No. 663,639

Int. Cl.² F42C *19/06*

U.S. Cl. 102—70.2 G **3 Claims**



1. In an air-flow operated electric bomb charging device for attachment to a bomb having a bomb fuze and including a main housing with a closure and installation ring attached to the upper part thereof carried on the bomb for generating electrical energy to energize the bomb fuze, the improvement comprising a pop-up cover slidably positioned over said installation ring, a lanyard operating to lift said pop-up cover when pulled, an air scoop positioned under said cover for exposure to air-flow when said cover is lifted upward, a bracket positioned between said cover and said air scoop for upward movement when said lanyard is pulled, said bracket including front and rear guide members, said rear guide member including a switch actuator portion as an integral part thereof, and switching means positioned within the main housing of said charging device for connecting a signal carried by a coaxial cable from a remote position to the bomb fuze in response to specific environmental conditions.

4,031,828

PRESSURIZED CHAFF CANISTER

Laverne J. Larson, Boxfod, Mass., assignor to The United States of America as represented by the Secretary of the Air Force, Washington, D.C.

Filed Jan. 28, 1976, Ser. No. 653,056

Int. Cl.² F42B *13/42*

U.S. Cl. 102—89 R **5 Claims**

1. A self pressurized chaff canister comprising: a housing; lining means witin the housing; case means having open ends movably positioned within the lining means; first and second end cap means adapted to cover the ends of said case means, and electric squib means for generating a gas to fill said case means and move said case within the housing.

4,031,829

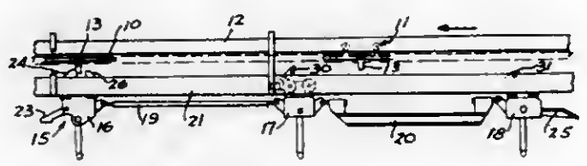
CONVEYOR SYSTEM

Edward L. Bell, St. Clair Shores, and Ivan L. Ross, Birmingham, both of Mich., assignors to American Chain & Cable Company, Inc., Bridgeport, Conn.

Filed June 2, 1975, Ser. No. 582,844

Int. Cl.² B61B *12/02*; B61J *3/00*

U.S. Cl. 104—172 S **5 Claims**



1. A carrier comprising

a plurality of trolleys adapted to move along a track,

means pivotally interconnecting said trolleys,

a first pusher dog mounted on a foremost trolley,

a second dog mounted on a succeeding trolley and movable to and from operative position for engagement by a pusher of a conveyor,

a third dog mounted on a further succeeding trolley and movable to and from operative position for engagement by a pusher of a conveyor,

and a projection on each of said second and third pusher dogs adapted to be engaged by portions of a track to hold said second and third dogs in inoperative position,

the projection on said second pusher dog extending from one side only of said second pusher dog and the projection on said third pusher dog extending from the opposite side only of said third pusher dog such that one of said second and third pusher dogs can be permitted to move upwardly into operative position without permitting the other of said second and third pusher dogs to move upwardly.

4,031,830

SAFETY CLAMPING DEVICE FOR PULL-CABLE IN AERIAL CABLEWAY ARRANGEMENT

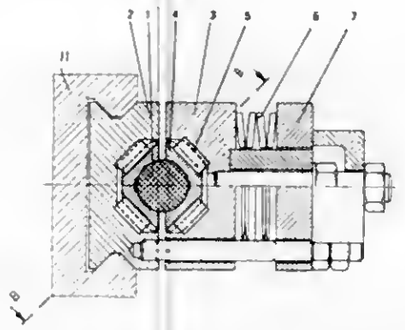
Peter Klaus Hirt, Farchant, and Kurt Switzeny, Cologne, both of Germany, assignors to Pohlig-Heckel-Bleichert Vereinigte Maschinenfabriken Aktiengesellschaft, Cologne-Zollstock, Germany

Filed Jan. 27, 1976, Ser. No. 652,759

Claims priority, application Germany, June 14, 1975, 2526745

Int. Cl.² B61B *12/12*

U.S. Cl. 104—223 **6 Claims**



1. A safety clamping device for a pull-cable in an aerial cableway by which overload protection may be provided between a pull-cable and a trolley of a cableway cabin, said clamping device comprisimg a first cable-clamping jaw and a second cable-clamping jaw, cable-clamping cups disposed between said cable-clamping jaw, a pull-cable extending between said cable clamping jaws and bilaterally embraced thereby, at least one spring storage means urging said cable clamping jaws toward each other, and a number of synthetic-resin strips extending between said cable-clamping cups and said cable-clamping jaws along the circumference and the length of said clamping device, a pressure plate abutting against one end of said spring storage means with said spring storage means operating against said pressure plate in the case of normal operation of said clamping device to provide a frictional coupling between the trolley and the pull-cable and to store energy, while on the other hand, in the case of pull-cable breakage to allow said synthetic-resin strips to be dropped and said pull-cable to be released and said spring storage means to be detensioned to effect reaction pressure developed and stored by said spring means and transmitted to said cable-clamping jaws.

4,031,831

TABLE FURNITURE

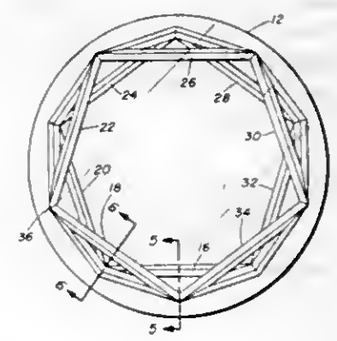
Pauline Dortch Davis, 42 Redwood Road, Severna Park, Md. 21146

Filed Aug. 27, 1975, Ser. No. 608,064

Int. Cl.² A47B *3/06*

U.S. Cl. 108—159 **7 Claims**

1. As an article of manufacture, a furniture structure comprising a base for supporting a horizontally disposed member in spaced relation to a floor, said base consisting only a plurality of triangles of identical size and shape, said triangles alternately extending upwardly and downwardly and being alternately inclined inwardly and outwardly with the locus of the points of said triangles lying on a circle, said triangles having a plurality of sides extending towards and supporting said horizontally disposed member.



4,031,832

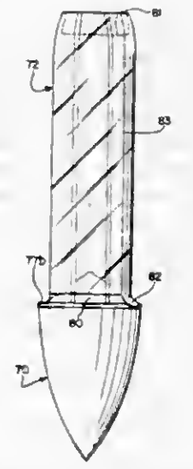
PLANTING SYSTEM

Bryant Edwards, Clarendon Hills, Ill., assignor to Illinois Tool Works Inc., Chicago, Ill.

Continuation-in-part of Ser. No. 538,295, Jan. 2, 1975, abandoned, and a continuation-in-part of Ser. No. 587,561, June 20, 1975, abandoned, and a continuation-in-part of Ser. No. 611,111, Sept. 8, 1975, abandoned. This application Mar. 26, 1976, Ser. No. 670,918

Int. Cl.² A01C *11/02*; A01G *9/10*

U.S. Cl. 111—4 **45 Claims**



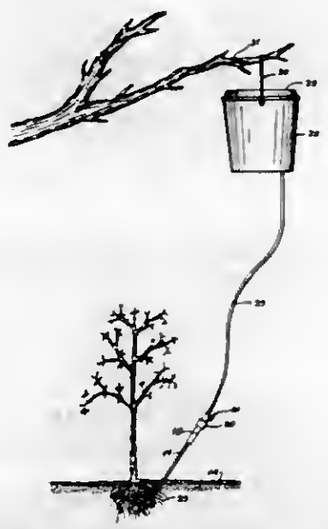
1. A planting method for a plurality of plants such as trees comprising the steps of: providing a plurality of containers each of which comprises a seedling cartridge having a base section with a horizontally extending shoulder and with spaced-apart elongated members extending upwardly from said base and with a thin plastics film disposed about said elongated members, placing a growing medium and plant seed in each of said plurality of containers and growing said plants to a seedling stage therein, thereafter transporting said plurality of seedling cartridges to an open ground planting site, removing the film from one of said seedling cartridges and inserting said seedling cartridge in a planting tool having a tubular section capable of accepting said seedling cartridge with the elongated members longitudinally therein and with the end of said tubular section abutting the upper side of said shoulder and about said base section, pushing said tubular section into the ground until said elongated members are within the ground, and withdrawing said tubular section to leave said seedling cartridge with said seedling growing therein in the ground, and thereafter repeating the foregoing steps from the step of removing the film from one of said seedling cartridges.

4,031,833

INJECTION IRRIGATING PROCESS AND APPARATUS

Cultlahuac Ibanez, Mexico D.F., Mexico, assignor to Tecnicas de Riego y Abono, S.A., Mexico City, Mexico

Filed Sept. 25, 1975, Ser. No. 616,694
Claims priority, application Mexico, Mar. 12, 1975, 157111
Int. Cl.² A01C 23/02
U.S. Cl. 111—7.1 4 Claims



1. An apparatus for injecting liquid into cultivated ground, comprising a container for containing liquid to be injected, said container being supported a short distance above the ground, a flexible tube having first and second ends of which the first is connected to the container for drawing off liquid therefrom, and a unitary rigid tube having first and second ends and having at its first end a pointed head member of larger external diameter than the rigid tube to facilitate insertion of the rigid tube into the ground and also having near the pointed head member a plurality of perforations to enable liquid in the interior of the rigid tube to enter the ground in the region of the pointed head member when the rigid tube is inserted in the ground, and the apparatus also comprising a connection member threadedly securing the second end of the flexible tube to the second end of the rigid tube and being removable from the rigid tube to afford access to the interior thereof, a bag having a rigid perforated cap and a pervious wall and containing fertilizer or conditioner and being adapted to be inserted in the interior of the rigid tube when the connecting member is removed therefrom and to be retained in the rigid tube with the perforated cap under the connecting member when the connecting member is replaced, and regulating means to control flow of liquid from the container to the interior of the rigid tube by way of the flexible tube and the connection member.

4,031,834

GRAIN DRILL WITH DISK BIASING MEANS

Richard J. Klenke, Spearville, Kans., assignor to American Products, Inc., Spearville, Kans.

Filed Sept. 8, 1975, Ser. No. 611,022
Int. Cl.² F23B 1/00
U.S. Cl. 111—85 1 Claim

1. In a grain drill having a frame with a seed hopper mounted thereon, a seed tube suspended from the bottom of the hopper for feeding seed from the hopper into the ground surface, gauge wheels rotatably mounted on the front of the drill frame, press wheels rotatably mounted on the rear of the drill frame, and an elongated horizontally mounted frame bar, attached to the frame, the frame bar positioned transverse to the direction of the movement of the grain drill, the improvement comprising:

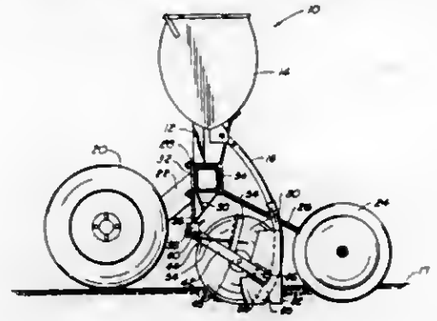
a disk bracket attached to and suspended downwardly from the frame bar;

a disk arm having a first end portion, a second end portion and a center portion, the first end portion of said disk arm pivotally mounted to said disk bracket;

a disk rotatably mounted to the center of said disk arm;

a disk boot attached to the second end portion of said disk arm, said boot having a side portion disposed against the side of said disk, the seed tube disposed between said disk and said disk boot; and

biasing means attached to said disk arm for urging said disk into the ground surface; said biasing means is a coil spring; said coil spring including a first end portion, a second end portion, and a coiled center portion, the first end portion and the coiled center portion mounted on said disk bracket, said improved grain drill further including an adjustable spring tension arm integrally attached to said disk arm, said tension arm receiving the second end portion of said coil spring thereon for adjusting the tension on said disk arm and urging said disk into the ground surface; said disk bracket including



a first end portion bolted to the frame bar, and a second end portion having a U-shaped arm with an arm shaft mounted therebetween, said first end portion of said disk arm having a bushing pivotally mounted on said arm shaft of said disk bracket; the coiled center portion of said coil spring is received around a first end portion of said bushing, the first end portion of said coil spring held against the U-shaped arm of said disk bracket; said improved grain drill further including a second coil spring having a first end portion, a second end portion, and a coiled center portion, the coiled center portion of said second coil spring received around a second end portion of said bushing, the first end portion of said second spring held against the U-shaped arm of said disk bracket, the second end portion of said second coil spring disposed against said adjustable spring tension arm thereby applying additional tension to said disk arm and urging said disk into the ground surface.

4,031,835

DEVICE FOR CLAMPING THE WORKPIECE IN A SEWING MACHINE

Andrew John Gilbride, Swampscott, and John Frederick Martin, South Essex, both of Mass., assignors to USM Corporation, Boston, Mass.

Filed May 7, 1976, Ser. No. 684,161
Int. Cl.² D05B 3/00
U.S. Cl. 112—76 14 Claims

1. In a bar tacker sewing machine having means to secure the workpiece for movement through a predetermined pattern under the stitching instruments of the sewing machine, a workpiece clamp comprising:

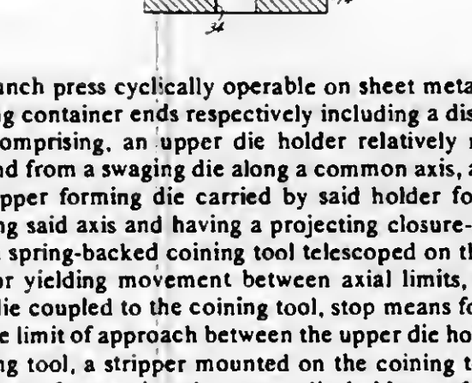
A. a lower clamping element operatively connected to the sewing machine for movement through the predetermined pattern;

B. a support arm fixed to the lower clamping element and extending under the stitching instruments of the sewing machine;

C. an upper clamping element mounted on the support arm for movement into and out of clamping engagement with the lower clamping element;

D. biasing means resiliently forcing the upper clamping element into clamping engagement with the lower clamping element;

E. remotely actuatable means mounted on the support arm and operatively connected to the upper clamping element



to cause movement thereof against the biasing means to release the workpiece; and,

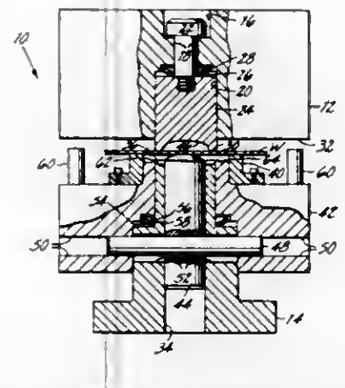
F. electrically operated control means to cause actuation of the workpiece release means.

4,031,836

MACHINE FOR MAKING CAN ENDS HAVING RUPTURABLE CLOSURES

Frederick Gerard Joseph Grise, 87 Main St., Osterville, Mass. 02655, and Walter Carl Lovell, 348 Mountain Road, Wilbraham, Mass. 01095

Filed Apr. 16, 1976, Ser. No. 677,798
Int. Cl.² B21D 51/44
U.S. Cl. 113—1 F 8 Claims



1. A punch press cyclically operable on sheet metal blanks for making container ends respectively including a disruptible closure comprising, an upper die holder relatively movable toward and from a swaging die along a common axis, a spring-backed upper forming die carried by said holder for movement along said axis and having a projecting closure-defining surface, a spring-backed coining tool telescoped on the swaging die for yielding movement between axial limits, a lower forming die coupled to the coining tool, stop means for determining the limit of approach between the upper die holder and the coining tool, a stripper mounted on the coining tool, and power means for causing the upper die holder to force the upper forming die against a blank on the stripper and into cooperative relation with the lower forming die whereby the periphery of the end closure is formed and, as the limit of approach is about to be determined by said stop means, to cause the coining tool to produce a line of weakening along at least a portion of said formed periphery, the springbacking of the upper forming die providing a greater resistance to unit load than the spring-backing of the coining tool so that bottoming of the upper forming die permits the loaded swaging die to cooperate with said projecting surface to radially dilate the closure periphery adjacent to said line of weakening, and thereafter relative retraction of the upper die holder in the operating cycle permits the still loaded coining tool to be de-energized and cooperate with said closure-defining surface of the upper forming die to tend to lock said dilated periphery to the remainder of the blank.

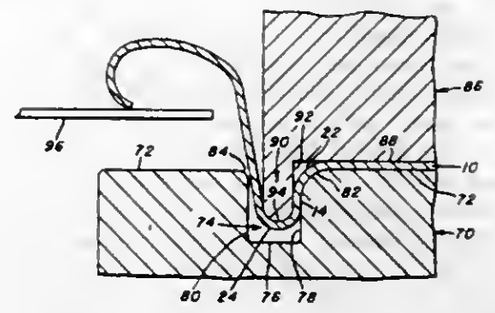
METHOD OF REFORMING A CAN END

Charles L. Jordan, Upper Burrell Township, Westmoreland County, Pa., assignor to Aluminum Company of America, Pittsburgh, Pa.

Filed May 21, 1976, Ser. No. 688,583
Int. Cl.² B21D 51/44
U.S. Cl. 113—121 C 10 Claims



1. A method for reforming a metallic can end to increase the can end's buckle resistance, comprising the steps of:

providing a sheet metal can end having a substantially planar center wall, an annular groove around said center wall bounded on the inside by an integral inner wall and on the outside by an integral chuckwall, a first curved portion between said center wall and said inner wall, a second curved portion at the bottom of said annular groove between said inner wall and said chuckwall, a peripheral flange extending radially outwardly from said chuckwall for securement of said can end to a container, and exterior and interior surfaces with respect to the exterior and interior of a container when said can end is secured thereon;

supporting said center wall of said can end against the interior surface thereof; and

reforming said can end by moving a drawing means into said groove and against the exterior surface of the second curved portion, while supporting the interior surface of the center wall to deepen said annular groove with respect to said center wall and reduce the radius of curvature of said second curved portion.

4,031,838

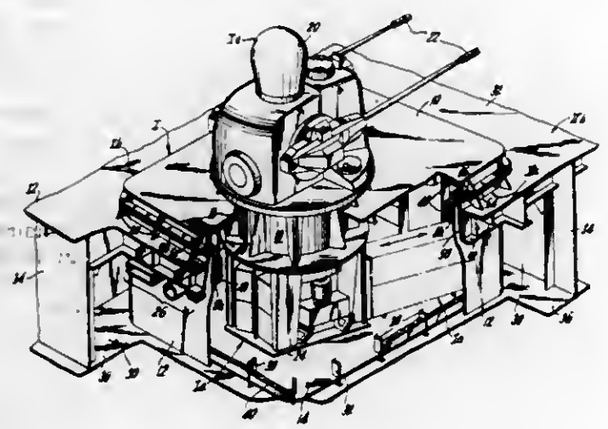
MODULAR INTERCHANGEABLE WEAPONS SUB-ASSEMBLY SYSTEM FOR WARSHIPS

Willy Schmidt, Ellerbek, Kr Pinneberg, and Karl-Otto Sadler, Hamburg, both of Germany, assignors to Blohm & Voss AG, Hamburg, Germany

Continuation-in-part of Ser. No. 521,083, Nov. 5, 1974, abandoned, which is a continuation of Ser. No. 399,245, Sept. 20, 1973, abandoned, which is a continuation of Ser. No. 198,510, Nov. 15, 1971, abandoned. This application Dec. 24, 1975, Ser. No. 644,316
Claims priority, application Germany, Nov. 14, 1970, 2056069
Int. Cl.² B63G 1/00
U.S. Cl. 114—1 7 Claims

1. A containerized modular assembly particularly for interchangeable mounting of operational units on warships by remote prefabrication of said operational units into operational unit sub-assemblies capable of interchangeable mounting upon said warship by standardized uniformly configured mating means, said assembly comprising: an operational unit; container means having said operational unit mounted therein in a manner to enable functioning interconnection of said

operational unit with said warship when mounted thereon; said operational unit and said container means being structurally combined as a unitary prefabricated modular operational unit sub-assembly; means defining on said warship a compartment adapted to receive therein said modular operational unit sub-assembly; adapter means including portions thereof defining adapter mating means formed of a standardized predetermined size and configuration, said adapter means being structurally formed as a part of said warship to define an opening for said compartment; container mating means formed from parts of said container means with a standardized predetermind size and configuration complementary to the size and configuration of said adapter mating means; said adapter mating means and said container mating means being in mounting engagement with each other to operatively mount said operational unit sub-assembly upon said warship within said compartment; adjustment means interposed between said adapter means and said container means for enabling adjustment of the attitude and orientation of said operational unit relative to said warship after said modular sub-assembly has been introduced into said compartment and movably arranged in mounting position by engagement between said adapter mating means and said container mating means; resilient sealing means extending in sealing engagement completely around said container means between said adapter mating



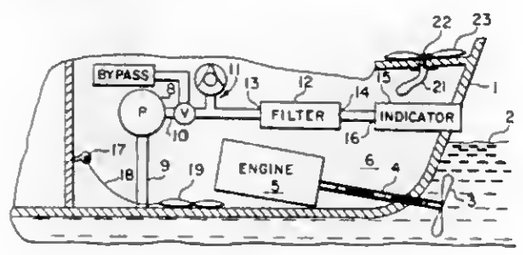
means and said container mating means to form a fluid-tight seal therebetween; and means for enabling application of said sealing means to effect said fluid-tight seal after said operational unit sub-assembly has had its attitude and orientation relative to said warship adjusted by operation of said adjustment means; said assembly further including means for enabling separation of said sealing means from between said adapter means and said container mating means to permit dismounting of said operational unit sub-assembly from said warship and mounting in the place thereof of another prefabricated modular operational unit sub-assembly having container means with substantially identical standardized container mating means, said adapter mating means and said container mating means each including complementary rims forming an annular gap therebetween which extends completely around said container means and which is adapted to receive therein said resilient sealing means, said assembly further including a stopper strip in abutting relationship between said adapter mating means and said container mating means closing off the innermost side of said annular gap, said container mating means having formed therein orifice means spaced around said container means in flow communication with said annular gap on the outermost side thereof to enable pouring therethrough of said sealing means while in liquid form to fill said annular gap. --

4,031,839

REUSABLE OIL ABSORBENT BILGE AND FUEL TANK OPENING PADS

Vito S. Pedone, Box 2733, Arlington, Va. 22202

Filed May 19, 1976, Ser. No. 687,942
Int. Cl.² B63B *35/00*
U.S. Cl. 114—270 15 Claims



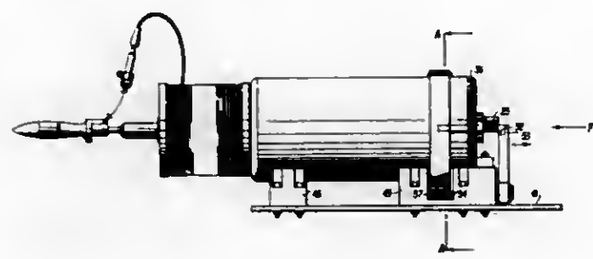
1. A method for removing hydrocarbon oil and its products from the bilge of a boat having an internal combustion engine contaminating the bilge area with the hydrocarbon oil and products to avoid contaminating the environment of the boat with such products, comprising the steps of: containing a particulate mass of expanded open pore oleophilic and hydrophobic synthetic resin within a generally flat envelope of woven oleophilic and hydrophobic synthetic resin fibers having interstices between the fibers substantially smaller than the particules; placing the envelope and contained particle mass within the bilge area of the boat in contact with the oil and bilge water; passing the oil through the envelope with a wicking action and absorbing the oil with the particulate mass within the envelope while generally preventing passage of water through the envelope to its interior; providing a generally centrally arranged passage through the envelope and particulate mass with the side walls of the passage sealed to prevent removal of the particulate mass; aligning the passage concentrically with the fuel tank filler opening of the boat, and thereafter placing a fuel filling nozzle through the passage and into the fuel tank filler opening and passing fuel through the nozzle into the fuel tank so that spilled fuel during filling and withdrawing of the nozzle will be directly engaged by the envelope and absorbed by the particulate mass.

4,031,840

PROCESS AND APPARATUS FOR RECOVERING SUNKEN WRECKS

Gerald Marc Albert Boisrayon, Clamart, and Gilbert Marius Henri Martin, La Seyne, both of France, assignors to Etat Francais, France

Filed Dec. 19, 1975, Ser. No. 642,591
Claims priority, application France, Jan. 24, 1975, 74.02195
Int. Cl.² B63C *7/02*
U.S. Cl. 114—51 10 Claims



1. An apparatus for recovering sunken wrecks from the water, said apparatus comprising:

a. a harpoon fastened to one end of a rope by means of a fastening part connected to the harpoon, said fastening part formed, at one end, as a male tip;

b. a submarine gun provided with a hull and adapted to be connected to a submarine vehicle;

c. a harpoon launching apparatus borne by said submarine gun, which comprises a float rigidly connected with a reel on which the other end of said rope is wound, both being removably fastened to said gun and;

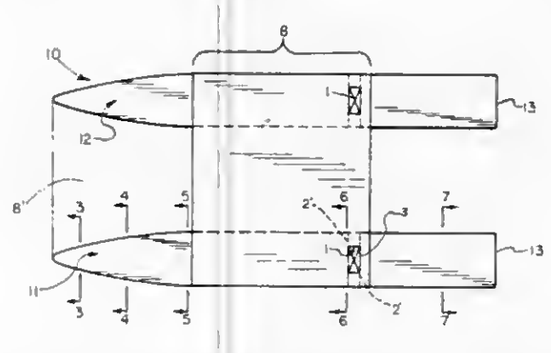
d. a device for the automatic fastening onto said male tip, formed by a hollow body which is threaded over said rope, said device having a pull cable fastened thereto.

4,031,841

CONTROLLED AIR FILM HULL FOR WATERCRAFT

Mainhardt Bredt, New Orleans, La., assignor to Bredt-Kat, Inc., New Orleans, La.

Continuation-in-part of Ser. No. 419,087, Nov. 23, 1973, abandoned, which is a continuation-in-part of Ser. No. 875,430, May 25, 1970, abandoned. This application June 30, 1975, Ser. No. 592,042
Int. Cl.² B63B *1/38*
U.S. Cl. 114—67 A 18 Claims



1. A watercraft of the step-lift planing type comprising:

at least one hull having an intermediate step-lift at its bottom;

an at least generally flat bottom hull portion aft of the step-lift, the underside of which is at least generally parallel to the water level;

air channel means extending through the hull to and communicating with the step-lift area through an opening for producing an air stream vacuum break at the step-lift and a thin, substantially non-propulsive, relatively low pressure and velocity air film along substantially all of the bottom of the aft hull portion, said air channel means being substantially free of any mechanical pressure inducing means;

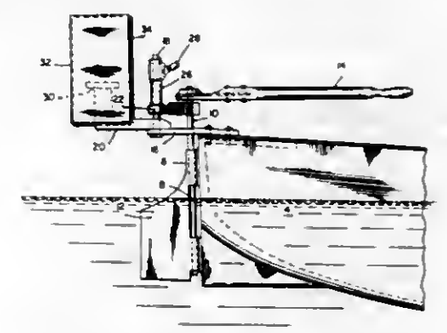
retaining means comprising a pair of elongated, relatively narrow, edge protrusions located along each port and starboard edge of the hull at the bottom thereof and extended aft at least generally parallel to the hull and at least generally parallel each to the other from the step-lift area to the stern, the lower tip of each edge protrusion extending vertically downward beyond the bottom of said flat hull portion a very short distance to contact the surface of the water when the watercraft if underway and on plane, said retaining means and said bottom hull portion forming aft hull air film confining means to retain said thin film of air beneath substantially all the entire area of the hull aft the step-lift, said film of air being confined above by the bottom of said aft hull portion, confined below by the surface of the water, and confined laterally by the said pair of elongated protrusions, but having unimpeded egress at the stern.

4,031,842

BOAT STEERING APPARATUS

Alden H. Simpson, 54 Pine Grove St., Springfield, Mass. 01110

Filed Apr. 26, 1976, Ser. No. 680,148
Int. Cl.² B63H *25/52*
U.S. Cl. 114—144 C 1 Claim



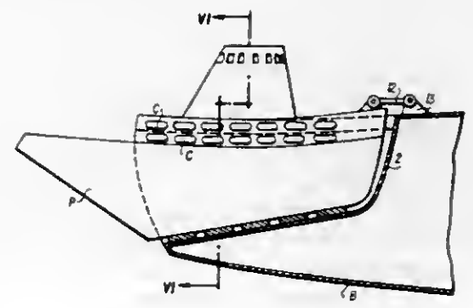
1. A self steering apparatus for a sailing craft and the like comprising a rudder and rudder post, a tiller mounted on said post for guiding said rudder, a stationary support member extending rearwardly and outboard of said craft through which said rudder post extends, a shaft extending through the support member, a beam mounted on said support and said shaft and being pivotal on the shaft, said shaft being in geared connection with said rudder post as an alternative guide for said rudder, and a pair of spaced fins secured to the pivotal beam respectively on opposed sides thereof and being forwardly and inwardly inclined to one another whereby said beam is moved in accordance with the relative wind forces on each side of the fins.

4,031,843

DEVICE FOR CONNECTING A BARGE AND A PUSHER

Jean-Paul Colin, Loire-Atlantique, France, assignor to Ateliers et Chantiers de Bretagne – A.C.B., Loire-Atlantique, France

Continuation-in-part of Ser. No. 385,577, Aug. 3, 1973, abandoned, which is a continuation of Ser. No. 575,234, May 7, 1975. This application Jan. 9, 1975, Ser. No. 539,831
Claims priority, application France, Aug. 9, 1972, 72.28708; Jan. 16, 1974, 74.01415
Int. Cl.² B63B *21/56, 35/70*
U.S. Cl. 114—247 3 Claims



1. In a system for interconnecting a barge and a pusher tug, having the stern of the barge complementary with the bow of the pusher tug, a longitudinal groove in the stern part of the barge, said groove having a section of substantially inverted T form in transverse cross-section to which the bow of said pusher tug conforms with clearance when the tug and the barge are brought together, a rigid thrust transmitting passive member attached at one end to said pusher tug and at the other end to the stern of said barge so as to transmit longitudinal forces and not forces at right angles to the longitudinal axis of the combined barge and pusher tug, expansible hydraulic compression members in the groove for interconnecting said bow and said stern, a pressure accumulator in fluid communi-

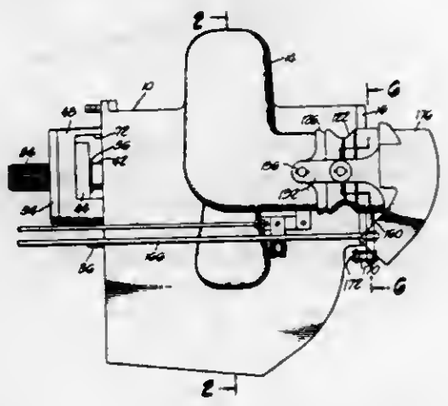
cation with said members, and means for expanding said expansible members after the tug and the barge have been interconnected by said thrust transmitting member.

4,031,844

DUAL JET BOAT PUMP

Hasan F. Onal, Oceanside, and Clarence R. Harmon, Rancho Sante Fe, Calif., assignors to Hydro-Tech Corporation, Denver, Colo.

Continuation of Ser. No. 621,818, Oct. 14, 1975, abandoned, which is a continuation of Ser. No. 447,749, March 4, 1974, abandoned. This application Mar. 11, 1976, Ser. No. 665,908
Int. Cl.² B63H 11/02
U.S. Cl. 115—12 R 5 Claims



1. A pump for propelling a boat, comprising:
a pump housing having a central impeller cavity;
inlet passage means communicating with the said impeller cavity;
a substantially horizontal pump shaft extending centrally through and being rotatably mounted in said housing;
an impeller positioned within said impeller cavity and fixed to rotate with said shaft;
dual discharge volutes communicating with said impeller cavity, said dual volutes extending about said central impeller cavity and terminating laterally at opposite sides and at the level of said shaft;
a pair of elbows associated respectively one with each of said dual volutes and each having a first part formed by an end of a volute, and each one of said elbows including a bend to have a second part extending rearwardly beside said housing with said second parts in spaced parallel relation generally at the level of said shaft; and
a pair of non-rotatable discharge nozzles mounted directly one on each of said second elbow parts adjacent said bends with the discharge ends of said discharge nozzles at generally the same level as said second elbow parts and directed rearwardly in the same direction as said second elbow parts to minimize the length of the fluid confinement thereby reducing friction losses and providing a compact construction.

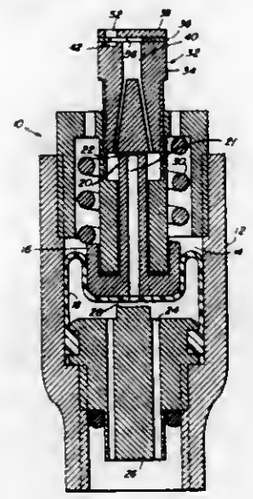
4,031,845

SLIT NOZZLE SOUND SIGNAL GENERATOR

Edward J. Cook, South Hamilton, Mass., assignor to Safety Research & Engineering Corporation, North Reading, Mass.

Filed Apr. 29, 1976, Ser. No. 681,537
Int. Cl.² B60C 23/02; G10K 10/00
U.S. Cl. 116—34 R 12 Claims

1. A sound generator actuated by a flow of gas, comprising
a. a block, a shim and a cover assembled in superimposed relation,
b. said block being formed with a flat face and a passage terminating at said face in a port located inwardly from the edges of said face and adapted to be connected to a source of compressed gas,
c. said block being formed with at least one cavity in said face located inwardly from the edges of said face and spaced from said port,
d. said shim being formed with an elongated opening of a length adapted to extend between said port and said cavity when said shim is in position over said face,
e. said shim being formed with an interaction edge at one end of said shim opening, said interaction edge extending transversely across the mid-portion of said cavity,



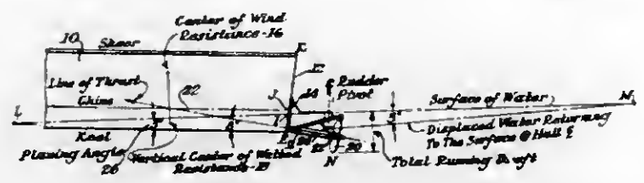
f. said cover being formed with a flat face and at least one opening discharge vent in said face, said cover face adapted to span said shim opening when said cover is in position over said shim with said vent in communication with said cavity through said shim opening,
g. said shim opening defining with the opposing flat faces of said block and cover a slit nozzle between said port and said cavity whereby gas delivered into said passage will flow through said nozzle and against said interaction edge to produce oscilations released through said vent.

4,031,846

ANTI-CAVITATION SHROUD AND RUDDER

John W. Tooe, 2601 Foulk Road, Wilmington, Del. 19810

Filed Oct. 9, 1975, Ser. No. 620,939
Int. Cl.² B63H 5/16
U.S. Cl. 115—39 19 Claims



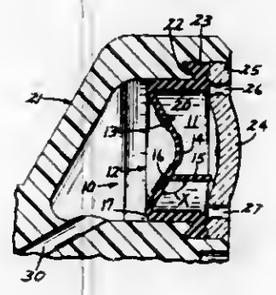
1. A shroud adapted to be mounted at the rear transom of a boat having a propeller, said propeller defining a propeller disc and a plane of revolution, a propeller shaft extending through said transom, a keel, and a hull having a planing center of resistance; said shroud extending rearwardly of said boat and being of expanding arcuate shape encompassing only the upper portion of said propeller disc and extending forwardly of said plane of revolution to said transom and rearwardly of said plane of revolution.

4,031,847

PRESSURE RATIO REVERSAL INDICATOR

Bruce M. Sullivan, Burnsville, Minn., assignor to Donaldson Company, Inc., Minneapolis, Minn.

Filed Apr. 21, 1976, Ser. No. 679,064
Int. Cl.² G08B 5/06
U.S. Cl. 116—65 9 Claims



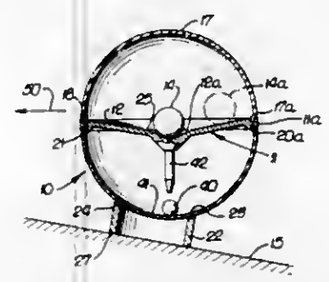
1. A generally cup-shaped indicator element of resilient, air impermeable material comprising:
a tubular wall member
a slack diaphragm closing one end of said member and movable into either an inward or an outward position with respect thereto, said diaphragm having an inner surface which is convex in said inward position of said diaphragm and concave in said outward position of said diaphragm;
a limited central area of augmented visibility on said inner surface of said diaphragm;
and an opaque tongue integral with said diaphragm, wider and longer than said central area, and extending from said inner surface, at an oblique angle with respect thereto, at a location spaced from said tubular member and said central area,
so that in said outward position of said diaphragm said tongue overhangs and conceals said area, while in said inward position of said diaphragm said tongue exposes said area, when viewed looking toward said inner surface.

4,031,848

INERTIAL PERFORMANCE INDICATOR

Robert H. Killen, Pasadena, Calif., assignor to Wayne D. Stelmie, Arcadia, Calif.

Filed Mar. 17, 1976, Ser. No. 667,487
Int. Cl.² G01P 15/02
U.S. Cl. 116—114 AH 8 Claims



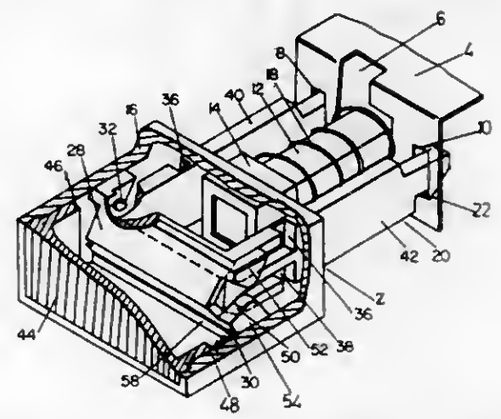
1. An inertial performance indicator, comprising
a. a carrier having a downwardly dished upper surface,
b. a first ball supported on said surface in a rest position, the ball adapted to be bodily displaced out of said rest position in response to predetermined acceleration of the carrier in a generally horizontal direction, and
c. means to adjustably support and level said carrier so that said upper surface is approximately level relative to horizontal, said means including ball and socket joint elements forming a universal joint below the level of the carrier,
e. said means including a leveling ball rollably supported on a downwardly dished interior surface associated with the lower hemisphere, there being a pointer integral with the carrier and projecting downwardly therefrom to point toward the leveling ball.

4,031,849

PUSH BUTTON SWITCH POSITION INDICATOR

Girishkumar Ratilal Mehta, Bombay, India, assignor to Mehta Engineering Enterprise, Maharashtra, India

Filed June 18, 1975, Ser. No. 587,804
Int. Cl.² H01H 9/16
U.S. Cl. 116—124 L 6 Claims



1. A push button switch indicator (2) having a longitudinal axis comprising:
a. a push button head (16) having a window fitted with a transparent cap (44) and a carrier (20) detachably mounted to switch frame means (4), said carrier being mounted in said head for longitudinal movement towards and away from said window while said head is maintained longitudinally by spring means (18) relative to said carrier and said frame means;
b. said carrier having a front end whereon a signal surface (56) is provided and a pair of limbs (40, 42) extending longitudinally towards the rear end of said carrier;
c. at least one shutter means (28, 30);
d. first attaching means (32, 34; 36, 38; 52, 54) provided on said carrier for mounting on the latter said shutter means at said front end of the carrier so that said shutter means is rotatable about bearing means forming an axis perpendicular to the longitudinal axis;
e. first operating cam means (46, 48) provided on said cap and co-acting with said first attaching means for operating the latter so that, on moving said head relative to said carrier, said shutter means pivotally moves into its "on" or first position for providing visual detection of said surface through said window; and
f. second operating cam means (58, 60) provided on said head and co-acting with said first attaching means for operating the latter so that, on moving said head relative to said carrier, said shutter means pivotally moves into its "off" or second position for preventing the detection of said surface through said window.

4,031,850

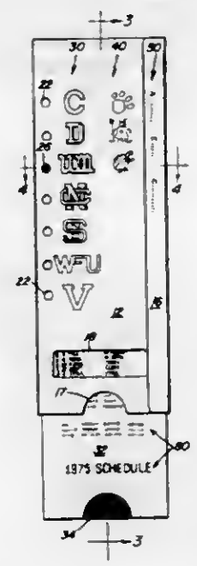
SCHEDULE AND RECORD INDICATOR

Everett E. Gantt, Gadsden, Ala., assignor to Sports Guides, Inc., Gadsden, Ala.

Filed Jan. 27, 1976, Ser. No. 652,813
Int. Cl.² G09F 9/00
U.S. Cl. 116—135 8 Claims

1. A schedule and record indicator for keeping abreast of future scheduled events and also past records of the same opponents comprising; a sleeve member having two rectangular flat sides, said flat sides being integral with each other along the longitudinal edges thereof to form a pocket therebetween, a third flat rectangular member slightly smaller in width than the width of the sleeve member and slidable within

said sleeve member, window means in at least one of the flat sides of the sleeve, and means for frictionally retaining the slidable third member in an adjusted indicating position within the sleeve, and the means for frictionally retaining said third member in proper adjustment within the sleeve including a



number of spaced holes along one edge of one side of said sleeve and an indicator portion along one edge of the third slidable member and in alignment with said spaced holes so that the third member may be properly adjuted by reference to the indicator portion as viewed through the holes.

4,031,851

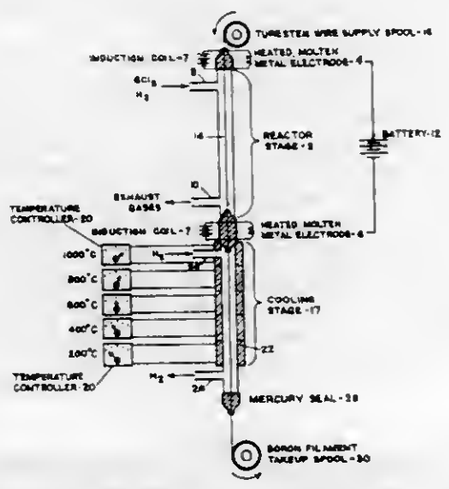
APPARATUS FOR PRODUCING IMPROVED HIGH STRENGTH FILAMENTS

Jose L. Camahort, 10 Fernwood Rd., Acton, Mass. 01720

Continuation-in-part of Ser. No. 386,691, Aug. 8, 1973, abandoned. This application Apr. 18, 1974, Ser. No. 462,073

Int. Cl.² C23C *13/02*

U.S. Cl. 118—49.1 **6 Claims**



TUNGSTEN WIRE SUPPLY SPOOL - 16
INDUCTION COIL - 7
HEATED MOLTEN METAL ELECTRODE - 6
REACTOR STAGE - 8
BATTERY - 12
EXHAUST GASES
TEMPERATURE CONTROLLER - 20
COOLING STAGE - 17
MERCURY SEAL - 28
BORON FILAMENT TAKEUP SPOOL - 30

I. A vapor deposition apparatus for forming composite, high strength filaments having a core material and a sheath material, comprising:

a. a reactor, including:

1. a reaction zone;
2. means for directing said core material through said reaction zone;
3. means to seal said reaction zone at its entrance end;
4. means to seal said reaction zone at its exit end, said means to seal comprising an inert, low-melting, high-boiling metal;
5. means to introduce a gaseous source of sheath material of boron to said reaction zone;
6. means to exhaust reaction gases from said reaction zone;
7. means to selectively heat said core to a temperature at least equal to the temperature at which the sheath material deposits onto the core material.

b. means for controllably cooling said composite material after it exits from the reactor and before it enters the ambient atmosphere to prevent buildup of internal stresses in said composite filament which substantially diminish its strength.

4,031,852

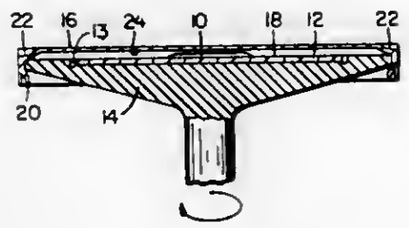
MICROSCOPE SLIDE CENTRIFUGE

Louis W. Clarke, Raleigh, N.C., and Burton H. Sage, Jr., Medfield, Mass., assignors to Corning Glass Works, Corning, N.Y.

Filed Jan. 2, 1976, Ser. No. 645,948

Int. Cl.² B05C *11/08*

U.S. Cl. 118—52 **3 Claims**



1. An apparatus for preparing blood films on a microscope slide comprising

a centrifuge including a platen having at least one surface suitable for accepting a microscope slide for spinning said microscope slide with a flat surface thereof perpendicular to the spin axis of the platen,

an enclosure having a broad flat interior surface closely disposed adjacent said flat microscope slide surface and parallel therewith a distance of up to about 0.3 inches, said enclosure closely surrounding said platen and substantially totally enclosing said microscope slide and said one surface of said platen,

means for firmly attaching said enclosure to said platen, and

means for spinning said platen and said enclosure together as one whereby due to said close disposition of the enclosure with respect to the microscope slide and platen, air flow between the slide and platen combination and the enclosure is minimal.

4,031,853

DEVICE FOR APPLYING INK TO A RIBBON

Raymond L. Conrad, 1598 W. Burrel Ave., Visalia, Calif. 93277

Filed Feb. 17, 1976, Ser. No. 658,585

Int. Cl.² B05C *11/00*

U.S. Cl. 118—264 **1 Claim**

1. A device for applying liquid ink to a ribbon for a typewriter comprising:

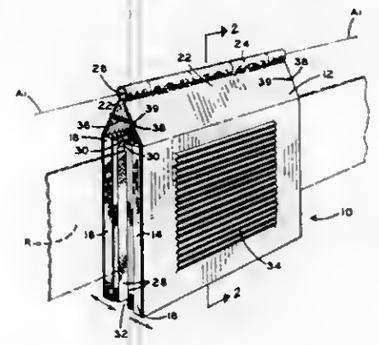
A. a case of a substantially planar configuration including a pair of opposed case halves, each case half being characterized by an endless lip projected from the periphery thereof for defining in said case a pair of pad cavities;

B. a pair of ink absorbent pads each being seated in a pad cavity and characterized by a face of a substantially planar configuration;

C. hinge means interconnecting said case halves for pivotal displacement about a common axis including a linear hinge member extended in spaced relation with adjacent edge portions of said case halves;

D. means for continuously urging the case halves in pivotal displacement for positioning the face of each pad of said pair of pads in an opposed relationship with the face of the other pad of the pair; and

E. stop means for limiting the pivotal displacement of said



case halves about said axis including stop means comprising a linear protuberance projected from one edge surface of the face of each pad of said pair of pads and extended in spaced parallelism with said axis for engaging the protuberance projected from the face of the other pad of the pair as the case halves are pivotally displaced.

4,031,854

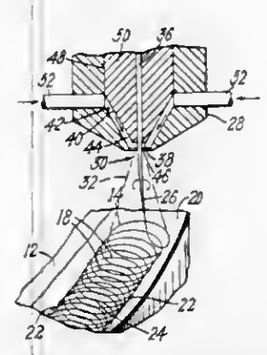
APPARATUS FOR COATING ARTICLES WITH ADHESIVE

Gordon V. Sprague, Jr., Danvers, Mass., assignor to USM Corporation, Boston, Mass.

Division of Ser. No. 417,352, Nov. 19, 1975, Pat. No. 3,911,173, which is a continuation-in-part of Ser. No. 329,362, Feb. 5, 1973, abandoned. This application Oct. 1, 1975, Ser. No. 618,484

Int. Cl.² B05C *5/00*

U.S. Cl. 118—641 **4 Claims**



1. Apparatus for depositing a hot molten thermoplastic resinous adhesive material onto a workpiece surface as a band of overlapping loops comprising an applying nozzle having an extrusion orifice at one end thereof, supply means connected to said nozzle for forcing said material through said orifice to form a thin filament for deposition on said surface, air supply means for directing a stream of air around said filaments, said air supply means being constructed and arranged to impart to said stream of air a component in the direction of said work surface for attenuating said filament and a rotational component for moving said filament in a circular path to generate a substantially conical envelope terminating on said workpiece surface, and means for causing relative movement between said nozzle and said workpiece surface in a predetermined path at substantially right angles to said conical envelope, said nozzle and said workpiece being spaced from one another a direct distance predetermined to deposit said material on said surface as a band of overlapping loops.

4,031,855

ARTIFICIAL INSEMINATION OF SHRIMP

Harvey O. Persyn, Crystal River, Fla., assignor to Ralston Purina Company, St. Louis, Mo.

Filed June 23, 1976, Ser. No. 699,142

Int. Cl.² A01K *61/00*

U.S. Cl. 119—2 **11 Claims**

1. A method of promoting the fertilization of shrimp eggs comprising selecting female shrimp with mature eggs or ovaries and male shrimp with a mature spermatophore, removing the spermatophore from the male shrimp, extracting the sperm mass from the spermatophore, and attaching the sperm mass to the female shrimp with mature eggs or ovaries to effectively fertilize the eggs upon spawning in sea water.

4,031,856

SQUIRREL-PROOF POST

Russell L. Chester, Box 42, Fontana, Wis. 53125

Filed June 4, 1976, Ser. No. 693,045

Int. Cl.² A01K *29/00*

U.S. Cl. 119—51 R **9 Claims**

I. A squirrel-proof post comprising a post adapted to support a bird platform at the top of the post, squirrel carrier means slidably related to the post for up and down movement with respect to the post, said squirrel carrier means being dimensioned to receive a squirrel which climbs onto the carrier means to transfer his weight from the post to the carrier means, and means biasing the carrier means toward the top of the post, the bias of said biasing means being insufficient to sustain the weight of a squirrel which has climbed up the post and onto the carrier means, whereupon the carrier means and squirrel will slide down the post to a position in which the squirrel is out of jumping range to the bird platform.

4,031,857

VOLUMETRIC ACCUMULATING DEVICE

Robert D. Jones, Oskaloosa, Iowa, assignor to Intraco, Inc., Oskaloosa, Iowa

Filed Mar. 15, 1976, Ser. No. 666,696

Int. Cl.² A01K *5/00*

U.S. Cl. 119—56 R **6 Claims**

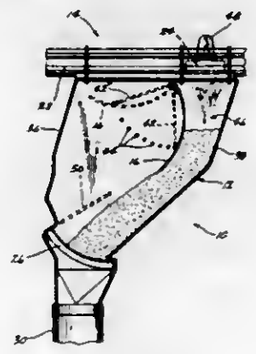
1. A volumetric accumulating device adapted to be connected to a conveyor system for receiving and holding a predetermined amount of granular or powdery material from the conveyor system, said device comprising:

a housing having two side walls and two end walls positioned therebetween, said housing adapted to be connected to the underside of the conveyor system, said housing including an upper portion adjacent to one of said end walls, said one end wall being spaced from the other end wall and including a portion converging downwardly toward the lower end of said housing and towards the other end wall thereby forming a discharge opening adjacent to said lower end and adjacent to said other end

wall, said upper portion including an inlet opening adapted to receive material therethrough;

means for selectively opening and closing said discharge opening;

metering means for selectively controlling the amount of material receivable within said housing, said means including a plate pivotally attached adjacent one end thereof to said housing and positioned transversely with respect to the sidewalls, the edges of said plate being complementary to the shape of the sidewalls whereby the



edges of the plate remain adjacent to the sidewalls during pivotal movement of the plate with respect to the sidewalls, said plate being movable between a vertically oriented position adjacent to said one end wall and a horizontally oriented position; and

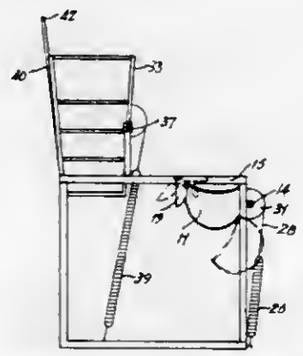
an inlet opening disposed in said upper portion of the housing and adapted to receive material therethrough, said inlet opening being positioned directly above the downwardly inclined end wall and generally between said one end wall and the pivotal axis of said plate.

4,031,858

STOCK HANDLING DEVICE

Brian Mervyn Harrington, P.O. Box 43, Darkan, 6392, Australia

Filed Dec. 23, 1975, Ser. No. 643,942
Int. Cl.² A61D *3/00*
U.S. Cl. 119—103 **10 Claims**



1. A stock handling device comprising:

a. a cradle shaped to receive and support an animal in an inverted position, the cradle being pivotally mounted on a frame for rotation about a first substantially horizontal axis coinciding with one side of the cradle;

b. latching means mounted on the frame for holding the cradle in a horizontal position, the latching means being releasable to permit the cradle to rotate about the first horizontal axis to discharge the animal therefrom; and

c. animal tipping means rotatable on said frame and having an entry to receive an animal and capable of being rotated about a second substantially horizontal axis to an inverted position to discharge the animal into the cradle in an inverted position, the tipping means having two opposed side walls and a floor, one of said side walls being fixed lying adjacent the cradle, the other of said side walls being remote from the cradle and movable inwardly from an outermost position to clamp an animal within the tipping means against the one of said side walls during the rotation of the animal tipping means to a discharge position, said tipping means also being provided with gate means at the entry thereof and closeable upon an animal entering the tipping means to prevent animals backing therefrom, said gate means being adapted to open upon an animal being tipped from the tipping means.

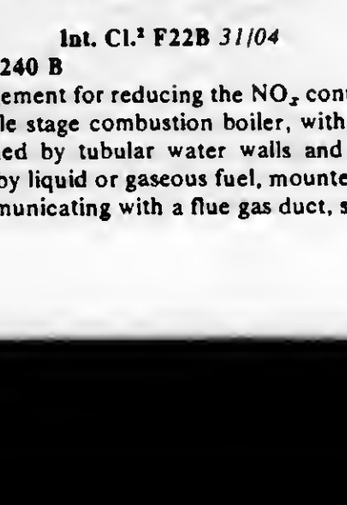
COLLAR FOR A SMALL ANIMAL

James P. Stewart, 14605 SE. Fairwood Blvd., Renton, Wash. 98055

Filed May 23, 1974, Ser. No. 472,733
Int. Cl.² A01K *27/00*
U.S. Cl. 119—106 **12 Claims**



1. A collar for a small animal, said collar comprising:

a. a tubular housing;

b. said tubular housing having a tubular passageway extending the entire length of said tubular housing;

c. an insert for positioning in said tubular passageway;

d. said tubular housing having a first end and a second end;

e. said tubular housing near said first end having a pair of opposing holes in the walls and which opposing holes connect with said tubular passageway;

f. said tubular housing near said second end having a tongue;

g. said tongue having a first end and a second end with said first end being in said tubular passageway and said tongue being secured to said tubular housing;

h. said tongue on said second end having opposed studs for mating with said opposing holes to form a collar from said tubular material; and,

i. said tubular housing being soft, flexible and resilient.

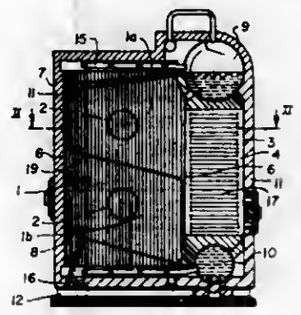
ARRANGEMENT FOR REDUCING THE NOX CONTENT OF FLUID GASES

Heinz Recbt, Oberhausen, Rhld., Germany, assignor to Deutsche Babcock & Wilcox Aktiengesellschaft, Germany

Filed Feb. 2, 1976, Ser. No. 654,345
Claims priority, application Germany, Feb. 3, 1975, 2504418
Int. Cl.² F22B *31/04*
U.S. Cl. 122—240 B **7 Claims**

1. An arrangement for reducing the NO_x content in the flue gases of a single stage combustion boiler, with a combustion chamber defined by tubular water walls and having plural burners, fired by liquid or gaseous fuel, mounted through one wall, and communicating with a flue gas duct, separated from

the combustion chamber by a transition zone, through a combustion gas flow opening, adjacent a wall opposite the burner mounting wall, connecting the combustion chamber to the flue gas duct, said arrangement comprising at least one substantially gas-tight partition, formed of water tubes, extending in the axial direction of the burners completely across said combustion chamber between the water walls thereof and said



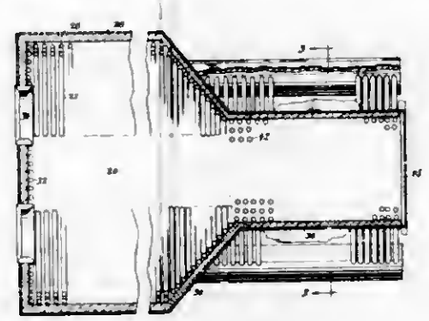
transition zone, and dividing said combustion chamber into sections each respective to a single burner and each communicating individually with said combustion gas flow opening, whereby the combustion gases, flowing through said sections from the respective burners to said combustion gas flow opening are in heat transfer contact with, and surrounded by, both the water walls of said combustion chamber and the water tubes of each said partition.

4,031,861

PULVERIZED COAL FIRED PACKAGE BOILER

William Hunter Pollock, East Granby, Conn., assignor to Combustion Engineering, Inc., Windsor, Conn.

Filed Apr. 5, 1976, Ser. No. 673,498
Int. Cl.² F22B *21/14*
U.S. Cl. 122—327 **4 Claims**



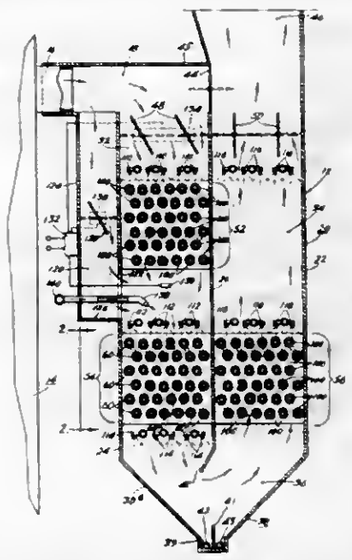
1. A shop assembled boiler comprising an upper drum that extends horizontally to form an elongate ridge along the apex of a boiler, a pair of lower drums positioned under the upper drum and spaced apart to comprise a base for said boiler, a housing with a front and rear portion enclosing the boiler, a plurality of tubular members connecting each lower drum to the upper drum formed to provide an open furnace cavity in the front portion of the housing having a hopper shaped bottom with tubular walls on opposite sides of an elongate throat, a bank of closely spaced tubes in the rear portion of the boiler formed to extend vertically between the lower drums and the upper drum and adapted to intercept hot gases that have traversed the cavity in the front portion of the boiler furnace, and coal burning apparatus penetrating the front portion of the furnace to exhaust hot products of combustion into the furnace cavity.

4,031,862

ECONOMIZER

Frank J. Smith, 7352 Limekiln Pike, Philadelphia, Pa. 19138

Filed Mar. 10, 1976, Ser. No. 665,501
Int. Cl.² F23J *3/02*; **F22D** *1/02*
U.S. Cl. 122—421 **8 Claims**



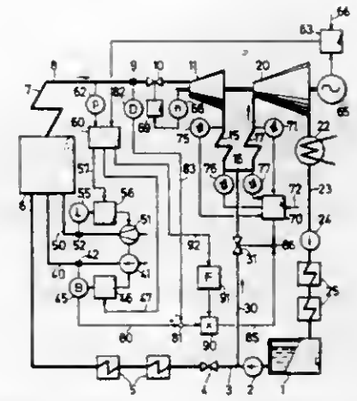
1. An economizer comprising a duct for conducting hot flue gases from a boiler to a stack, a plurality of parallel heat exchange tube assemblies disposed within said duct extending transversely to the flow of said flue gases, said tube assemblies each comprising an outer tube of a first material, an inner tube of a second material coaxially disposed in spaced relation within said outer tube, and an intermediate layer between said inner and outer tubes completely filling the space therebetween, a major portion of the composition of said intermediate layer comprising graphite or carbon, and means for connecting said inner tubes to a source of liquid to provide a flow of liquid through said tube assemblies to transfer heat energy from said flue gases to said liquid.

4,031,863

PROCESS AND A CONTROL SYSTEM FOR CONTROLLING THE EXIT TEMPERATURE OF VAPOR FLOWING THROUGH A CONTACT HEATING SURFACE OF A VAPOR GENERATOR

Fritz Läubli, Winterthur, Switzerland, assignor to Sulzer Brothers Limited, Winterthur, Switzerland

Filed Sept. 26, 1975, Ser. No. 617,063
Claims priority, application Switzerland, Sept. 17, 1974, 12628/74
Int. Cl.² F22G *5/12*
U.S. Cl. 122—479 R **14 Claims**



1. A process for controlling the exit temperature of vapor

flowing through a contact heating surface of a vapor generator, said process comprising the steps of

obtaining a first signal corresponding to the amount of an instantaneous flow of heat supplied by a fuel delivered to the vapor generator;

obtaining a second signal corresponding to the quantity of vapor flowing momentarily through the contact heating surface;

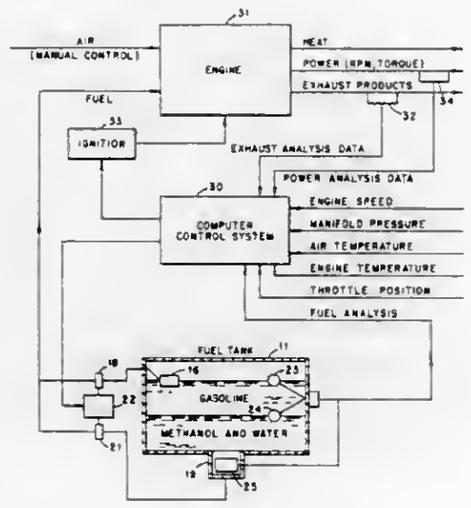
comparing said first and second signals to obtain a comparison signal; and

imposing said comparison signal on a control element acting on the exit temperature of the contact heating surface.

4,031,864
MULTIPLE FUEL SUPPLY SYSTEM FOR AN INTERNAL COMBUSTION ENGINE

William T. Crothers, Sunol, Calif., assignor to The United States of America as represented by the United States Energy Research and Development Administration, Washington, D.C.

Filed Mar. 9, 1976, Ser. No. 665,191
Int. Cl.² F02B *75/12*
U.S. Cl. 123—1 A **14 Claims**



1. A method for supplying a combustion engine with fuel from a multiple liquid fuel supply contained in a single container, said multiple liquid fuel being phase-separable to form a two-phase liquid, the upper phase containing a major proportion of a first component of the multiple fuel and the lower phase containing a major proportion of a second component of the multiple fuel, which comprises:

inducing phase separation of the multiple liquid fuel, thereby establishing the two-phase liquid in the container;

supplying the combustion engine with liquid selected from the group consisting of liquid withdrawn from the upper phase, liquid withdrawn from the lower phase, and liquid withdrawn from both the upper phase and the lower phase.

4,031,865
HYDROGEN-OXYGEN FUEL CELL FOR USE WITH INTERNAL COMBUSTION ENGINES

Patrick Dufour, 14 Hawthorne St., Laconia, N.H. 03246

Filed Oct. 1, 1975, Ser. No. 618,442
Int. Cl.² F02B *43/08*
U.S. Cl. 123—1 A **1 Claim**

1. In combination, an internal combustion engine having an intake manifold,

and a carburetor for supplying a fuel-air mixture to said engine,

a hydrogen and oxygen gas generator for supplying a hydrogen gas fuel supplement to said engine,

said gas generator comprising a cell containing water,

a negative and positive electrode extending into said water,

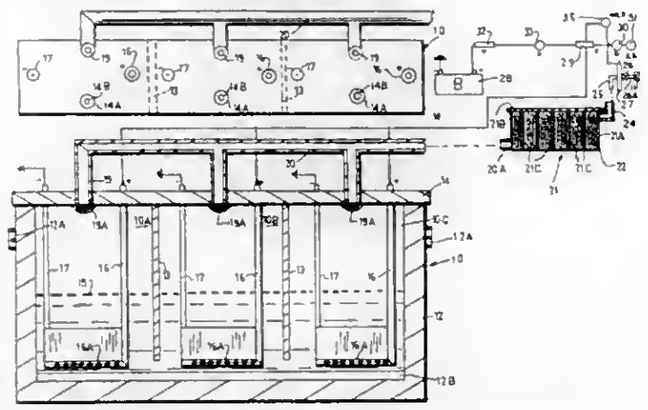
a catalyst of an alkaline base dispersed in said water,

an electrical D.C. power supply connected in circuit with said electrodes whereby hydrogen gas is generated when said electrodes are energized,

a rheostat switch in circuit with said power supply to control the rate of said hydrogen gas generator,

a dryer,

conduit means connecting the gases generated in said cell to said dryer,



means for directing the gases dried in said dryer to said intake manifold,

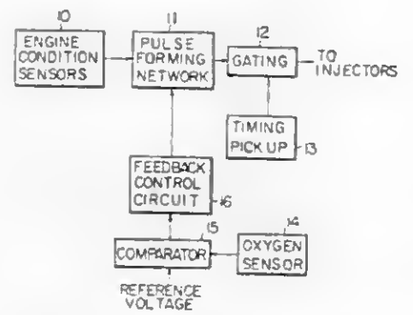
and accelerator means operatively connected to said rheostat switch for controlling the rate of gas generation in accordance to engine demand,

and wherein said positive electrode is perforated to permit the introduction of air into said cell to enhance liberation of the hydrogen gas forming at the negative electrode.

4,031,866
CLOSED LOOP ELECTRONIC FUEL INJECTION CONTROL UNIT

Masaharu Asano, Fujisawa, Japan, assignor to Nissan Motor Co., Ltd., Yokohama, Japan

Filed July 23, 1975, Ser. No. 598,280
Claims priority, application Japan, July 24, 1974, 49-84960
Int. Cl.² F02B *3/00*
U.S. Cl. 123—32 EB **7 Claims**



1. An electronic fuel injection control unit for internal combustion engines including a fuel injecting device, comprising:

means including a composition sensor for sensing the concentration of the composition in the emissions from the engine and generating a correction signal at one of first and second discrete values depending upon whether the sensed concentration is above or below a predetermined value;

means for generating a train of clock pulses in step with each engine revolution;

means for counting the clock pulses to generate a first signal when the number of counted clock pulses reaches a predetermined value in the presence of the correction signal at the first discrete value and a second signal when the number of the counted clock pulses reaches the predetermined value in the presence of the correction signal at the second discrete value;

a variable gain operational amplifier responsive to the correction signal to provide a gain-controlled signal and capable of providing different amplification in response to said first or second signal from the counting means;

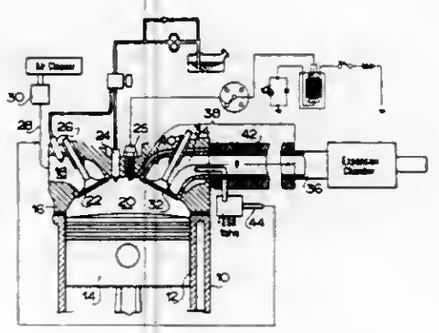
means for generating first and second transient signals in response to the first and second signals, respectively, from said counting means, said transient signals having opposite polarities to the polarity of the gain-controlled signal and being combined therewith; and

a pulse forming network responsive to the combined signals to generate an injection pulse, the duration of which is dependent on the magnitude of the gain-controlled signal, said injection pulse being supplied to said fuel injecting device.

4,031,867
INTERNAL COMBUSTION ENGINE COMBUSTION PROCESS

Hiroki Yasuda, Hachioji; Shuji Sawafuji, Musashino, and Hitoshi Suzuki, Chofu, all of Japan, assignors to Fuji Jukogyo Kabushiki Kaisha, Tokyo, Japan

Filed Dec. 18, 1975, Ser. No. 641,738
Claims priority, application Japan, Dec. 28, 1974, 50-3275
Int. Cl.² F02B *3/00*
U.S. Cl. 123—32 ST **8 Claims**



1. An internal combustion engine having at least one cylinder, comprising

a combustion chamber in each cylinder,

an intake port communicating with a corresponding combustion chamber and provided with an intake valve,

means for feeding air fuel mixture into said combustion chamber through said intake port,

injection nozzle means for supplying fuel into said combustion chamber in the form of droplets in suspension in said mixture,

a spark plug provided in said combustion chamber,

an exhaust valve operatively communicating with said combustion chamber,

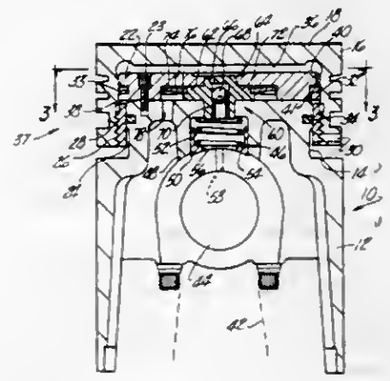
an exhaust gas passage without a gas stagnating portion and communicating with said exhaust valve, and including a predetermined zone defining a volume, the latter extending from immediately adjacent said exhaust valve, said exhaust gas passage having an open end, and

heat insulation means in said predetermined zone immediately adjacent to said exhaust valve for preventing exhaust gas temperature in said predetermined zone from lowering below a predetermined temperature, the latter being a function of the volume of said predetermined zone with respect to engine displacement volume so as to cause sufficient self-reaction oxidation in said predetermined zone in order to have HC concentration below 10 ppm and CO concentration below 0.1 percent.

4,031,868
VARIABLE COMPRESSION RATIO PISTON

Albert M. Karaba, Muskegon; Alexander P. Brouwers, Bloomfield Hills, and Thomas J. Pearsall, Grand Haven, all of Mich., assignors to Teledyne Industries, Inc., Los Angeles, Calif.

Continuation-in-part of Ser. No. 611,863, Sept. 10, 1975. This application Feb. 20, 1976, Ser. No. 659,727
Int. Cl.² F02B *75/04*
U.S. Cl. 123—78 B **10 Claims**

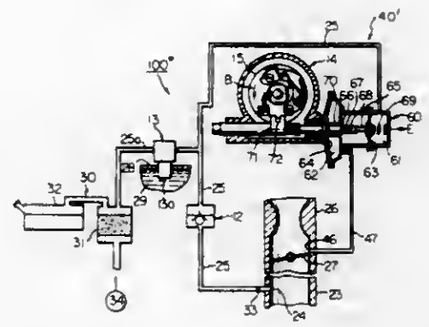


1. In an internal combustion engine, a piston having an inner member and an outer member telescopically received by said inner member, said members being movable in response to reciprocation of the piston with respect to a combustion chamber of the engine, a first fluid chamber and a second fluid chamber varying in volume in response to said relative movement and to variations in the quantity of fluid therein, means supplying fluid to said chambers, said means comprising a first passage in said piston connecting with said first fluid chamber, a one way inlet valve disposed in said first passage and a second passage in said piston connecting said first chamber with said second chamber, the improvement comprising a sealing groove in said inner member and a sealing member carried in said sealing groove, said second passage extending through said sealing groove and said sealing ring acting as a valve means to regulate fluid flow between said first and second chamber.

4,031,869
IGNITION-TIMING ADJUSTING SYSTEM FOR SPARK-IGNITION INTERNAL COMBUSTION ENGINES

Takanori Onishi, and Ken Shiozawa, both of Toyota, Japan, assignors to Toyota Jidosha Kogyo Kabushiki Kaisha, Japan

Filed Jan. 20, 1975, Ser. No. 542,448
Claims priority, application Japan, Feb. 18, 1974, 49-018475
Int. Cl.² F02P *5/04*
U.S. Cl. 123—117 A **8 Claims**

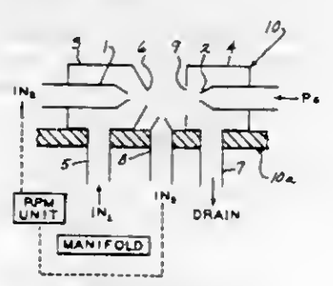


1. An ignition timing control system for an internal combustion engine comprising:

an intake tube for delivering a combustible mixture to an engine and having a vacuum port in the wall of said tube;

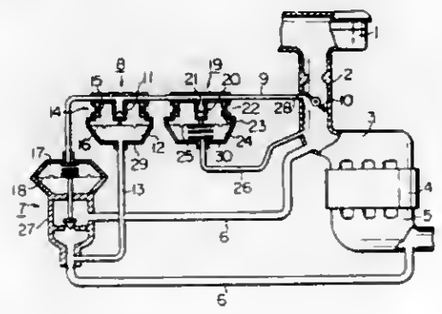
a throttle valve mounted in the intake tube;
an ignition timing means synchronized with the engine;
a vacuum actuator having a vacuum chamber and an actuator means connected to the ignition timing means for advancing the ignition timing of the engine in response to increasing vacuum level in the vacuum chamber;
a vacuum line connecting the vacuum chamber of said actuator to the vacuum port in the intake tube;
an air line between the vacuum chamber and the atmosphere;
first valve means in said vacuum line between the vacuum port of the intake tube and the vacuum chamber of the actuator, said first valve means being responsive to the difference in vacuum levels in the intake tube at the vacuum port and in the vacuum chamber of the actuator to open the vacuum line when the level of vacuum at the vacuum port is greater than the level of vacuum in the vacuum chamber and to close the vacuum line when the vacuum level at the vacuum port is less than the vacuum level in the vacuum chamber; and
second valve means in said air line responsive to engine temperature to close the air line when the engine is colder than a predetermined temperature and to open the air line when the engine is warmer than said predetermined temperature, such that the vacuum chamber of the actuator is exposed to the greatest level of vacuum at the vacuum port under all operating load conditions during cold engine operation and to atmospheric pressure when the engine is warmed up.

4,031,870
FUEL CHARGE INJECTION APPARATUS FOR INTERNAL COMBUSTION ENGINES
Shinji Ozawa, Kanagawa, Japan, assignor to Mikuni Kogyo Co., Ltd., Tokyo, Japan
Filed Mar. 20, 1975, Ser. No. 560,170
Int. Cl.² F02B *33/00*; **F02M** *7/00*; **F02D** *11/08*; **F02M** *17/02*
U.S. Cl. 123—119 R **12 Claims**



1. In a fuel charge injection apparatus wherein an impacting stream charge injection device having a pair of opposing stream forming means to define impacting fuel and air streams and having means to move the impacting stream position therebetween for selective introduction into the engine, and having a signal source means to establish an engine related control signal for controlling at least one of said streams, comprising a stream control chamber means enclosing the discharge end of one of said stream forming means and having an orifice aligned with said stream forming means, and a control signal port connected to said chamber to receive said engine related control signal and to control the strength of the corresponding stream.

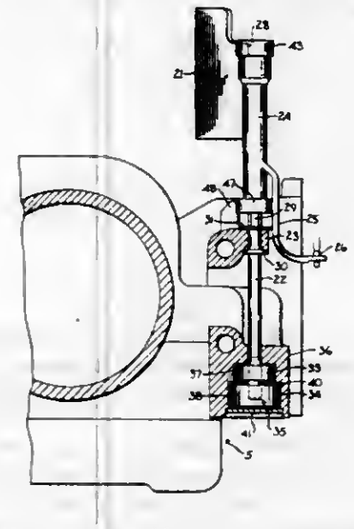
4,031,871
EXHAUST GAS RECIRCULATION SYSTEM OF A MOTOR VEHICLE
Makio Hamaoishi, Toyota, Japan, assignor to Toyota Jidosha Kogyo Kabushiki Kaisha, Toyota, Japan
Filed May 27, 1976, Ser. No. 690,656
Claims priority, application Japan, Mar. 2, 1976, 51-21757
Int. Cl.² F02M *25/06*
U.S. Cl. 123—119 A **4 Claims**



1. In an exhaust gas recirculation system of a motor vehicle which comprises:
a diaphragm type EGR valve mounted on an EGR pipe which connects the exhaust manifold and the intake manifold;
an opening path for air from the atmosphere diverged from a connecting pipe which connects the diaphragm chamber of said EGR valve and the EGR port near the carburetor throttle valve, and;
a diaphragm type vacuum control valve (VCV) arranged at the opening end of said opening path, the diaphragm chamber of said VCV communicating with the inlet of said EGR valve, the improvement comprising another opening path for air from the atmosphere being diverged from the connecting pipe between said diaphragm chamber of said EGR valve and said EGR port, and another VCV, which operates in response to the vacuum pressure in the intake manifold, being arranged at the opening end of said second opening path.

4,031,872
THERMOSTATIC AUTOMATIC CHOKE CONTROL FOR SMALL ENGINES
Robert G. Thompson, Milwaukee, and Heinz K. Gund, Brookfield, both of Wis., assignors to Briggs & Stratton Corporation, Wauwatosa, Wis.
Continuation-in-part of Ser. No. 516,641, Oct. 21, 1974, abandoned, which is a division of Ser. No. 417,402, Nov. 19, 1973, Pat. No. 3,863,614. This application Sept. 19, 1975, Ser. No. 614,891
Int. Cl.² F02B *33/00*
U.S. Cl. 123—119 F **10 Claims**

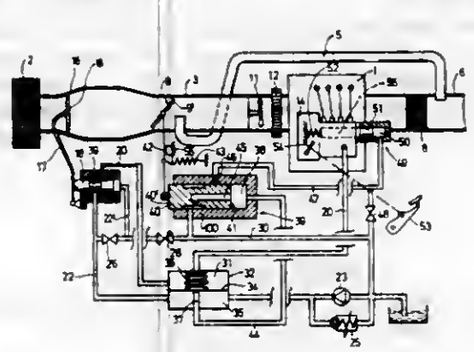
4. A control device wherein an imbalance between opposing forces acting on a movable control element urge the same in one or the other of two opposite directions with respect to a fixed element, depending upon the sense of the imbalance, characterized by:
A. a pair of thermostatic governor means to govern the response of said control element to the opposing forces acting thereon,
said pair of thermostatic governor means having responses of opposite sense to a change in ambient temperature; and
B. means operatively interposing said governor means between said control element and said fixed element in a manner such that each of the two governor means can govern response of said control element to the opposing forces acting thereon independently of the other, whereby the two governor means can coact to govern the response of said control element to the opposing forces



acting thereon, over a wide temperature range without objectionably stressing either one of them.

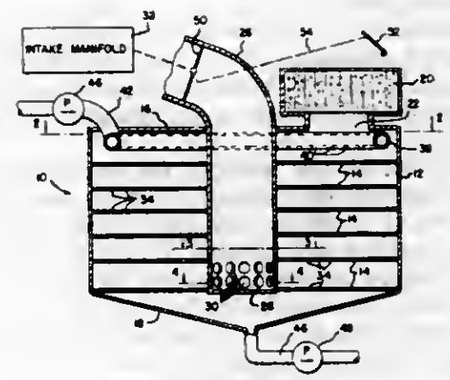
h. means providing a variable restoring force against the displacements of the servomotor piston;
i. a differential pressure valve having an uncontrolled pressure chamber, a controlled outflow opening in a chamber having an essentially constant reference pressure, and means connecting the controlled outflow opening to the working chamber of the servomotor;
j. fuel metering means including a control slide connected to and displaceable by the air metering means, a throttle whose cross-section is varied by the displacements of the control slide, and means for establishing a regulatable, substantially constant return force acting against the displacements of the control slide; and
k. a fuel suction line connected to the fuel injection means, the uncontrolled pressure chamber of the differential pressure valve and, upstream of its connection to the uncontrolled pressure chamber, to the throttle whose cross-section is varied, wherein:
i. the arbitrarily varied fuel quantity serves as a reference parameter for the operation of the servomotor; and
ii. the servomotor piston is displaceable, against the variable restoring force, between two positions, one corresponding to a fully opened position of the throttle valve and closed exhaust gas recycling line, and the other corresponding to a substantially closed throttle valve.

4,031,873
FUEL INJECTION SYSTEM FOR INTERNAL COMBUSTION ENGINES HAVING CONTROLLED EXHAUST GAS RECYCLING
Werner Banzhaf, Sindelfingen; Gerhard Stumpp, Stuttgart-Vaihingen, and Gerhard Schiellnsky, Schwaikheim, all of Germany, assignors to Robert Bosch G.m.b.H., Stuttgart, Germany
Filed June 30, 1976, Ser. No. 701,160
Claims priority, application Germany, July 10, 1975, 2530777
Int. Cl.² F02M *25/06*, *7/00*; **F02B** *31/00*
U.S. Cl. 123—119 A **16 Claims**



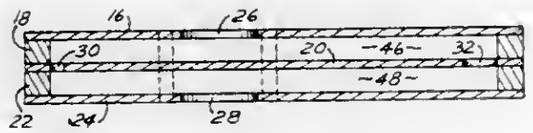
1. A fuel injection system for an internal combustion engine, comprising in combination:
a. a suction tube through which an air flow is established;
b. an exhaust gas line through which an exhaust gas flow is established;
c. an exhaust gas recycling line connected to the exhaust gas line and to the suction tube, the suction tube connection defining therein a discharge outlet of the recycling line;
d. a throttle valve controlling the flow of the exhaust gas in the recycling line, said throttle valve being mounted within the suction tube upstream of and in operative association with the discharge outlet of the recycling line;
e. air metering means mounted to partially extend into said suction tube and be displaceable by the air flow thereon;
f. fuel injection means including means for arbitrarily varying the fuel quantity delivered by the fuel injection means;
g. a servomotor including a displaceably mounted piston, a working chamber and means connecting the piston to the throttle valve for controlling the opening thereof;

4,031,874
CARBURETOR
John E. Alwine, 4341 Willow Brook Ave., Apt. 102, Los Angeles, Calif. 90029
Filed Oct. 8, 1975, Ser. No. 620,843
Int. Cl.² F02M *17/22*
U.S. Cl. 123—134 **6 Claims**



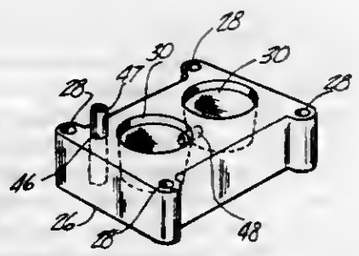
1. A carburetor for supplying a fuel mixture to an internal combustion engine including a closed hollow body, a series of closely perforated baffle plates extending between the side walls of the body and spaced apart between the top and bottom of the body, an air inlet opening in the body above the uppermost baffle plate, a fuel mixture pipe extending into the body through the top of the body, down through a number of baffle plates to an inlet opening located below a number of baffle plates, the portion of the baffle plate immediately above the inlet opening being imperforate adjacent the pipe to prevent excess liquid fuel from being drawn through such plate immediately adjacent the inlet opening, a fuel supply for distributing liquid fuel over the uppermost of said baffle plates so that when the engine is in operation liquid fuel and air are drawn down through the perforations in the baffle plates and the fuel is evaporated to form a gaseous fuel mixture subsequently drawn into the fuel mixture pipe through said inlet openings, the bottom of the body forming a sump for collection of excess liquid fuel and a return fuel system for flowing such liquid fuel away from the carburetor.

4,031,875
FUEL VAPORIZER
Darwin A. Tyler, 26054 East St. U12, Llano, Calif. 93544
Filed Sept. 15, 1975, Ser. No. 613,057
Int. Cl.² F02M *29/00*
U.S. Cl. 123—141 **5 Claims**



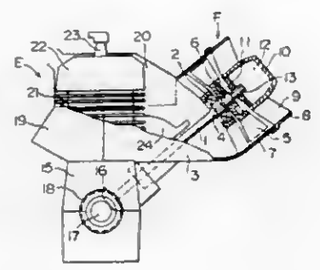
1. Vaporizing means particularly adapted for use in converting wet mixtures of fuel and air from the jets of a carburetor for an internal combustion engine to substantially dry mixtures, said vaporizer means comprising:
a body formed of a thermally conductive material having a relatively flat elongate first internal chamber, a relatively flat, elongate second internal chamber in superposed relationship with the first internal chamber and a relatively thin partition separating the two chambers;
said body having a first opening into said first internal chamber and a second opening into said second internal chamber;
said partition having a first port interconnecting the first and second internal chambers and a second port interconnecting said chambers;
the first and second openings in said body being of equal size and shape and in peripheral and axial alignment, said first port being offset a first distance in one longitudinal direction from the aligned axes of said first and second openings, and said second port being offset a second distance in the opposite longitudinal direction from said axes;
said body being sized and shaped, and its openings and chambers being positioned and otherwise adapted, to permit its interposition between said carburetor and said internal combustion engine in a way to receive air-fuel mixtures from the carburetor jets through said first opening, and discharge said mixtures, after they have passed through at least one of the ports in said partition, into the intake manifold of the engine through said second opening;
whereby the air-fuel mixtures are detoured through said body between the carburetor and intake manifold, when the engine is running, and undergo increases in velocity when passing through one or both of said ports and, additionally, absorb engine heat through the thermally conductive material of the body so that vaporization of fuel droplets in the mixture takes place to render said fuel more completely combustible in said engine.

4,031,876
FUEL ATOMIZER
Robert G. Hoots, 7427 Lawrence St., Grand Blanc, Mich. 49505
Continuation-in-part of Ser. No. 451,949, March 18, 1974. This application July 7, 1975, Ser. No. 593,718
Int. Cl.² F02M *29/00*
U.S. Cl. 123—141 **7 Claims**



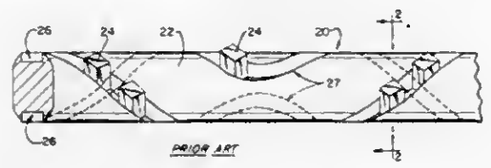
1. A liquid fuel atomizer device for an internal combustion engine, comprising:
a. a base member having at least two throughbores formed therethrough and at least one internal transverse bore extending between the throughbores and in communication therewith,
b. and grids disposed in each of the throughbores comprising a plurality of superposed fine mesh grids comprising alternating layers of copper grids and brass grids, the grids being coated with copper oxide and potassium dichromate, and
wherein the transverse bore is in communication with the throughbores in the region of the grids.

4,031,877
ENGINE LUBRICATING OIL PUMP
Tetsuzo Fujikawa, Kobe, and Kichiji Misawa, Akashi, both of Japan, assignors to Kawasaki Jukogyo Kabushiki Kaisha, Kobe, Japan
Filed Feb. 19, 1976, Ser. No. 659,231
Claims priority, application Japan, Feb. 26, 1975, 50-27103
Int. Cl.² F02F *7/00*
U.S. Cl. 123—195 A **5 Claims**



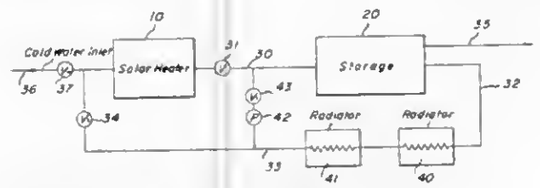
1. Internal combustion engine comprising an engine portion having a power output member, cooling blower means driven by said power output member of the engine portion for producing flow of engine cooling air, said blower means having fairing means at hub portion thereof, lubricating oil pump means disposed in said fairing means of the blower means and driven by said power output member of the engine portion to provide supply of lubricating oil to the engine portion as the engine rotates.

4,031,878
CROWN CUTTING WIRE
George H. Hall, P.O. Box 244, Westford, Mass. 01886
Filed Nov. 12, 1975, Ser. No. 631,083
Int. Cl.² B28D *1/08*
U.S. Cl. 125—21 **9 Claims**



1. A wire saw comprising in combination:
an elongated flexible metallic body having a substantially circular cross section, a curved outer surface and, at least one helical ridge on said curved outer surface along the length of said body,
a plurality of blocks of composite comminuted abrasive in a bonding matrix resiliently mounted on said body along said at least one ridge in spaced-apart relation to one another;
the bottom surfaces of said blocks being shaped to substantially mate with said body outer surface.

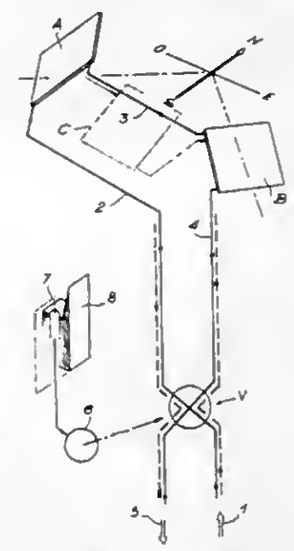
4,031,879
SOLAR ENERGY CONVERSION PLANT
J. P. Parham, R.R. 2, Box 475, Melbourne, Fla. 32901
Filed Oct. 28, 1975, Ser. No. 625,856
Int. Cl.² F24J *3/02*
U.S. Cl. 126—271 **7 Claims**



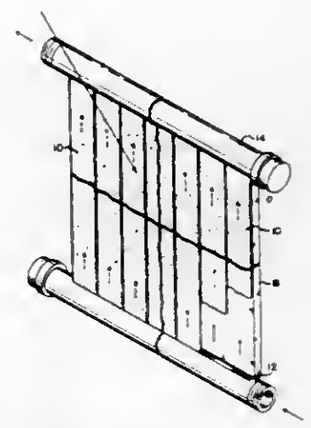
1. A solar energy conversion plant, comprising:
a solar radiation converter system including,
a solid radiation to heat converter, a plurality of heat exchange members thermally connected to said radiation to heat converter and a housing adapted to support said radiation converter and form a container for said heat exchange members wherethrough a heat absorbent fluid is circulated;
a fluid circulating system adapted to inject a heat absorpitive fluid into said solar radiation converter system at a first temperature and extract said fluid from said system at a second temperature wherein said second temperature is greater than said first temperature;
a fluid storage means adapted to receive heated fluid from said solar radiation converter system, said receiving means including a one-way pressure valve adapted to permit fluid transfer from said radiation converter system to said storage means when the differential pressure therebetween exceeds a predetermined value;
heat radiation means adapted to receive heated fluid from said storage means;
means to return said fluid from said radiation means to said solar radiation converter system including a one-way valve;
a solar radiation converter system bypass connected between said radiation means return fluid line and said storage means, said interconnection to said storage means adapted to be downstream of said pressure valve;
a fluid pump in said bypass system; and
a one-way valve between said fluid pump and said storage means.

4,031,880
METHOD AND DEVICE FOR COLLECTING SOLAR ENERGY
Bernard Devin, Gif-sur-Yvette, France, assignor to Commissariat a l'Energie Atomique, Paris, France
Filed Apr. 19, 1976, Ser. No. 678,117
Claims priority, application France, Apr. 21, 1975, 75.12367
Int. Cl.² F24J *3/02*
U.S. Cl. 126—271 **9 Claims**

1. A method for collecting solar energy by means of a system of stationary collectors differently oriented with respect to the sun, of the type in which a heat-transporting fluid is circulated; circulating the heat-transporting fluid through said system of collectors connected together in series from the collector which is least exposed to solar radiation to the collector which is the most exposed to solar radiation and reversing the direction of flow of the fluid within the collectors automatically at a moment of the day which is determined beforehand so as to control the quantity of energy delivered by the collectors by flow of the heat transporting fluid from the collector least exposed to solar radiation to the collector most exposed to solar radiation.



4,031,881
SOLAR HEATER
Heinz E. P. Thiel, 468 Willis Drive, Oakville, Ontario, Canada
Filed Oct. 20, 1975, Ser. No. 624,249
Int. Cl.² F24J *3/02*
U.S. Cl. 126—271 **2 Claims**



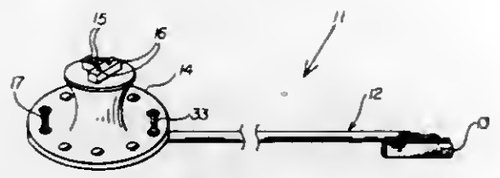
1. A solar heater comprising:
a plurality of liquid conducting metal pipes arranged in an array to receive incident solar radiation from a mean direction on one side of said array,
said metal pipes each being formed from sheet metal having a predetermined reflectivity on both sides bent to form a tube,
means for connecting to said pipes a liquid conduit connected to supply liquid to said pipes to flow therethrough,
means for connecting to said pipes a liquid conduit for carrying away liquid which has flowed through the pipes in said array,
said pipes in said array being provided, with a treated heat absorptive surface on the side thereof designed to approximately face the direction of incident solar radiation,
the pipes in said array being provided with an inner surface having the reflectivity produced by a surface not coarser than that providing a centre-line average of 60μ".

4,031,882

APPARATUS FOR INTERFACING TO ANATOMIC SIGNAL SOURCES

Carlo J. DeLuca, Newton, Mass., assignor to Liberty Mutual Insurance Company, Boston, Mass.

Division of Ser. No. 595,582, July 14, 1975. This application June 28, 1976, Ser. No. 700,195
Int. Cl.² A61B 5/04
U.S. Cl. 128—2.1 R 5 Claims



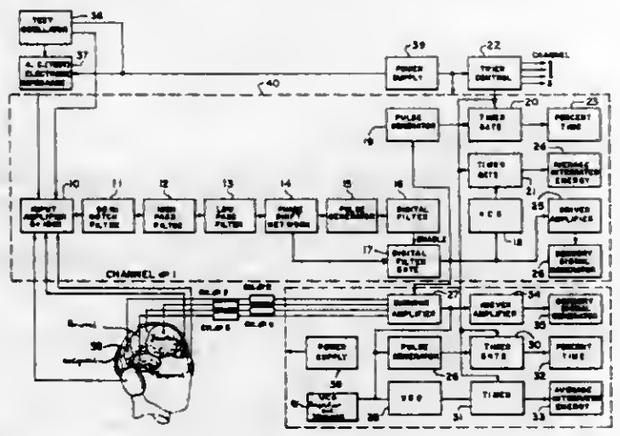
1. An electrical system for interfacing to anatomic signal sources and comprising:
terminal means suitable for anatomic implantation so as to receive primary signals generated physiologically;
coupling means comprising a piece of sheet material secured to said terminal means and being shaped and arranged for juxtaposition to the outer surface of a nerve, said sheet material having interstices of a size for receiving tissue growth after being implanted;
electrical lead means suitable for anatomic implantation and connected to said terminal means so as to receive said primary signals;
output circuit means connected to receive said primary signals from said electrical lead means; and
electrical insulator means suitable for anatomic implantation and enclosing said terminal means so as to shield said terminal means from noise signals generated physiologically, said insulator means comprising an elongated hollow casing closed at one end and enclosing said coupling means and of a size to surround the nerve so as to disrupt external electrical conductive paths to said terminal means.

4,031,883

MULTIPLE CHANNEL PHASE INTEGRATING BIOFEEDBACK COMPUTER

Lester G. Fehmi, Princeton, N.J., and Joseph R. Schneider, Larchmont, N.Y., assignors to Biofeedback Computers, Inc., Rocky Point, N.Y.

Division of Ser. No. 492,954, July 29, 1974, Pat. No. 3,978,847. This application July 21, 1976, Ser. No. 707,480
Int. Cl.² A61B 5/04
U.S. Cl. 128—2.1 B 17 Claims



1. An apparatus for measuring the electroencephalographic activity of at least two lobes of the brain of a human trainee and providing the trainee with a sensory signal in response to a combination of amplitude and the inphase activity of each of the brain lobes comprising:
a plurality of electrical contacts coupled to the head of the trainee, said contacts being disposed adjacent to at least two lobes or areas of the brain, and to a neutral area of the trainee's head for obtaining at least two signals from said contacts which correspond to each of said at least two lobes or areas of the brain;
at least one amplifier for amplifying said at least two signals;
filter means coupled to said at least one amplifier for filtering the signals to obtain output signals each within a defined frequency range;
a summing amplifier coupled to said filter means for summing the in-phase signals of the defined frequency band of the amplified brain wave activity to produce a phase relevant measure of the trainee's brain wave activity;
audio signal means coupled to said summing amplifier for producing an auditory signal and modulating the volume of the auditory signal responsive to the amplitude and phase of the summed brain wave activity, so as to present to the trainee an audible signal which reflects the degree of phase parity and amplitude of the signals recorded from said at least two lobes or areas of the brain.

15. An apparatus for measuring the bioelectrical activity such as muscle activity of at least two regions of the body of a human trainee and providing the trainee with a sensory signal in response to a combination of amplitude and the inphase activity of each of the regions of the body comprising,
a plurality of electrical contacts for coupling to the body of the trainee, said contacts being disposed adjacent to at least two regions of the body, and to a neutral area of the trainee's body so as to obtain at least two signals from said contacts which correspond to each of said at least two regions of the body;
at least one amplifier coupled to said contacts for amplifying said at least two signals;
a summing amplifier coupled to said at least one amplifier for summing the in-phase signals of the amplified signals to produce a phase relevant measure of the trainee's bioelectrical activity;
filter means coupled to said summing amplifier for filtering the summed signals to obtain an output signal within a defined frequency range; and
signal means coupled to said filter means for producing a tactile signal and modulating the magnitude of the tactile signal responsive to the amplitude and phase of the summed bioelectrical activity so as to present to the trainee and tactile signal which reflects the degree of phase parity and amplitude of the signals recorded from said at least two regions of the body.

4,031,884

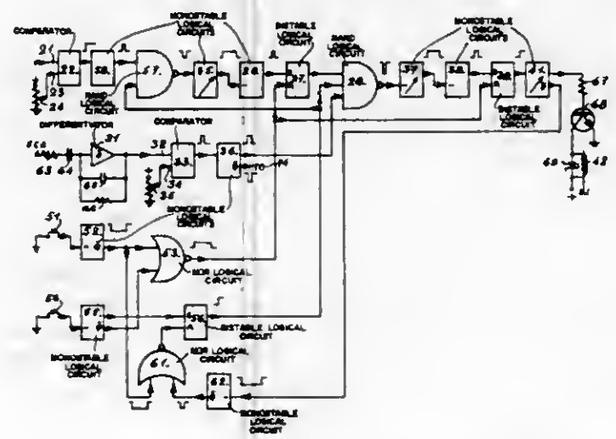
APPARATUS FOR CORRELATING THE RESPIRATORY AND CARDIAC CYCLES

Daniel Georges Christian Henzel, Noisy le Grand, France, assignor to Institut National de la Sante et de la Recherche Medicale, Paris, France

Filed June 2, 1975, Ser. No. 583,184
Claims priority, application France, June 7, 1974, 74.19669
Int. Cl.² A61B 5/02, 5/08
U.S. Cl. 128—2.05 R 9 Claims

1. An apparatus for correlating respiratory and cardiac cycles comprising:
means for defining a chosen period in the progress of the respiratory cycle as the end of a regulatable delay beginning when the ascending front of the inspiratorial pressure reaches a regulatable level,
means for defining a chosen period in the progress of the cardiac cycle as the end of a regulatable delay beginning when the differential dV/dt of the blood pressure reaches a regulatable level,

means for activating an operator upon the coincidence of



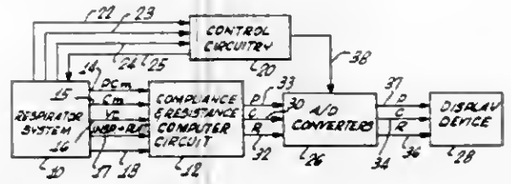
these two periods in time after a regulatable delay and during a regulatable period.

4,031,885

METHOD AND APPARATUS FOR DETERMINING PATIENT LUNG PRESSURE, COMPLIANCE AND RESISTANCE

James E. P. Davis, Santa Monica, and David M. Omelich, Cerritos, both of Calif., assignors to Puritan-Bennett Corporation, Kansas City, Mo.

Filed Oct. 15, 1975, Ser. No. 622,536
Int. Cl.² A61B 5/08
U.S. Cl. 128—2.08 13 Claims



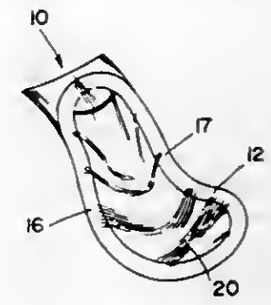
1. For use with a respirator system of the volume-compensated type in which a preselected volume of gas is delivered to a patient during an inspiration phase of the patient breathing cycle, apparatus for the determination of patient compliance and resistance comprising:
control means operable to initiate computation and display of patient compliance and resistance;
means for sampling the system pressure at the end of the inspiration phase;
means included within said control means for ensuring a plateau phase, following the inspiration phase and preceeding an expiration phase, long enough to allow the system pressure to equalize with the patient lung pressure;
means for sampling the system pressure at the end of the plateau phase, to obtain a measure of the lung presure at the end of the inspiration phase;
means for monitoring the actual volume of gas delivered to the patient; and
means for computing and displaying patient compliance, as derived from the monitored volume and the system pressure sampled at the end of the inspiration phase, and patient resistance, as derived from the monitored volume and the two sampled values of the system pressure.

4,031,886

OCCLUSIVE PESSARY

Vera B. Morhenn, 731 De Soto, Palo Alto, Calif. 94303

Continuation of Ser. No. 612,284, Sept. 11, 1975, abandoned. This application Aug. 30, 1976, Ser. No. 718,614
Int. Cl.² A61F 5/24
U.S. Cl. 128—130 13 Claims



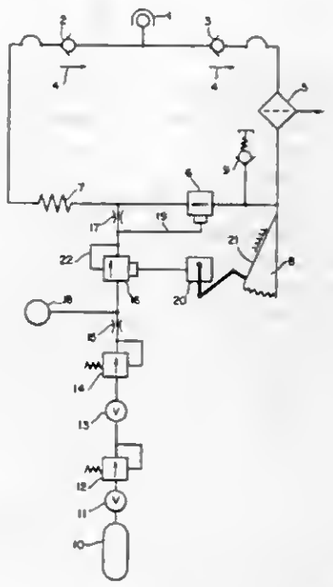
13. In combination, a pessary for the support and stabilization of the human uterus comprising a frame made of an elongated body of generally cross-section formed into a closed figure; and a bag made of thin and flexible material receiving said frame entirely therewithin, whereby said frame is totally enclosed within said bag.

4,031,887

BREATHING APPARATUS PROVIDING PRESSURE COMPENSATION

Imre Botos, Lidingo, and Ivan Aldine Hellquist, Rotebro, both of Sweden, assignors to AGA Aktiebolag, Sweden

Filed Feb. 26, 1976, Ser. No. 661,490
Claims priority, application Sweden, Mar. 14, 1975, 7502855
Int. Cl.² A62B 7/02
U.S. Cl. 128—142 R 8 Claims



1. Breathing apparatus for use under water, in a noxious atmosphere or under like conditions, said apparatus comprising:
a container for breathing gas,
a breathing circuit including connecting means, connected in said breathing circuit, for connection to the breathing organs of a user, carbon dioxide absorbing means connected in said breathing circuit and an expansible gas chamber connected in said breathing circuit,
a conduit for supplying breathing gas from said breathing gas container to said breathing circuit, and
means, including valve means connected in said conduit, for controlling the operation of said breathing circuit to

provide (i) a first operating period wherein said breathing circuit form a closed breathing circuit and a breathing gas is caused to circulate in said breathing circuit until the oxygen concentration of the circulating breathing gas is reduced to a predetermined value and (ii) a second operating period, which alternates with said first operating period, wherein the used breathing gas is released to the ambient environment and fresh gas is supplied to the breathing circuit;

wherein the improvement comprises:

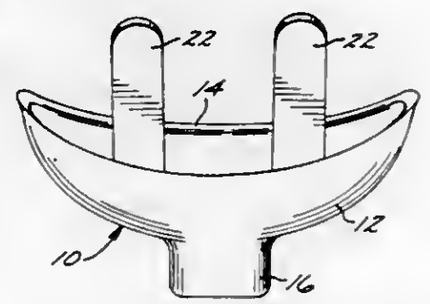
a dosing bottle, and means for, during the first operating period, connecting the bottle to the breathing gas container so as to store in the bottle fresh gas having a pressure exceeding the pressure in the breathing circuit and for, during the second operating period, connecting the bottle to the breathing circuit so as to supply the contents of the bottle to the breathing circuit and thus to the expansible gas chamber until the pressure in the dosing bottle is substantially equal to the pressure in the breathing circuit.

4,031,888

BREATHING MOUTHPIECE FOR UNDERWATER USE

William D. Walters, 2940 Andros St., Costa Mesa, Calif. 92626

Filed Jan. 5, 1976, Ser. No. 646,878
Int. Cl.² A62B 7/00
U.S. Cl. 128—145 A **5 Claims**



1. A breathing mouthpiece for underwater use comprising:

a housing having a flexible edge contoured to surround the wearer's mouth and fit snugly against the face in spaced relation to the wearer's lips to permit free movement of the lips, said housing further having a central port to breath through; and

a pair of elongated, flexible bit members affixed interiorly to said housing on opposite sides of said port and sufficiently laterally spaced apart on opposite sides of said port, and projecting beyond said edge sufficiently, to fit between molar teeth of the wearer, the portion of said housing between said bit members and adjacent said port being open to permit the wearer's lips to come together adjacent said port, said bit members being sufficiently thick to allow them to be gripped by molar teeth of the wearer and sufficiently thin to enable the wearer's lips to come together whereby said mask can be held in position while yet allowing free movement of the lips and limited movement of the front teeth.

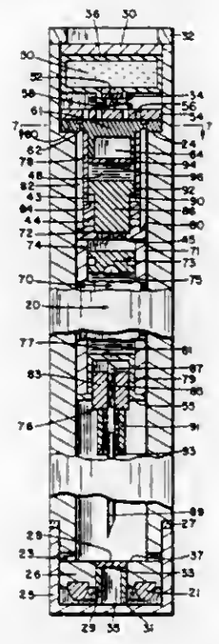
4,031,889

POWER OPERATED ASPIRATING HYPODERMIC SYRINGE

William Floyd Pike, 915 Alamosa, Carlsbad, N. Mex. 88220

Continuation-in-part of Ser. No. 559,961, March 25, 1975, Pat. No. 3,977,401, and a continuation-in-part of Ser. No. 593,771, July 14, 1975, Pat. No. 3,977,402. This application May 19, 1976, Ser. No. 687,893
Int. Cl.² A61M 5/00
U.S. Cl. 128—215 **7 Claims**

1. A disposable gas pressure operated hypodermic syringe for automatically inserting a hypodermic needle into tissue, drawing a vacuum in said needle, and finally injecting medicament into the tissue, comprising: an elongated tubular main housing having a sealed first end, being the triggering end, and a second end, being the needle end; a source of compressed gas housed in a first end portion of the main housing; an elongated unitary tube slidably supported in the main housing and extending from a first end which is proximate the source of compressed gas when the syringe is in the preset condition to a second end which is foreshortened from the second end of the main housing by the length of an extensible portion of the hypodermic needle, substantially; a sliding valve member having a cylindrical head and a cylindrical stem, said cylindrical stem having a diameter less than that of the head, said valve member cylindrical head having a hermetic fit in a reduced cross sectional portion of the elongated unitary tube, and the stem portion having a hermetic fit with a further reduced cross sectional portion of the elongated unitary tube, said sliding valve member being situated in the elongated unitary tube proximate the source of compressed gas; a medicament chamber support in the elongated unitary tube be-



tween the sliding valve member and the second end of said elongated unitary tube; a piston closing the end of the medicament chamber facing the sliding valve member; a hypodermic needle supported in the second end of the elongated unitary tube proximate the medicament chamber, said hypodermic needle having an elongated end portion housed in and facing the second end of the main housing; manual means for releasing the compressed gas into the first end of the main housing to propel the elongated unitary tube to the second end of the main housing and to insert the elongated end portion of the hypodermic needle into tissue; means for admitting gas pressure to the head of the sliding valve member on the side facing the medicament chamber, means for restricting the movement of the sliding valve member to a selected rate of travel, the movement of the stem of said sliding valve producing a vacuum in the medicament chamber thereby effecting the function of aspirating, means controlled by the sliding valve member when it has completed the aspiration stroke, substantially, for admitting gas pressure into the medicament chamber to inject the medicament into tissue.

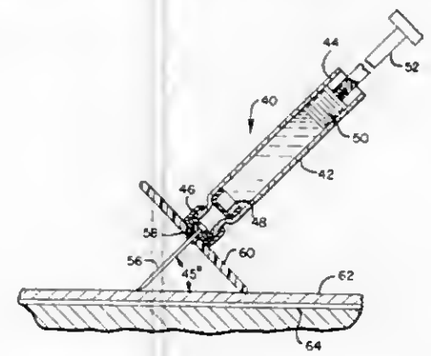
4,031,890

SAFETY I. V. INJECTOR

Gerlof Homan, St. Louis, Mo., assignor to Survival Technology, Inc., Bethesda, Md.

Filed Jan. 14, 1976, Ser. No. 648,972
Int. Cl.³ A61M 5/32
U.S. Cl. 128—215 **3 Claims**

1. An I.V. injector having a cylindrical barrel open at one end and closed at the other end by sealing means, a cannula mounted on the closed end outwardly of the sealing means, a plunger slidably carried in the open end of the barrel, a chamber formed in the barrel between the plunger and the sealing means, said chamber being adapted to receive a high concentrate I.V. medicament, and means at the closed end of the barrel to prevent the presentation of the cannula at an included angle between the cannula and the patient's blood vessel of less than 45°, thus preventing proper intravenous



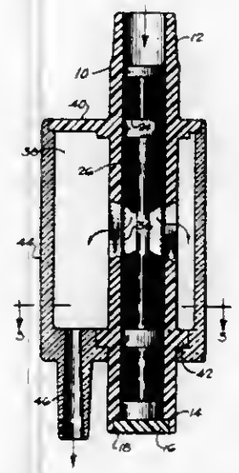
injection of the aforesaid medicament into a patient by causing the user to become aware that the usual intravenous injection procedure cannot be followed thereby inducing the user to check the injector, said means comprising spacer means mounted on the closed end of the barrel and extending perpendicularly outward from the longitudinal axis of the barrel a distance whereby the included angle between the cannula and the patient's blood vessel upon presentation of the cannula for injection will be at least 45° thereby making an intravenous injection impractical due to the steep angle of entry.

4,031,891

AIR ELIMINATING FILTER

Thurman S. Jess, Mundelein, Ill., assignor to Baxter Travenol Laboratories, Inc., Deerfield, Ill.

Filed Nov. 3, 1975, Ser. No. 628,435
Int. Cl.² A01M 5/16
U.S. Cl. 128—214 R **2 Claims**



1. An air-eliminating filter for intravenous liquids comprising:

an elongated, hollow, tubular filter support member defining inlet means at one end thereof and closed at its other end, a plurality of circumferentially-spaced, longitudinally extending ribs defined along an intermediate portion of said tubular member, and circumferentially spaced window portions defined between said ribs to permit communication between the interior and exterior of said tubular support member;

a tubular, hydrophilic filter element capable of passing aqueous liquid therethrough when wet with said liquid, while simultaneously blocking the flow of air, positioned wthin said tubular member in coaxial relationship thereto, said hydrophilic filter element being carried by a central portion of said ribs to occlude central portions of said window openings;

a pair of tubular, hydrophobic filter elements capable of repelling aqueous liquid and passing air therethrough, each being positioned adjacent an end of said hydrophilic tubular filter element, said hydrophobic filter elements being carried by end portions of said ribs to block flow through end portions of said window openings,

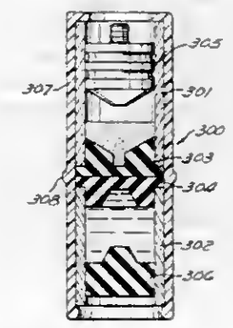
and manifold means mounted on said tubular member to enclose said hydrophilic filter but not to enclose said hydrophobic filters, said manifold means including outlet means to discharge liquid therefrom.

4,031,892

TWO-CHAMBER MIXING SYRINGE

Alfred A. Hurschman, Hudson, Ohio, assignor to Ampoules Corporation, Hudson, Ohio

Division of Ser. No. 489,746, July 18, 1974, Pat. No. 3,946,732, which is a continuation-in-part of Ser. No. 386,594, Aug. 8, 1973, abandoned. This application Feb. 13, 1976, Ser. No. 657,860
Int. Cl.² A61M 5/00
U.S. Cl. 128—218 M **9 Claims**



1. A two-chamber mixing vial comprising:

a. a glass cylinder;

b. closure means closing one end of said cylinder;

c. an end diaphragm closing the other end of said cylinder; and

d. a stationary intermediate diaphragm within said cylinder separating the interior of the cylinder into first and second chambers respectively defined by said closure means and intermediate diaphragm and by said intermediate diaphragm and end diaphragm; said cylinder and intermediate diaphragm having coacting parts that comprise means for locking the intermediate diaphragm against axial movement toward the said plunger during a mixing operation and during a dispensing operation.

4,031,893

HYPODERMIC INJECTION DEVICE HAVING MEANS FOR VARYING THE MEDICAMENT CAPACITY THEREOF

Sheldon Kaplan, Potomac; George B. Calkins; Stanley J. Sarnoff, both of Bethesda, and N. Lawrence Dalling, Wheaton, all of Md., assignors to Survival Technology, Inc., Bethesda, Md.

Filed May 14, 1976, Ser. No. 686,636
Int. Cl.² A61M 5/00
U.S. Cl. 128—218 F **6 Claims**

1. In a hypodermic injection device comprising a gun, a cartridge holder in operative relationship to the gun, a cartridge within the holder, said gun comprising a sleeve open at one end thereof, a plunger positioned within the sleeve, spring power means acting on said plunger tending to move it out the open end of the sleeve, restraining means cooperating with

said plunger to prevent plunger movement, safety means acting on said restraining means to render it inoperative, said cartridge holder comprising a hollow shell acting as a prolongation of the gun sleeve, said cartridge including an ampoule comprising a hollow cylindrical sleeve, a piston slidably positioned in one end thereof and means mounting a cannula extending from and closing off the other end, a medicament chamber formed between the piston and the cannula, the

cartridge fitting within the cartridge holder with the free end of the cannula within the end of the holder remote from the gun, a resilient sheath covering the cannula to maintain the cannula in sterile condition, the improvement comprising:

means positioned between the outer face of the piston and the adjacent end of the plunger to control the position of the piston within the ampoule sleeve thus determining the volume of the medicament chamber and thus the quantity of medicament carried in the syringe.

4,031,894

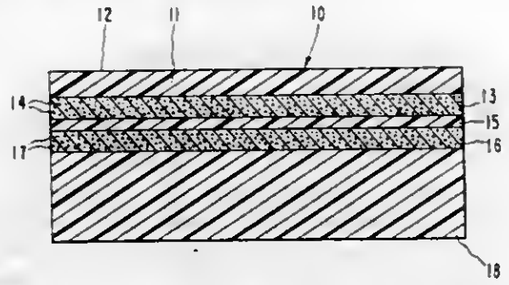
BANDAGE FOR TRANSDERMALLY ADMINISTERING SCOPOLAMINE TO PREVENT NAUSEA

John Urquhart; Santosh Kumar Chandrasekaran, both of Palo Alto, and Jane Elizabeth Shaw, Atherton, all of Calif., assignors to Alza Corporation, Palo Alto, Calif.

Continuation-in-part of Ser. No. 638,947, Dec. 8, 1975, abandoned, which is a continuation-in-part of Ser. No. 547,504, Feb. 6, 1975, abandoned. This application Sept. 7, 1976, Ser. No. 721,602

Int. Cl.² A61F 7/02; A61L 15/06

U.S. Cl. 128—268 **12 Claims**



1. A therapeutic system in the form of a bandage for administering scopolamine base through unbroken skin to inhibit emesis and nausea for a prolonged time period comprising a sandwich-type laminate of:

a. a backing lamina that is substantially impermeable to scopolamine base, one face of which forms the top of the bandage:

b. a scopolamine base reservoir lamina adjacent the opposite face of the backing lamina comprising

i. about 0.2 to about 3 mg scopolamine base dispersed in a gelled mixture of

ii. mineral oil of about 10 to about 100 cp at 25° c, and polyisobutene;

c. a microporous membrane lamina adjacent and below the scopolamine reservoir lamina through which the scopolamine base is released from the reservoir lamina after the bandage is affixed to the skin at a substantially constant rate in the range of about 0.3 to about 15 μg/hr; and

d. a contact adhesive lamina adjacent and below the microporous membrane lamina by which said bandage is affixed to the skin comprising about 10 to about 200 μg scopolamine base per cm^2 effective surface area dispersed in a gelled mixture of said mineral oil and said polyisobutene.

4,031,895

SYRINGE ASSEMBLY PACKAGE

Robert E. Porter, 1734 Machado St., Oceanside, Calif. 92054

Filed Apr. 5, 1976, Ser. No. 674,033

Int. Cl.² A61M 5/18; B65D 81/32

U.S. Cl. 128—272.1 **11 Claims**

1. A prepackaged syringe assembly comprising a support structure, a syringe having a discharge needle and a barrel adapted to be loaded with a first substance and a container adapted to be loaded with a second substance, said syringe and said container being mounted in said structure for relative slidable and rotational displacement, said syringe having its needle tip within said structure and said container mounting within the structure a sealing body wherein the needle tip is imbedded in one relative position of rotation of said syringe and container for isolation of said substances while in the structure and also mounting a puncturable closure element laterally spaced from said sealing body adapted to permit entry of the needle tip into the container in another relative position of rotation of the syringe and container in the package for admixture of said substances and reloading of the syringe with the mixture, said syringe being separable from the remainder of the assembly for immediate use after said reloading.

4,031,896

SURGICAL SUCTION SETS

Per Magnus Lennart Ronnmark, Gislaved, Sweden, assignor to Molnlycke AB, Gothenburg, Sweden

Filed Oct. 17, 1975, Ser. No. 623,500

Claims priority, application Sweden, Oct. 18, 1974, 7413157

Int. Cl.² A61M 1/00

U.S. Cl. 128—276 **10 Claims**

1. A surgical suction device for removing fluid from a wound and adapted to be connected to a suction pump by a hose pipe, said device comprising:

a tubular-shaped handle,

an inner tube extending from one end of said handle and having a suction opening at one end thereof and a tip at the other end thereof,

an outer tube surrounding said inner tube to form an annular space therebetween, said inner and outer tubes being movable relative to each other,

a plurality of openings formed in said channel for quickly removing large quantities of fluid from a wound,

said outer tube including at one end thereof a tapered section having a suction opening at one end and a seat member at its other end, and

the tip of said inner tube being movable into and out of contact with said seat member so that when said tip and said seat member are in contact with each other, a single tube suction function is obtained in that suction is applied only to said tip, and when said tip and said seat member are out of contact with each other, a sump suction function is obtained in that suction is applied to both said plurality of openings and said tip.

4,031,897

COLLECTOR FOR AMNIOTIC FLUID

Adan Graetz, Apartado Postal 374, Cuernavaca, Mor, Mexico

Filed Apr. 21, 1976, Ser. No. 679,060

Int. Cl.² A61F 5/44

U.S. Cl. 128—286 **13 Claims**

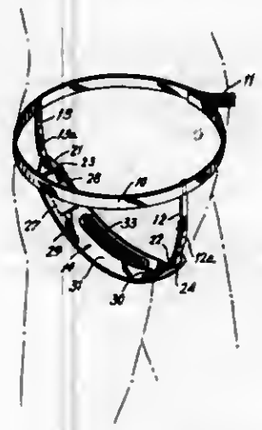
1. An article for collecting and retaining amniotic fluid discharged from an expectant mother, which comprises

a. body encircling support means,

b. a flat, flexible pocket-forming member engaged at forward and rearward ends by said support means,

c. said pocket-forming member having a fluid receiving opening in its upper portion,

d. a fluid receiving receptacle formed of lightweight, flexible, foldable material and having its open upper end secured to and communicating with said openings,



e. a flat pocket formed in said pocket-forming member, below said fluid receiving opening, for the reception and containment of said receptacle in a flat, folded condition,

f. said receptacle being quickly removable from said pocket while said article is being worn by the user, to place said receptacle in fluid receiving condition.

4,031,898

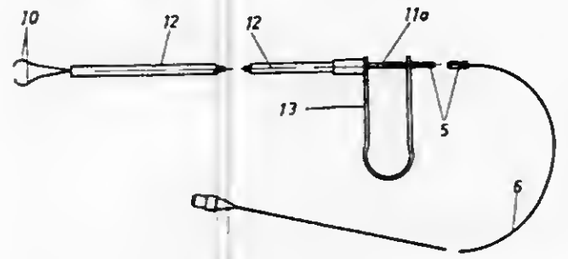
SURGICAL INSTRUMENT FOR COAGULATION PURPOSES

Siegfried Hiltebrandt, Aug.-Lammle-Str. 16, D-7134 Knittlingen, and Helmut Wurster, Mozartstr. 20, D-7519 Oberderdingen, both of Germany

Continuation of Ser. No. 529,042, Dec. 3, 1974, abandoned. This application Sept. 13, 1976, Ser. No. 722,926

Int. Cl.² A61N 3/04; A61B 17/38

U.S. Cl. 128—303.1 **1 Claim**



1. A coagulation probe having a head and having a heating element embodied within the head, the head being adapted to be heated up to a predetermined maximum temperature in a temperature range extending from about 110° C to about 150° C necessary for the coagulation of thermolabile tissue during a predetermined heating period and alternating cooling-off period for the head, the heating element being a part of a circuit energized by electrical current of an electrical voltage source and being adapted to be switched-off initiating and during the cooling-off period such that after this later period a sticking of tissue to the head is prevented, the said circuit having switch means for opening and closing said circuit adapted thereby to energize and deenergize respectively, the heating element, said switch means adapted to be automatically controlled by a settable electronic control means for closing said switch for a predetermined adjustable length of time and opening said switch for a predetermined length of time substantially equivalent to said cooling-off period and for working signal means giving signals at respectively a beginning and an end of said heating period, and giving a different signal for indicating the end of the cooling-off period.

4,031,899

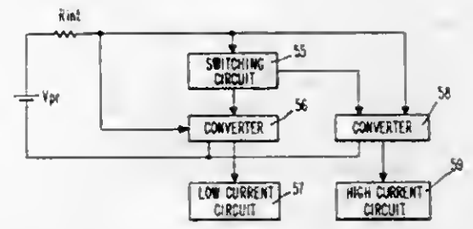
LONG LIFE CARDIAC PACER WITH SWITCHING POWER DELIVERY MEANS AND METHOD OF ALTERNATELY DELIVERING POWER TO RESPECTIVE CIRCUIT PORTIONS OF A STIMULUS DELIVERY SYSTEM

Alexis C. M. Renirie, Dieren, Netherlands, assignor to Vitatron Medical B.V., Dieren, Netherlands

Filed Jan. 22, 1976, Ser. No. 651,549

Int. Cl.² A61N 1/36

U.S. Cl. 128—419 PS **38 Claims**



1. Self contained pacer apparatus for delivering stimulus pulses, comprising:

a. a battery source which provides an output which varies with the loading thereof and having characteristics which vary as a function of its energy depletion;

b. a source sensitive stimulus pulse generating circuit;

c. a stimulus output circuit, driven by the output of said source sensitive circuit, for delivering said stimulus pulses; and

d. connecting means for connecting said source output respectively to said source sensitive circuit and to said stimulus output circuit so that the loading of each of said circuits has no effect upon said source output when connected to the other of said circuits.

BRASSIERE ADJUSTABLE IN HEIGHT, IN PARTICULAR FOR BATHING SUITS

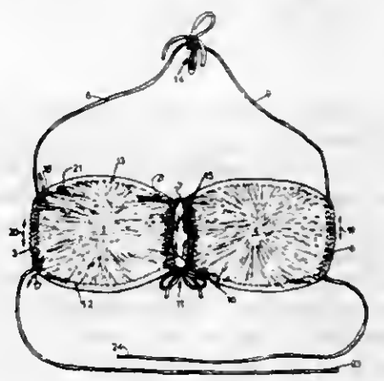
Christian Guidoni, Immeuble "Le Plein Horizon" 62 Chemin du Bois, Rillieux la Pape, Rhone, France

Filed June 14, 1974, Ser. No. 479,536

Claims priority, application France, June 15, 1973, 73.22580

Int. Cl.² A41C 3/00; A41D 7/00

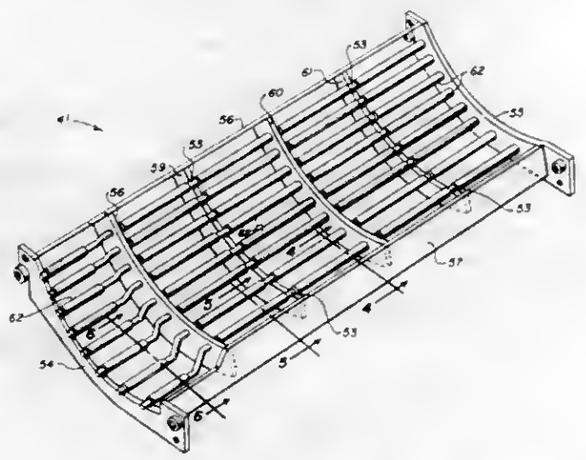
U.S. Cl. 128—493 **9 Claims**



1. A brassiere comprising, in combination:

first and second separate and individually and independently movable and adjustable fabric pieces;
said first fabric piece having tubular hems at opposite edges thereof;
said second fabric piece having tubular hems at opposite edges thereof;
said first and second fabric pieces comprising two surfaces of fabric which constitute pouches each of which has a substantially rectangular shape on which said tubular hems border the vertical sides thereof, and on which the upper horizontal side thereof is provided with a flat seam, and on which the lower horizontal side thereof has a hem inside of which an elastic means is provided;
said elastic means being connected to the fabric near the corners of said rectangular surface;
first means slidably disposed through a tubular hem of said first fabric piece and through a tubular hem of said second fabric piece for independently adjustably and removably interconnecting said first and second fabric pieces at adjacent edge thereof and for providing an adjustable and variable space between said adjacent edges of said first and second separate and individually and independently movable and adjustable fabric pieces;
a first elongated member slidably disposed through the other tubular hem of said first fabric piece;
a second elongated member slidably disposed through the other tubular hem of said second fabric piece; and
the two ends of said first elongated member being removably and adjustably connected to the two ends of said second elongated member for independently adjustably and removably interconnecting said first and second fabric pieces at the remote edges thereof and for facilitating easy removal of said brassiere from the wearer thereof.

4,031,901
CONCAVE FOR AN AXIAL FLOW TYPE COMBINE
Edward W. Rowland-Hill, Lancaster, Pa., assignor to Sperry Rand Corporation, New Holland, Pa.
Filed June 7, 1976, Ser. No. 693,676
Int. Cl.² A01F *12/24*
U.S. Cl. 130—27 T **40 Claims**



1. In an axial flow combine having a mobile frame adapted to be propelled forwardly over a field of grain bearing crop material, at least one longitudinally extending axial flow threshing and separating unit mounted within the frame, said unit including a generally cylindrical casing and a rotor mounted for rotation with the casing, said casing including an improved lower longitudinally extending concave, the rotor having means mounted on the periphery thereof and being operable upon rotation of said rotor and in cooperation with the improved concave to thresh grain from the unthreshed grain bearing crop material introduced into said unit and advance the crop material through said unit while subjecting the crop material to a threshing and separating action wherein threshed and separated grain material passes through said concave to a grain handling and cleaning means disposed underneath said axial flow unit, said improved concave comprising:
a. a plurality of longitudinally extending rod-like members;
b. at least two spaced apart transversely extending arcuate shaped support members for supporting said rod-like members, said rod-like members being arranged to define an arc about a common axis and aligned generally parallel to each other; and
c. one or more sleeve members rotatably mounted on at least one of said spaced apart rod-like members so as to define openings between adjacent ones of said members and facilitate the passage of threshed and separated crop material therethrough.

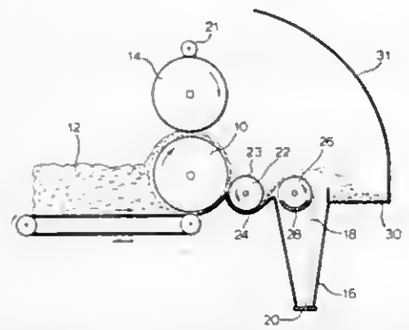
WINNOWING OF TOBACCO
Warren A. Brackmann, Cooksville, and Daniel Dilanni, Toronto, both of Canada, assignors to Rothmans of Pall Mall Canada Limited, Toronto, Canada
Filed Aug. 29, 1975, Ser. No. 608,842
Claims priority, application United Kingdom, Sept. 5, 1974, 38921/74
Int. Cl.² A24B *1/02*; **A24C** *1/02*; **A24B** *7/14*
U.S. Cl. 131—109 B **26 Claims**



1. A method for the production from a source of tobacco particles of a relatively wide and thin downwardly-flowing stream of tobacco particles moving at a speed in excess of that achievable by gravitational forces alone, which comprises:
forming from said source a broad stream of tobacco particles of width substantially equal to the width of said downwardly-flowing stream, said tobacco particles in said broad stream flowing at a predetermined speed in substantially separated condition one from another in a flow path intersecting a plane of flow of said downwardly-flowing stream,
rotating adjacent to and beneath said broad stream and at the upper end of said downwardly-flowing stream an air-permeable and tobacco-impermeable foraminous cylindrical surface of length substantially equal to the width of said broad stream about its axis parallel to said plane of flow of said downwardly-flowing stream at a peripheral speed at least equal to said predetermined speed and equal to the speed of particles in said downwardly-flowing stream,
subjecting the tobacco particles in said broad stream to air flow transverse to the direction of movement thereof towards said foraminous surface by suction air flow applied across said foraminous surface, to deflect tobacco particles from said broad stream into engagement with said foraminous surface,
gripping said deflected and engaged particles to said foraminous surface by said suction whereby said gripped particles assume the speed of said foraminous surface and remain in substantially separated condition,
transporting said gripped particles on said foraminous surface until the particles are moving in a substantially vertically-downwardly direction, and
releasing said transported particles from said suction grip when they are moving in said vertically downwardly direction to form said downwardly-flowing stream of tobacco.

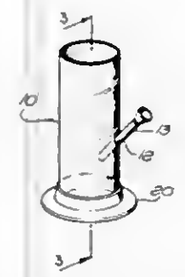
REMOVABLE WATER TIGHT BASE FOR BONG
Eric Karl, Los Angeles, Calif., assignor to Sarah's Family, Inc., Inglewood, Calif.
Filed Sept. 16, 1976, Ser. No. 723,875
Int. Cl.² A24F *1/30*
U.S. Cl. 131—173 **7 Claims**



1. A device for filtering tobacco smoke through liquid comprising:
a first hollow tube having first and second open ends and an outer surface for maintaining a volume of filtering liquid and having an opening in the side thereof;
a second smoke conducting tube disposed through the opening in said first tube having one end disposed in the filtering liquid and the other end communicating with the tobacco;
sealing means having a circumferential flange having inner and outer surfaces and a mouth and adapted for detachable mounting to the bottom of said first tube for sealing said first end of said first tube; and
base means having a recess for receiving sealing means for providing additional pressure to said sealing means and for providing a support for the combination of said sealing means and said first tube.

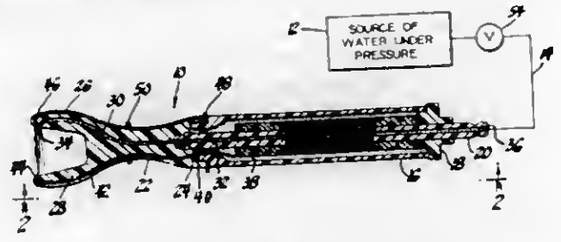
Filed Sept. 4, 1975, Ser. No. 610,270
Int. Cl.² A61C *15/00*
U.S. Cl. 132—91 3 Claims

1. Mouth cleaning apparatus comrprising:
a source of liquid under pressure;
a hollow body;
a head mounted on the body, said head having a pair of spaced arms suited for supporting a length of dental floss between them, a first of said arms having an opening, and first conduit means connected with said opening for discharging a stream of liquid adjacent said arms;
an elongated tube having one end connected to the head so as to be supported in the body, the tube being connected to the source of liquid under pressure and having longitudinal second conduit means fluidly connected to the first conduit means for cooperating therewith for passing liquid therethrough from said source to the opening in the head;
plug means mounted on the body opposite the head for supporting the tube end opposite the end connected to the head, the plug being removeable from the body to permit removal of the tube therefrom, and to permit access into the body; and



a length of dental floss disposed in the body in a stored position about the tube and the second conduit means, the floss being extended from said stored position in the body so as to be connected between the arms of the head in a position adjacent said head opening, the floss on one side of the arm being clamped betweem the head and the body and the floss on the opposite side of the arms being connected to the head whereby the floss between the arms is supported in a taut position for removing matter from the teeth of the user as a stream of liquid is being discharged adjacent the floss.

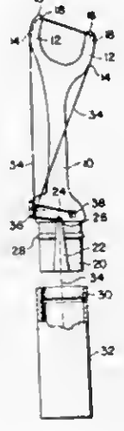
DENTAL FLOSS HOLDER AND DISPENSER
John J. Kelley, Harwinton, Conn., assignor to The Raymond Lee Organization, Inc., a part interest
Filed May 25, 1976, Ser. No. 689,731
Int. Cl.² A61C *15/00*
U.S. Cl. 132—91 3 Claims



1. A dental floss holder and dispenser comprising:
a forked member having a shank with two spaced outwardly disposed prongs at one end, said prongs having outer surfaces with longitudinally extending grooves and tips with transversely disposed aligned bores essentially coplanar with the grooves;
a longitudinally disposed sleeve secured at one end to the other end of the shank, said sleeve having a first conically shaped hollow bore extending longitudinally through the sleeve between its ends, the apex of the bore being disposed at one end of the sleeve, said sleeve having a second bore extending transversely from the outside surface to said apex:
a floss cutter secured to said shank adjacent said other end;
a hollow container with floss therein detachably engaging the sleeve, said floss passing through said first and second bores, along said grooves, through the aligned bores of the prongs and terminating at the cutter; and
manually vertically adjustable slidable means secured to said shank intermediate its ends for detachably engaging the floss before it reaches the prongs and after it leaves the prongs to draw taut that portion of the floss which extends between the aligned bores in the prongs.

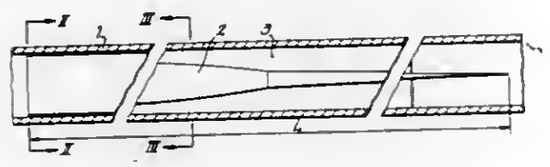
FROTH FORMATION LIMITER FOR DRAWINGS-OFF DEVICE OF CARBON DIOXIDE CONTAINING BEVERAGES

Ramon Apellaniz, Lasne-Chapelle-Saint-Lambert, Belgium, assignor to Euracom S.A., Brussels, Belgium

Filed June 3, 1975, Ser. No. 583,459
Claims priority, application Belgium, June 5, 1974, 253663; May 29, 1975, 254366
Int. Cl.² B67D 1/12
U.S. Cl. 137—170.1 9 Claims

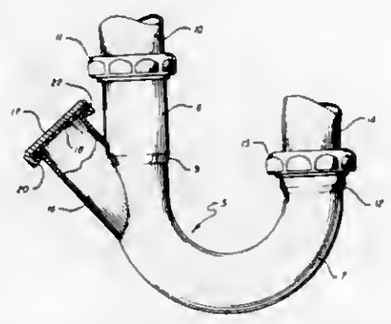


1. A foam formation limiter for drawing-off devices for containers of pressurized carbonated beverages, comprising:
a cylindrical tubular member having a beverage entrance end and defining a flow path for said beverage; and
a foam limiter comprising an elongated member extending centrally within said tubular member and defining with said tubular member and annular flow path for said beverage, said foam limiter being of greatest diameter at said entrance end and tapering to a point in the direction of beverage flow in said tubular member whereby to define, with said tubular member, an annular flow path of increasing sectional area and decreasing boundary surface area, said foam limiter tapering differently in first and second regions of its length said first region tapering convexly and according to a parabolic law and said second region tapering to said point according to a hyperbolic law.

4,031,914
SINK TRAP WITH CLEAN OUT OPENING

John E. Nerl, 4776 Lawndale Road, Syracuse, N.Y. 13215

Filed Dec. 31, 1975, Ser. No. 645,521
Int. Cl.² F16K 9/00
U.S. Cl. 137—247.51 1 Claim

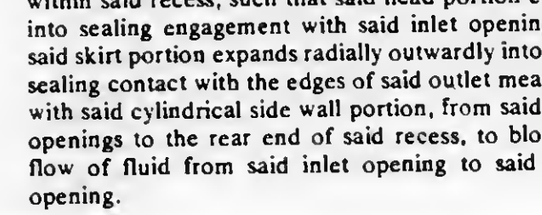


1. In a one piece sink trap, a tubular J-bend having a vertical leg portion terminating at its lower end in an arcuate portion, the arcuate portion bending through substantially 180° from its junction with the leg portion and terminating in an upwardly facing open end, the cross-sectional area of the J-bend being substantially constant from one end to the other, clean out means for the sink trap comprising a unitary tubular branch member that is integrally connected to and communicates with the leg portion of the J-bend adjacent its junction with the arcuate portion, the cross-sectional area of the branch member being substantially the same as that of the J-bend, the branch member extending obliquely upwardly and outwardly from its connection with the J-bend and having an upwardly facing open upper end, the opening at the upper end of the branch member being as large as the cross section of the remainder of the member, a manually removable non-threaded twist-off cap normally forming a closure for the upper end of the branch member, the upper end of the branch member being formed with an outwardly projecting flange having notches therein, the cap having inwardly projecting lugs at its lower edge dimensioned so as to pass through the flange notches whereby twisting the cap brings no lugs into securing engagement with the underside of the branch member flange, and means on the cap that coacts with the branch member upper end to seal the connection therebetween.

4,031,915
IRRIGATION SYSTEM FLUSHING VALVE

Bruce A. McElhoe, Walalua, and Joseph G. Tabrah, Kahuku, both of Hawaii, assignors to Hawaiian Sugar Planters' Association, Honolulu, Hawaii

Division of Ser. No. 522,912, Nov. 11, 1974, Pat. No. 3,921,905. This application June 12, 1975, Ser. No. 586,213
Int. Cl.² F16K 15/14
U.S. Cl. 137—529 3 Claims

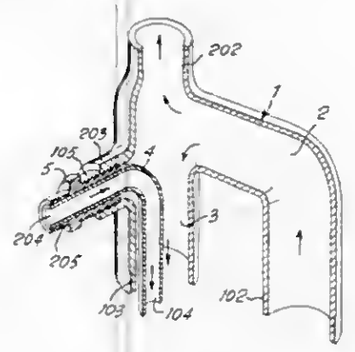


1. A springless valve for controlling the discharge of fluid from a conduit, said valve comprising:
a housing including:
a longitudinally extending, cylindrically shaped chamber having a cylindrical side wall portion and front and rear end wall portions,
an inlet opening associated at said front end wall portion of said chamber and being arranged to conduct pressurized fluid from said conduit to said chamber,
a pilot opening extending though said rear end wall portion of said chamber and being aligned with said inlet opening to conduct pressurized pilot fluid to said chamber, and
an outlet opening arranged in the side wall portion of said chamber and disposed axially rearwardly and radially outwardly of said inlet opening, to conduct pressurized fluid from said chamber,
a valve element slidably disposed in said chamber, said valve element being formed of resiliently deformable material and comprising:
a head portion disposed opposite said inlet opening, and
a cylindrical skirt portion integral with said head portion and defining a recess which opens generally rearwardly toward said pilot opening,
said skirt portion having a cylindrical outer wall free of outward projections and extending from said head portion to the end of the recess and lying generally opposite said cylindrical side wall portion of said housing;
said valve element being rearwardly slidable in response to urgings of pressurized fluid from said inlet opening to allow passage of fluid from said inlet opening to said outlet opening; and
said valve element being forwardly slidable and resiliently expandable, in response soley to sufficient urgings of pilot fluid pressure from said pilot opening acting within said recess, such that said head portion extends into sealing engagement with said inlet opening, and said skirt portion expands radially outwardly into direct sealing contact with the edges of said outlet means and with said cylindrical side wall portion, from said outlet openings to the rear end of said recess, to block the flow of fluid from said inlet opening to said outlet opening.

4,031,916
FITTING FOR A RADIATOR IN A SINGLE DUCT HEATING SYSTEM

Angelo Camerano, Savona, Italy, assignor to Monorapid S.A.S. di Camerano Angelo & C., Sanova, Italy

Filed Mar. 12, 1975, Ser. No. 557,868
Claims priority, application Italy, Mar. 13, 1974, 12530/74
Int. Cl.² F16L 41/02
U.S. Cl. 137—561 A 5 Claims



1. In a single duct heating system, of the type in which a single main flow pipe serves for supplying heating water to a radiator and for returning water therefrom, a fitting for joining a radiator to the main flow pipe, said fitting being in the form of a housing comprising:
a. an inflow duct connected to the main flow pipe through a pipe union;
b. an inlet duct for the radiator veering off from the said inflow duct at an upward angle and connected to an inlet pipe for the radiator through a pipe union, said inlet duct defining an inlet axis;
c. an outflow duct connected to the main flow pipe through a pipe union, said outflow duct being a continuation of the inflow duct veering off therefrom in a downward direction and defining an outflow axis coaxial with said inlet axis;
d. a further pipe union for connection to a return conduit from the radiator, said pipe union being arranged with its axis perpendicular to the outflow axis of the outflow duct;
e. a return duct consisting of an open ended pipe section disposed within the housing, said pipe section being tightly fitted by one of its ends into the said further pipe union and by the other of its ends into the outflow duct and having a bend therein of substantially 90° so that the said ends are substantially perpendicular to each other, whereby the return flow from the radiator flows in the same direction as the outflow in the outflow duct.

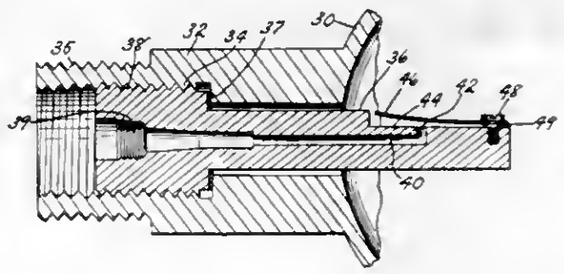
CONSTANT FLOW GAS REGULATOR

Charles R. De John, 35 Beverly Road, West Caldwell, N.J. 07006, and Edwin L. Heger, 271 Henry St., Paramus, N.J. 07652

Continuation-in-part of Ser. No. 458,520, April 8, 1974, abandoned. This application Sept. 8, 1975, Ser. No. 611,009
Int. Cl.² F16K 15/14, 17/24
U.S. Cl. 137—613 11 Claims

1. A constant-flow gas regulator apparatus adapted to be mounted inside of a vessel containing gas under high pressure comprising an elongated regulator body having at least one flat surface, a conduit through said body with one end thereof terminating in an opening in said flat surface in communication with the interior of the vessel and its other end communicating with the exterior of the vessel, and an elongated, radiused, resilient spring reed having a radius of curvature throughout its entire length and having one end thereof operably secured to said surface with a portion of said spring reed extending over the opening in said surface in spaced relation thereto such that the longitudinal axis of said reed is positioned above said opening, the surface area of said reed being about 15 to 100 times the surface area of said conduit opening, whereby said spring reed is maintained in spaced relation

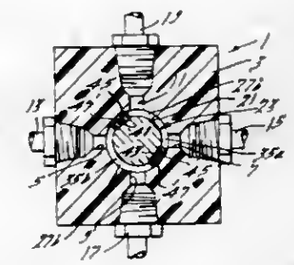


to said opening so as to maintain a substantially constant gas flow rate from the regulator as the internal gas pressure in the vessel decreases or fluctuates over a wide pressure range.

4,031,918
ROTARY SPOOL VALVE

Harlan R. Cagle, Cheboygan, Mich., assignor to Sahlin International, Inc., Birmingham, Mich.

Filed May 24, 1976, Ser. No. 689,007
Int. Cl.² F16K 11/07
U.S. Cl. 137—625.23 17 Claims



1. In a valve having a body with a cylindrical bore and a plurality of ports opening into said bore, a generally cylindrical spool assembly rotatably mounted in said bore to control flow between said ports, said spool assembly comprising a spool member and an elastomeric O-ring member mounted on the spool member, said O-ring member being stretched lengthwise of the spool member and secured thereto so that it extends substantially less than all the way around the circumference of the spool member, said O-ring member sealingly engaging the wall of said bore and being rotatable with the spool assembly to pass across from one side to the other of at least one of said ports and provide means for flow control for said one port.

ARTICULATED RISER

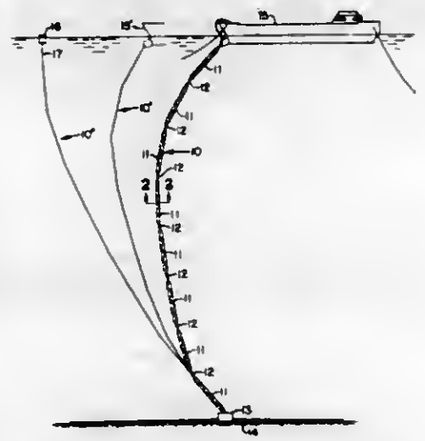
John E. Ortloff; Alfred S. Arcache, and Robert E. Haring, all of Houston, Tex., assignors to Exxon Production Research Company, Houston, Tex.

Continuation of Ser. No. 186,881, Oct. 6, 1971, abandoned. This application Aug. 18, 1975, Ser. No. 605,588
Int. Cl.² F17D 1/08
U.S. Cl. 137—799 9 Claims

1. An articulated marine riser apparatus comprising:
a. at least two elongate structures situated in end-to-end relation and arranged in a substantially vertical orientation, each said structure including at least three rigid, fluid-handling lines that are rigidly affixed thereto and extend the length thereof;
b. a universal joint connecting each adjacent pair of elongate structures, each said joint serving to transfer axial loads between the adjacent structures and including a

pair of transverse flexural axes to permit omnidirectional flexure;

c. at least three flexible fluid-handling lines that interconnect corresponding rigid, fluid-handling lines situated in the adjacent elongate structures;



d. a foundation structure situated on the floor of a body of water; and

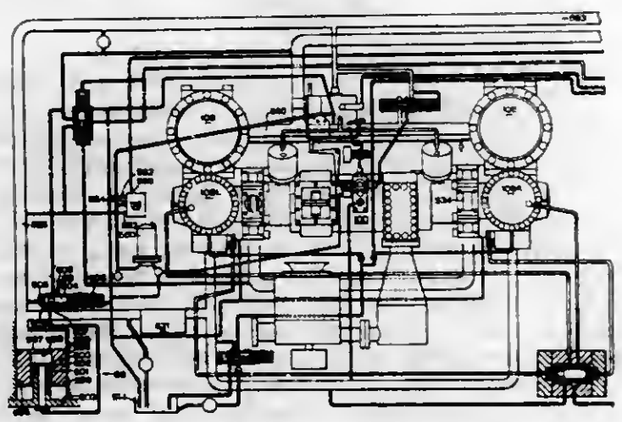
e. a universal joint interconnecting said foundation structure and the lowermost elongate structure.

4,031,920

PRESSURIZED HYDRAULIC SUMP SYSTEM

William Maurice Bard Fitzgerald, R.R. No. 1, Claremont, Ontario, Canada

Division of Ser. No. 305,453, Nov. 10, 1972, Pat. No. 3,841,797. This application Sept. 9, 1974, Ser. No. 504,723
Int. Cl.² F16L 55/04
U.S. Cl. 138—31 4 Claims



1. A pressurized hydraulic sump system comprising means defining a variable volume reservoir,

a sump manifold in fluid communication with said reservoir,

a control valve having a first port communicating with the sump manifold and having a movable valve member therein responsive to sump pressure in said manifold,

said means comprising a piston defining a movable wall of said reservoir which is backed by a fluid space and displaceable to vary the volume of the reservoir in response to differences between hydraulic pressure in said reservoir and hydraulic pressure within said fluid space, a source of fluid pressure,

the control valve being a shuttle valve, an outlet port connected to said fluid space, and a further port connected to said source of fluid pressure

said valve member being spring-biased and displaceable against its spring bias in response to sump pressure at said first port to a first position connecting said outlet port to said first port and a second position connecting said further port to said outlet port,

the piston being displaceable in one or other direction according to whether the sump pressure is greater or less than the value determined by the magnitude of said spring bias.

4,031,921

HYDROGEN-ISOTOPE PERMEATION BARRIER

Victor A. Maroni, Naperville, and Erven H. Van Deventer, Joliet, both of Ill., assignors to The United States of America as represented by the United States Energy Research and Development Administration, Washington, D.C.

Filed Sept. 9, 1975, Ser. No. 611,722
Int. Cl.² B32B 15/18, 15/20
U.S. Cl. 138—140 2 Claims

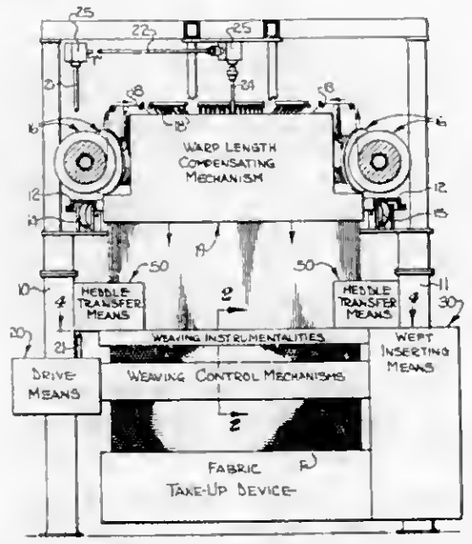
1. A composite tube for use as a hydrogen barrier in a system in which at least one surface contacts a molten salt of lithium containing tritium and an opposite surface contacts a liquid metal stream, said tube comprising an inner tubular layer of austenitic stainless steel, an intermediate, tubular layer of a bronze comprising about 10 weight % A1, 4 weight % Fe and the balance essentially Cu and a outer tubular layer of a refractory metal alloy selected from the group consisting of molybdenum base alloys, niobium base alloys and vanadium base alloys, said outer tubular layer being adapted for contacting said molten base of lithium metal.

4,031,922

VERTICALLY ARRANGED TRIAXIAL WEAVING MACHINE

Wayne C. Trost, Burns Darsie, and Frank P. Trumpio, all of Rockford, Ill., assignors to Barber-Colman Company, Rockford, Ill.

Filed Mar. 25, 1976, Ser. No. 670,341
Int. Cl.² D03D 41/00
U.S. Cl. 139—11 5 Claims



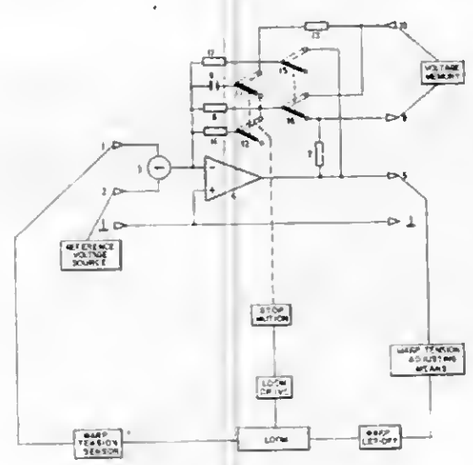
1. A weaving machine for making triaxial fabrics comprising creel means for supplying warp strands and mounted for rotation about a generally vertical axis, a plurality of elongate heddles arranged in weftwise rows spaced vertically from said creel means for guiding warp strands supplied from said creel means, means engaging warp strands intermediate said creel means and said heddles for guiding warp strands into an array of two generally parallel sheets of generally parallel warp yarns, means for moving said heddles longitudinally to form the warp strands into warp sheds and for moving said heddles and the warp strands guided thereby weftwise during weaving in timed relation with rotation of said creel means, and means for transferring said heddles from one end of one weftwise row to an adjacent end of another weftwise row.

4,031,923

WARP TENSION CONTROLLER

Adrianus Henricus van Duynhoven, Deurne, Netherlands, assignor to Rutl-Te Strake B.V., Deurne, Netherlands

Filed Dec. 18, 1975, Ser. No. 641,987
Claims priority, application Netherlands, Feb. 25, 1975, 7502246
Int. Cl.² D03D 49/06
U.S. Cl. 139—97 2 Claims



1. A warp tension controller for a loom, comprising a warp tension sensor for generating a first signal which is a measure of the warp tension, a source of a reference signal, means for comparing said signals and producing an output signal representing deviation of said first signal from said reference signal, an operational amplifier having an inverting input connected to receive said output signal, and having an output connected to means for adjusting the warp tension, and a feedback circuit connected between said input and said output of said amplifier, comprising a resistor in parallel to an integrating capacitor, wherein the improvement comprises a voltage memory having an input connected to the output of said amplifier, for producing a sustained output voltage equal to the voltage applied to its input when the loom is running, and a switch which during slower than normal operation of the loom connects a relatively small resistance between the input and the output of said amplifier, disconnects said capacitor from the output of said amplifier and connects it to the output of said voltage memory, to apply to said capacitor a voltage equal to the voltage which existed at the output of said amplifier when the loom was running at its normal operating speed.

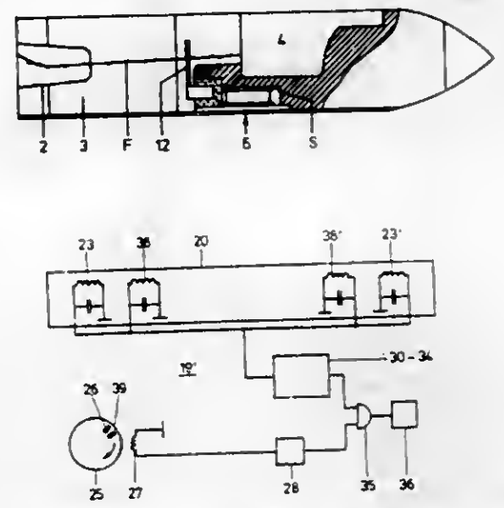
2. A warp tension controller for a loom, comprising a warp tension sensor for generating a first signal which is a measure of the warp tension, a source of a reference signal, means for comparing said signals and producing an output signal representing deviation of said first signal from said reference signal, an operational amplifier having an inverting input connected to receive said output signal, and having an output connected to means for adjusting the warp tension, and a feedback circuit connected between said input and said output of said amplifier, comprising a resistor in parallel to an integrating capacitor, wherein the improvement comprises a voltage memory having an input connected to the output of said amplifier, for producing a sustained output voltage equal to the voltage applied to its input when the loom is running and a switch which, while the loom is stopped, disconnects said capacitor from the output of said amplifier and connects it to the output of said voltage memory, to apply to said capacitor a voltage equal to the voltage which existed at the output of said amplifier when the loom was running.

4,031,924

ELECTRONIC EQUIPMENT FOR MONITORING YARN TRAVEL ON A TEXTILE MACHINE

René Domig, Kusnacht; Ernst Morf, Zurich, and Erich Loepfe, Zollikerberg, all of Switzerland, assignors to Aktiengesellschaft Gebrueder Loepfe, Wetzikon, Switzerland

Filed Apr. 8, 1976, Ser. No. 675,140
Claims priority, application Switzerland, Apr. 23, 1975, 5200/75
Int. Cl.² D03D 51/18, 51/34, 51/40
U.S. Cl. 139—336 12 Claims



1. Equipment for monitoring the yarn travel on a textile machine, comprising piezoelectrical yarn sensing means intended to be arranged at a moving part of the textile machine, and electronic receiving means intended to be mounted outside said moving part of the textile machine; said piezoelectrical yarn sensing means comprising a piezoelectrical transducer element and a yarn sensing member forming a mechanical vibratory system, and an induction coil having a winding electrically connected to the piezoelectrical transducer element; the induction coil winding and piezoelectrical transducer element constituting a first electrical resonant circuit tuned to one of the natural frequencies of said mechanical vibratory system; the electronic receiving means comprising at least one further electrical resonant circuit tuned to said natural frequency.

4,031,925

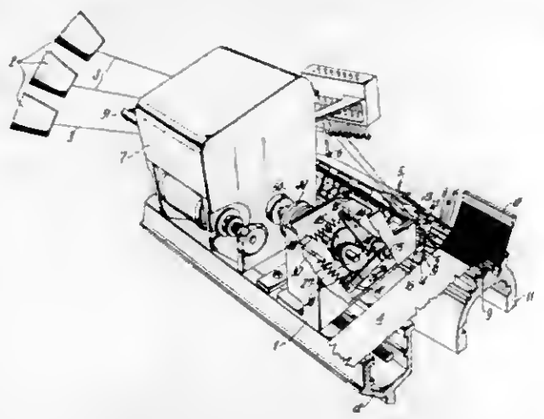
DEVICE FOR CUTTING THE WEFT IN A SHUTTLELESS LOOM HAVING A CONTINUOUS WEFT-SUPPLY MECHANISM

Nicola Santucci, Schio, Italy, assignor to Nuovo Pignone, S.p.A., Florence, Italy

Filed Apr. 29, 1975, Ser. No. 572,652
Claims priority, application Italy, Apr. 30, 1974, 22104/74
Int. Cl.² D03D 47/00, 47/38, 49/70
U.S. Cl. 139—429 5 Claims

1. Weft-cutting apparatus for a shuttleless loom of the type having a drive shaft and a continuous weft supply, in which a selected weft thread coming from a fixed bobbin mounted at a point spaced from the fabric prepared on said loom remains attached to the edge of said fabric during the movement of a picking needle inside rhe shed and until after said weft thread has been beaten into the fabric, comprised of an upper L-shaped lever, an oppositely disposed lower L-shaped lever, a stationary pin upon which said L-shaped levers are fulcrumed at their midpoint so that a gap is provided between said levers along the path of said selected weft thread and said levers are adapted to be pivoted about said fulcrum between open non-cutting position and closed cutting position, a first transverse cutting blade fixed to the inner end of the upper lever, a second transverse cutting blade pivoted to the inner end of the

upper lever and adapted to bear against said first transverse blade when the levers are in closed position, resilient means for urging said second transverse blade to pivot toward the first transverse blade when the levers are in closed position, a stub shaft mounted for rotation with said drive shaft, a first control cam keyed to said stub shaft, a second control cam



keyed to said stub shaft, a first roller mounted on the outer end of the upper lever to ride over the surface of the first cam, a second roller mounted on the outer end of the lower lever to ride over the surface of the second cam, and springs attached to said levers to urge said rollers against their associated cams so that said levers are pivoted from open position to closed position and return during each revolution of said stub shaft.

4,031,926

LOOM WITH MEANS FOR INTRODUCING THE FILLING THREADS BY MEANS OF A FLUID

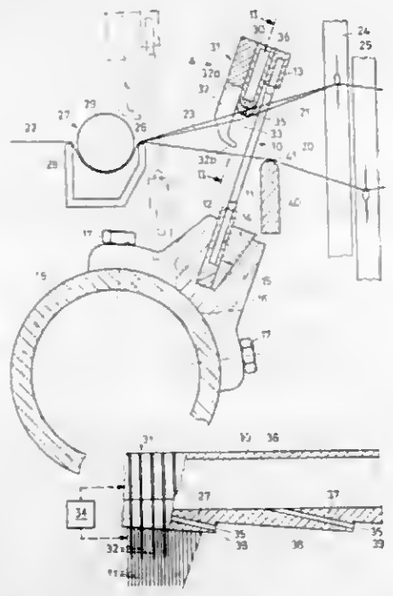
Hans Zollinger, Tann-Rutl, and Rolf Honegger, Durnten, both of Switzerland, assignors to Rutl Machinery Works Ltd., Rutl, Switzerland

Filed Sept. 8, 1975, Ser. No. 611,329

Claims priority, application Switzerland, Sept. 11, 1974, 012338/74

Int. Cl.² D03D *47/30*

U.S. Cl. 139—435 **5 Claims**



1. Loom having a means for inserting filling threads into a shed of warp threads by means of a gaseous fluid and having a reed for beating up the inserted filling threads, a supporting and drive mechanism for the reed, and temples for spreading the cloth in the width-way direction, the means for inserting the filling threads comprising a comb of parallel channel forming blades adapted to move with the reed and form a guide channel for the insertion of the filling threads by said gaseous fluid, the comb of channel forming blades being arranged on the side of the reed facing the fell of the cloth, and being carried by a slat of the reed which is remote from the supporting and drive mechanism for the reed and above the warp threads, said blades extending from the slat downwardly towards the warp threads, said supporting and drive mechanism including a shaft mounting the reed, said shaft having an axis of rotation positioned below the warp threads and forwardly of the fell so that said reed is moved through an arc which positions the channel forming blades within the warp shed during insertion of the weft and above the temples and the plane of the warp during beat-up of the weft.

4,031,927

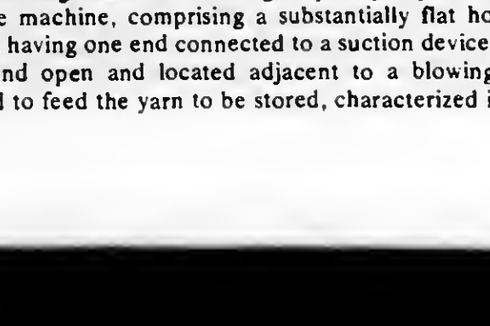
HEALD FRAME DRIVE OF THE SHEDDING MOTION OF WAVE-TYPE SHEDDING LOOMS

Jury Ivanovich Komarov, ulitsa Miklukho-Maklaya, 29, korpus 1, kv. 215; Alexei Nikolaevich Parshin, Nagornaya ulitsa, 34, korpus 1, kv. 53, and Ljubov Yakovlevna Gorbunova, Chertanovskaya ulitsa, 51, korpus 1, kv. 21, all of Moscow, U.S.S.R.

Filed Oct. 7, 1976, Ser. No. 730,462

Int. Cl.² D03D *47/26*

U.S. Cl. 139—436 **1 Claim**



1. A heald frame drive of the shedding motion of a wave-type shedding loom, comprising: guides; actuators accommodated in said guides for reciprocation in a vertical plane; heald frames secured to the top ends of respective actuators and having healds through which warp threads can be drawn; follower means carried by the bottom ends of said actuators; each said actuator having a longitudinal groove made therein; a spring accommodated in this groove; a plurality of cam plates adapted to move in a horizontal plane and be permanently engaged by said followers of respective actuators under the action of respective springs, to effect the reciprocation of said actuators jointly with said heald frames carried thereby, whereby sheds are formed of the warp threads; means for effecting the motion of said cam plates; each said spring being received in the longitudinal groove of a respective actuator so that the axis thereof is offset with respect to the vertical axis of a respective follower in the direction of movement of said cam plates.

4,031,928

STORING MEANS FOR FORMING LOOP-SHAPED YARN LENGTHS IN A TEXTILE MACHINE

Paul Gunneman, Helmond, Netherlands, assignor to Rutl-Te Strake B.V., Deurne, Netherlands

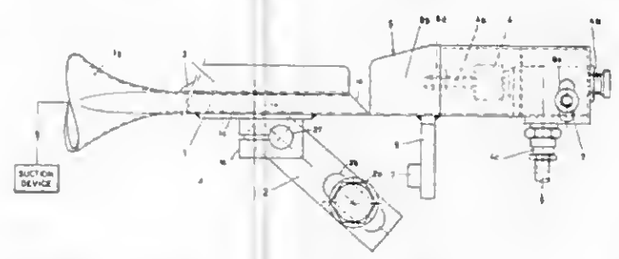
Filed Dec. 24, 1975, Ser. No. 644,185

Claims priority, application Netherlands, Apr. 9, 1975, 7504245

Int. Cl.² D03D *47/36*; B65H *17/32*

U.S. Cl. 139—452 **4 Claims**

1. A storing means for forming loop-shaped yarn lengths in a textile machine, comprising a substantially flat horizontal conduit having one end connected to a suction device and the other end open and located adjacent to a blowing nozzle adapted to feed the yarn to be stored, characterized in that a trough-like yarn-storing means is provided immediately above and substantially coextensive with said conduit, and said blowing nozzle is spaced from and directed toward the end of said



trough-like means, the axis of said nozzle extending just above the level of said conduit and at the level of said trough-like means.

4,031,929

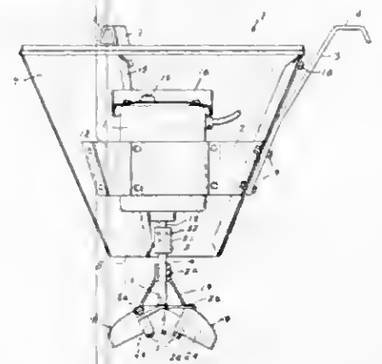
SPREADER FOR A GRANULAR PRODUCT

Wayne E. Cobb, and Edward W. Cobb, both of 358 Harrison St., Valparaiso, Ind. 46383

Filed Feb. 12, 1976, Ser. No. 657,393

Int. Cl.² A01C *19/00*

U.S. Cl. 239—684 **22 Claims**



1. A spreader for spreading a flowable granular product, said spreader comprising a hopper provided with a lower substantially unobstructed outlet, elongated shaft means supported by said hopper vertically through said outlet, said shaft means having an upper extremity disposed in the hopper for connection with means for rotating the shaft means and a lower extremity, a mounting carried by said lower extremity for rotation with said shaft means, a pair of elongated curved blades which are generally curved about the longitudinal axis of said shaft means, said blades having inner ends and outer free ends, and means connecting and securing only said inner ends to said mounting for pivotal adjustment at substantially diametrically disposed locations with respect to said axis of said shaft means, the arrangement being such that when the blades are adjusted to locate their free ends closer to said axis and said shaft means, mounting and blades are rotated as a unit and a product flows through the outlet the blades will direct the product for deposit in a smaller area about said axis then when said free ends are located a greater distance from said axis.

4,031,930

AUTOMATIC SHUT-OFF NOZZLE WITH LOCKABLE VAPOR RELIEF VALVE

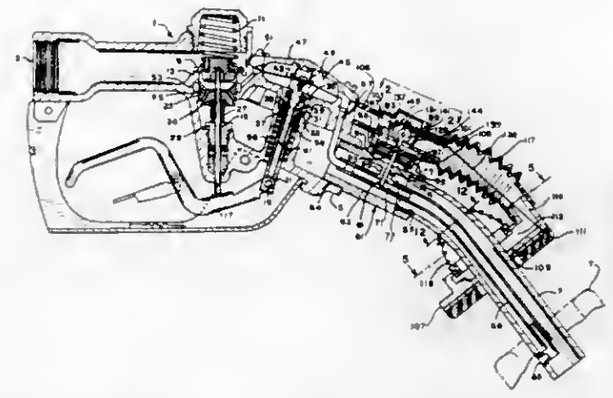
Grenville G. Sutcliffe, Ville Ridge, and Janis Dumpis, St. Aon, both of Mo., assignors to Husky Corporation, Pacific, Mo.

Filed Feb. 9, 1976, Ser. No. 656,433

Int. Cl.² B65B *3/18*, *57/14*

U.S. Cl. 141—207 **15 Claims**

1. In a liquid dispensing nozzle, a body having a inlet, an outlet and liquid passage means therebetween including a main valve controlling the flow of liquid from said inlet to said outlet, a spring biasing said main valve closed, a spout fixedly connected to said outlet and adapted for insertion in the inlet opening of a tank, manually actuated means for opening said main valve in opposition to said spring, Venturi means in said fuel passage means including a vacuum take-off, a vacuum chamber, means connecting said vacuum take-off to said vacuum chamber, means responsive to vacuum within said chamber caused by the flow of liquid through said Venturi means operatively connected to said manually actuated means for releasing the same and thereby permitting said spring to close said main valve, vent passage means communicating with said vacuum chamber to render said vacuum-responsive means inoperative when said vent passage means is open and having a port insertible in the tank with said spout, a normally open vent control valve in said vent passage means between



said port and said vaccum chamber, vapor conduit means adapted for sealed communication with the tank inlet opening, a pressure responsive element exposed directly to pressure in said vapor conduit means and arranged to close said vent control valve when vapor pressure in the tank and said vapor conduit excceds a predetermined value whereby said vacuum-responsive means becomes operable to release said manually operated means and thereby permits said spring to close said main valve, and latch means engaging said pressure-responsive element to hold said vent control valve closed except when said spout is inserted in a tank and releasing the same to open responsive to full insertion of said spout in a tank, whereby to maintain vacuum in said chamber and prevent opening of said main valve except when said spout is inserted in a tank and to break the vacuum in said chamber and thereby permit said main valve to be opened while said spout is inserted in a tank.

4,031,931

MORTISING MACHINE

Barry Vivian Balcombe, Cloverdale, Australia, assignor to Louisa Mary Balcombe, Cloverdale, Australia

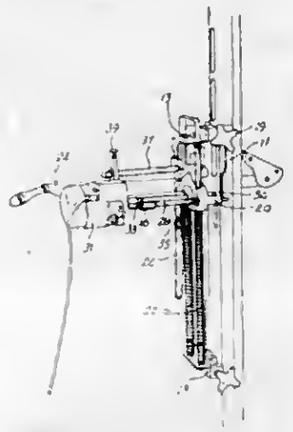
Filed Nov. 12, 1975, Ser. No. 631,392

Int. Cl.² B27F *5/00*

U.S. Cl. 144—83 **7 Claims**

1. A mortising machine comprising: a clamping means whereby the machine may be mounted upon a workpiece; a drive motor mounted such that its drive shaft is substantially perpendicular to the working face of the workpiece; a cutting head mounted to the end of said shaft adjacent the workface; a means to support said shaft between said motor and said head, said support means also providing support for said motor, said shaft and said motor being slidably mounted to said support means, to be movable perpendicular to the workface; feeding means between said support means and said motor such that said shaft can be fed through said support means; and a guide mounted to said clamping means, to which said support means is slidably mounted, such that said support means together with said shaft are capable of movement on said guide perpendicular to that produced by said feeding

means, wherein the latter includes a screw-threaded rod rotatably mounted to said support means and constituting a threaded engagement by a housing of said motor, the end of said rod mounted to said support means having a lugged formation thereon, at least one spring-loaded pawl mounted on one of said clamping means and said guide such that, said said



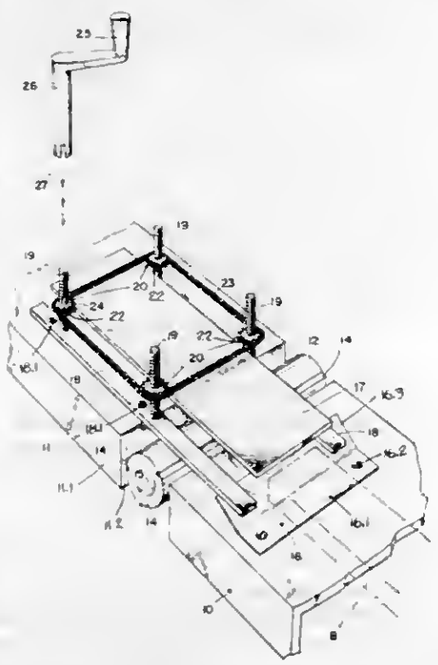
lugged formation is moved past said pawl in one particular direction, said rod is caused to rotate because of the engagement of said pawl with said lugged formation, and when the latter is moved in the opposite direction, there is only resilient engagement of said pawl with said lugged formation, with the absence of rotation of said rod.

4,031,932

PLANING ATTACHMENT FOR JOINTERS

Edgar F. Leasure, 4959 E. Lagoon Road, West Farmington, Ohio 44491

Filed June 28, 1976, Ser. No. 700,143
Int. Cl.² B27C 1/12
U.S. Cl. 144—117 R 10 Claims



1. A board planing attachment for a jointer having a bed with a flat upper surface and a rotary cutter adjacent to one end of said bed, comprising:

a pair of flat bars connected flatwise to said upper surface to extend in spaced side-by-side relation along the normal line of board movement over said flat upper surface,

a pair of screw rods carried by each bar to extend upwardly therefrom with their axes normal to said flat upper surface, said rods being held to said bars against rotation,

four sprocket gears, each having an internally threaded bub threaded on a respective rod,

a bed plate overlying said bed upper flat surface and having an end portion overlying said cutter, said bed plate having a lower flat surface and a slide connection with each sprocket hub, each slide connection being disposed at a respective one of four spaced peripheral portions of said bed plate with two on each side of the latter, so that as said sprockets are rotated said bed plate is moved vertically at each said connection, whereby the lower flat surface of said bed plate may be brought into parallelism with the upper flat surface of said bed by screw adjustment of respective sprockets,

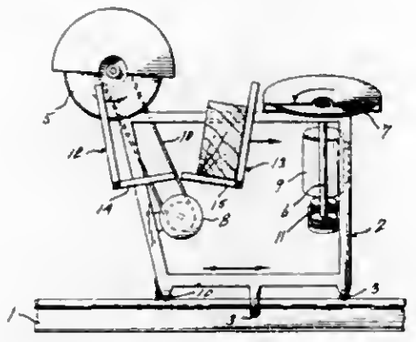
the lower flat surface of said bed plate providing a guide for the upper surface of a board slid along the upper flat surface of said bed to define a predetermined selectable distance between said lower flat surface and said cutter.

4,031,933

TENON CUTTING MACHINE WITH CIRCULAR SAWS

Ernest Piche, 2 Forget St., St. Agathe, Canada

Filed Oct. 21, 1976, Ser. No. 734,737
Int. Cl.² B27F 1/08
U.S. Cl. 144—198 R 5 Claims



1. A tenon cutting machine for cutting skew tenon faces at an end of a piece of timber, comprising a carriage reciprocatively displaccable in a predetermined direction, a timber carrying bench operatively holding a piece of timber in a direction lengthwise orthogonally to said predetermined direction, said bench being laterally slanted in said direction at a predetermined angle of skew transversely of the piece of timber, a first circular saw blade rotatively mounted on said carriage and displaceable therewith in said predetermined direction and extending in a plane orthogonally intersecting said piece of timber at one end thereof and parallel to said predetermined direction, a second circular saw blade rotatively mounted on said carriage and displaceable therewith in said predetermined direction, said second circular saw blade extending in a plane longitudinally inclined relative to the piece of timber and intersecting said one end thereof at the longitudinal tenon angle of the desired skew tenon faces, and drive means connected to said saw blades and operatively rotating the latter for cutting into said one end of the piece of timber upon bodily displacement of said saw blades and carriage in said predetermined direction.

4,031,934

ADJUSTABLE ROUTER BIT

Rigo Stadler, 65 Hillside Ave., New York, N.Y. 10040

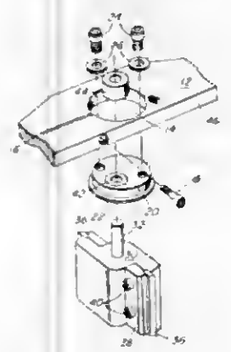
Filed Sept. 1, 1976, Ser. No. 719,622
Int. Cl.² B27C 5/00; B27G 13/12
U.S. Cl. 144—218 1 Claim

1. In a router bit having replaceable cutting blades in a cutter head secured to a rotatable shaft, a device for adjustment of the depth of cut of said cutting blades comprising:

a lengthwise oriented guide plate having a circular opening centrally located along its horizontal axis adapted to receive a circular, rotatable plate and having a tension groove emanating from said circular opening parallel to the lengthwise axis of said guide plate;

a clamp screw threadably inserted in the leading edge of said guide plate and extending through said tension groove to open and close said groove;

a circular plate rotatably mounted in said circular opening in said guide plate, having a lower perimeter edge slightly larger in diameter than said circular opening;



said circular plate being retained in said guide plate by its lower perimeter edge and by retaining screws and washers on its upper surface;

said circular plate being able to rotate when said clamp screw is loosened and being held in a fixed position when said clamp screw is tightened;

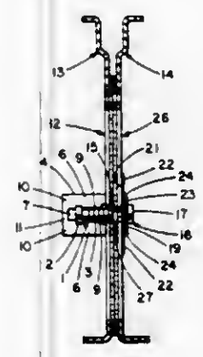
the shaft of said router bit, being eccentrically secured to said rotatable plate such that the depth of cut of said router bit is controlled by the rotation of said circular plate.

4,031,935

CAPTIVE FASTENER ASSEMBLY

Lary D. Jones; Robert H. van Outer, both of Lexington, Ky., and Ernest S. Kettelson, Minooka, Ill., assignors to Square D Company, Park Ridge, Ill.

Division of Ser. No. 597,062, July 18, 1975, Pat. No. 3,986,544. This application Apr. 21, 1976, Ser. No. 678,786
Int. Cl.² F16B 5/02, 39/00
U.S. Cl. 151—41.76 1 Claim



1. A captive fastener assembly comprising a two-piece fastening device, including first and second fastening members, said first and second fastening members being engageable for fastening and separable for unfastening, first and second captivating means, wherein said first fastening member includes a threaded shank extending from a first end and a radially enlarged head formed at the opposite second end, said radially enlarged head includes a pair of radially extending slots opening to diametrically opposite sides of the periphery of said head, said first captivating means includes a pair of spaced apart parallel guide rails defining a passageway therebetween, the respective inner edges of said guide rails facing said passageway being slidably received in respective ones of said pair of slots in said head of said first fastening member, said threaded shank being positioned in said passageway when said guide rails are slidably received in said slots, said threaded shank being then held substantially parallel to said guide rails for reciprocating movement between an fastening and an unfastening position, said second fastening means includes an internally threaded nut, a washer axially aligned with said nut and secured to one side thereof, said threaded shank of said first fastening member being threadably engageable with said internally threaded nut, said second captivating means includes a bracket member having an inner surface to face a work piece when secured thereto, a pair of substantially flat mounting ears projecting laterally from each opposite end of said bracket, an intermediate portion of said bracket spaced outwardly from the plane of the inner surface of said laterally projecting mounting ears, the inner surface of said intermediate portion being spaced from the inner surfaces of said laterally projecting mounting ears a distance slightly greater than the thickness of said washer to permit rotation thereof while restraining substantial reciprocal movement of said washer in an axial direction relative to said bracket when secured to said work piece, an opening through said intermediate portion of said bracket member to receive said nut therethrough when said washer is positioned adjacent said inner surface of said laterally projecting mounting ears, said nut being sufficiently elongated to project outwardly of said bracket member for engagement by external means to rotate said nut, including a first and second work piece to be fastened together, said first captivating means is secured to said first work piece with said first fastening member operably mounted therein, said second captivating means is secured to said second work piece with said second fastening member operably mounted therein, said captivating means being secured to said respective work pieces at locations whereby said first and second fastening members are aligned for fastening engagement when said work pieces are in position for fastening, opening means through said first and second work pieces to permit communication between said first and second fastening members when aligned for fastening engagement, wherein said pair of guide rails of said first captivating means are at least as long as said first fastening member including the combined length of said threaded shank and said head, and fastener dismounting means to enable removal of said first fastening member from said first captivating means and re-installation of said member in said first captivating means, including an integrally formed cross-arm member extending across said passageway and between said pair of guide rails at the end thereof remote from the portion securable to said work piece, said fastener dismounting means comprising a recess in one of said guide rails opening to said passageway adjacent said cross-arm member, the configuration and dimension of said recess conforming to the cross-sectional configuration and dimension of the head of said first fastening member to enable the portion of said head adjacent said recess to rotatably pass through said recess for removal of said member from said captivating means and re-installation therein.

4,031,936

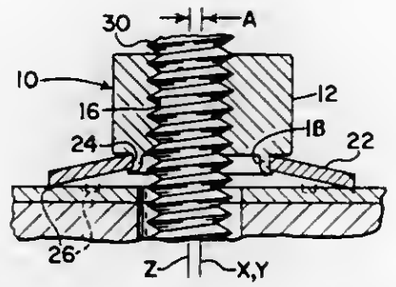
PREASSEMBLED SPRING WASHER FASTENER UNIT

Gary Martin Curtis, Elgin, Ill., assignor to Illinois Tool Works Inc., Chicago, Ill.

Filed Nov. 14, 1975, Ser. No. 632,118
Int. Cl.² F16B 39/24
U.S. Cl. 151—37 1 Claim

1. A preassembled locking fastener unit inlcuding a nut member with a threaded bore formed therein, a compressible, generally conical spring washer with a substantially circular outer periphery and substantially circular, uninterrupted inner periphery formed by an aperture therein, the outer peripbery being concentric with the uninterrupted inner periphery, a generally annular means formed on the clamping surface of the nut with a central axis offset laterally from the central axis of the threaded bore of the nut, the outer periphery of the washer member including locking teeth means to retard free

movement of the washer relative to a work surface when associated therewith, the clamping surface of the nut further including a plurality of teeth integral therewith and spaced circumferentially about the axis of the threaded bore and positioned to overlie the inner marginal surface of the washer member, each tooth including a locking surface extending substantially perpendicular to the clamping surface of the nut and a camming surface, the associated inner marginal surface of the washer including locking recesses including camming surfaces and locking surfaces complementary to the camming



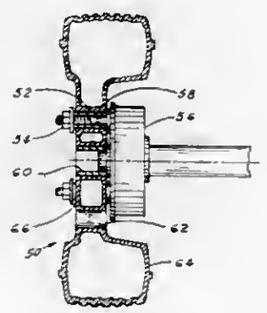
and locking surfaces of the teeth on the clamping surface of the nut wherein the substantially perpendicular surfaces are forward when the nut member is rotated in a tightening direction to urge the washer to rotate therewith in said tightening direction creating visible scribe marks in the workpiece, while the camming surfaces allow relative rotation between the washer and nut when the nut is rotated in an untightening direction but in such a manner that the washer is forced to move laterally across the workpiece thereby resisting unauthorized loosening of the joint formed thereby.

4,031,937

UNITARY TIRE-WHEEL

Edward J. Georgia, Los Altos, Calif.; Russell K. H. Eggers, Baltimore, and Ernest L. Molnar, Timoolum, both of Md., assignors to Zedron, Inc., Baltimore, Md.

Filed June 2, 1975, Ser. No. 582,624
Int. Cl.² B60B 9/22
U.S. Cl. 152—9 **6 Claims**



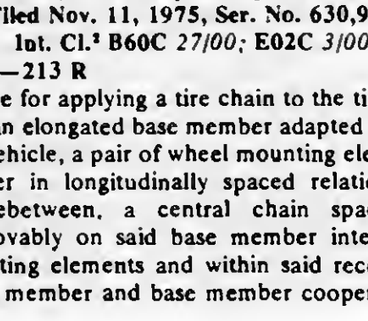
1. A one-piece inflatable tire-wheel having a pneumatic tire portion including a crown portion and a pair of spaced apart sidewalls which cooperatively define a toroidal air chamber coextendant thereabout, a wheel portion including a central hub and a pair of spaced apart sidewalls, each of said sidewalls of said wheel portion being integral with one of said sidewalls of said tire portion and extending therefrom to said central hub and being integral with said central hub, said sidewalls of said wheel portion defining a continuous air chamber therewithin and interconnecting said central hub and said pneumatic tire portion as a unitary one-piece tire-wheel, said air chamber of said tire portion opening into said air chamber of said wheel portion and providing unitary and continuous inflatable air chamber means within said tire-wheel for receiving pneumatic pressurization in maintaining the structural integrity of said tire-wheel to provide a pneumatically sustained tire-wheel, said wheel portion including a plurality of hollow structural reinforcing tie members disposed intermediate said central hub and said pneumatic tire portion, said tie members including wall portions integral with and extending between said sidewalls of said wheel portion in a manner to restrict lateral deformation thereof, and valve means for inflation of said air chamber means of said inflatable tire-wheel to the desired pneumatic pressure.

4,031,938

PNEUMATIC TIRE TREAD

Henri Verdier, Beauregard-l'Eveque, France, assignor to Compagnie Generale des Etablissements Michelin, raison sociale Michelin & Cie, France

Filed Feb. 26, 1976, Ser. No. 661,800
Claims priority, application France, Mar. 4, 1975, 75.06814
Int. Cl.² B60C 11/06
U.S. Cl. 152—209 R **3 Claims**



1. A pneumatic tire with a radial carcass reinforcement which is provided with a tread having circumferential ribs separated by circumferential grooves, said ribs having walls which follow a broken-line outline forming salient and reentrant angles, characterized by the fact that said ribs have:

a. a salient angle recess on each side of and near each said salient angle;

b. two salient angle incisions for each said salient angle wherein each said incision has a length less than half of the width of the rib and being, with respect to each said salient angle, on the outside and near each said salient angle recess;

c. a reentrant angle recess in each said reentrant angle;

d. two reentrant angle incisions for each said reentrant angle wherein each said incision has a length less than half of the width of the rib and being, with respect to each said reentrant angle, on the outside and near each said reentrant angle recess;

and by the fact that

e. the distance measured in the circumferential direction between the two salient angle incisions of each said salient angle is greater than the distance between the two reentrant angle incisions of each said reentrant angle.

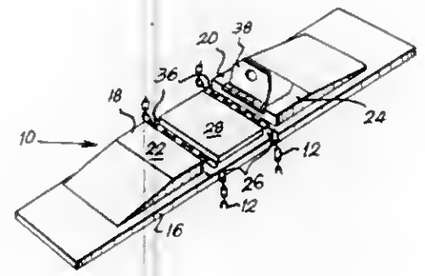
TIRE CHAIN APPLYING DEVICE

Joseph De Martini, 3728 Canyon Way, Martinez, Calif. 94553

Filed Nov. 11, 1975, Ser. No. 630,922
Int. Cl.² B60C 27/00; E02C 3/00
U.S. Cl. 152—213 R **5 Claims**

1. A device for applying a tire chain to the tire of a vehicle comprising an elongated base member adapted to support the wheel of a vehicle, a pair of wheel mounting elements on said base member in longitudinally spaced relation defining a recess therebetween, a central chain spacing member mounted movably on said base member intermediate said wheel mounting elements and within said recess, means on said spacing member and base member cooperable to selectively slide said spacing member longitudinally within said recess and thereby define at least one transverse chain-receiving slot between said spacing member and said wheel mounting elements.

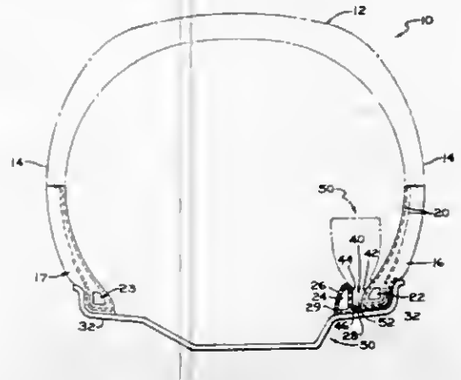


4,031,940

PNEUMATIC TIRE

Donald R. Bartley, Cuyahoga Falls, and Robert F. Jones, Westfield Center, both of Ohio, assignors to The B. F. Goodrich Company, Akron, Ohio

Filed Feb. 21, 1975, Ser. No. 551,769
Int. Cl.² B60C 15/00
U.S. Cl. 152—362 R **4 Claims**



1. In a pneumatic tire adapted for combination with an emergency use device with an anchoring means therewith for disposing said device internally of the tire, which tire includes a pair of axially spaced annular bead portions, the improvement wherein the tire comprises

A. a pair of axially spaced, inextensible, circular bead members embedded within one of the bead portions, and

B. an arcuate, anchoring channel for mounting the device within the tire, said anchoring channel being

1. formed in the one bead portion,

2. located between the bead members and

3. contoured to receive the anchoring means of the device.

4,031,941

CONCENTRIC CONTRA-ROTATING BEAD DEFLECTOR MECHANISM FOR TIRE MOUNTING APPARATUS

S. W. Malinski, Tamaroa, Ill., and Thomas L. Mueller, St. Louis, Mo., assignors to S. W. Malinski, Tamaroa, Ill.

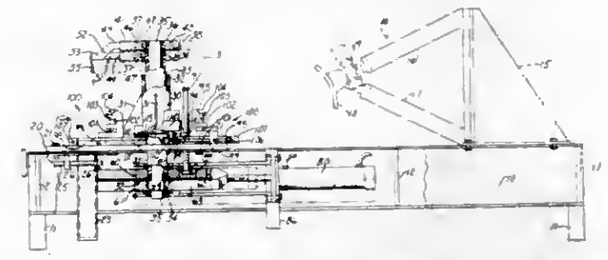
Filed Feb. 17, 1976, Ser. No. 658,600
Int. Cl.² B60C 25/06
U.S. Cl. 157—1.17 **8 Claims**

1. In tire mounting apparatus of the type in which two bead-deflecting arms are rotated simultaneously in opposite senses, the improvement comprising

platform means having a fixed vertical sleeve, an outer tubular shaft therein and projecting thereabove and therebelow, and a central shaft within the outer shaft and projecting above and below it,

a radial arm secured to the upper end of the central shaft, a second radial arm secured therebeneath to the upper end of the outer shaft, and vertical offset means to position their radially outer arm ends in the same plane,

tire bead deflectors secured to said radially outer ends,



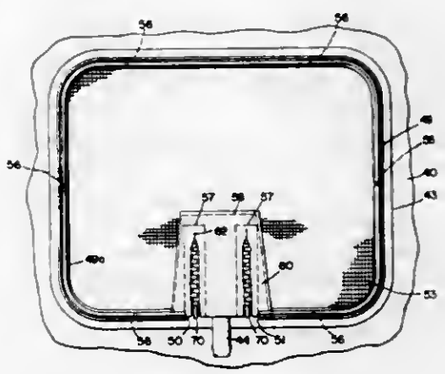
gears secured on the lower end of the outer shaft and therebeneath on the projecting portion of the central shaft, and means meshing with said gears to drive said shafts in opposite senses.

4,031,942

WINDOW SCREENS FOR VANS AND THE LIKE

Warren E. Shelton, Cleveland, Ohio, assignor to Van-Camper Corporation, Cleveland, Ohio

Filed Dec. 15, 1975, Ser. No. 640,708
Int. Cl.² E06B 3/32
U.S. Cl. 160—103 **3 Claims**



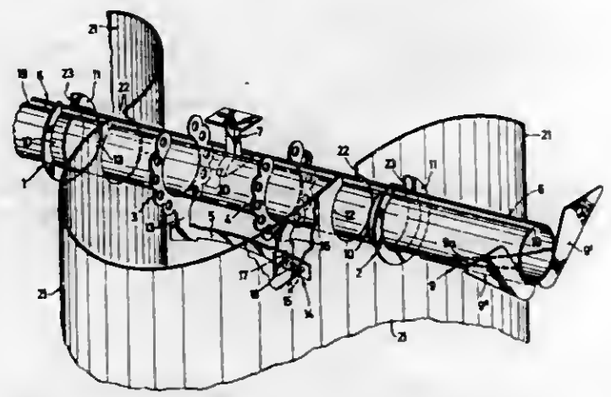
1. A screen for use in combination with an openable window mounted within a window opening in a van or like vehicle and having a window manipulating handle affixed to the window adjacent one edge thereof and projecting inwardly of the opening, said screen comprising a rigid frame conforming to the periphery of the window opening for reception thereabout inward of the window, said frame having a pair of spaced ends aligned with each other for positioning to the opposite sides of the window handle upon a positioning of the screen about the window opening, said screen further including flexible wire screening having a peripheral edge secured to said frame peripherally about the frame and covering the area bounded by the frame, slot means through the edge of the screening between the spaced ends of the frame and alignable with the window handle for access thereto, said slot means extending inwardly from the edge of the screening for only a portion of the width of the screening, at least one piece of flexible material secured to said screening in overlying relationship to said slot means, said flexible material having an outer edge extending between the spaced ends of the frame, said piece of material having spaced slits therein paralleling and overlying said slot means and extending inwardly from the outer edge of the material, and a pair of zipper assemblies mounted on said piece of material with one zipper assembly associated with each slit for a selective opening and closing thereof, the portion of the flexible material between the zipper assemblies, upon an opening of both zipper assemblies, defining an access for the window handle, said flexible material and zipper assemblies, when closed, being inwardly flexible to accommodate the inwardly projecting window handle.

4,031,943

SYSTEM FOR HANGING CURTAINS

Sabino Silvestre, Madrid, Spain

Filed May 3, 1976, Ser. No. 682,786
Int. Cl.² A47H 1/00, 13/14
U.S. Cl. 160—330 7 Claims



1. In a system for hanging gathered curtains: a horizontal tubular suspension rod having a longitudinal slot running the length of the upper side of the tubular rod; means for supporting the tubular rod from a fixed surface including at least one intermediate support member having an enlarged portion housed within the interior of the tubular rod and a narrow portion extending through the slot for fastening to the fixed surface; a curtain having a top portion provided with a plurality of holes through which the rod extends, each of said holes having a portion extending to the upper edge of the curtain to form a slot in said upper edge of a width slightly greater than the thickness of said narrow portion of said support member so that the curtain can slide past the said support member; each pair of adjacent holes in said top portion of the curtain being provided with a pair of curtain-gathering ring assemblies one of which is fastened to the curtain at the location of one of the holes and the other being fastened to the curtain at the location of the other hole of the pair, each of said ring assemblies having a radial slot therethrough and conforming to its respective curtain hole; and linking means of adjustable length connecting one ring assembly with the other of the pair.

4,031,944

DEVICE FOR OPENING AND CLOSING OF CORD OPERATED CLOSURES

Howard J. Morrison, Deerfield, and Derek A. Brand, Naperville, both of Ill., assignors to Marvin Glass & Associates, Chicago, Ill.

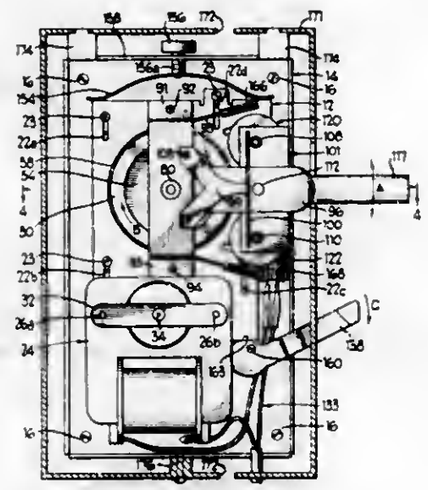
Filed Aug. 11, 1975, Ser. No. 603,342
Int. Cl.² A47H 5/02; B66D 1/76
U.S. Cl. 160—331 20 Claims

1. An opening and closing device for cord operated closures having a pair of cords or a pair of cord runs, one cord or cord run for opening the closure and the other cord or cord run for closing the closure, comprising:

a frame structure;

a unidirectional motor mounted on the frame structure, including drive means for engaging and longitudinally driving either one of said cords; and

direction determining means for selective closing or opening of the closure, said direction determining means being movably mounted on said frame structure for engaging



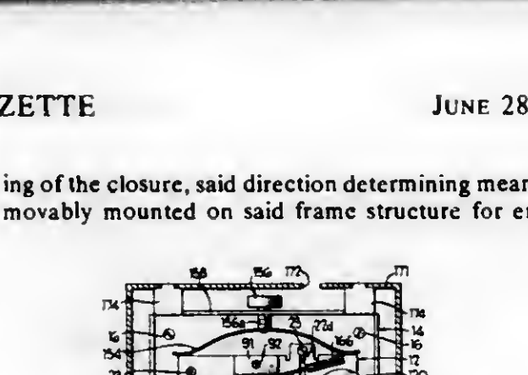
either one of said cords and bringing said cord into driving engagement with said drive means.

4,031,945

PROCESS FOR MAKING CERAMIC MOLDS HAVING A METAL OXIDE BARRIER FOR CASTING AND DIRECTIONAL SOLIDIFICATION OF SUPERALLOYS

Michael F. X. Gigliotti, Jr., Scotia, and Charles D. Greskovich, Schenectady, both of N.Y., assignors to General Electric Company, Schenectady, N.Y.

Filed Apr. 7, 1976, Ser. No. 674,548
The portion of the term of this patent subsequent to Aug. 3, 1993, has been disclaimed.
Int. Cl.² B22D 21/06
U.S. Cl. 164—72 23 Claims



1. A method for forming a barrier layer at the mold-metal interface in a mold suitable for the casting and directional solidification of superalloys therein including the process steps of:

placing a mold made of a material comprising a first refractory oxide bonded together by silica within a furnace;

introducing a controlled prevailing atmosphere into the furnace;

heating the mold in the controlled prevailing atmosphere at an elevated temperature for a sufficient period of time to dissolve some of the first refractory oxide into the silica;

casting a melt of superalloy metal into a cavity of the mold, and

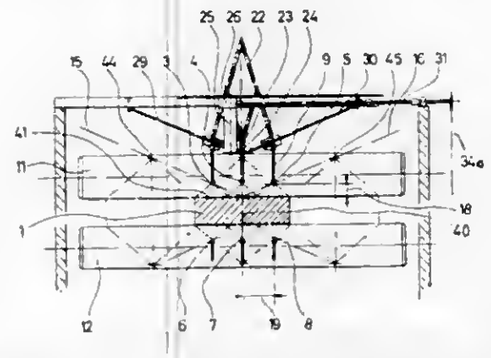
forming a barrier layer comprising a second refractory oxide by the oxidation of at least one constituent of the superalloy within the mold in integral contact with the first refractory oxide material, the barrier layer having a surface defining at least a portion of the interior wall surfaces of the cavity into which the superalloy melt is cast and comes into contact therewith, and having a thickness greater than 1 micron to substantially prevent the molten metal from penetrating into the mold structure and the microstructure of the mold in the vicinity of the cavity exhibiting a substantially porous free structure containing silica bearing phases therein in contact with the barrier layer.

4,031,946

METHOD AND APPARATUS FOR CHANGING THE SECONDARY COOLING DURING CONTINUOUS CASTING OF STEEL

Heinrich Martl, Forch; Andreas Zogg, Zug, and Oskar Hardegger, Hirzel, all of Switzerland, assignors to Concast AG, Zurich, Switzerland

Filed Feb. 20, 1975, Ser. No. 551,103
Claims priority, application Switzerland, Feb. 28, 1974, 2815/74
Int. Cl.² B22D 11/124
U.S. Cl. 164—89 9 Claims



1. A method of cooling a steel strand of substantially rectangular cross-section in the secondary cooling zone of a continuous casting machine, wherein spray nozzles having operating positions are arranged in a group of essentially parallel rows, each row comprising at least two spray nozzles, said rows extending transversely with respect to the direction of travel of the strand, the spray nozzles emitting cooling agent to form substantially adjoining cooling agent patterns on the strand surface, the improvement comprising the steps of: synchronously groupwise altering the distance of said nozzles from said strand surface and at the same time groupwise altering the distance between said nozzles of a row in dependency upon a change in the strand format, the distance of the nozzles of a row from the strand surface and between each other being altered such that the operating positions of each nozzle lie along a substantially straight line which intersects with the strand surface, whereby the cooling agent patterns on the strand surface remain in a substantially adjoining position with respect to each other.

4,031,947

METHOD AND APPARATUS FOR SLUG CASTING

John E. Connolly, Wyoming, Mich., assignor to Walter W. Nichols, Hickory Corners, Mich., a part interest

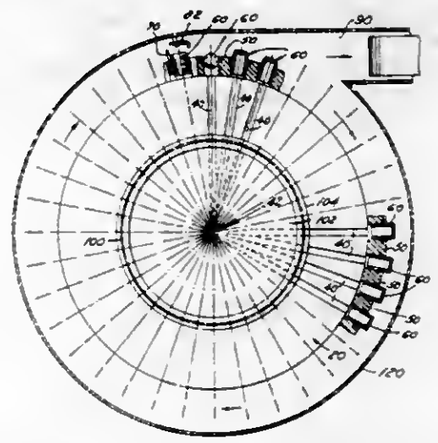
Filed Oct. 8, 1975, Ser. No. 620,766
Int. Cl.² B22D 13/00, 5/02
U.S. Cl. 164—114 8 Claims

1. In a method of continuous casting of individual castings in a system which includes revolving a plurality of radially disposed molds around an axis of revolution and distributing molten metal to said molds from a source on said axis of revolution, that improvement which comprises:

a. mounting said plurality molds circumferentially around said axis of revolution along a transverse axis of each mold wherein each of said plurality of molds can be moved to a fill position and later to a dump position while revolving continuously about the axis of revolution,

b. retaining the molds in a fill position while being filled with molten metal and cooled,

c. causing said molds to move to an inverted position while still revolving about said axis of revolution wherein the chilled casting is dumped, and



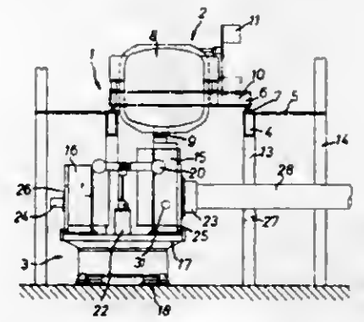
d. utilizing the inertial force of the dumped revolving casting to move it to a conveyance area away from the casting system.

4,031,948

MOLD-EQUIPPED CASTING OVEN UNIT FOR CONTINUOUS ROD CASTINGS

Bernhard Bergmann, Balsthal, Switzerland, assignor to Von Roll AG, Gerlafingen, Switzerland

Filed June 13, 1975, Ser. No. 586,842
Claims priority, application Switzerland, June 15, 1974, 8203/74; Jan. 17, 1975, 545/75
Int. Cl.² B22D 11/10, 11/128
U.S. Cl. 164—281 H 4 Claims



1. In a continuous rod casting equipment line for horizontally forming and pulling one or more rod stems, a mold and oven unit, comprising, in combination:

reservoir oven means (2) for intermittently receiving quantities of casting melt and controllably discharging the casting melt downwardly in molten condition;

mold assembly means composed of at least two individual mold assemblies (15,16), each provided with a continuous-casting chill mold (23,24) and forming therewith an antechamber for the mold, said mold being assembled as part of said mold assembly so as to form a side of said antechamber and to provide for continuous casting in a manner in which the cast material moves horizontally out of the mold, said antechamber formed by said mold assembly being capable of containing a quantity of melt for the mold sufficient for assuring continuity of the casting operation while the mold assembly is supplied with melt from said reservoir oven means (2), and

a positioning turntable (17), having a base (18) providing a rotatable mount therefor and having a plurality of locations at which the respective mold assemblies are fixably mountable on the rotatable part of said turntable (17), said turntable being mounted on its said base so as to be

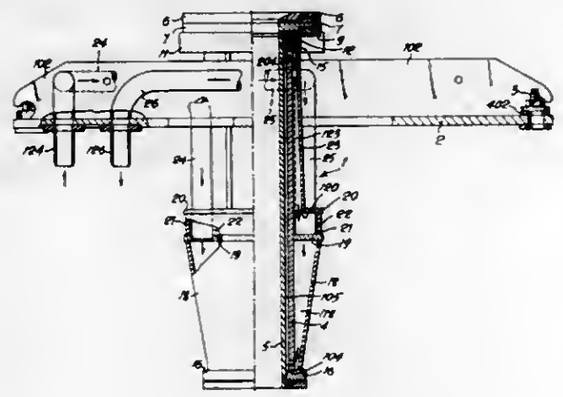
rotatable between a plurality of predetermined orientation positions in each of which one of said mold assemblies mounted on said table is placed in a predetermined operating position, in which it can receive melt discharged from said oven means (2), and another mold assembly thereon is simultaneously placed in a standby position, in which it can be replaced and its replacement mounted, trued up and preheated.

4,031,949

WATER COOLED MOLD FOR THE CONTINUOUS CASTING OF METALS

Piero Colombo, 27, Via Leopardi, Udine, Italy

Filed Apr. 23, 1976, Ser. No. 679,316
Claims priority, application Italy, Apr. 28, 1975, 12587/75
Int. Cl.² B22D *11/02*
U.S. Cl. 164—283 M **1 Claim**



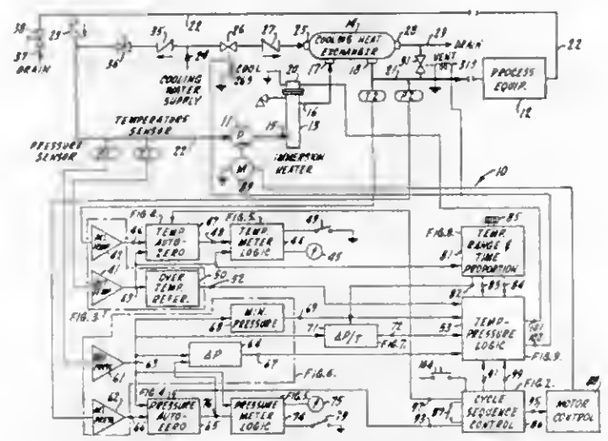
1. A mold for the continuous casting of molten metals comprising an inner tubular mantle, an outer tubular mantle surrounding said inner tubular mantle leaving between them a cooling jacket for the flow of cooling water, an outer, funnel shaped mantle surrounding the said outer mantle of the mold from the lower end of the mold up to substantially one half of its height, defining in cooperation with the outer mantle of the mold a cooling water inlet manifold chamber the cross sectional area of the flow passage of which is progressively decreasing from its upper end to its lower end, communication ports formed in the said outer tubular mantle of the mold placing in communication the lower end of said water inlet manifold chamber with the lower end of said cooling jacket of the mold, cooling water supply pipes communicating with the upper end of said water inlet manifold chamber, a second, funnel shaped mantle surrounding the upper end of the mold, and defining in cooperation with the outer mantle of the mold a a water outlet manifold chamber, the cross sectional area of the flow passage of said water outlet manifold chamber being progressively increasing from its upper end to its lower end, communication ports formed in the said outer tubular mantle of the mold placing in communication the upper end of said water outlet manifold chamber with the upper end of said cooling jacket of the mold, and communication ports formed in the lower end of said water outlet manifold chamber placing in communication said water outlet manifold chamber with a water exbaust chamber communicating with the used cooling water exhaust pipes of the continuous casting plant.

4,031,950

PROCESS FLUID CIRCULATION AND TEMPERATURE CONTROL SYSTEM

Gilbert F. Shultz, Novi, Mich., assignor to Application Engineering Corporation, Elk Grove Village, Ill.

Filed Feb. 17, 1976, Ser. No. 658,350
Int. Cl.² G05D *27/00*
U.S. Cl. 165—31 **21 Claims**



1. A process fluid circulation and temperature control system comprising:

a main heat exchange means, electrically actuatable between an active heat-exchange condition and an inactive condition, for effecting a heat exchange with a process fluid;

a pump for circulating a process fluid through the heat exchange means and through an external process apparatus that utilizes the process fluid to effect a second heat exchange;

a thermal sensor for sensing the temperature of the process fluid at a given point on its circulation path;

temperature control circuit means, coupled to the thermal sensor and to the heat exchange means, for actuating the heat exchange means between its active and inactive operating conditions in response to changes in the temperature of the process fluid;

a delivery pressure sensor for sensing the pressure of the fluid delivered to the process apparatus to develop a delivery pressure signal;

a return pressure sensor for sensing the pressure of the fluid returned to the pump to develop a return pressure signal;

and pressure differential control circuit means, coupled to both pressure sensors and to the temperature control circuit means, for inhibiting actuation of the heat exchange means to its active condition except in the presence of a differential of predetermined sign and amplitude between the delivery pressure signal and the return pressure signal.

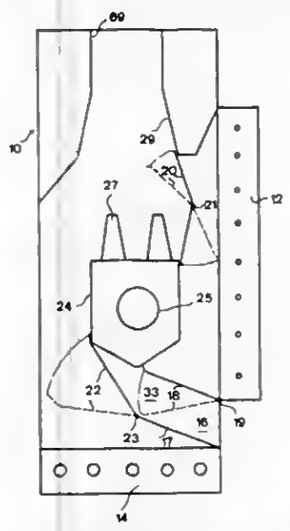
4,031,951

AIR CLIMATIZING DEVICE

Peter Engler, Mosbach, Germany, assignor to Luwa AG, Zurich, Switzerland

Filed Nov. 13, 1974, Ser. No. 523,549
Claims priority, application Switzerland, Nov. 21, 1973, 16447/73
Int. Cl.² G05D *23/00*; **F28F** *27/02*
U.S. Cl. 165—103 **15 Claims**

1. An apparatus for controlling the flow of air in an air climatizing device, comprising a housing having means defining air throughpassages, a plurality of flap members for controlling said air throughpassages, an adjustment motor and transmission means for actuating the flap members in a predetermined sequence, said transmission means comprising a plurality of relatively movable gears which are in continual power transmission-meshing engagement with one another during operation of the apparatus and entrainment elements cooperating with predetermined ones of said gears at predetermined regions thereof, means for drivingly connecting each



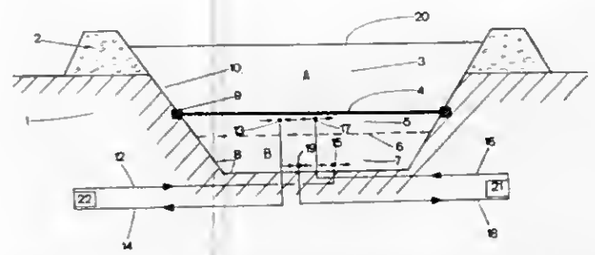
entrainment element with each of its associated flap members in a respective position of each said entrainment element for positively driving each said associated flap member.

4,031,952

HEAT ENERGY ACCUMULATOR

Bernard Contour, Residence "Les Petits Princes" 27, rue Jacques Lemercier, Versailles (Les Yvelines), France

Filed Jan. 13, 1975, Ser. No. 540,729
Claims priority, application France, Jan. 15, 1974, 74.01218; Feb. 12, 1974, 74.04736
Int. Cl.² F01K *1/10*
U.S. Cl. 165—104 S **8 Claims**



1. A system for accumulating and storing heat energy comprising:

means defining a container having bottom and side walls;

a horizontally extending diaphragm disposed above the bottom wall of the container and separating the container into an upper compartment and a lower compartment, said lower compartment being filled with heated water;

the upper compartment being filled with a heavy mass sufficient to apply a uniform pressure to the diaphragm and to the heated water in the lower compartment, said pressure being of a magnitude which is no less than that exerted on the diaphragm by the water in the lower compartment;

first fluid circuit means for communicating the water in the lower compartment with a heat source to circulate water between the lower compartment and the heat source;

second fluid circuit means for communicating the water in the lower compartment with a heat sink to circulate hot water from the lower compartment between it and the heat sink;

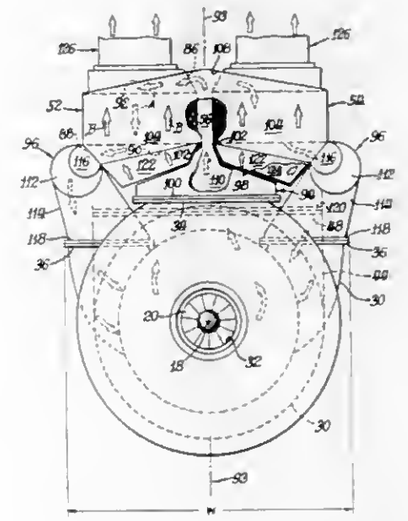
said lower compartment, first fluid circuit and second fluid circuit comprising a closed fluid circuit in which the mass of water is constant.

4,031,953

HEAT EXCHANGER SYSTEM AND DUCTING ARRANGEMENT THEREFOR

Jan C. Kline, Brimfield, Ill., assignor to Caterpillar Tractor Co., Peoria, Ill.

Filed Dec. 23, 1974, Ser. No. 535,877
Int. Cl.² F02C *7/10*; **F02G** *1/00*; **F28F** *9/26*, *3/08*
U.S. Cl. 165—166 **2 Claims**



1. A heat exchanger system and ducting arrangement therefor for transferring heat from a first fluid emanating from a first passage to a second fluid emanating from a second passage and circulating therethrough, comprising:

pair of longitudinally oriented and side-by-side heat exchanger units individually having a plurality of first and second primary surface heat exchanging plate assemblies alternately arranged in a generally upright, transversely oriented and longitudinally stacked manner and defining a plurality of first fluid flow paths and a plurality of second fluid flow paths alternately therethrough and so constructed and arranged that an elongated space is defined between said units for substantially the full length thereof:

a bifurcated inlet duct for delivering the first fluid upwardly from said first passage to said heat exchanger units and said first fluid flow paths, and including a pair of longitudinally extending channels individually connected upwardly to said heat exchanger units;

a pair of exhaust conduits for conducting the first fluid upwardly away from said heat exchanger units after heat is extracted therefrom;

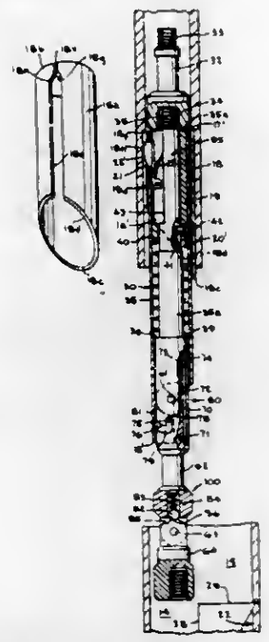
a common inlet plenum including a cover spanning between said heat exchanger units generally above said elongated space, a pair of end walls spanning between the ends of the heat exchanger units, and a centrally disposed duct connected to the heat exchanger units, said centrally disposed duct being longitudinally interposed between said channels and of a construction sufficient for delivering the second fluid oppositely from said second passage upwardly to said elongated space and therefrom in two separate directions symmetrically oppositely outwardly to said heat exchanger units and to said second fluid flow paths; and

a pair of outlet manifolds for conducting the heated second fluid from said heat exchanger units.

4,031,954
FLOW VALVE INSTALLATION AND REMOVAL APPARATUS

Gerald P. Herbert; Ferdinand M. McGinn, and Hugh D. Embree, all of Lafayette, La., assignors to Production Specialties, Inc., Lafayette, La.

Filed Sept. 13, 1976, Ser. No. 722,534
Int. Cl.² E21B *23/00*
U.S. Cl. 166—117.5 **5 Claims**



1. A well installation comprising:
a. a well tubing having a plurality of tubing mandrels each having a main bore therethrough with an orientation sleeve mounted in the main bore and a valve receiving side pocket offset from the main bore, said orientation sleeve including:
1. an elongated hollow tubular body having an upper and lower end;
2. said lower end extending upwardly at an angle relative to the longitudinal axis of said tubular body to form a sloping guide surface which extends upwardly and away from the offset pocket;
3. a first slot extending longitudinally of said tubular body from the highest portion of said guide surface, said first slot terminating in spaced relation to said upper end of said tubular body;
4. a second slot extending from the upper end of said first slot to the upper end of said tubular body; and
5. said second slot being substantially smaller in width than said first slot to form a pair of aligned shoulders at the juncture of said first and second slot which are spaced from each other by said second slot whereby debris may discharge from said first slot through said second slot and into the tubing;
b. guard and guide means above the valve receiving side pocket and including spaced sides facing the main bore and having vertical edge surfaces and an inner upwardly tapered end to guide a valve into the valve receiving side pocket;
c. a support body adapted to be moved through the tubing mandrels;
d. a movable body carried by and longitudinally movable relative to the support body;
e. a longitudinal guide key having an upwardly directed shoulder and an inclined surface facing downwardly, pivotally carried by said movable body for outward movement from said movable body and movable downwardly through said sleeves but an upward movement of said movable body engagable with the lower end of any sleeve immediately thereabove to slide along said first slot means and engage said aligned shoulders;
f. shifting tool means pivotally supported from said support body and adapted to support a valve handling support;
g. cooperating releasing means on said support body and movable plunger initially holding said shifting tool means aligned in the main bore; and
h. cooperating shifting means connected between said shifting tool means and said support body for shifting said shifting tool means into the side pocket when the releasing means is actuated.

4,031,955
DOWN HOLE INHIBITOR INJECTOR

Charles A. Ledet, Houston, Tex., assignor to Baker Oil Tools, Inc., Houston, Tex.

Filed Jan. 20, 1976, Ser. No. 650,741
Int. Cl.² E21B *33/12*
U.S. Cl. 166—183 **14 Claims**

1. Apparatus for use in a subterranean well to inject inhibitor solution within and below the bore of a well packer mechanism and thereafter circulate said solution with produced hydrocarbons through and to the top of said well, comprising: valving means for selective transmission of said inhibitor solution within said well through said apparatus; mandrel means for receipt of said valving means; by-pass means in communication with said valving means for carrying said inhibitor solution therethrough; tubular means having first and second tubing, said first tubing defining a flow path in communication with said by-pass means for carrying said inhibitor solution, and said second tubing defining a flow path for fluid transmission to the top of the well; and well packer means for receipt of said first and second tubing, said packer means defining therein a flow path communicating with the flow path defined within said first tubing whereby said inhibitor solution is exposed to and circulated within the flow path in said packer means and in communication with the flow path defined in said second tubing.

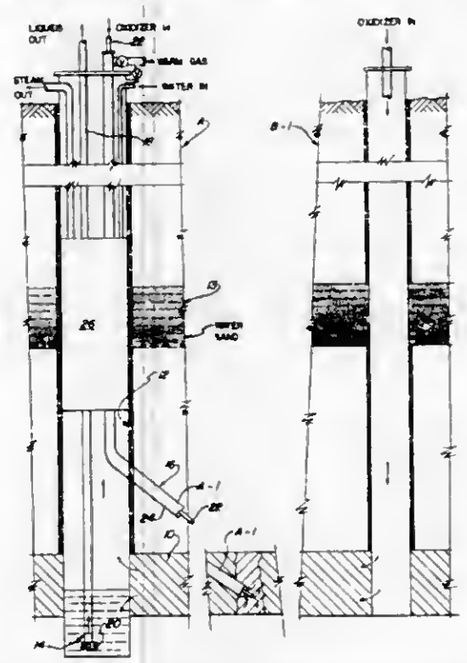
4,031,956
METHOD OF RECOVERING ENERGY FROM SUBSURFACE PETROLEUM RESERVOIRS

Ruel C. Terry, Denver, Colo., assignor to In Situ Technology, Inc., Denver, Colo.

Filed Feb. 12, 1976, Ser. No. 657,550
Int. Cl.² E21B *43/24*
U.S. Cl. 166—261 **6 Claims**

1. A method of extracting heat from a petroleum reservoir in the earth by consuming the petroleum in situ comprising the steps of:

establishing at least two injection passages and a removal passage between a surface location and the petroleum reservoir,
injecting an oxidizer through one of the injection passages into the petroleum reservoir,
igniting the petroleum reservoir through said one passage to create a fire front which progresses toward the other of said injection passages,
injecting an oxidizing agent into said other injection passage while maintaining the injection through said one injection passage,
allowing channels to be formed in the petroleum reservoir by burning petroleum,



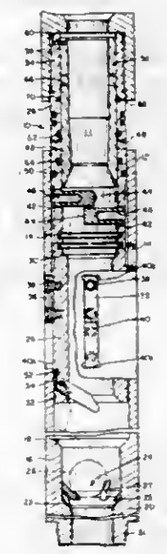
injecting a plugging agent into the most rapidly forming channels,
controlling oxidizer injection so that petroleum is consumed in the fire,
collecting fluids produced by the burning petroleum in the removal passage,
conveying the fluids through the removal passage to the surface location, and
forming an underground burn pattern by injection of a non-flammable fluid into the reservoir at locations where it is desired to discourage further burning.

4,031,957
METHOD AND APPARATUS FOR TESTING AND TREATING WELL FORMATIONS

Lawrence Sanford, 4047 Hollister, Houston, Tex. 77055

Filed July 23, 1976, Ser. No. 708,029
Int. Cl.² E21B *43/00*, *43/27*, *47/00*
U.S. Cl. 166—264 **26 Claims**

1. A single trip method of treating a formation in a well bore comprising:
lowering into said well bore an operating tool string having a packer, a perforated shoe supported below said packer, a first valve means supported above said packer and a second valve means supported above said first valve means;
setting said packer above said formation,
manipulating said first valve means to open a flow passage for circulation downwardly through said string, said first and second valve means, said packer and said shoe to said formation, and upwardly from said formation through said shoe, said packer, said first and second valve means and said string for testing said formation.
manipulating said first vavle means to prevent flow upwardly or downwardly therethrough,
manipulating said second valve means to open a first lateral flow path providing communication from the interior of said tool string to said well bore,
reverse circulating a fluid through said first lateral flow path to remove foreign matter,
manipulating said second valve means to close said first lateral flow path,
manipulating said first valve means to open said flow passage,
introducing a treating fluid into said formation,
manipulating said first valve means to prevent flow upwardly or downwardly therethrough,
manipulating said second valve means by longitudinal movement of said tool string to open a second lateral flow path providing communication from the interior of said tool string to said well bore, and
reverse circulating a fluid through said second flow path to remove foreign matter.



21. Apparatus adapted for attachment to a tool string to be lowered into a well bore for treating a formation in said well bore comprising a packer, a perforated shoe supported below said packer, first conduit means connecting said perforated shoe and said packer, first valve means supported above said packer, second conduit means connecting said first valve means and said packer, second valve means supported above said first valve means, third conduit means connecting said first and second valve means, said first valve means being operative to selectively provide a flow passage for circulation downwardly through said first and second valve means, said packer to said shoe and upwardly from said shoe through said packer and said first and second valve means, said second valve means including means to provide a first lateral flow path from the interior of said second valve means to said well bore and means to provide a second lateral flow path from the interior of said second valve means to said well bore when said first lateral flow path is closed and said tool string is moved longitudinally.

4,031,958
PLUGGING OF WATER-PRODUCING ZONES IN A SUBTERRANEAN FORMATION

Burton B. Sandiford, Placentia, and Robert K. Knight, Fullerton, both of Calif., assignors to Union Oil Company of California, Brea, Calif.

Filed June 13, 1975, Ser. No. 586,731
Int. Cl.² E21B *33/138*
U.S. Cl. 166—270 **25 Claims**

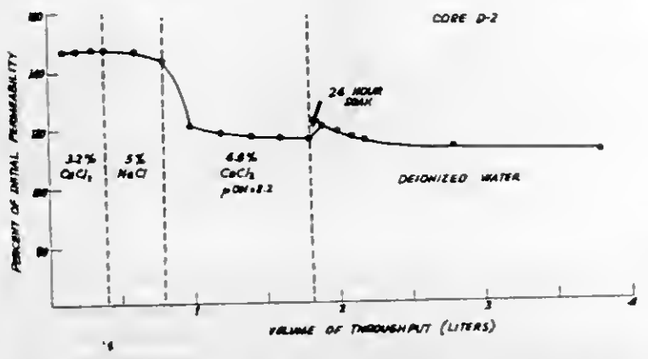
1. A method for selectively plugging the permeable water channels of a subterranean formation of nonuniform permeability penetrated by a well, which comprises:

a. introducing a polymer-thickened aqueous solution of a first reactive chemical into said well communicating with said formation, said solution containing a polymer thickening agent added in an amount sufficient to render the solution substantially more viscous than the subsequently injected liquids;
b. followed by introducing a low viscosity inert aqueous spacer liquid into said well;
c. followed by introducing a low viscosity aqueous solution of a second reactive chemical which, in the formation, contacts and reacts with said first reactive chemical to produce an insoluble precipitate or gel;
d. followed by introducing a second low viscosity inert aqueous spacer liquid; and
e. followed by introducing a second aqueous solution of said first reactive chemical which, in the formation, contacts and reacts with the aqueous solution of a second reactive chemical introduced in step (c) to produce an insoluble precipitate or gel.

4,031,959
METHOD OF MAINTAINING THE PERMEABILITY OF HYDROCARBON RESERVOIR ROCK

James H. Henderson, Dallas, Tex., assignor to Permeator Corporation, Houston, Tex.

Continuation-in-part of Ser. No. 647,769, Jan. 9, 1976, abandoned, which is a continuation of Ser. No. 542,297, Jan. 20, 1975, abandoned. This application July 7, 1976, Ser. No. 703,216
Int. Cl.² E21B *43/04*, *43/26*, *43/27*
U.S. Cl. 166—307 **11 Claims**

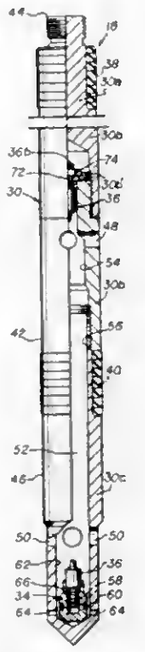


1. A method of maintaining and stabilizing the permeability of subsurface hydrocarbon reservoir rock containing clay particles and, where clay damage has occurred, of improving the permeability of the rock, said method comprising:
a. injecting down a well bore traversing said rock an aqueous solution of alkaline earth metal hydroxide and a salt of an alkaline earth metal the concentration of alkaline earth metal cation in the solution being greater than 10,000 ppm and the pH value of the solution being greater than 10;
b. forcing said solution under pressure out into the reservoir rock formation and away from said well bore;
c. maintaining the pressure to prevent the solution from flowing back into the well bore and to cause the solution to remain within the rock formation for a time period and with a volume which is:
1. insufficient to consolidate sand, but
2. sufficient
i. in respect of expansible clay particles to alter their electrical behavior, thereby causing them, in hydrated form, to occupy a smaller effective volume than prior to the altering, and
ii. in respect of non-expansible clay particles and originally expansible clay particles whose electrical behavior has thus been altered pursuant to (i), chemically to transform them into clay particles which are capable of permanently adhering to rock substrates, thereby to decrease the existing sensitivity of both expansible and non-expansible clay particles to fluids and permanently to change the clay particle structure so as to prevent future sensitivity of fluids
d. thereafter relcasing the well head pressure, thereby enabling solution to flow back into the well bore.

4,031,960
CIRCULATING VALVE

William A. Dudley, Garland, Tex., assignor to Teledyne, Inc., Garland, Tex.

Filed Feb. 25, 1976, Ser. No. 661,249
Int. Cl.² F04F *1/08*; E21B *43/12*
U.S. Cl. 166—317 **33 Claims**



1. A circulating valve for use in a well comprising:
valve housing means;
seal means around said valve housing means;
first circulating port means in said valve housing means on one side of said seal means;
second circulating port means in said valve housing means on the other side of said seal means;
passage means in said valve housing means between said first and second circulating port means;
valve plug means movable between an initial position blocking flow through said passage means and a second position permitting flow through said passage means; and
frangible drawbar means to releasably maintain said valve plug means in said initial position.

4,031,961
OIL AND GASOLINE FIRE EXTINGUISHING COMPOSITION

Alfred R. Globus, Bayside, N.Y., assignor to Guardian Chemical Corporation, Hauppauge, N.Y.

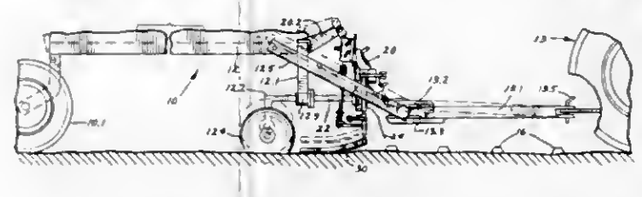
Division of Ser. No. 452,603, March 19, 1974, Pat. No. 3,979,302. This application June 30, 1976, Ser. No. 701,295
Int. Cl.² A62C *1/00*
U.S. Cl. 169—47 **3 Claims**

1. A process for extinguishing hydrocarbon fires comprising contacting said fire with a composition comprising a polymerized (hydrated amide-amine) complex formed from at least one fatty acid having 8 to 18 carbon atoms and at least one dialkanol amine having 1 to 6 carbon atoms per alkanol group.

4,031,962
FARM IMPLEMENT POSITIONER

Earl H. Ellinger, Crookston, Minn., assignor to Dee, Inc., Crookston, Minn.

Filed Oct. 14, 1975, Ser. No. 621,804
Int. Cl.² A01D *33/00*
U.S. Cl. 171—8 **6 Claims**

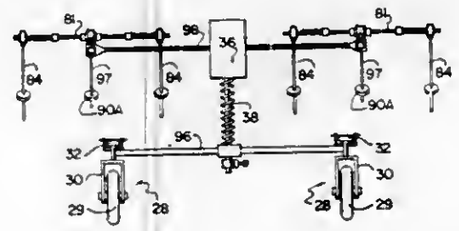


1. A positioner for maintaining the position of an implement such as a sugar beet harvester in correct alignment with the plants of a crop row, and comprising
a harness pivotable about an upright axis and mountable to an implement;
a pair of spaced, elongated sensing shoes for contacting plants in a plant row therebetween;
linkage means pivotally mounting the shoes at their forward ends to the harness for swinging movement of the shoes with respect to the harness, and including means limiting generally horizontal swinging movement of the shoes with respect to the harness to unison movement of the shoes toward and away from each other;
means resiliently urging the shoes to swing toward each other for mutual contact with successive plants of a crop row therebetween, whereby misalignment of the implement with a crop row causes the harness to rotate about its upright axis; and
implement steering means responsive to rotation of the harness about its axis to steer the implement into realignment with the crop row.

4,031,963
DEPTH CONTROL DEVICE FOR GROUND WORKING AGRICULTURAL IMPLEMENTS

Erhard Poggemiller, Box 128, Luseland, Saskatchewan, and Ralph Sweet, Box 3, Forgan, Saskatchewan, both of Canada

Filed Apr. 14, 1975, Ser. No. 567,624
Int. Cl.² A01B *63/114*, *63/12*, *65/06*
U.S. Cl. 172—4 **22 Claims**

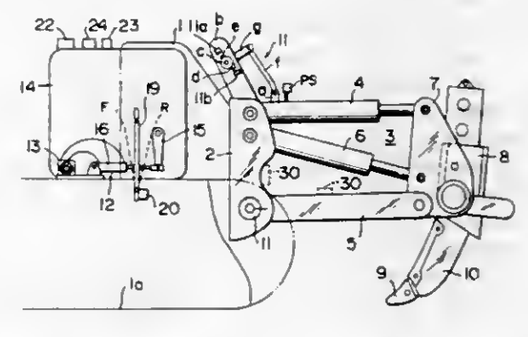


1. A depth control device for earth working agricultural implements such as cultivators, seed drills, discers, underground harvesters and planters and the like which includes supporting framework, ground engaging wheels supporting said framework, earth working components supported from said supporting framework and means to raise and lower and hence adjust the depth of penetration of said earth working components in the ground being worked; said device comprising in combination at least two surface engaging sensing members spaced apart from one another and each operatively secured by one end thereof to said framework and extending in advance of said earth working components, means operatively connected between said surface engaging sensing members to average out the vertical movement required to operate said means to adjust said depth of penetration, said means operatively connected between said surface engaging sensing members including a connecting bar secured by one end thereof to one of said surface engaging sensing members and by the other end thereof to the other of said surface engaging sensing members, and means operatively connected between said connecting bar and said means to adjust the depth of penetration of said earth working components to operate said last mentioned means thereby maintaining said earth working components at a predetermined depth of penetration relative to the surface of the ground.

4,031,964
AUTOMATIC CONTROL SYSTEM CONTROLLING A RIPPER USED ON A CONSTRUCTION EQUIPMENT

Yasuyuki Takahashi, and Tomobaru Sano, both of Hirakata, Japan, assignors to Kabushiki Kaisha Komatsu Seisakusbo, Japan

Filed Jan. 29, 1975, Ser. No. 545,318
Claims priority, application Japan, Feb. 1, 1974, 49-12725
Int. Cl.² A01B *63/112*
U.S. Cl. 172—9 **6 Claims**



1. Automatic control system for a ripper used on a construction equipment comprising:
a ripper mounted on the rear portion of the body of the construction equipment and including a shank, tilt cylinders for tilting the shank, lift cylinders for raising or lowering the shank, links disposed in parallel to the tilt cylinders and a shank holding structure for securely holding the shank;
a load detector mounted on the ripper and capable of detecting overload applied to the shank;
a depth detector for detecting predetermined upper and lower limit positions of the shank; and
a control device actuated by the outputs of the load detector and the depth detector for maintaining penetration depth of the shank at the predetermined lower limit when normal load is applied to the shank and raising the shank when a predetermined overload is applied thereto to reduce the load to a value less than the overload;
whereby penetration depth of the shank is automatically controlled to a value at which no overload is applied to the shank; said control device comprising:
a first relay circuit producing a first control signal when overload is applied to the shank at a shank position which is lower than the upper limit position;
a second relay circuit producing a second control signal when load less than overload is applied to the shank at a shank position which is not the predetermined shank position;
an electromagnetic valve switched to a shank raising position upon receipt of the first control signal, to a shank lowering position upon receipt of the second control signal and to a neutral position when the valve receives neither signal; and
a hydraulic actuation means for actuating the lift cylinders responsive to switching of the electromagnetic valve;
said hydraulic actuation means comprising:
an actuator actuated by the electromagnetic valve;
an operation lever actuated by the rod of the actuator; and

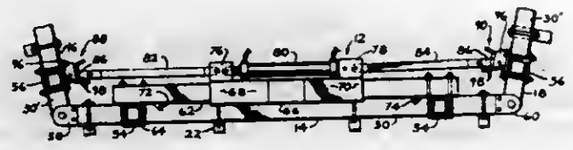
ripper actuation valve interlocked with the operation lever for switching operation and changing direction of fluid from a fluid source to the lift cylinder.

4,031,965

TILLAGE TOOL WING FOLDING KIT

Calvin B. Blair, P.O. Box 97, Barnard, Kans. 67418

Filed Dec. 17, 1975, Ser. No. 641,628
Int. Cl.² A01B *63/00*
U.S. Cl. 172—311 **10 Claims**



1. A wing lifting arrangement having structural characteristics adapting same for use in combination with an earthworking implement having a central carriage with a rigid frame portion and lateral wings hingedly connected to said central carriage, said arrangement comprising:

a. an elongated main frame member adapted for mounting on said frame portion transversely of said carriage;

b. a pair of cylinder mounts slideable along said frame member;

c. an extensible cylinder connected to said mounts and extending therebetween and operable to urge said mounts toward and away from each other;

d. a pair of arms respectively pivotally connected at a first end thereof to said cylinder mounts and extending in generally opposite directions away from said cylinder; and

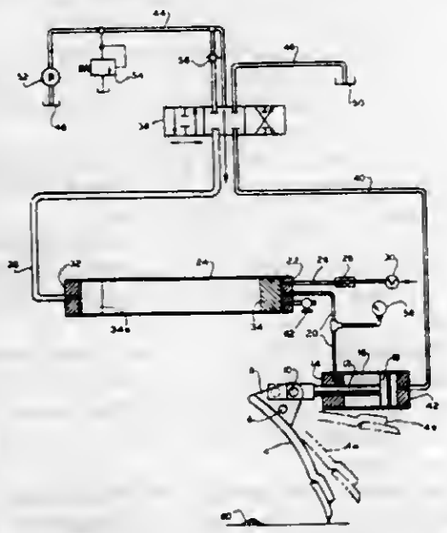
e. a wing connector adapted for mounting on each of said wings, said arms respectively being pivotally connected at a second end thereof to said wing connectors, whereby the contraction of said cylinder produces relative movement of said cylinder mounts toward each other and folding of the wings about said central carriage.

4,031,966

OPERATING AND SHOCK CYLINDER ASSEMBLY FOR VEHICLE UNDERBODY SCRAPERS AND THE LIKE

Eugene A. Farrell, Fishers Landing, N.Y., assignor to Frink Sno-Plows, Clayton, N.Y.

Filed June 21, 1976, Ser. No. 698,037
Int. Cl.² E02F *3/12*
U.S. Cl. 172—794 **9 Claims**



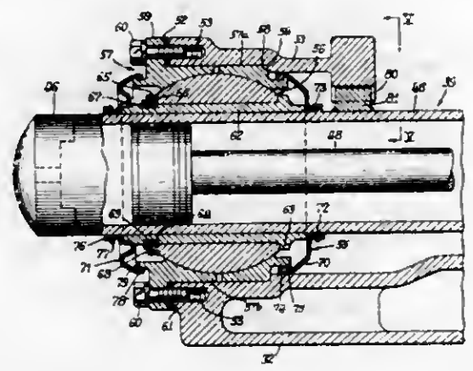
1. An operating and shock cylinder assembly for a vehicle mounted scraper blade that is pivotable between retracted and road engaging positions, a first vehicle mounted cylinder having a free floating piston therein, a second vehicle mounted cylinder having a piston and a rod connected at one end to the piston, the rod passing through an end of the cylinder and being connected at its other end to the pivotable scraper blade, a multi-position control valve, means to deliver hydraulic fluid under pressure to the valve, means connecting the valve to one end of the first cylinder, means connecting the other end of the first cylinder to one end of the second cylinder, means also connecting said other end of the first cylinder to a source of air under pressure, and means to charge the first cylinder with air under pressure, said air charge causing the free floating piston to occupy a position adjacent the end of the cylinder connected to the valve, said air charge also causing the piston in the second cylinder to move to a position whereby the scraper blade is pivoted downwardly into road engaging position, said control valve being movable after the first cylinder has been charged with air to a position whereby hydraulic fluid under pressure is delivered to the first cylinder causing the free floating piston to move toward the end of the cylinder connected to the air source and second cylinder, said piston movement causing the air in the first cylinder to pass into the second cylinder and be further compressed, the compressed air in the second cylinder acting to firmly but yieldably bias the scraper blade into road engaging position.

4,031,967

MOTOR GRADER WITH SPHERICAL BEARING MOUNTING FOR BLADE TILT CYLINDERS

Robert Allan Atherton, Chillicothe, and Carroll Richard Cole, Decatur, both of Ill., assignors to Caterpillar Tractor Co., Peoria, Ill.

Filed June 14, 1976, Ser. No. 696,105
Int. Cl.² E02F *3/76*, *3/85*
U.S. Cl. 172—795 **10 Claims**



1. In a motor grader which includes a circle having a pair of integral, depending support arms at its rearward portion, blade carrying means including a pair of bearing housings the lower end portions of which are mounted on transverse pivots in the lower extremities of the support arms so said housings are forward of the arms, a grader blade assembly mounted on said bearing housings, and hydraulic cylinder and piston means mounted on the circle and operatively connected to the bearing housings for tilting the latter about said transverse pivots, an improved cylinder mounting comprising, in combination:

a pair of integral sleeves on the circle which have longitudinal axes aligned with upper portions of the bearing housings;

transverse pivot pins on the bearing housings aligned with said longitudinal axes;

a hydraulic cylinder and piston unit positioned in each of said sleeves and having a piston rod connected to one of said transverse pivot pins;

a bearing collar secured to the cylinder of said unit within the sleeve, said collar having spaced circumferential flanges;

a spherical bearing removably mounted on said collar between said flanges;

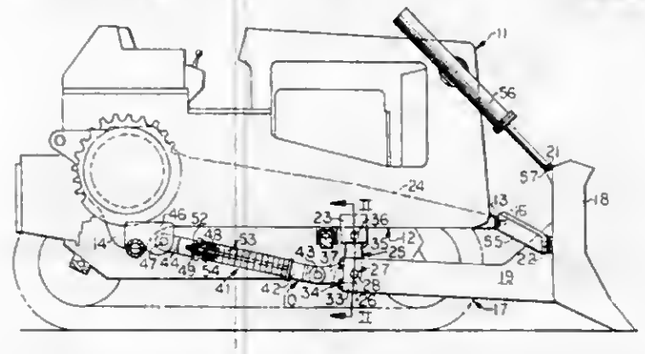
and a socket secured to the interior of the sleeve, said socket mounting the spherical bearing for limited universal movement, said socket having a first annular element toward the rod end of the unit and a second annular element toward the head end, said elements having facing surfaces on opposite sides of the transverse median plane of the spherical bearing, and means maintaining said annular elements in snug engagement with said spherical bearing.

4,031,968

CUSHIONED PUSH DOZER DEVICE

Ronald L. Krolak, Morton, and Duane L. Parker, Peoria, both of Ill., assignors to Caterpillar Tractor Co., Peoria, Ill.

Filed Oct. 28, 1975, Ser. No. 626,421
Int. Cl.² E02F *3/76*
U.S. Cl. 172—801 **7 Claims**



1. A resilient push dozer arrangement for a vehicle having a longitudinally extending mounting frame, comprising;

a push dozer transversely disposed at one end of the vehicle;

an elongated push arm rigidly secured to and extended from such dozer in juxaposition below said mounting frame of the vehicle;

means for swingably attaching the push arm to the mouting frame so that the push arm and hence the push dozer is movable in a rearward direction relative to the mounting frame when an impact load is applied in a rearward direction to the push dozer, said means including a rigid supporting link having an end pivotally attached to the mounting frame and pivotally connected to and swingably supporting the distal end of the push arm; and

means for cushioning the rearward movement of the push dozer and push arm so that shock loads applied to the push dozer are cushioned and transmitted in a rearward direction to the mounting frame at a point relatively widely spaced from said attaching means by the cushioning means independent of the attaching means.

4,031,969

METHOD AND APPARATUS FOR EARTH BORING

Roy H. Cullen, and Jimmie R. Aker, both of Houston, Tex., assignors to Roy H. Cullen

Division of Ser. No. 448,975, March 7, 1974, Pat. No. 3,926,269. This application June 27, 1975, Ser. No. 591,125
Int. Cl.² E21B *3/10*
U.S. Cl. 175—65 **8 Claims**

1. A method of deep earth boring in a borehole with a rotating drill bit driven by an electric motor power means and mounted with a drilling string of desired length formed by a plurality of connected tubular pipe joints having communicating bores which enables communication of the drill bit with a supply of drilling fluid, including the steps of:

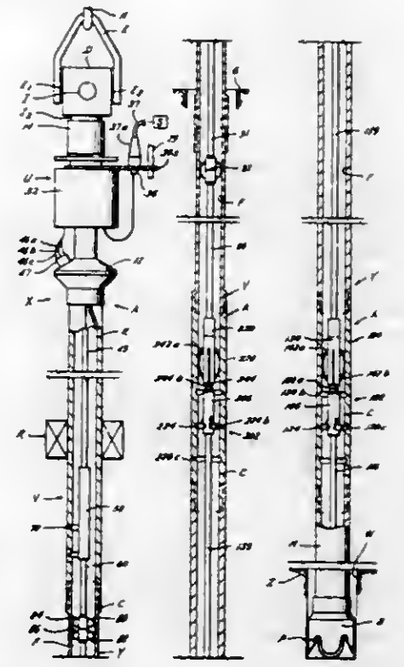
drilling a borehole to a predetermined depth and thereafter removing the drill bit and drill string from the borehole;

assembling a drill bit with an electric motor power means to form a unit to effect earth formation penetrating rotation with the drill bit when the electric motor power means is operated;

lowering the drill bit and electric motor power means therewith in the borehole to the predetermined depth on a drilling string composed of pipe having a bore extending therethrough and a first electrical connector at the lower end thereof;

lowering an electrical power conductor cable means having a length substantially the same as the drilling string in the bore of the drilling string with a second electrical connector at its lower end and connecting the lower end of the second electrical connector with said first electrical connector to establish an electrical connection between said conductor means and said motor power means to supply electrical power to the drill bit and electric motor power means unit;

releasably securing the upper end of the electrical power conductor cable means with the drilling string with a securing means releasable from the drilling string by an upward force applied to the electrical power conductor cable means which effects disconnection of the electrical connectors;



connecting the electrical power conductor cable means with a source of electrical power for supplying electrical power to the drill bit and electric motor power means unit to rotate the drill bit;

supplying electrical power to the drill bit and electric motor power means unit when desired to rotate the drill bit to effect earth formation penetrating rotation of the drill bit wherein earth boring is effected;

flowing drilling fluid through the bore of the drilling string while supplying electrical power to rotate the drill bit;

adding tubular pipe joints to extend the length of the drilling string;

installing additional electrical power conductors in the bore of the added on pipe joints prior to the step of connecting the electrical power conductor means with the source of electrical power;

thereafter removing said additional electrical power conductors from the drilling string; and

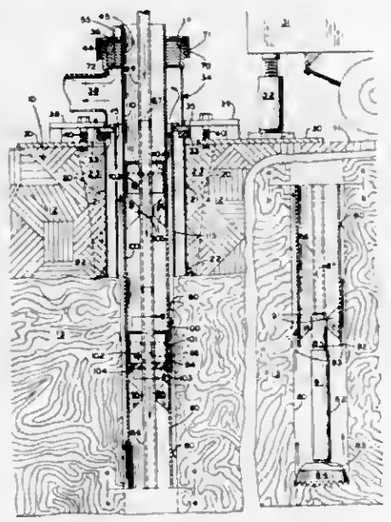
lowering a fishing tool down into the bore of the drilling string to engage and remove said electrical power conductor cable means from the drilling string by applying the upward force thereto with the wireline fishing tool means for thereafter permitting running a tool through the bore substantially to the bottom of the drilling string.

4,031,970

BOREHOLE DRILLING APPARATUS

Billie E. Belknap, P.O. Box 846, Reedley, Calif. 93654

Filed Feb. 9, 1976, Ser. No. 656,362
Int. Cl.² E21B 1/06, 21/00
U.S. Cl. 175—103 12 Claims



1. A well drilling apparatus comprising:

A. a slip discharge conduit,

B. means mounting the slip discharge conduit in a fixed upright position in the ground in substantially air-tight relation therewith,

C. discharge means connected to the slip discharge conduit and laterally extended therefrom above the surface of the ground,

D. an elongated drill pipe extended through the slip discharge conduit for elevational movement relative thereto having an end above the conduit adapted for connection to a source of air under pressure and an end below the conduit,

E. a pneumatically actuated hammer mounted on the lower end of the drill pipe adapted to release compressed air from the drill pipe therethrough having the drill pipe supported thereon for elevational movement therewith,

F. a debris conduit mounted in circumscribing relation on the drill pipe for elevational movement therewith and defining a passage therebetween having an upper end disposed in the slip discharge conduit and an open lower end adjacent to the hammer to receive air released by the hammer and debris generated thereby, and

g. a sliding seal between the slip discharge conduit and the upper end of the debris conduit to force said air and debris up the passage and out the laterally extended discharge means.

4,031,971

JET NOZZLE DRILLING ASSEMBLY

Thomas R. Miller, Waynesburg, Pa., assignor to Continental Oil Company, Ponca City, Okla.

Filed Oct. 8, 1976, Ser. No. 730,883
Int. Cl.² E21B 1/06
U.S. Cl. 175—107 4 Claims

1. In a drilling assembly comprising

a. a fluid supply shaft;

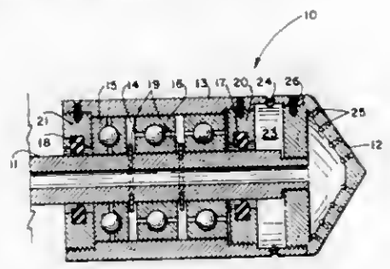
b. a jet nozzle rotatably mounted on an end of said fluid supply shaft and having a plurality of outlet ports adapted to impart rotational force to said nozzle upon passage of fluid through said ports;

c. a housing affixed to said nozzle and extending rearwardly therefrom to encompass a portion of said fluid supply shaft;

d. a bearing section between said fluid supply shaft and said housing, said bearing section including thrust bearing means and radial bearing means; and

e. retaining means connected to said fluid supply shaft and adapted to retain said nozzle, housing and bearing means in position on said fluid supply shaft;

the improvement comprising:



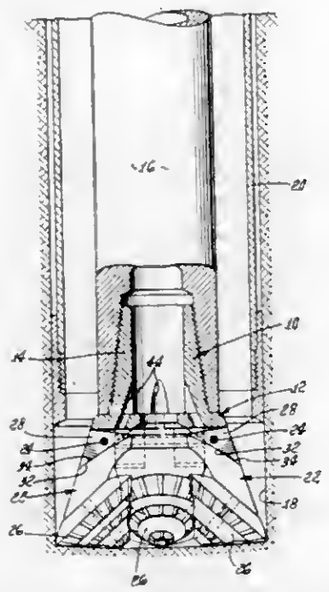
vent means providing an unrestrained fluid passage from the rear of said nozzle to the exterior of said housing whereby pressurized fluid leaking between the fluid supply shaft and the nozzle may pass freely to the exterior of the housing, thereby avoiding fluid contamination of said bearing section.

4,031,972

EXPANDABLE AND CONTRACTIBLE ROTARY WELL DRILLING BIT

Irving X. Burg, 2301 Bayside Drive, Corona del Mar, Calif. 92625

Filed Mar. 8, 1976, Ser. No. 664,960
Int. Cl.² E21B 9/26
U.S. Cl. 175—263 4 Claims



1. In a rotary drill bit which is contractible to fit within a casing to permit withdrawal through the casing, and which is expandable below the casing to drill a well bore of a diameter larger than the outside diameter of the casing so as to permit the casing to follow the bit to prevent collapse of and/or lost circulation from the well bore thereabove, the combination of:

a. a base having an upper end threaded for connection to the lower end of a rotary drill string in the casing for driving the bit;

b. a plurality of cutter arms circumferentially spaced around said base therebelow and respectively having cutters thereon;

c. a plurality of pivot pins respectively pivotally connecting said cutter arms to said base for simple pivotal movement inwardly and outwardly between retracted positions corresponding to the contracted condition of the bit and extended positions corresponding to the expanded condition of the bit, said pivot pins having circular cross sections and being disposed in holes of circular cross section in said base and said cutter arms, respectively;

d. a plurality of interengageable expansion stop means on said base and on said cutter arms, respectively, for preventing outward pivotal movement of said cutter arms beyond their extended positions corresponding to the expanded condition of the bit and for transferring the weight of said base and the drill string to said cutter arms without applying any substantial loads to said pivot pins, each of said interengageable expansion stop means including a first set of interengageable expansion stops on said base and the corresponding cutter arm adjacent one end of the corresponding pivot pin and below and radially outwardly of the corresponding pivot pin, a second set of interengagable expansion stops on said base and the corresponding cutter arm adjacent the other end of the corresponding pivot pin and below and radially outwardly of the corresponding pivot pin, and a third set of interengageable expansion stops on said base and the corresponding cutter arm intermediate the ends of the corresponding pivot pin and above and radially outwardly of the corresponding pivot pin; and

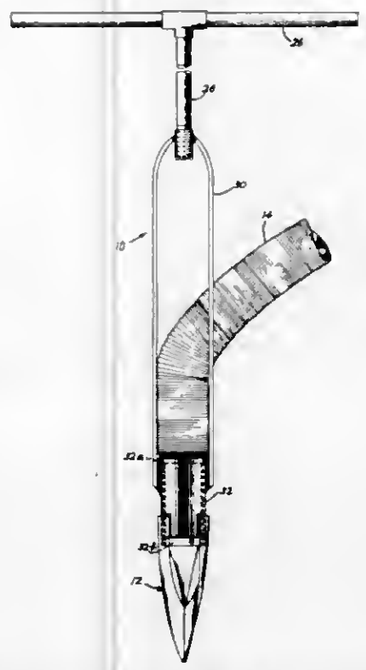
e. a plurality of interengageable contraction stop means on said base and on said cutter arms, respectively, for preventing inward pivotal movement of said cutter arms beyond their retracted positions corresponding to the contracted condition of the bit, said expansion stop means limiting inward pivotal movement of said cutter arms to values such that the weight of said base and the drill string pivots said cutter arms outwardly into their extended positions, to expand the bit, when said cutters rest on the bottom of said well bore.

4,031,973

PLACER MINING TOOL

Robert G. Claye, 420 South St., Yreka, Calif. 96097, and David S. Wilson, P.O. Box 12, Klamath River, Calif. 96050

Filed Nov. 10, 1975, Ser. No. 630,530
Int. Cl.² E21B 49/00
U.S. Cl. 175—320 2 Claims



1. A manually operable ore digging instrumentality for use in placer mining including, in combination,

a. a bit carrying sleeve of substantial diameter,

b. manually operable means for turning the sleeve back and forth and for thrusting it downward continuously or intermittently as required, and

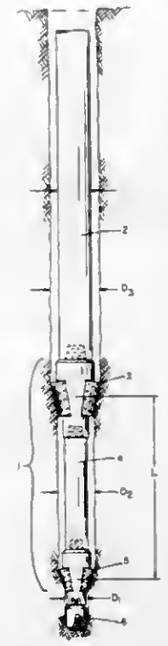
c. bit forming means fixedly attached to said sleeve consisting of three like arcuate earth-boring segments, the segments being generally rectangular in shape but each tapered at a small acute angle along its lower end, and being twisted to bring the beveled edges at their lower ends to a common axis along which they are united to one another, but being spaced from one another at their widest portions by substantially more than their own individual widths, the construction and arrangement being such that material dislodged in pieces or chunks by manual reciprocation of the bit whose maximum dimensions do not exceed the maximum width of a bit segment can be accepted between the bit segments and pass unobstructedly through the sleeve.

4,031,974

BORING APPARATUS CAPABLE OF BORING STRAIGHT HOLES

Carl R. Peterson, Boxford, Mass., assignor to Rapidex, Inc., Gloucester, Mass.

Filed May 27, 1975, Ser. No. 581,379
Int. Cl.² E21B 9/24
U.S. Cl. 175—334 7 Claims



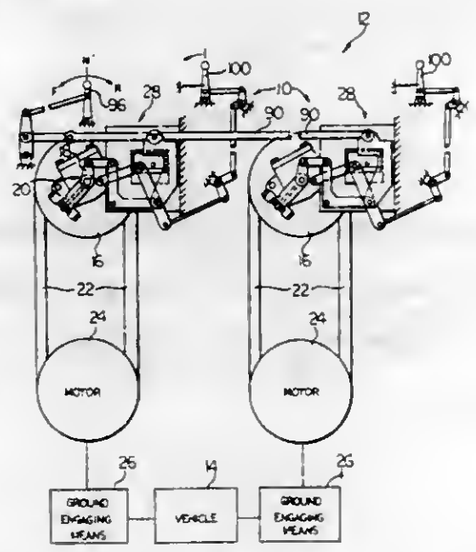
1. A rock boring assembly for producing a straight hole for use in a drill string above a pilot boring bit of predetermined diameter smaller than the desired final hole size, said boring assembly comprising a small conical boring bit and a larger conical boring bit, said conical boring bits mounted of lower and upper ends of an elongated spacer, respectively, the major effective cutting diameter of each of said conical boring bits being at least 10% greater than the minor effective cutting diameter of the respective bit, said spacer having a cross-section resistant to bending under the expected cutting forces, said spacer being rigidly connected to said conical bits to rotate therewith while spacing said conical boring bits apart a distance at least five times the major cutting diameter of said small conical boring bit, thereby spacing the pivot provided by said two conical boring bits to limit bodily angular deflection of said assembly and providing a substantial moment arm to resist lateral forces applied to said assembly by said pilot bit and drill string, and said spacer spacing said conical bits a distance than about 20 times the major cutting diameter of said lower conical boring bit to enable said spacer to act as a bend-resistant beam to resist angular deflection of the axis of either of said conical boring bits relative to the other when it receives uneven lateral force due to non-uniformity of cutting conditions about the circumference of said bit, said spacer spacing said conical bits apart by from 4 to 16 feet.

4,031,975

MECHANICAL MULTIPLIER FOR THE PURPOSE OF SPEED AND STEERING CONTROL FOR HYDROSTATIC SYSTEM

William K. Engel, Peoria, Ill., assignor to Caterpillar Tractor Co., Peoria, Ill.

Filed Jan. 21, 1976, Ser. No. 650,832
Int. Cl.² B62D 11/04
U.S. Cl. 180—6.48 7 Claims



1. In a control system for a hydrostatic drive of a vehicle comprising a pair of hydrostatic pumps the output of each of which is adjustable by moving an arm attached to a servo valve controlling the displacement of said pumps, each pump powering a respective hydraulic motor which drives a respective ground engaging means of said vehicle, an improved mechanical arrangment for controlling the speed and steering functions of said system, comprising:

A. a pair of pump adjusting means, one communicating with each of said pumps, each adjusting means comprising:

1. a first crank mounted centrally thereof to a frame adjacent said pump, a first end of said first crank drivingly linked to said arm;

2. a second crank mounted centrally thereof to said frame, a first end of said second crank drivingly linked to a second end of said first crank; and

3. a third crank mounted centrally thereof to said frame, a first end of said third crank drivingly linked to said second end of said first crank and a second end of said third rank drivingly linked to independent steering linkage means;

B. a pair of independent operator adjustable steering means, each respective one of said pair of steering means operatively connected to move a respective one of said pair of independent steering linkage means; and

C. tying means drivingly mounted adjacent a second end of each of said second cranks linking their movement.

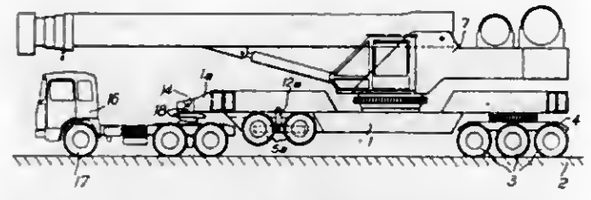
4,031,976

CONSTRUCTION VEHICLE HAVING RETRACTABLE WHEELS FOR TOWING

Bernard Lucien Lambert, Montceau-les-Mines, France, assignor to Potain Poclain Materiel (P.P.M.), Montceau-les-Mines, France

Filed Oct. 7, 1975, Ser. No. 620,466
Claims priority, application France, Oct. 9, 1974, 74.33991
Int. Cl.² B62D 61/12, 53/00
U.S. Cl. 180—14 R 4 Claims

1. A self-propelling construction machine comprising a frame provided with at least two groups of ground engaging members disposed and spaced longitudinally on said frame, one end of the frame being provided with a means for coupling to a towing vehicle, wherein the first group of ground engaging members is disposed near said end provided with the coupling means, said first group comprising means for elevating the ground engaging members with respect to the frame to a position above the ground, and the second group of displacement members being at a constant height relative to the frame and enabling movement of the machine when it is coupled to the towing vehicle, a prime mover on said machine, said first



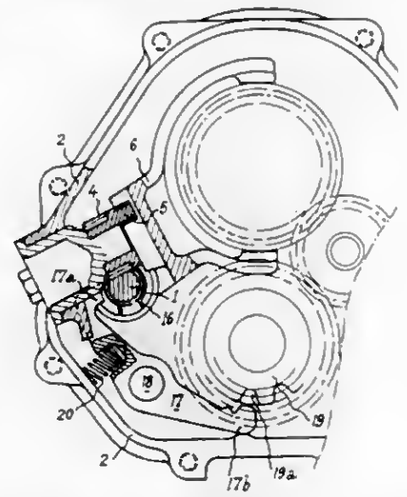
group of ground engaging members comprising drive members, means for transmitting power from said prime mover to said drive members, and said second group of members being mounted for steering movement, whereby said machine may be self-propelled and steered at a construction site, and whereby the machine may be coupled to a towing vehicle and transported over highways with the first group retracted.

4,031,977

TRANSMISSION DEVICES FOR MOTOR VEHICLES

Albert Grosseau, Chaville, France, assignor to Societe Anonyme Automobiles Citroen, France

Filed Jan. 8, 1976, Ser. No. 647,605
Claims priority, application France, Jan. 14, 1975, 75.00999
Int. Cl.² B60T 1/06
U.S. Cl. 180—77 R 13 Claims



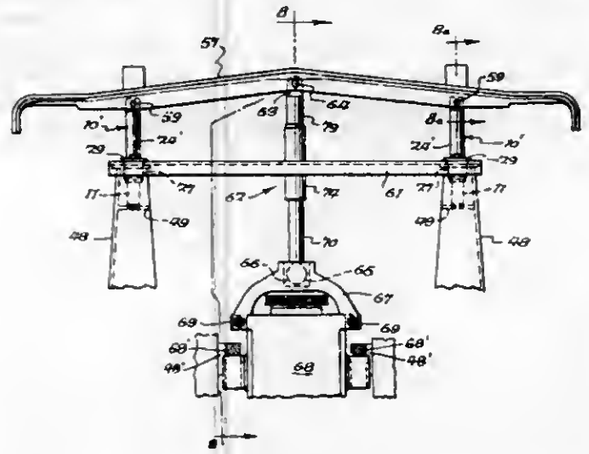
1. In a transmission device for a motor vehicle, means for providing a reverse drive condition of the transmission device, means for immobilizing the vehicle when the vehicle is stationary, first actuating means for actuating the reverse drive means, second actuating means for actuating the immobilizing means, and means for controlling the first and second actuating means, the control means comprising a manually actuated, slidable, selector rod, a rack, and first stop means, the rack and first stop means being movable with the selector rod, the first actuating means comprising a pinion arranged to engage the rack, and the second actuating means comprising a cam and second stop means connected to the cam, the cam being movable in at least one direction by the rod during a part of its displacement, by cooperation between the first and second stop means.

4,031,978

ENERGY ABSORBER UNIT AND ENERGY MANAGEMENT SYSTEM

Paul H. Taylor, Grand Island, N.Y., assignor to Tayco Developments, Inc., North Tonawanda, N.Y.

Filed May 28, 1975, Ser. No. 581,544
Int. Cl.² B60N 21/00
U.S. Cl. 180—91 15 Claims



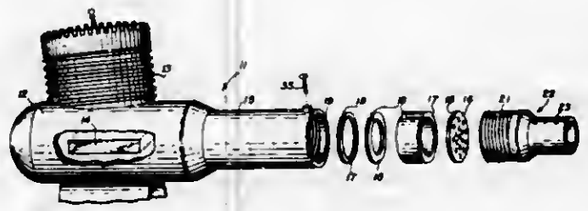
1. An energy management system for a vehicle having a frame, an engine movably mounted on said frame, and a bumper comprising impact energy absorbing unit means having first and second end portions, first means coupling said first end portion of said energy absorbing unit means to said bumper and second means coupling said second end portion of said energy absorbing unit means to said engine to cause impacts received by said bumper to be transmitted to said first end portion of said energy absorbing unit means while the forward momentum of said engine moving forwardly relative to said frame is transmitted to said second end portion of said energy absorbing unit means.

4,031,979

ADJUSTABLE MUFFLER FOR MODEL AIRCRAFT TYPE ENGINES

Roger W. Raleigh, 530 Alsace Lorraine, Half Moon Bay, Calif. 94019

Filed Apr. 24, 1975, Ser. No. 571,374
Int. Cl.² F01N 1/00
U.S. Cl. 181—69 10 Claims



1. In a muffler for muffling the exhaust of a two-cycle combustion engine of the type commonly used to power miniature aircraft, cars, boats and models:

baffle chamber means adapted to be connected in gas communication with and downstream of the exhaust port of the combustion engine for flow therethrough of the exhaust gases as fed into said baffle chamber means from the engine;

a plurality of baffle means adapted to be disposed in said baffle chamber means in spaced apart relation in the direction of the exhaust gas flow therethrough for providing different sonic wave reflections from each of said baffle means for reflecting sonic waves in the exhaust stream back to the engine for muffling the flow of the exhaust flow therethrough; and

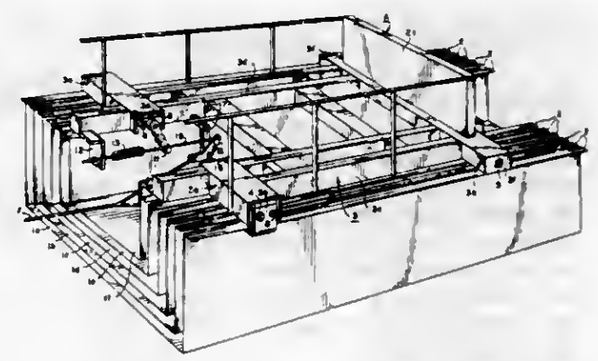
nozzle means having lesser cross-sectional dimensions for the flow of exhaust gas therethrough than those of said baffle chamber means so as to produce a sonic wave reflection in said baffle chamber and adapted to be connected in exhaust gas communication with and downstream of said baffle chamber means for reflecting sonic wave energy without substantially restricting the flow of exhaust gas therethrough for further muffling the flow of exhaust gas.

4,031,980

BRAKING DEVICE FOR LADDER LIFTER

Fusaji Terayama, Osaka, and Tetsuo Kozai, Higashiosaku, both of Japan, assignors to Morita Pump Kabushiki Kaisha, Osaka, Japan

Filed Aug. 14, 1975, Ser. No. 604,761
Int. Cl.² E06C 7/12
U.S. Cl. 182—103 3 Claims

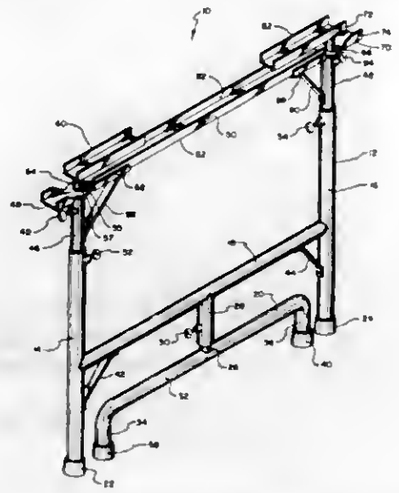


1. In an aerial ladder assembly having at least one pair of laterally spaced, channel-shaped ladder rails forming a ladder unit, a ladder lifter unit having laterally spaced rotatable wheels mounted thereon for rotational movement along each of said pairs of ladder rails of said ladder unit, rope means associated with said ladder lifter unit to raise or lower said lifter unit along the ladder rails of said ladder unit, the improvement of a braking device for stopping the movement of the ladder lifter unit along the ladder unit upon the breaking of the rope means, said braking device comprising elongated plate element means having a serrated upper surface fixed to the upper surface of each ladder rail of the ladder unit along the longitudinal length of each rail, brake cam element means having a bottom serrated surface pivotally mounted adjacent its upper end to said ladder lifter unit above each of said ladder rails, longitudinally tensionable spring means operatively connected intermediate the respective ends thereof to each brake cam element means, lever means pivotally mounted to said ladder lifter unit and connected at one end to one end of said spring means and at the other end to the rope means, bracket means mounted on said lifter means in longitudinally spaced relationship to said lever means and connected to the other end of said spring means whereby when said rope means are under tension, said spring means will be likewise under tension to maintain the brake cam element means in a raised state away from the serrated plate element means on said ladder rails but upon loss of tension in the rope means, the lever means will be pivoted forwardly causing the spring means to effect the pivoting of the brake cam element means towards the ladder rails to cause a meshing of the serrated surface of the cam element means against the serrated surface of each plate element means of each ladder rail to stop the movement of the ladder lifter unit along the ladder unit.

4,031,981
FOLDABLE WORK PLATFORM

Edward Spencer, La Grange, Ill., assignor to Little Giant Industries Inc., American Fork, Utah

Filed June 1, 1976, Ser. No. 691,926
Int. Cl.² E04G 1/32
U.S. Cl. 182—153 6 Claims

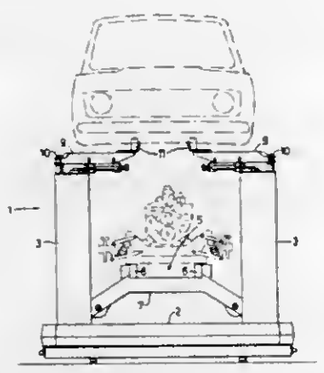


1. A foldable work platform comprising in combination:
a base comprising two upright, hollow legs rigidly interconnected by a cross piece and a support stand rotatably attached to the cross piece for selectively giving stability to the base when in upright position;
a scaffold adjustably cooperating with the base and comprising two downwardly depending hollow members rigidly interconnected by an open cross channel, each member being telescopically received by a leg, and means for securing each leg and hollow member together;
an arm configurated as an open U-shaped channel rotatably and extensibly carried upon the scaffold at at least one end thereof; and
wooden inserts nested within the cross channel and arms, the inserts extending above the sides of the channels.

4,031,982
DEVICE FOR MOUNTING CHASSIS DETAILS ONTO AN AUTOMOBILE BODY

Olov Halvar Lindfors, Goteborg, Sweden, assignor to AB Volvo Penta, Goteborg, Sweden

Filed Mar. 20, 1975, Ser. No. 560,556
Claims priority, application Sweden, Mar. 22, 1974, 7403918
Int. Cl.² B60S 13/00
U.S. Cl. 187—8.59 2 Claims

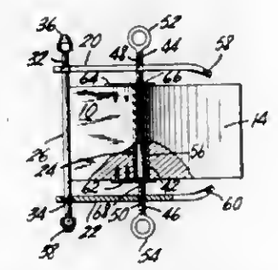


1. Device for mounting chassis details onto an automobile body, said device comprising an elongated rectangular platform, wheels supporting said platform, upright members mounted upon opposite ends of said platform at the corners of said platform, support means for an automobile body mounted on the upper part of each of said upright members, for movement between a first position under the body and a second position at the side of the body, said support means comprising support arms, said mounting means for said support means comprising vertical axles on which said arms are mounted for horizontal swinging movement between said first and second positions, a fixture for chassis details supported by the platform, each of said upright members having a jack connected to said fixture for raising the fixture relative to the platform to a level at which it relieves the weight of the body from said support means when said support means are in said first position and for lowering the fixture relative to the platform to lower the body when the support means are in said second position.

4,031,983
TIRE CHOCK

Peter S. Lentini, 623 Spruce St., Kulpmont, Pa. 17834

Continuation of Ser. No. 552,856, Feb. 25, 1975, abandoned.
This application June 14, 1976, Ser. No. 695,387
Int. Cl.² B60T 3/00
U.S. Cl. 188—32 11 Claims

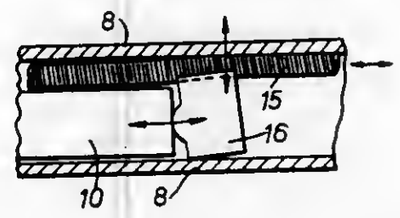


1. A wheel chock for preventing inadvertent movement of a wheel rotatably mounted on an axis comprising:
a. a base member having a wheel-engaging element for engaging the circumferential periphery of said wheel and being of sufficient height to prevent wheel rotation about said axis;
b. a frame mounted on said base member comprising at least two releasable gripping arms, an adjusting rod, means for movably securing said arms to said rod; and gripping arms anchoring means;
said adjusting rod being disposed at a greater distance from said axis than the circumferential periphery of said wheel and being essentially parallel to the axis of said wheel when said wheel engaging element is abutting the outer circumference of said wheel; each of said gripping arms having a proximal end and a distal end; said gripping arms extending radially inwardly of the circumferential periphery of said wheel in unsupported and unconnected embrace of said wheel at opposite sides thereof when said wheel-engaging element is abutting the outer circumference of said wheel; said distal ends extending beyond said wheel-engaging element toward the axis of said wheel when said wheel-engaging element is abutting the outer circumference of said wheel; said rod in cooperation with said securing means being adapted to alter the separation between said distal ends of said arms for the purposes of engaging and disengaging said wheel; and said proximal ends of said gripping arms being axially movable with respect to each other whereby the separation between said proximal ends is variable to permit adjustment of said frame to accommodate different sizes of tire.

4,031,984
BRAKE ACTUATOR AND THRUST RECEIVING STRUCTURE

Anthony William Harrison, Birmingham, England, assignor to Girling Limited, Birmingham, England

Filed June 8, 1976, Ser. No. 693,800
Claims priority, application United Kingdom, June 9, 1975, 24697/75
Int. Cl.² B61H 15/00
U.S. Cl. 188—59 6 Claims

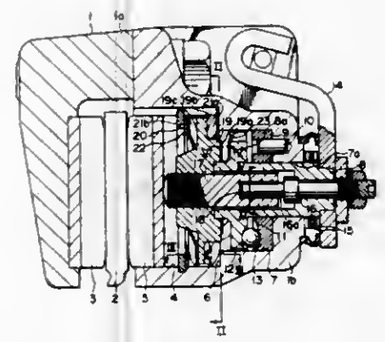


1. A brake for a rotor having a braking surface, said brake comprising a body of friction material having a forward end engageable with said braking surface and a rear end; a support for said body of friction material; adjusting means which moves said body of friction material relative to said support to compensate for wear of the friction material, said adjusting means comprising a screw member extending substantially parallel with the direction of movement of said body of friction material, and a thrust member in screw threaded engagement with said screw member and engaging said body of friction material to transmit braking forces from said screw member to said body of friction material; and means for applying braking forces to said screw member; wherein said thrust member can rock into force-transmitting engagement with said support under the action of the braking and reaction forces, the rotation of said thrust member urging said screw member into engagement with said support, whereby said thrust member and screw member are clamped together in said support and reaction forces are transmitted transversely of said screw member and said thrust member to said support in the region of the engagement between said thrust member and said screw member.

4,031,985
MECHANICAL DISC BRAKE

Hiroshi Ito, Kawasaki, Japan, assignor to Tokico Ltd., Kawasaki, Japan

Filed Oct. 12, 1976, Ser. No. 731,202
Claims priority, application Japan, Oct. 20, 1975, 50-126149
Int. Cl.² F16D 65/56
U.S. Cl. 188—71.9 3 Claims

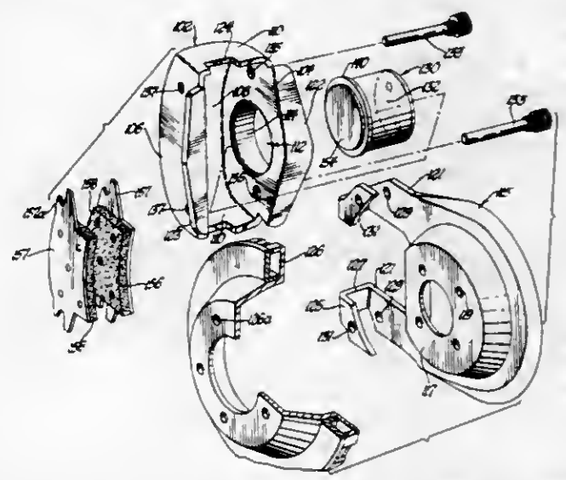


1. A mechanical disc brake comprising an input shaft axially displaceable upon receipt of a rotational movement input, a bolt connected at one end to said input shaft for receiving only said rotational movement of the shaft and abutting at the other end against a friction pad, a nut threaded on said bolt for normally receiving said axial displacement of the input shaft and also for receiving said rotational movement of the input shaft when subjected to clamping force, waved washers disposed on the opposite sides of a radial and outward extension of said nut to normally bias the nut against said input shaft, and a ratchet mechanism disposed between said input shaft and nut to transmit said rotational movement of the input shaft to said nut so as to displace the bolt toward said friction pad in accordance with the rotational amount of the input shaft, characterized in that at least one side of said radial and outward extension of the nut is formed with at least one recess for receiving the projection of one of said waved washers whereby inadvertent rotation of the nut is prevented.

4,031,986
DISK BRAKE CONSTRUCTION HAVING STAMPED SUPPORT

Tom H. Thompson, 540 Grander View Road, Milford, Mich. 48042

Continuation of Ser. No. 454,357, March 25, 1974, abandoned. This application Sept. 18, 1975, Ser. No. 614,583
Int. Cl.² F16D 55/22
U.S. Cl. 188—72.4 15 Claims



1. Disc brake apparatus comprising: an actuator support including an integral body of stamped sheet metal of uniform thickness having a pair of spaced, substantially flat side walls, a top portion extending between the top edges of said side walls, a pair of end portions each extending between the end edges of said spaced pair of side walls at opposite ends of said top portion such that said top portion extends between the upper ends of said end portions, a stiffening flange projecting outwardly from the lower edge of at least one of said side walls, an actuator opening formed in at least one of said side walls, an integral flange struck from said one side wall and projecting from the periphery of and surrounding said opening to define an integral sleeve having an outwadly projecting cylindrical wall for axially receiving a disc brak actuator assembly, a disc brake actuator module received in said actuator opening and sleeve and supported by the cylindrical wall of said sleeve, said module comprising a cylindrical housing having a closed end and an open end with an actuator mounted therein and axially extendable and retractable with respect to said housing in response to fluid pressure changes in said housing, said housing being received in said sleeve with a friction fit and being formed with a retaining flange projecting outwardly from one end of said housing and engaging said side wall to prevent axial movement of said housing in one direction with respect to said side wall.

4,031,987

SPRING APPLIED, ELECTRICALLY RELEASED BRAKE WITH ADJUSTABLE THRUST ELEMENT

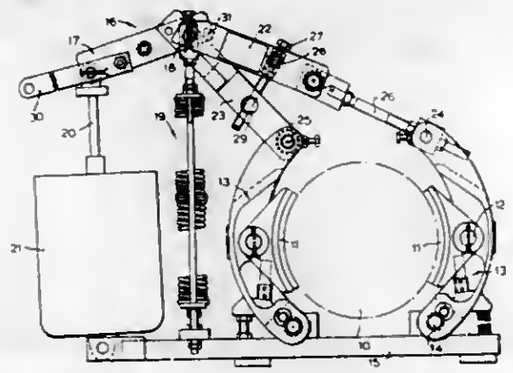
David John Webb, Bridgwater, England, assignor to Elliston, Evans and Jackson Limited, Bridgwater, England

Filed Oct. 24, 1975, Ser. No. 625,303

Claims priority, application United Kingdom, Oct. 26, 1974, 46422/74

Int. Cl.² B60T 13/04

U.S. Cl. 188—75 1 Claim



1. An electrically controlled brake comprising a fixed support, two brake arms each having upper and lower ends and each carrying a respective brake shoe, the lower ends of said brake arms being pivoted to the support, a brake control assembly comprising a brake control member pivotally secured at spaced positions to an electrically controlled thrustor and to a spring biasing means respectively, the thrustor and biasing means tending to move the brake control member in opposed directions and the thrustor being capable, in use, of overcoming the biasing force of said biasing means, first and second levers each having a pair of ends, one end of each lever being pivotally connected to an upper end of a respective one of said brake arms, and the other ends of said levers being pivotally connected together and to said brake control member at a single pivot point, the spring biasing means also being connected to said pivot point, an adjusting device capable of being steplessly lengthened and shortened connecting together said first and second levers at an intermediate position disposed between the ends of said levers, said adjusting device comprising an adjusting screw rotatably mounted in one of said levers but held captive against axial movement, the other of said levers having a transverse pin rotatably mounted therein, and the adjusting screw having screw-threaded engagement within said pin and transversely thereof, whereby rotation of the adjusting screw to adjust the length of the adjusting device varies the angle between said first and second levers only, without varying the length of the levers.

4,031,988

STALL CONTROL AND WEAR BLOCK FOR RECREATIONAL SKATE BOARDS

David John Hill, 1/71 Evans St., Harbord N.S.W. 2096, Australia

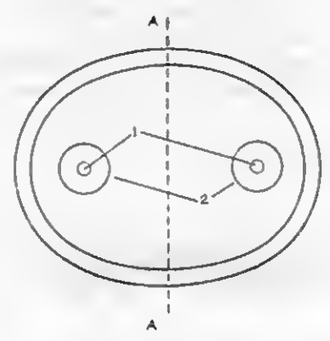
Filed Apr. 28, 1976, Ser. No. 681,056

Claims priority, application Australia, Jan. 7, 1976, 4468/76

Int. Cl.² A63C 17/00

U.S. Cl. 188—250 B 3 Claims

1. A stall control and wear block for skateboards including a platform, comprising a plate-like element formed from moldable material having a plan configuration with major opposing elliptical sides symmetric about a transverse axis, the opposing major elliptical sides containing a central sector of 160° which constitutes a wear edge of which the central 120° is a control edge, no part of the wear and control edges having a radius of less than 15 millimeters or more than 110 millimeters, and at least two countersunk holes formed on the transverse axis of said block adapted to receive connectors for the attachment of the block to the skateboard platform.



4,031,989

DOUBLE EFFECT HYDRAULIC SHOCK ABSORBER

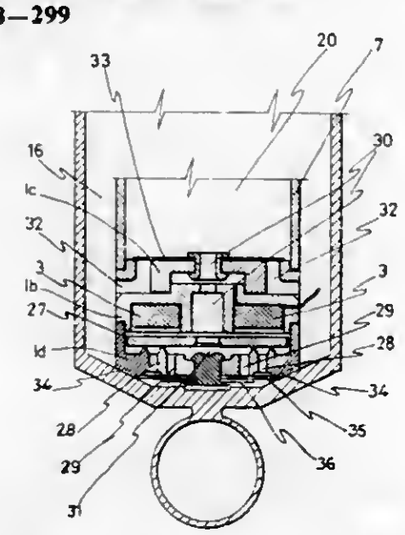
Antonio Giner Blazquez, Lepanto 194 5°-1ª, Barcelona 13, Spain

Filed Feb. 3, 1976, Ser. No. 654,872

Claims priority, application Spain, Feb. 22, 1975, 435006; Dec. 18, 1975, 443663

Int. Cl.² F16F 9/46

U.S. Cl. 188—299 4 Claims



1. A double effect shock absorber comprising:
an inner tube defining an inner chamber having fluid therein;
an outer tube concentric with said inner tube and defining therewith an annular outer chamber;
a piston attached to a rod which extends through one end of said inner tube and movable within said inner chamber;
a body assembly attached to the other end of said inner tube and thereby closing said inner chamber at said other end of said inner tube;
said body assembly including a first body member having therein an annular chamber;
an electromagnet positioned within said annular chamber of said first body member;
said body assembly including a second body member attached to said first body member and defining therewith a collection chamber in permanent communication with said inner chamber;
first and second exhaust duct means extending through said second body member and connecting said outer annuiar chamber with said collection chamber;
first closure valve means for closing said first exhaust duct means;
second closure valve means for closing said second exhaust duct means, said second closure valve means having a stronger resistance to opening than said first closure valve means; and
blocking means positioned within said collection chamber, for blocking said first exhaust duct means when said electromagnet is deactivated, and for opening said first exhaust duct means when said electromagnet is activated;
whereby, when said electromagnet is activated, movement of said piston within said inner chamber toward said body assembly will cause said fluid to pass through said first exhaust duct means and open said first closure valve means to pass to said outer annular chamber, while said second closure valve means closes said second exhaust duct means;
whereby, when said electromagnet is deactivated, movement of said piston within said inner chamber toward said body assembly will cause said fluid to pass through said second exhaust duct means and open said second closure valve means to pass to said outer annular chamber, while said first exhaust duct means remain closed by said blocking means.

4,031,990

SET OF CURRENT COLLECTING ELEMENTS USED FOR A CURRENT COLLECTING ROLLER

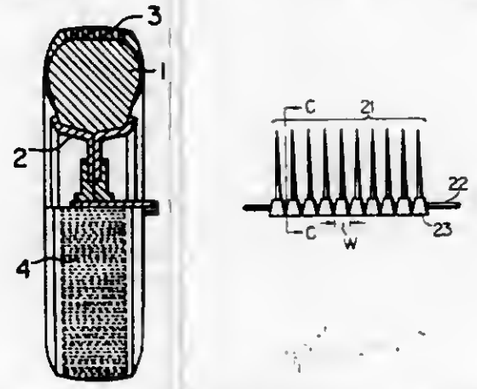
Kazumi Matsui, Tokyo; Takashi Umemori, Musashino; Yutaka Shibata, Takaishi; Kinzo Yamamura, Fujilders; Tamisuke Kimura, Kobe, and Tomokazu Kashiwara, Nishinomiya, all of Japan, assignors to Japanese National Railways, Tokyo; Sumitomo Electric Industries, Ltd., Osaka and Sumitomo Rubber Industry, Ltd., Kobe, all of, Japan

Filed Nov. 14, 1975, Ser. No. 632,164

Claims priority, application Japan, Nov. 26, 1974, 49-136472

Int. Cl.² B60L 5/04

U.S. Cl. 191—63 9 Claims



1. A current collecting apparatus for use in a current collecting member operatively connected to a current collecting roller, said current collecting apparatus comprising:
a plurality of juxtaposed electroconductive elements having truncated lower portions with at least one hole therethrough; and
a lead wire fitted through and secured to said holes in said plurality of electroconductive elements.

4,031,991

COIN OPERATED ELECTRONIC PARKING METER

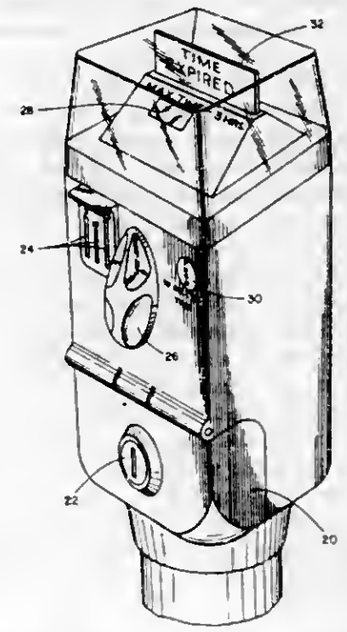
Steve Malott, Schaumburg, Ill., assignor to Qonaar Corporation, Elk Grove Village, Ill.

Filed Dec. 29, 1975, Ser. No. 644,598

Int. Cl.² G06F 9/00

U.S. Cl. 194—1 R 17 Claims

1. A token actuated timing device comprising:
a. means for storing preprogrammed numerical values at a plurality of addressable memory locations;
b. means for detecting the type and number of each type of token inserted into said device and for addressing a selected memory location each time a token is inserted, said location corresponding to the type and number of token of that type inserted;
c. first counter means for down counting from any present number to zero at a rate determined by an applied clock frequency and producing a zero detect signal on reaching zero;
d. means for presetting said first counter means to the value stored at said selected memory location;
e. second counter means for selectively counting up or down at a rate determined by an applied clock frequency;
f. means for producing first and second clock frequencies;
g. control means operative each time a token is detected for



i. applying said first clock frequency to said first counter means to down count said first counter means to zero,
ii. simultaneously up counting said second counter means at said first clock frequency until said zero detect signal is produced by said first counter means,
iii. down counting said second counter means at said second clock frequency after said zero detect signal is produced, and
h. means for displaying the count on said second counter means.

4,031,992

PRINTING DEVICE

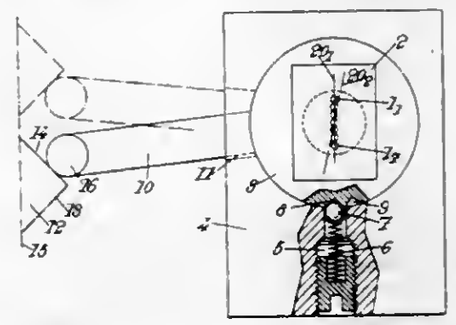
Roger Murat, and Guy Glay, both of Argenteuil, France, assignors to Societe d'Applications Generales d'Electricite et de Mecanique S A G E M, Paris, France

Filed Nov. 11, 1975, Ser. No. 630,923

Claims priority, application France, Nov. 14, 1974, 74.37624

Int. Cl.² B41J 3/04

U.S. Cl. 197—1 R 4 Claims



1. A device for printing data comprising:
at least one printing member of the needle impact type and including a printing head movable in a predetermined direction so as to inscribe the data in lines on a substrate;
a plurality of needles carried by said head for selectively

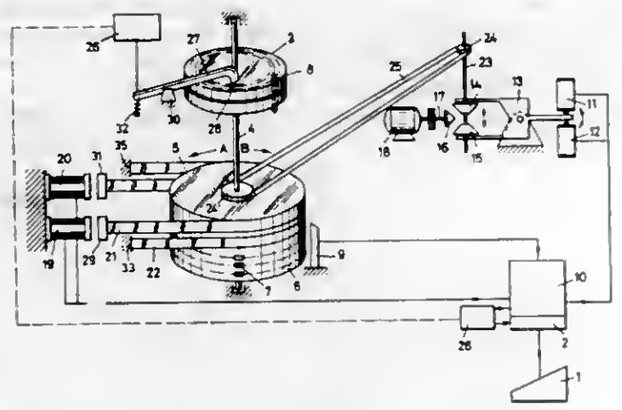
projecting against said substrate at one end, so as to inscribe characters on a predetermined point grid;
synchronizing means for generating pulses in synchronism with the movement of said printing head in said predetermined direction, each of said pulses corresponding to a column of said point grid;
upright character generator means connected to said synchronizing means and producing at an output for each needle, a sequence of pulses for causing projections of said needle against the substrate in order to inscribe a given upright character, said sequence depending on the character to be inscribed and being controlled by the pulses generated by said synchronizing means;
a plurality of OR gate means each comprising a first and a second input, the first input being connected at the output of said upright character generator means;
for each needle, with the exception of one needle in an extreme position, a shift register having a clock input and a serial input for receiving pulses from the corresponding output of said upright character generator means and a serial output, the clock input of said shift register receiving pulses from said synchronizing means, and the serial output of each shift register being connected to the respective second input of a corresponding OR gate means, the number of stages of said shift register depending on the position of said needle and determining the delay between receipt of a pulse from said generator means and appearance of that pulse at the serial output; and
control means for inhibiting the output of the respective shift register when it is desired to inscribe upright characters and preventing the application of a signal to said first input of the OR gate means when it is desired to inscribe an inclined character.

4,031,993

ELECTRONIC EMBOSSING MACHINE

Rainer Eberhard Gürgens, and Helmut August Michael Schottle, both of Berlin, Germany, assignors to Pitney-Bowes, Inc., Stamford, Conn.

Filed Sept. 25, 1975, Ser. No. 616,639
Claims priority, application Germany, Oct. 1, 1974, 2446890
Int. Cl.² B41J *1/30*
U.S. Cl. 197—6.6 **3 Claims**



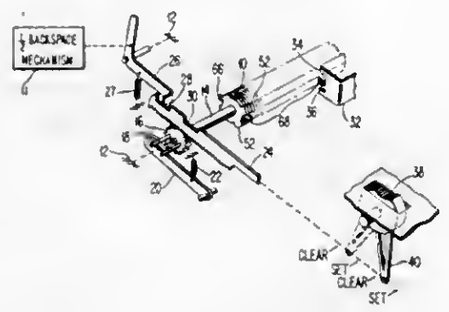
1. An electronic embossing machine comprising:
a keyboard having a plurality of characters,
a memory electronically associated with said keyboard to receive information therefrom and operative for storing such information,
a logic controller associated with said memory for receiving information therefrom, said memory being operative to inform said logic controller as to the character selected by said keyboard,
a drum supported upon a rotatable shaft for rotation therewith, said drum having a plurality of numerically arranged code addresses about the perimeter thereof,
a scanner adjacent to said drum for reading said code addresses as they are conveyed thereacross, sid scanner being operatively connected with said logic controller for supplying information thereto and informing said logic controller as to the code address being read,
a die head bearing a plurality of dies thereon and an opening intermediate adjacent dies, said die head being supported by said shaft for rotation therewith, said dies on said die head having characters thereon corresponding to the characters on said keyboard and to the code addresses on said drum, wherein the embossing position is defined as the posture of the die head when the code address corresponding to the die having the character selected by the keyboard is adjacent said scanner,
brake means associated with said logic controller and operative to brake said shaft upon receipt of a brake signal from said logic controller, said brake means including a pair of brake straps disposed about said drum and a movable pawl disposed adjacent said die head,
electromagnetic means connected to said one end of each brake strap and operative to extend its respective brake strap to engage said drum upon receipt of said brake signal and means for moving said pawl into an opening within said die head upon receipt of said brake signal,
a pair of opposed electromagnets each operatively connected with said logic controller to be alternately energized thereby,
drive means operatively connected to said shaft for rotation thereof in an "A" direction upon one of said electromagnets being energized and in a "B" direction upon the other of said electromagnets being energized, said logic controller upon receiving information from said memory indicating the selected character to be embossed and information from said scanner indicating which die is in the embossing position being operative to determine the required direction of rotation of said shaft for the shortest distance to place the die with the selected character into the embossing position and being operative to send a signal energizing the appropriate one of said electromagnets to drive said shaft until said selected character is placed in the embossing position, at which time said logic controller is operative to terminate the energizing of said electromagnets and actuate said brake means to hold said die head stationary with said selected die in the embossing position.

4,031,994

DOUBLE TAB RACK FOR A TYPEWRITER

John O'Neil Schaefer, Lexington, Ky., assignor to International Business Machines Corporation, Armonk, N.Y.

Filed Dec. 24, 1975, Ser. No. 644,256
Int. Cl.² B41J *21/04*
U.S. Cl. 197—70 **8 Claims**



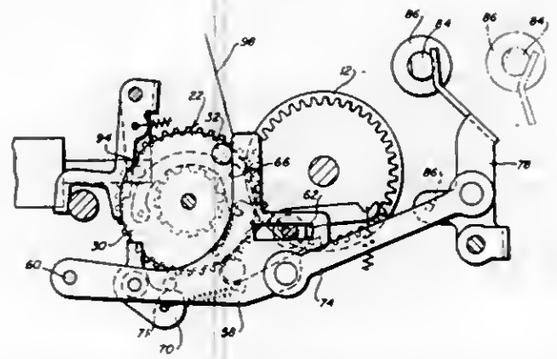
1. A tab rack assembly comprising a tab rack member and a plurality of tab stop members, each tab stop member representing an incremental escapement position of a printing mechanism relative to a record sheet, said tab rack member being movable to present alternatively one side thereof or the opposite side thereof to a tabulator control mechanism;
said tab stop members each having two active control projections extending therefrom for engagement by said tabulator control mechanism;
said control projections being opposite each other with respect to the axis of said tab rack member;
said tab stop member being configured to provide means for retention of each of said control projections in each of two positions respectively;
whereby two discreet and independent sets of tab commands may be set into and retained simultaneously in a tab rack member.

4,031,995

KEYBOARD ACTUATED PAPER INSERTION AND EJECTION MECHANISM

Rudolf Blum, Nurnberg, and Bernd Stiller, Berlin, both of Germany, assignors to Triumph Werke Nurnberg A.G., Nurnberg, Germany

Filed Mar. 17, 1976, Ser. No. 667,554
Claims priority, application Germany, June 13, 1975, 2526445
Int. Cl.² B41J *13/20*
U.S. Cl. 197—138 A **4 Claims**



1. In a typewriter having a rotatable platen and an associated paper hold down bail pivotally mounted for movement between a closed position in rolling contact with said platen and to an open position spaced from said platen,
energizable motor means connected to rotatably index said platen to control movement of a sheet of paper,
a first clutch part rotatably driven by said platen,
a second rotatable clutch part selectively engageable with and driven by said first clutch part and having a camming pin,
a solenoid,
means for coupling over a platen revolution said first and second clutch parts upon energization of said solenoid,
a control lever connected to said paper bail and positioned to be driven by said camming pin to pivot said paper bail to open and closed positions in each clutch cycle, and
operator controlled means for energizing said motor means and for energizing said solenoid.

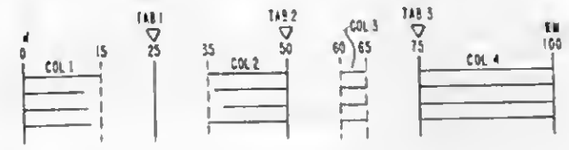
4,031,996

TAB REPOSITIONING SYSTEM

Dennis Gene Busch, Austin, Tex., assignor to International Business Machines Corporation, Armonk, N.Y.

Filed Dec. 31, 1975, Ser. No. 645,732
Int. Cl.² B41J *25/18*
U.S. Cl. 197—176 **10 Claims**

1. A tab repositioning system comprising:
a. storage means having a number of storage locations for storing tabs set along a text line;
b. means for addressing one of said storage locations in said storage means; and
c. means upon addressing one of said storage locations for



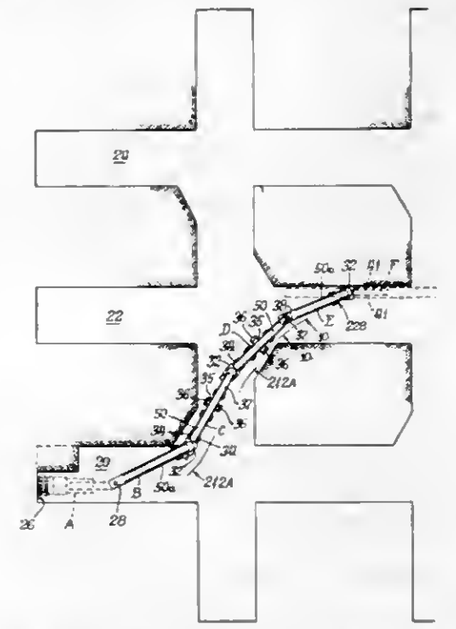
causing set tabs following said addressed location to be repositioned in said storage means.

4,031,997

MOBILE TELESCOPICAL ARTICULATED CASCADE CONVEYOR SYSTEM FOR MINING AND AUTOMATIC SELF-TRAMMING WHEEL-MOUNTED CONVEYOR UNIT THEREFOR

Robert C. Nelson, Bluefield, W. Va., assignor to New River Manufacturing Company, Inc., Glen Lyn, Va.

Filed Dec. 5, 1975, Ser. No. 637,977
Int. Cl.² B65G *21/14*
U.S. Cl. 198—301 **10 Claims**



1. In a mobile conveyor system for mining having a series of elongated mobile conveyor units articulately interconnected in cascade relationship with each of said units positioned to discharge onto a succeeding unit for conveying material from a movable source to a remote stationary floor conveyor, each mobile conveyor unit having a conveyor frame with an endless conveyor element trained for orbital movement between pulleys at opposite ends and driving means for said conveyor element, at least one of said mobile conveyor units intermediate the end units of said series comprising:
tramming frame means intermediate the receiving and discharge ends of the conveyor frame of said one conveyor unit including a pair of separate and independent tramming subframes on opposite sides of said conveyor frame, each subframe being separately guided for independent up and and down movement relative to said conveyor frame and having a single mine-bottom-engaging wheel comprising the sole ground support for said subframe and enabling said one conveyor unit to tilt freely up and down as a unit about said wheels;
the receiving end of said conveyor frame engaging the mine bottom to provide, with said two wheels, a three-point ground-stabilized support for the entire said conveyor frame, the receiving end portion of said conveyor frame having track means located between said receiving end and said wheels;
said conveyor frame comprising with the endless conveyor

element and the pulleys associated therewith, a single integral assembly which is vertically tiltably adjustable, as a unit, independently of the tramming frame means, about the point of engagement of its receiving end with the mine bottom, and is rockably adjustable, as a unit, independently of the tramming frame means, about a longitudinal axis extending along the length of the endless conveyor element;

power-actuated elevating means acting between each of said subframes and the corresponding side of said conveyor frame, either of said elevating means when independently actuated being effective to rockably adjust said conveyor frame about said longitudinal axis and thereby adjust the transversely level condition thereof, both of said elevating means when simultaneously actuated being effective to vertically tiltably adjust the entire said conveyor frame about the said point of engagement of its receiving end with the mine bottom and thereby adjust the height thereof relative to the tramming frame means;

a carriage connected to the adjacent inbye mobile conveyor unit and movable thereby back and forth on said track means along the so-stabilized receiving end portion to provide a connection between said one mobile conveyor unit and said adjacent inbye mobile conveyor unit enabling self-tracking variable telescopic movement therebetween;

the discharge end portion having means for connection with an adjacent outbye mobile conveyor unit;

power tramming means for driving said wheels to self-propel said one mobile conveyor unit; and

automatic control means operable in response to movement of the carriage by the adjacent mobile conveyor unit in one direction along the track means to actuate said power tramming means to move said one conveyor unit in the same direction.

4,031,998

AUTOMATIC SORTING CONVEYOR SYSTEMS

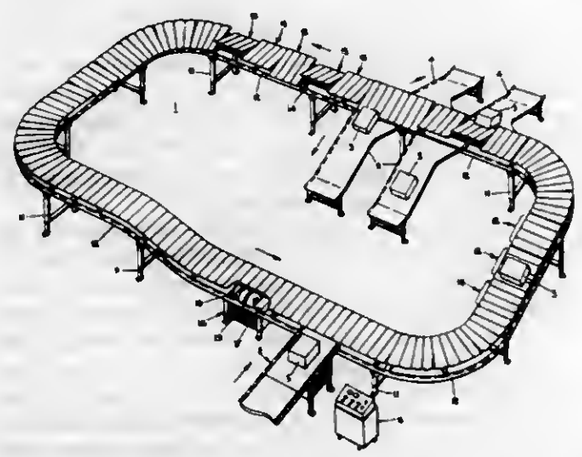
Shin Suzuki, Tokyo; Masami Uesugi, and Michi Sekine, both of Yokohama, all of Japan, assignors to Rapistan, Incorporated, Grand Rapids, Mich.

Filed Mar. 4, 1976, Ser. No. 663,853

Claims priority, application Japan, Mar. 20, 1975, 50-32945

Int. Cl.² B65G *43/00*

U.S. Cl. 198—365 **6 Claims**



1. In an automatic sorting conveyor system including a plurality of support structures to support articles for movement along said conveyor, said support structures being adapted to move in endless fashion along a predetermined path formed by first guide means in said conveyor to thereby receive articles and deposit same at predetermined sorting stations along said path, and driving means for urging said supporting structures along said path, the improvement comprising:

said first guide means being formed centrally along said predetermined path;

each said supporting structure forming an independent article supporting surface including a plurality of slat elements, said slat elements in each said supporting structure being disposed in overlapping relationship;

each said supporting structure including a plurality of carriage means, each said carriage means individually supporting an associated one of said slat elements for movement along said path, said carriage means being supported in said first guide means for movement along said predetermined path;

pivot means on each said carriage means for each of said plurality of slat elements in each said support structure whereby said plurality of overlapping slat elements in each of said support structures can be pivoted about said pivot means and shifted in unison between a level position and a tilted position independently of the position of adjacent upstream and downstream support structures;

actuating means connected to at least one of said carriage means in each of said support structures to cause same to pivot about said pivot means;

second guide means for said actuating means, said second guide means being arranged along said predetermined path on opposite sides of said first guide means and adapted to receive and guide said actuating means to normally maintain said plurality of slats in said level position;

switching means associated with said second guide means, said switching means being disposed proximate said sorting stations along said path, said switching means being adapted for cooperative operation with said actuating means and said second guide means to shift said support structure to said tilted position at said sorting station to thereby deposit articles carried on said support structure at said sorting station.

4,031,999

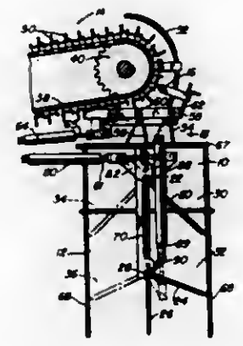
APPARATUS FOR AND METHOD OF ACCUMULATING AND THEREAFTER RELEASING, EN MASSE, A PRE-DETERMINED NUMBER OF INDIVIDUAL, ELONGATED, CYLINDRICAL ARTICLES

Roland W. Wagner, and William K. Switzer, both of Cincinnati, Ohio, assignors to Warrick Equipment Corporation, Cincinnati, Ohio

Filed Jan. 23, 1976, Ser. No. 651,718

Int. Cl.² B65G *47/44*

U.S. Cl. 198—418 **22 Claims**



1. A device for accumulating and thereafter releasing, en masse, a predetermined number of individual, elongate, cylindrical articles, comprising:

a pair of article-receptive chambers, each having upper and lower open ends;

means selectively and sequentially introducing a plurality of individual, elongate articles into the upper end of one or the other of said chambers;

an upper gate disposed intermediate the upper and lower ends of said chambers and movable between alternate closed, article-supporting and opened, article-releasing positions first in one and then in the other chamber, said gate when in closed position defining the bottom of an article-receptive upper compartment in one or the other of the chambers;

a lower gate disposed adjacent the lower ends of said chambers and movable between alternate closed, article-supporting and opened, article-releasing positions first in one and then in the other chamber, said gate when in closed position defining the bottom of an article-receptive lower compartment in one or the other of the chambers;

actuator means for each of said gates to move them from one to the other of their closed and opened positons; and

control means responsive to the number of articles received in the compartments of said chambers to actuate said actuator means.

4,032,000

TRANSPORT DEVICE FOR CYLINDRICAL OBJECTS ROD-SHAPED, SUCH AS CIGARETTES

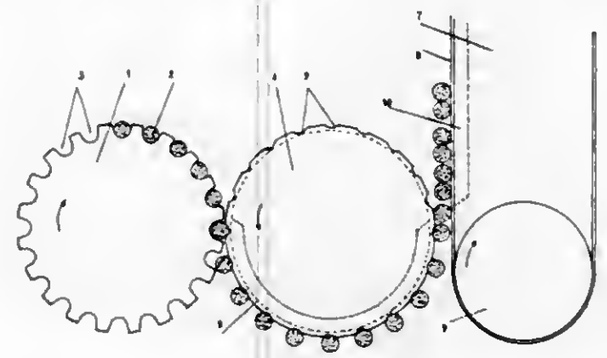
Jean-Francois Leclerc, and Henri Anfossi, both of Orleans, France, assignors to Service d'Exploitation Industrielle des Tabacs et des Allumettes, France

Filed Apr. 2, 1976, Ser. No. 673,081

Claims priority, application France, Apr. 4, 1975, 75.10530

Int. Cl.² B65G *47/57*

U.S. Cl. 198—428 **1 Claim**



1. A device for transporting a plurality of like cylindrical rod-shaped objects such as cigarettes transversely to their longitudinal axis comprising first upstream conveying means and second downstream conveyor means, said first conveying means comprising a cylindrical conveyor having a plurality of like shallow sockets for receiving said objects and said second conveying means comprising a smooth endless belt, said second conveying means being disposed from said first conveying means at a distance such that the length of the shortest perpendicular line from the surface of the second conveying means to the deepest point of the socket is approximately equal to the diameter of the objects, first suction means operable to retain said objects in said sockets over a circumferential portion of said first conveying means which portion terminates approximately in the region of said shortest line, and second suction means operable to retain a pair of said objects contiguously grouped on the ascending portion of said second conveying means which portion begins approximately in the region at which the suction means of said first conveying means terminates.

4,032,001

DETACHABLE CONVEYOR BUCKET APPARATUS

Danny L. Hild, P.O. Box 284, Tribune, Kans. 67879

Filed Sept. 2, 1975, Ser. No. 609,670

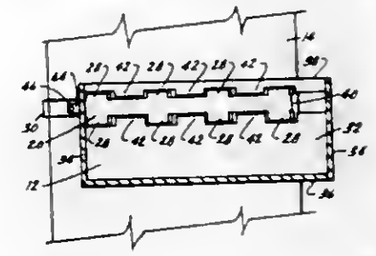
Int. Cl.² B65G *15/00*

U.S. Cl. 198—711 **2 Claims**

1. A detachable conveyor bucket apparatus, the apparatus attached to an endless conveyor belt, the apparatus comprising:

an elongated bracket transversely mounted to the conveyor belt, said bracket having a top and bottom portion with U-shaped bracket flanges extending outwardly therefrom and equally spaced one from the other; and

a bucket having side portions, a front portion, a rear portion and an open top portion, the rear portion having an elongated slot having U-shaped slot flanges, the elongated slot being substantially a mirror image of said elongated bracket, said bracket inserted into the slot and there-



through, said bucket moved laterally along the length of said bracket until the U-shaped slot flanges are positioned behind the U-shaped bracket flanges thereby engaging the rear portion of said bucket between said bracket and the conveyor belt;

a side portion of the U-shaped bracket flanges of said bracket is projected outwardly at an angle to the length of said bracket, the angled side portion used as a guide in sliding the slotted rear portion of said bucket when the rear portion of said bucket is engaged between the conveyor belt and said bracket.

4,032,002

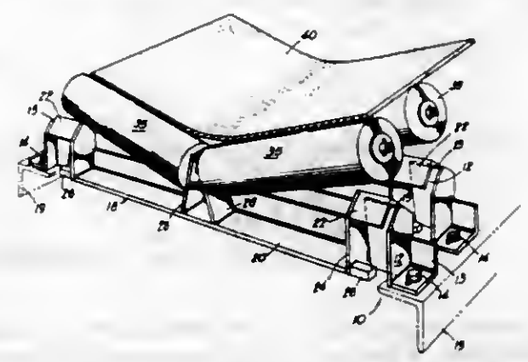
SELF-TRAINING IDLER ASSEMBLY

Allen S. Jackson, Atlanta, Ga., assignor to Clifford G. Hollyfield, Jr., Roswell, Ga., a part interest

Filed Feb. 26, 1976, Ser. No. 661,726

Int. Cl.² B65G *39/16*

U.S. Cl. 198—808 **5 Claims**



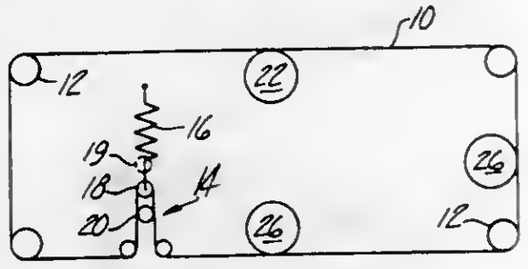
1. Mechanism for automatically training a troughed belt in both of its directions of linear travel comprising a support frame, a series of pendulum cradles on the support frame transversely of and beneath the troughed belt, pairs of transversely inclined divergent axis belt support and training rollers journaled on said pendulum cradles and being swingable bodily with the cradles relative to said support frame, and fulcrum means on said support frame and cradles substantially above the centers of gravity of the cradles from which the cradles and said rollers swing freely and are self-centering under the influence of gravity.

4,032,003

HYDROSTATIC CONVEYOR DRIVE

James S. Hull, Waterford, Mich., assignor to Melvin Corporation, Bay City, Mich.

Filed Apr. 30, 1976, Ser. No. 682,137
Int. Cl.² B65G 23/32
U.S. Cl. 198—855 18 Claims



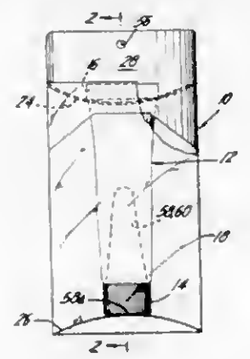
12. A conveyor drive system for maintaining a constant pull on a conveyor independently of load on the conveyor comprising, a closed circuit hydrostatic drive having a variable displacement pump, a fixed displacement motor connected to the conveyor, a supply line for delivering hydraulic fluid from said pump to said motor, a return line for delivering hydraulic fluid from said motor to said pump, control means movable to vary the displacement of said pump, actuating means connected to said control means to move the latter in proportion to the pressure in said supply line to vary the delivery of hydraulic fluid from said pump to said motor to vary the speed of said motor, said actuating means comprising a hydraulic cylinder, means biasing said cylinder in one direction with a constant force, and a fluid conduit communicating said cylinder with said supply line for moving said cylinder in the other direction in response to pressure in said supply line.

4,032,005

DISPLAY CONTAINERS

William J. Vereb, Ringwood, N.J., assignor to J. & P. B. Myers Inc., Moonachie, N.J.

Filed Oct. 22, 1975, Ser. No. 624,594
Int. Cl.² B65D 5/08, 25/54
U.S. Cl. 206—45.14 19 Claims



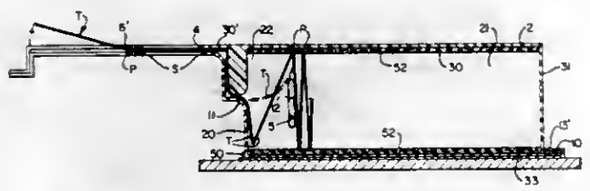
1. An article-display container adapted to be flat when stored and to become expanded for containing an article, including a back wall of dimensionally stable sheet material, a front panel of dimensionally stable transparent material, said back wall and said front panel being of substantially equal width and having lateral margins substantially aligned with each other so that the container can be flat for storage, said front panel having bent-over portions united to said back wall along said lateral margins of the latter, said sheet material including lenticular-shaped flaps defined by outwardly bowed arcs intersecting at said lateral margins, said flaps being joined to other portions of said sheet material by creases extending along respective ones of said arcs, means including said flaps when erected from said other portions of said sheet material end closures of the container and for bowing said back wall and said front panel apart for providing an article-containing space, said sheet material including a display panel having lateral margins aligned with the aforesaid lateral margins, at least part of the display panel being disposed behind said front panel in position to be bowed forward against the front panel by said flap when erected.

4,032,004

TICKET DISPENSING ARRANGEMENT

Francis William Coates, Kings Highway Towers, Apartment A705, Maple-Shade, N.J. 08052

Filed July 9, 1975, Ser. No. 594,246
Int. Cl.² A45C 11/18
U.S. Cl. 206—39.6 45 Claims



1. A dispensing apparatus for dispensing tickets, the apparatus comprising: a base member; a cover member disposed on said base member including a top wall spaced from said base member, a pair of spaced vertical side walls extending from said top wall to said base member, and a rear wall, said top wall, said side walls and said rear wall of said cover member forming the outer walls of the dispensing apparatus and defining therebetween a chamber for housing a plurality of tickets; a dispensing slot provided at one end of said chamber for dispensing tickets therefrom; a first locking means arranged on the top wall of the cover member for retaining a ticket in said dispensing slot; and a second locking means provided on said base member for preventing re-insertion of a withdrawn ticket into said chamber.

4,032,006

SHOCK RESISTANT CONTAINER

Victor F. Cantarella, Monroe, and John G. Smith, Warwick, both of N.Y., assignors to International Paper Company, New York, N.Y.

Filed Oct. 13, 1976, Ser. No. 731,880
Int. Cl.² B65D 5/50
U.S. Cl. 206—45.19 23 Claims

1. A unitary blank for constructing a shock resistant container, said blank comprising:

a front wall-forming section, said front wall-forming section comprising first and second front wall-forming panels, each of said front wall-forming panels having weakened longitudinal score lines, to thereby form, respectively, first and second shadow-forming panels;

top and bottom wall-forming panels hingedly connected along longitudinal score lines to a first pair of opposite edges of said front wall-forming section;

first and second tuck flaps hingedly connected along longitudinal score lines to said top and bottom wall-forming panels respectively, one of said tuck flaps having a transverse slot therein;

a pair of end wall-forming panels hingedly connected along a second pair of opposing outer edges of said front wall-forming section along transverse score lines;

a pair of back wall-forming panels, each hingedly connected along one edge of each of said end wall-forming panels along a score line parallel to said transverse score line, each of said back wall-forming panels being approximately one-half the length of said front wall-forming panels; and

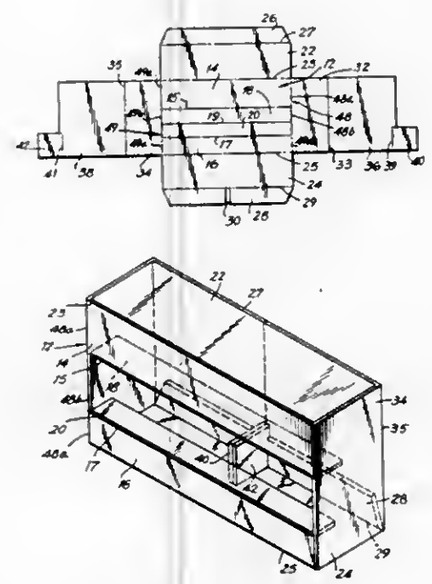
first and second tab means hingedly connected along a transverse score line along a portion of the other edge of each of said back wall-forming panels, said transverse score lines being parallel to the transverse score lines at the opposite edges of said back wall-forming panels.

12. A shock resistant container for holding and displaying a fragile article of merchandise, such as a bottle or a decanter, constructed from a single blank, said container being generally tubular in shape and comprising:

a front wall section consisting of first and second front wall panels;

first and second shadow panels hingedly connected to said first and second front wall panels, respectively, wherein said shadow panels are folded inwardly from the plane of said front wall section to thereby form an aperture in said front wall section;

a pair of oppositely disposed top and bottom wall panels hingedly connected along a first pair of opposing outer edges of said front wall section;



a pair of tuck flaps respectively hingedly connected to said top and bottom wall panels along weakened longitudinal score lines that are parallel to said edges of said front wall section, the tuck flap hinged to said bottom wall panel having a transverse slot therein;

a pair of oppositely disposed end wall panels hingedly connected along a second pair of opposed outer edges of said front wall section;

a pair of back wall panels, each hingedly connected along one edge of each of said end wall panels, said back wall panels overlying said tuck flaps and meeting to thereby form a substantially continuous back wall section for the container; and

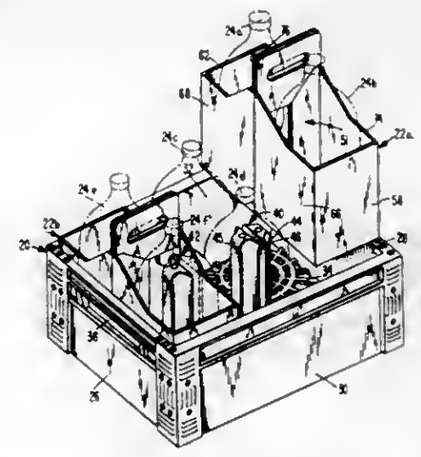
means for simultaneously locking said container in erected position and supporting the article of merchandise contained therewithin, said means comprising first and second tabs which are in face-to-face contact and are hingedly connected to one corner of each of said back wall panels, each of said tab means being folded at a right angle to said back wall section, each of said tab means being inserted into the slot formed in said tuck flap.

4,032,007

TWO-BOTTLE BASKET CARRIER

Earl J. Graser, and Jerry F. Wilson, both of Monroe, La., assignors to Olinkraft, Inc., West Monroe, La.

Filed Oct. 19, 1976, Ser. No. 733,782
Int. Cl.² B65D 75/00
U.S. Cl. 206—173 13 Claims



1. A two-bottle carrier for use with a shipping case which is adapted to contain at least four bottles wherein the shipping case has at least one split divider post for separating the bottles in the case, the carrier comprising

a pair of side walls,

a pair of end walls extending between opposite ends of the pair of side walls,

a bottom,

said bottom having an opening midway between the end walls and adjacent one of the side walls for receiving one half of the split divider post, and

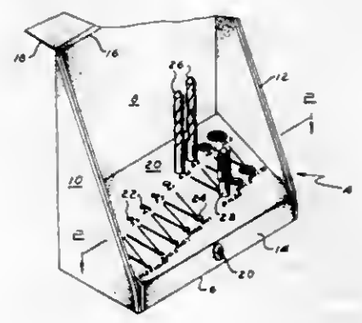
a center partition extending from the other side wall and spaced from the one side wall to accommodate the one half of the split divider post between the one side wall and the center partition.

4,032,008

TOOL HOLDER GUIDE INDICIA FOR TAP AND DRILL SETS

Richard N. Vecchiarelli, 64 Prospect St., Ludlow, Mass. 01056

Filed June 7, 1976, Ser. No. 693,735
Int. Cl.² B65D 85/24
U.S. Cl. 206—379 4 Claims



1. Tool holder for a plurality of taps and a plurality of drills disposed therein comprising means for holding said taps in a predetermined succession according to the diametrical size of said taps, means spaced from the succession of taps for holding said drills in a predetermined succession related to the diameter thereof, each of said tap and drill holding means being adapted to receive and hold a drill and tap of a given size, and indicia which lead from each tap holding means toward a pair of adjacent drill holding means adapted to hold drills of different diametrical size, one of said pair of drills

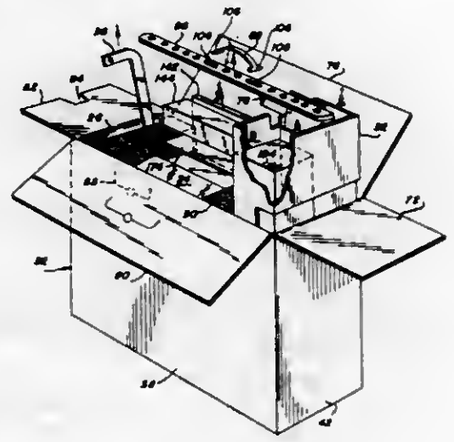
being the tap drill for the tap from which one of said indicia leads and the other of said pair being the clearance drill toward which the other of said indicia leads, said indicia including adjacent pairs thereof which extend toward each of a plurality of said drill holding means in converging relation, each drill holding means toward which said indicia extend in converging relation being adapted to hold one drill of the proper diametrical size to serve as both the clearance drill for one of said taps and the tap drill for the next successive size tap whereby a plurality of said drills are dual functional for use with successive size taps.

4,032,009

CONTAINER SYSTEM FOR GARAGE DOOR OPENER

Robert E. Taylor, Evanston, Ill., assignor to Robert E. Taylor and Aaron M. Schmidt, both of Chicago, Ill.

Filed Feb. 11, 1976, Ser. No. 657,051
Int. Cl.² B65D *81/04*
U.S. Cl. 206—321 **10 Claims**



1. A compact container system for holding components of a remote controlled electric garage door opener, comprising, in combination:

a. a variable capacity container for holding at least one of a transmitter and a receiver;

b. a twin compartment container including a first compartment and a second compartment for holding the variable capacity container; and

c. a corrugated cardboard carton having a plurality of hinged panels defining end walls and sidewalls for snugly holding both a motor unit and the twin compartment container generally in adjacent relationship.

4,032,010

MARKER ASSEMBLY

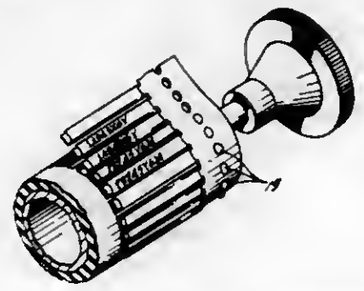
Joseph H. Evans, Palo Alto, Calif., assignor to Raychem Corporation, Menlo Park, Calif.

Continuation-in-part of Ser. No. 580,596, May 27, 1975, which is a division of Ser. No. 369,836, June 14, 1973, Pat. No. 3,894,731. This application July 23, 1975, Ser. No. 598,412
The portion of the term of this patent subsequent to July 15, 1992, has been disclaimed.
Int. Cl.² B65D *85/20*
U.S. Cl. 206—345 **5 Claims**

1. An assembly comprising

a carrier, said carrier including a base and projections extending from said base; and

a plurality of tubular sleeves, said sleeves being snugly and slidably disposed over said projections so as to admit of removal of said projections when drawn past the ends thereof, said sleeves being of heat recoverable material and dimensionally unstable on said projections such that



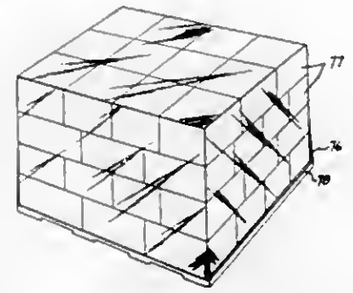
said sleeves are heat recoverable to a lesser transverse dimension when removed from said projection.

4,032,011

PACKAGING ASBESTOS FIBERS

Gerard Lucien Lambert, Asbestos, Canada, assignor to Johns-Manville Corporation, Denver, Colo.

Division of Ser. No. 438,969, Feb. 4, 1974. This application Feb. 26, 1976, Ser. No. 661,576
Int. Cl.² B65D *19/00*
U.S. Cl. 206—386 **2 Claims**



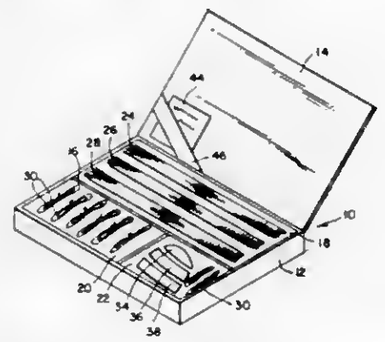
1. An assemblage comprising a plurality of dense packages of asbestos fiber each comprising a compacted mass of asbestos fibers having a density of at least about 90 PCF, arranged on a pulpable pallet and secured thereto.

4,032,012

SCARF AND HAT KIT

Enola Bishop, 5808 N. Winthrop, Chicago, Ill. 60660

Filed Aug. 24, 1976, Ser. No. 717,035
Int. Cl.² B65D *69/00*
U.S. Cl. 206—574 **7 Claims**



1. A sewing kit for forming an article of clothing comprising:

a covered box having

a plurality of upright partitions therein dividing said box into a plurality of compartments,

a plurality of fabric strips in one of said compartments which when sewn together form an article of clothing, and

a plurality of individual yarn lengths having at least one needle permanently attached to an end thereof in another one of said compartments for sewing said fabric strips together to form said article of clothing whereby the needles remain a part of the finished article as decoration therefor.

4,032,013

APPARATUS FOR ARRANGING AND STORING BOBBINS OF YARN OR THREAD

Kimiko Matsumoto, 324-1, Oaza-Shirakibaru, Onojo, Fukuoka, Japan

Continuation of Ser. No. 476,416, June 4, 1974, abandoned. This application Nov. 10, 1975, Ser. No. 630,338
Int. Cl.² A47F *7/00*; B65H *49/02*
U.S. Cl. 211—13 **2 Claims**

1. Apparatus for storing bobbins of yarn or thread comprising, a frame having a plurality of horizontal, vertically spaced, rod-like crosspieces spaced vertically from each other a distance greater than the axial length of a bobbin and used in an upstanding position in use, a plurality of bobbin-holders for storing bobbins with yarn or thread individually depending therefrom on respective ones of said crosspieces, each bobbin-holder having an insert portion insertable axially into an axial bore of a bobbin for removably holding a bobbin depending on said bobbin-holder, hook means on each bobbin-holder for removably freely hanging the bobbin-holders individually on said crosspieces in a condition with a corresponding bobbin suspended on said insert portion, said insert portion comprising a split, hollow cylindrical portion of lesser axial length than a bobbin and insertable into the axial bore of a bobbin in an inwardly compressed state, said bobbin-holder having another hollow cylindrical portion of greater diameter as an upward extension on said insert portion defining therewith an annular shoulder limiting the axial extent of insertion of said insert portion into the corresponding bobbin, said hook means comprising a hook extending outwardly from said another hollow cylindrical portion for removably suspending said bobbin-holder on a crosspiece with a bobbin depending therefrom for removal of the individual bobbin-holder and the corresponding bobbin from the crosspiece jointly and for return to a hanging position jointly on a crosspiece, and said another cylindrical portion having an axial slit for receiving an end of yarn therein from the corresponding bobbin to avoid thereof from said bobbin.

4,032,014

DISPLAY EASEL

Donald P. Weiss, Kinnelon, N.J., assignor to Advertising Displays Corporation, Englewood Cliffs, N.J.

Filed Jan. 30, 1976, Ser. No. 653,663
Int. Cl.² A47F *7/00*
U.S. Cl. 211—49 R **1 Claim**

1. A display rack which can be readily erected between a collapsed and erected position comprising:

a plurality of transversely and longitudinally extending ribs to define a back panel,

support means including a pair of spaced apart leg members hingedly connected to a transversely extending rib, whereby said leg members can be folded between a collapsed and erected position,

complementary base member hingedly connected to a transversely extending rib spaced from said first mentioned transversely extending rib,

said base member being readily folded between an erected and collapsed position,

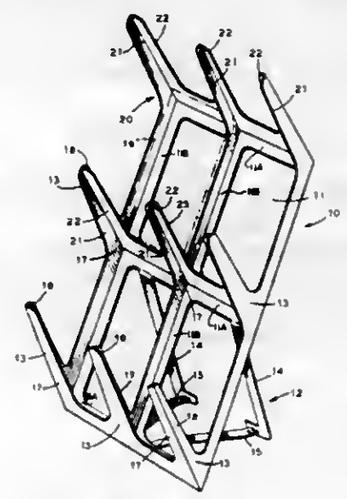
said leg members and base member having complementary interlocking means for locking said members in the erected position,

and a plurality of brackets connected to said longitudinal and transversely extending ribs so as to project normal thereto,

said brackets being disposed at the points of intersection of said longitudinally and transversely extending ribs,

said brackets including angularly disposed side walls, whereby the complementary sides of opposed brackets define a support adapted for holding therebetween a plurality of articles to be displayed,

said brackets including opposed corner brackets having the side walls thereof disposed at substantially right angles,



and intermediate brackets disposed between said corner brackets,

said intermediate brackets having a side wall which is common to the complementary side walls of said corner brackets,

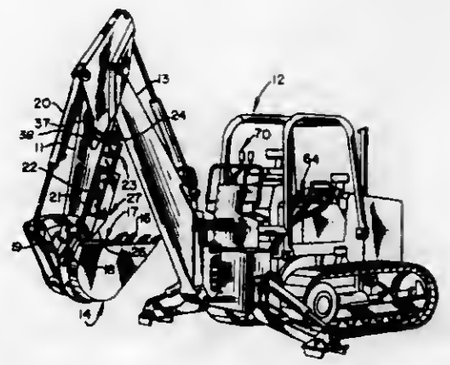
said side walls of the brackets being arranged so that the compartments defined thereby are in open communication with one another.

4,032,015

BUCKET CLEANER AND CONTROL FOR A DIGGING MACHINE

Charles Wayne Hemphill, Duncanville, Tex., assignor to Adco Company, Dallas, Tex.

Filed June 23, 1976, Ser. No. 698,906
Int. Cl.² E02F *3/80*, *3/85*
U.S. Cl. 214—767 **17 Claims**



8. In a backhoe type digging machine having a dipper stick to which there is pivotally mounted a bucket, and having means by which the bucket is moved from an uncurled into a curled configuration;

with the bucket having opposed side walls, and a curved bottom wall connecting the side walls together and forming a rear wall to leave a digging end spaced from the rear wall, the improvement comprising:

a bucket cleaning apparatus comprised of a blade manner; a housing; a guide member; means by which said blade member is affixed to said housing, means slidably captur-

ing said housing to said guide member such that said housing can slidably move in captured relationship respective to said guide member;

means by which said guide member is affixed to a marginal length of said dipper stick in spaced relationship respective to the connection by which the bucket and dipper stick are pivotally joined;

means by which said housing is moved along said guide member towards and away from said bucket such that said blade member can be extended into engagement with the bottom of the bucket with a progressive movement to cause the free end of the blade to contact the bottom of the bucket as the bucket is moved from a curled into an uncurled position; thereby discharging the contents of the bucket.

4,032,016

MOBILE CRANE WITH MEANS FOR EQUALIZING THE AXLE LOAD

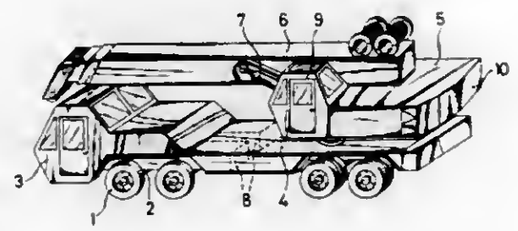
Wilfried Gräf, Dortmund, Germany, assignor to O & K Orenstein & Koppel Aktiengesellschaft, Berlin, Germany

Filed Feb. 23, 1976, Ser. No. 660,359

Claims priority, application Germany, Feb. 21, 1975, 2507476

Int. Cl.² B66C 23/72

U.S. Cl. 212—49 **6 Claims**



4. A mobile crane which includes: a lower carriage having a front section, an upper carriage having a first end portion adapted to support an operator's stand and also having a second end portion opposite said first end portion, first fluid storage container means arranged at said front section of said lower carriage, second fluid storage container means arranged at said second end portion of said upper carriage, conduit means leading from said first to said second fluid storage container means, pump means interposed in said conduit means and operable selectively to pump fluid from said first fluid storage means to said second fluid storage container means thereby permitting liquid which serves for equalizing axle loads of the crane when driving over roads to be pumped to said second fluid storage container means to serve as ballast and counterweight during hoisting operations of said crane, and means pivotally connecting said upper carriage to said lower carriage and being provided with passage means therethrough, said conduit means passing through said passage means.

4,032,017

ADJUSTABLE BRACKET ASSEMBLY FOR A RAIL CAR COUPLER

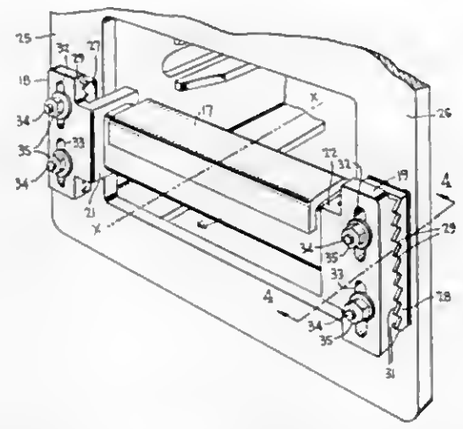
Glen D. Larsen, Upper Marlboro, Md., assignor to Southern Railway Company, Washington, D.C.

Continuation-in-part of Ser. No. 572,861, April 29, 1975, Pat. No. 3,987,907. This application May 13, 1976, Ser. No. 686,098

Int. Cl.² B61G 7/12

U.S. Cl. 213—61 **9 Claims**

6. In a rail car with a coupler having its shank portion resting on a coupler carrier member and bracket members supporting said carrier member at opposite ends thereof, said bracket members and said carrier member comprising a bracket assembly capable of being incrementally adjusted vertically relative to side plates of the rail car, said carrier member having opposing bearing surfaces, said bracket members each having at least one vertically elongated opening therein, each said bracket member having opposing surfaces lying parallel to said side plates, at least one of said surfaces having horizontally extending toothed serrations thereon of a predetermined tooth size, lock means on said side plates, said lock means including toothed serrations of a tooth size equal to said predetermined tooth size, fastener elements on said lock means extending through said elongated openings, one of said bearing surfaces lying in a plane containing a trough between a pair of adjacent teeth of said bracket member serrations, and the other of said bearing surfaces lying in a



second plane containing an apex of one of the teeth of said bracket member serrations, said serrations of said lock means and of said bracket members being intermeshed, and said planes being shiftable relative to said side plates, when said carrier member is in a first position, by an amount equal to at least the size of said one of said teeth, said planes being further shiftable relative to said side plates by an amount equal to at least one-half the size of said teeth, when said carrier member is moved to a second position inverted from said first position as by rotating the bracket assembly 180° about an axis perpendicular to said side plates, and means engaging said fastener elements for retaining said bracket members and said lock means together.

4,032,018

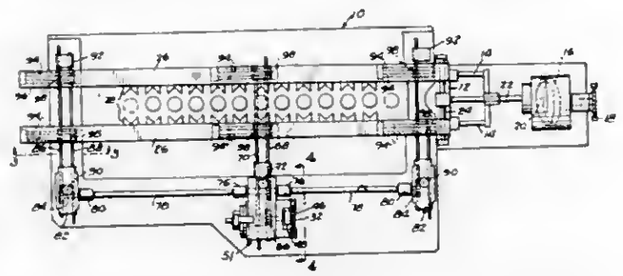
WORKPIECE TRANSFER MECHANISM

Bernard J. Wallis, 25200 Trowbridge Ave., Dearborn, Mich. 48124

Filed Nov. 21, 1975, Ser. No. 634,122

Int. Cl.² B65G 47/90

U.S. Cl. 214—1 BB **13 Claims**



1. In a device for transferring workpieces between successive stations of a die mounted in a stamping press, said transfer device being of the type which comprises a base, a carriage reciprocable on said base in a linear path through a stroke corresponding to the distance between the successive stations in the die and a finger bar mounted for movement with the carriage and for reciprocating movement transversely of the path of travel of the carriage between work engaging and

retracted positions, that improvement which comprises means for actuating the finger bar to said work engaging and retracted positions comprising a cam adapted to be mounted on and reciprocate in a linear path with the ram of the press, said cam having a track thereon extending generally in the direction of said linear path of reciprocation of said ram and having a portion offset transversely of said last-mentioned linear path, a crank rotatably mounted on said base, a cam follower on said crank and adapted to be interengaged by said cam track and to be displaced by said offset portion thereof in response to said reciprocation of the ram to rotate said crank in opposite directions and means operably interconnecting said crank and said finger bar for shifting the finger bar between said work engaging and retracted positions in response to rotation of said crank.

4,032,019

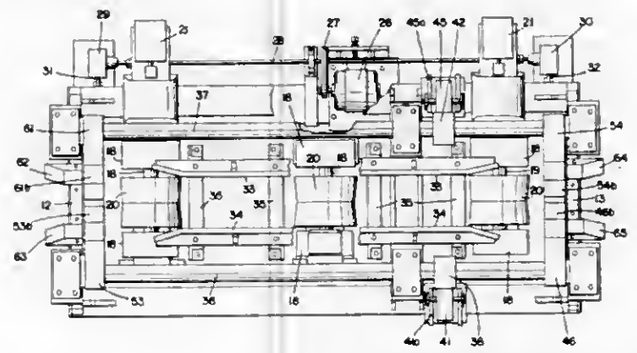
BILLET CONVEYOR AND TURNER

Stanley Darwin Noll, Shaker Heights, and William F. Delfeld, Lyndhurst, both of Ohio, assignors to Production Experts, Inc., Cleveland, Ohio

Filed Aug. 25, 1975, Ser. No. 607,216

Int. Cl.² B65G 7/00

U.S. Cl. 214—1 QG **6 Claims**



1. In a billet turner, billet turner mechanism comprising a pair of spaced parallel shafts, means for selectively imparting oscillatory movement to said shafts about their axes, billet support levers secured to said shafts, each of said levers including a billet support, said billet support of each of said levers being normally disposed in a common horizontal plane, and a flip lever pivotally secured to each of said first-named levers and movable relative to the latter whereby when one of said parallel shafts is rotated about its axis, its billet support lever will cause the billet support to be elevated out of said common plane and its flip lever will cause the billet to be moved along said billet support extension to the end of said extension and to fall by gravity onto the billet support extension of the other lever, and simultaneously turn about the longitudinal axis of the billet.

4,032,020

ARTICLE EXCHANGING APPARATUS

Shozo Kato; Yutaka Takahashi, both of Nagoya; Yorio Miyaji, Osaka; Naomitsu Kondo, Osaka, and Mikio Fukumoto, Osaka, all of Japan, assignors to Sumitomo Chemical Company, Limited and Kabushiki Kaisha Miyazaki Tekkosho, both of Osaka, Japan

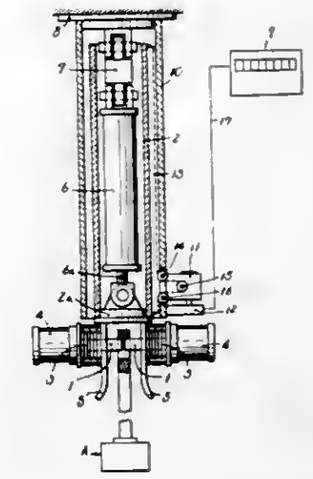
Filed Apr. 7, 1975, Ser. No. 565,714

Claims priority, application Japan, Apr. 5, 1974, 49-39203

Int. Cl.² B66C 13/16

U.S. Cl. 214—1 BB **4 Claims**

1. In an article exchanging apparatus for removing a consumed article from a processing unit and replacing same with a fresh consumable article having base plate means for engagement with transporting apparatus capable of being moved substantially horizontally, lifter means secured at one end to said base plate means in suspended relationship thereto, and article gripping means secured to the opposite end of said lifter means for releasably engaging a fresh or consumed article, the improvement of an article level unit for insuring the proper replacement of a fresh article for a consumed article at the same level at which the consumed article was at the time of its removal, said article level unit comprising load switch means interposed between the base plate means and the lifter means to constitute the connection therebetween, said switch means being actuatable by the weight of the article and the associated parts to which it is connected, means for detecting the vertical displacement of the consumed article operatively associated with the lifter means and the article gripping means, pulse generator means operatively connected to said vertical displacement detecting means for generating a signal corresponding to the upward or downward movement of the article, article level measuring and indicating means operatively connected to said switch means to said pulse generator means, said article level measuring and indicating



means including an indicator unit operable to give a value corresponding to the level of the article whereby said article level measuring and indicating means will be actuated by said switch means upon the raising of a consumed article and which will receive a pulse generator signal to indicate the vertical displacement of the consumed article in terms of a fixed value on said indicator unit, said switch means will be closed upon release of the consumed article and will be reactuated upon engagement by said article gripping means of a fresh replacement article and will give on said indicator unit the vertical displacement of the fresh article in terms of a fixed value and the vertical height of the fresh article will thereafter be adjusted to give a zero value setting corresponding to the final reference value thereby placing the fresh article at a level coinciding with the level of the consumed article at the time it was withdrawn.

4,032,021

DEPALLETIZERS

Michael David Mabey, Bishampton, near Pershore, and James Malcolm Foster, Harrowgate, both of England, assignors to Depallorator Corporation Limited, Ireland

Filed Aug. 22, 1975, Ser. No. 607,064

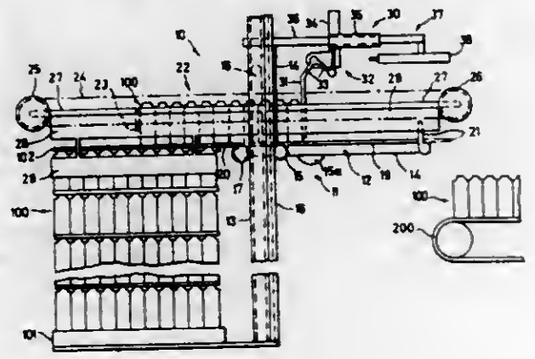
Claims priority, application United Kingdom, Aug. 23, 1974, 37206/74

Int. Cl.² B65G 59/02

U.S. Cl. 214—8.5 F **5 Claims**

1. A depalletiser for unloading tiers of goods from a pallet onto a take-off surface, said pallet having an uppermost tier, said depalletiser comprising vertical support means; a horizontal platform supported by said vertical support means; lift means for displacing said platform vertically up and down the support means so as to sequentially aline the platform with the uppermost tier on the pallet and with the take-off surface and transfer means movable with the platform for displacing tiers of goods from the pallet onto the platform and from the platform onto the take-off surface; and

means movable with the platform for locating about the tier of goods immediately below the uppermost tier on the



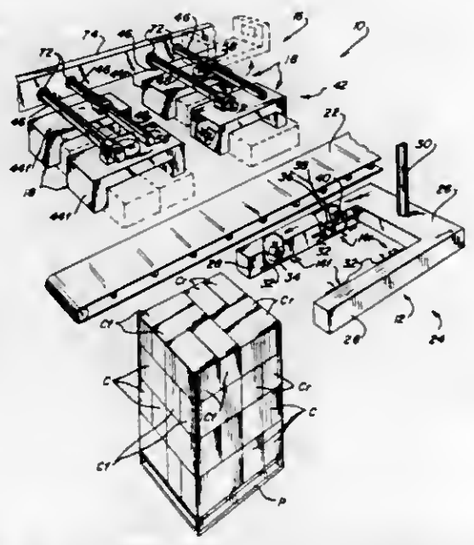
pallet so as to steady the stack of goods on the pallet during transfer of the uppermost tier.

4,032,022

APPARATUS FOR HANDLING CARTONS AND THE LIKE

John S. Smith, 965 11th St., Boulder, Colo. 80302

Filed Nov. 3, 1975, Ser. No. 628,518
Int. Cl.² B65G 59/02
U.S. Cl. 214—8.5 C 9 Claims



1. Apparatus for handling cartons and the like comprising in combination:

first releasable gripping means adapted to releasably grasp a plurality of cartons, said first gripping means including first separating means for separating at least some of the cartons gripped by the first gripping means from other cartons gripped by the first gripping means,

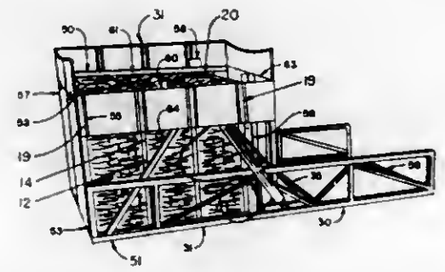
second releasable gripping means for grasping the separated cartons held by the first gripping means and removing the cartons grasped by the second gripping means from the first gripping means when the cartons are released by the first gripping means, said second gripping means being movable relative to said first gripping means and including second separating means adapted to further separate cartons grasped by said second gripping means and deposit the further separated cartons at a pre-selected location.

4,032,023

APPARATUS FOR LOADING TOBACCO IN BARNS

Frank W. Macintosh, Mt. Holly, N.C., assignor to Gas-Fired Products, Inc., Charlotte, N.C.

Filed Mar. 29, 1976, Ser. No. 671,279
Int. Cl.² B65G 47/00
U.S. Cl. 214—16.4 R 5 Claims



1. Apparatus for loading leaf tobacco for curing comprising in combination,

a. an air permeable container for receiving and supporting the tobacco during curing;

b. a loading device including a longitudinal frame stationary in use and a loading fixture pivotally supported in a first loading position at one end of said frame and adapted to receive a container at the lower level of said longitudinal frame in said first loading position, means to lift and rotate the loading fixture and its associated container from said first loading position to a second curing position at the other end of the frame, said means to lift and rotate said loading fixture comprising a pivot located approximately at the lower level of said longitudinal frame, whereby the placement of the container is such that when said loading fixture is rotated the side of said container rests on the upper level of said longitudinal frame and, said loading fixture including a trackway on which the container rests in the loading fixture when in the second or curing position; and

c. a tobacco curing barn adjacent said loading device and including a trackway in alignment and as an extension of said trackway in said loading fixture when in the second or curing position.

4,032,024

APPARATUS FOR DISTRIBUTION OF CHARGE MATERIAL IN SHAFT FURNACES, PARTICULARLY HIGH PRESSURE BLAST FURNACES

Ulrich Genge, Duisburg, and Manfred Eutenereu, Neukirchen-Vluyn, both of Germany, assignors to Demag Aktiengesellschaft, Germany

Filed Nov. 12, 1975, Ser. No. 631,071
Claims priority, application Germany, Nov. 26, 1974, 2455767
Int. Cl.² B66C 17/08
U.S. Cl. 214—35 R 11 Claims

1. Apparatus for evenly distributing charge material to shaft furnaces, comprising

a. a furnace with a stationary hopper disposed in the top of said furnace;

b. an annular support disposed in said furnace adjacent the bottom of said hopper and arranged to pivot on a first horizontal axis extending through said furnace;

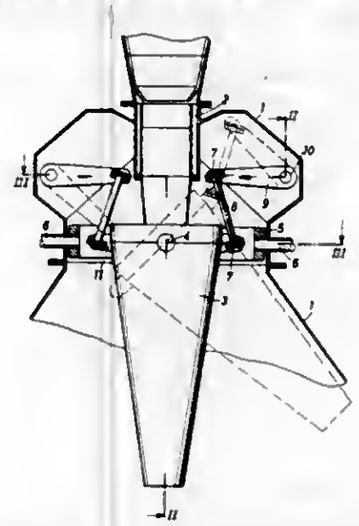
c. a distributor pipe disposed on said support and arranged to pivot in vertical plane on a second horizontal axis on said support;

d. said first and second horizontal axes being perpendicular to each other; characterized by

e. reversible drive means positioned outside the wall of said furnace;

f. first means connecting said drive means to said annular support for the pivoting thereof around said first axis;

g. linkage means connecting the circumferential edge of said distributor pipe to said drive means to pivot said pipe around said second horizontal axis;



h. said linkage means including a non-fixed universal connecting said drive means and said distributor pipe.

4,032,025

BACKHOE BUCKET TILT

Warren N. Ross, Hermiston, Oreg., assignor to Audie B. Tomlinson, Cove, Oreg.

Filed June 20, 1975, Ser. No. 588,702
Int. Cl.² E02F 3/86
U.S. Cl. 214—138 R 4 Claims

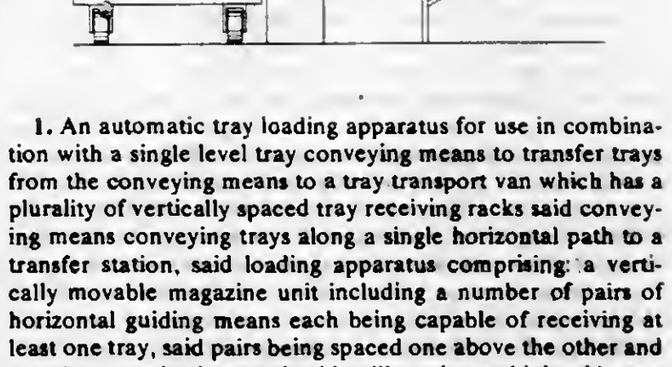
1. In a backhoe, a main boom, a jib boom having an upper end and a lower end, a forked member having an upper end rigidly secured to the lower end of the jib boom and having a lower bifurcated end, a yoke pivotally mounted on the lower bifurcated end of the forked member on a tilt axis and having its arms extending upwardly between said bifurcated end, a bucket pivotally mounted on the lower end of the yoke for pivotal movement on the yoke on a bucket pivot axis transverse to said tilt axis, first manually controlled means for pivoting the bucket about said bucket pivot axis, a double-ended fluid cylinder pivotally mounted between the bifurcated end of the forked member on a third axis above and parallel to said tilt axis locating said cylinder between the arms of the yoke, said fluid cylinder including a housing having a central piston and a rod at each end extending outwardly of said housing parallel to said bucket pivot axis, one rod engaging with one arm of the yoke and the other rod engaging with the other arm of the yoke, the total length of the rods at least equal to the spacing between the arms of the yoke so that the rods always engage both arms, second manually controlled means for said fluid cylinder, the extension of a selected rod resulting in the simultaneous retraction of the other rod and the exertion of a direct force upon a selected arm of the yoke by said selected rod thereby selectively pivoting said yoke and bucket around said tilt axis by said selected rod.

4,032,026

BULK HAULING FREIGHT CAR UNLOADING APPARATUS AND METHOD OF OPERATION

Paul W. McCormick, 200 Lee Drive, Coraopolis, Pa. 15108

Continuation of Ser. No. 387,804, Aug. 13, 1973, now Defensive Publication No. T922,002. This application Feb. 10, 1976, Ser. No. 656,987
Int. Cl.² B65G 67/34
U.S. Cl. 214—152 3 Claims



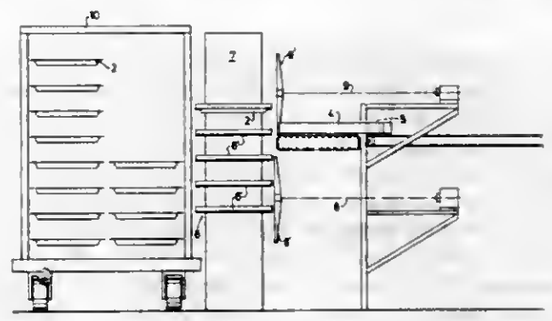
1. The method of unloading a first train of open hopper cars containing bulk material without decoupling the cars comprising pushing the train of cars by a rear engine through a vertically extending helical, 360° loop of track such that the open ends of the cars face the center of the loop; retaining the contents in the car until the car passes through the first quadrant of the loop, connecting an engine to the front car of the train after the latter has passed entirely through the loop and continuing to move the train through the loop through the pushing and pulling forces respectively of the front and rear engines.

4,032,027

AUTOMATIC TRAY LOADING DEVICE

Gunnar V. Lindberg, Vallingbyvagen 212, 162 21 Vallingby, Sweden

Filed Aug. 18, 1975, Ser. No. 605,230
Int. Cl.² B65G 47/00
U.S. Cl. 214—16.6 4 Claims



1. An automatic tray loading apparatus for use in combination with a single level tray conveying means to transfer trays from the conveying means to a tray transport van which has a plurality of vertically spaced tray receiving racks said conveying means conveying trays along a single horizontal path to a transfer station, said loading apparatus comprising: a vertically movable magazine unit including a number of pairs of horizontal guiding means each being capable of receiving at least one tray, said pairs being spaced one above the other and together constituting a unit; side pillars along which said magazine unit is vertically guided; means for moving said magazine unit upwards and downwards in steps, each step being equal to the vertical distance between adjacent pairs of tray guiding means; one side of said magazine unit being a tray

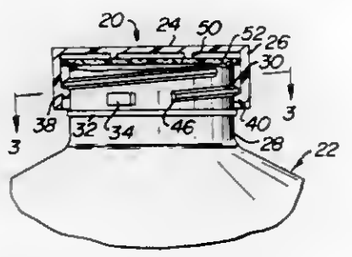
input side between said pillars and said input side being disposed adjacent said transfer station at the side of and parallel with the tray conveying means; a magazine loader at said transfer station disposed adjacent said magazine input side and adapted to laterally reciprocate and engage and shift at least one tray sideways from the conveying means onto an adjacent pair of horizontal guiding means; loading means for horizontally shifting vertically carried trays from said magazine unit to the tray transport van comprising, a first loader device located under the magazine loader and adjacent said magazine input side and a second loader device located above both the first loader device and the magazine loader and adjacent said magazine input side, each loader device being powdered by a step motor means and the two loader devices being alternately operable to shift trays, each loader device having tray shifting structure adapted to simultaneously engage and laterally shift the trays from a plurality number of pairs of said horizontal guiding means.

4,032,028

SAFETY CAP

Oscar Reiss, Great Neck; Leon R. Brynes, Brooklyn, and Frank De Cicco, Hamilton Beach, all of N.Y., assignors to APL Corporation, New York, N.Y.

Filed Sept. 13, 1976, Ser. No. 722,949
Int. Cl.² B65D *85/56, 55/02;* **A61J** *1/00*
U.S. Cl. 215—217 **4 Claims**



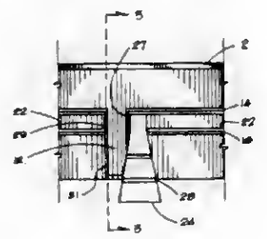
1. A screw-type safety cap for use in combination with a bottle having a threaded neck with a top planar edge, said cap including a top wall and a depending peripheral skirt, said skirt having a thread on the inner surface thereof for rotatably engaging and screwing said cap with the threaded neck of said bottle, said cap having a resilient member disposed under the top of said cap for engaging the top edge of said neck, said threads of said cap and the threads on said bottle being so dimensioned in thickness and space therebetween that the cap is axially slidable with respect to said bottle, said threads on said bottle having at least two interruptions which form at least two recesses in the threads of said bottle, said cap having at least two projections on the inner surface of said skirt, said projections being spaced both axially and radially with respect to each other, as are the two recesses in said bottle thread, the projection on said skirt which is most spaced from the top of said cap being dimensioned so that it is too large to fit in any recess of said bottle other than the recess lowest on the neck of said bottle, said cap being secured to said bottle by rotating said cap until all of said projections are aligned with said recess, said resilient member causing said cap to be urged away from said bottle and the projections to be disposed in said recesses whereby said cap in locked on said bottle and cannot be removed unless the user presses said cap against the bottle to dislodge said projections from said recesses to enable unscrewing said cap.

4,032,029

TAMPER-PROOF BOTTLE CAP AND CONTAINER

Benjamin Arthur Cochrane, 181 Sonora Ave., Danville, Calif. 94526

Filed Apr. 5, 1976, Ser. No. 673,630
Int. Cl.² B65D *41/32*
U.S. Cl. 215—256 **13 Claims**



1. A deformable plastic cap comprising (1) a top disk, (2) a cylindrical thin-walled outer skirt extending substantially perpendicularly from said disk, and (3) a cylindrical inner skirt extending substantially perpendicularly from said disk enclosed within said outer skirt and substantially coaxial therewith;

said outer skirt scored along a circumferential first score line below said disk and scored along a circumferential second score line downwardly spaced from said first score line, said first and said second score lines forming (a) a weakened cylindrical band traversing said outer skirt in an arc from about 250° to about 358° and (b) a narrow strip between the ends of said cylindrical band from the incompleted arc;

a tab attached to one end of and extending outwardly from said cylindrical band;

a first weakened area extending from said first score line to said second score line between said narrow strip and said tab;

a second weakened area extending from said first score line to said second score line between said narrow strip and the opposite end of said cylindrical band from said tab;

a narrow circumferential first bead around the inside of said outer skirt between said first score line and said disk;

a narrow circumferential second bead around the inside of said outer skirt below said first score line; and

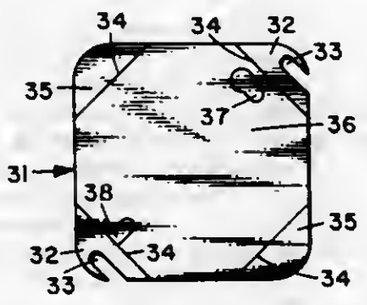
a third score line extending downwardly from said second score line to a lower portion of said outer skirt below said second bead.

4,032,030

MODIFIABLE UTILITY OUTLET BOX COVER ELEMENT

David L. Bass, 2407 Loiurno Road, Chesapeake, Va. 23323, and Kenneth B. Meador, 403 Anndora Road, Portsmouth, Va. 23701

Filed Dec. 23, 1976, Ser. No. 753,851
Int. Cl.² H02G *3/14*
U.S. Cl. 220—3.8 **2 Claims**



1. A modifiable cover element for a utility outlet box comprising a sheet of relatively thin material at least initially having an edge outline corresponding in size and shape to the

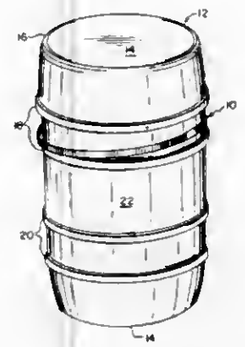
frontal configuration of a first utility outlet box, said cover element having openings or the like formed therein through which screws may be passed into screw receiving means carried by said first utility outlet box when said cover element is congruently frontally positioned against said first utility outlet box for securing said cover element thereto, said cover element having slots cut into one of the surfaces thereof along which removable portions thereof may be readily broken away to leave a remaining portion thereof having an edge outline substantially corresponding in size and shape to the frontal configuration of a second utility outlet box, said remaining portion of said cover element including portions readily removable therefrom to define openings or the like therein through which screws may be passed into screw receiving means carried by said second utility outlet box when said remaining portion of said cover element is substantially congruently frontally positioned against said second utility outlet box for securing said remaining portion of said cover element thereto.

4,032,031

PLASTIC DRUM WITH LIFT RING

Paul Belokin, Jr., Hayward, Wis., assignor to K and M Rubber Company, Elk Grove Village, Ill.

Filed Oct. 12, 1976, Ser. No. 731,621
Int. Cl.² B65D *25/00, 7/42*
U.S. Cl. 220—85 R **4 Claims**



1. In combination with a drum of synthetic material of the type which has relatively unobstructed substantially rimless ends not readily engageable for handling and having at least one pair of annular roll ridges spaced apart on the exterior of and located near one axial end of the drum, means for securing the drum to a hand truck that has a downwardly engaging hook device thereon, said means comprising:

a loose circlet of a diameter greater than the diameter of the drum between said roll ridges and smaller than the outer diameter of said roll ridges, formed of a material having sufficient strength to withstand the tension applied in handling said drum through the engagement of said hand truck hook device with the circlet, between the circlet and the drum surface between said roll ridges.

4,032,032

FLAME GUARD ANTI-ROTATION DEVICE

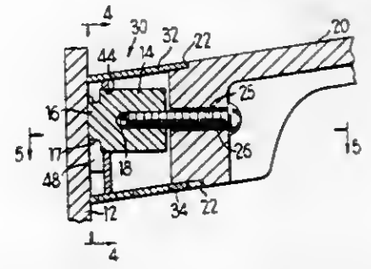
William Michael Carroll, 1111 E. Dean Road, Milwaukee, Wis. 53217, and John Day, Studio House, Shatterford, Warley, Worcestershire, England

Filed May 4, 1976, Ser. No. 682,839
Int. Cl.² B65D *25/28*
U.S. Cl. 220—94 R **11 Claims**

1. In a cooking utensil having a vessel with weld stud mounted thereon and a handle extending from said weld stud, an improved safety interlock between said handle and said vessel, said interlock comprising:

a. a non-circular tubular member having ends interfacing with the vessel and the adjacent end of the handle, and extending over said weld stud;

b. separate interlock means within said tubular member spaced from the adjacent end of said handle and having an aperture extending over and frictionally engaging said weld stud and a periphery engaging said tubular member, said weld stud, interlock means and said tubular member



being non-annular for precluding relative rotation between said vessel and said handle; and

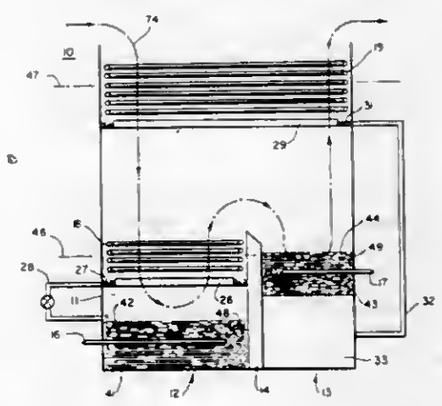
c. bolt means extending through said handle, tubular member and threaded into said weld stud for joining said assembly.

4,032,033

METHODS AND APPARATUS FOR HEATING ARTICLES

Tze Yao Chu; Yogesh Jaluria, both of Lawrence Township, Mercer County; Peter Frederick Lillenthal, II, Princeton, and George Michael Wenger, Franklin Township, Somerset County, all of N.J., assignors to Western Electric Company, Inc., New York, N.Y.

Filed Mar. 18, 1976, Ser. No. 668,012
Int. Cl.² H05K *3/34;* **B23K** *3/04*
U.S. Cl. 228—200 **7 Claims**



1. A method for heating an article to an elevated temperature in a condensation heat transfer facility which is open to the atmosphere, comprising the steps of:

transporting the article into the facility, through a body of secondary vapor, into a body of hot saturated primary vapor;

heating the article to the elevated temperature by condensing the primary vapor thereon to transfer the latent heat of vaporization to the article;

removing the article from the hot saturated primary vapor; and

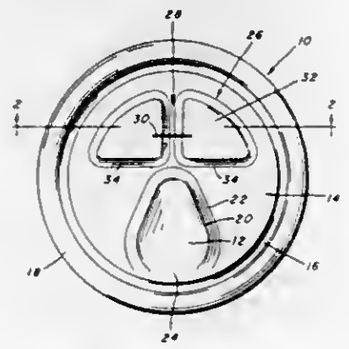
immersing the article in a liquid prior to withdrawal of said article from the facility.

4,032,034

PRESSURE RELEASE DEVICE FOR A CONTAINER

Wilburn Coy Willis, Hagerstown, Ind., assignor to Aluminum Company of America, Pittsburgh, Pa.

Filed Nov. 18, 1976, Ser. No. 742,893
Int. Cl.² B65D 41/32
U.S. Cl. 220—266 11 Claims



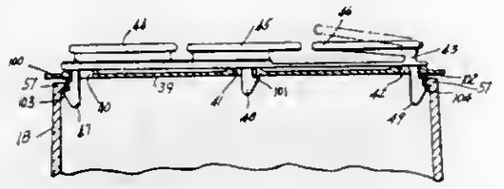
1. In a container having a vent release means comprising a container wall having an inwardly projecting hollow rib and a weakening line across the rib, an improveent comprising walls transverse to the longitudinal axis of said rib and to the general plane of said container adjacent to both ends of said rib, which improvement minimizes effects of changes in internal pressure of said container on the force required to rupture said weakening line.

4,032,035

CHILD-RESISTANT COVER FOR CONTAINERS

Joseph J. Tepas, Jr., Easton, Conn., and Arlon G. Sangster, Sterling, Mass., assignors to Olin Corporation, New Haven, Conn.

Continuation-in-part of Ser. No. 437,077, Jan. 28, 1974, Pat. No. 3,870,471. This application Mar. 7, 1975, Ser. No. 556,362
Int. Cl.² B65D 45/16
U.S. Cl. 220—318 22 Claims



I. A cover which is adapted to be used for a container having an opening at one end and having a latch lip adjacent to said opening, said cover comprising a plate, a handle secured to said plate having at least two grips, a releasing grip and a non-releasing grip, two latching means for securing said plate to said latch lip, said latching means being responsive to said releasing grip to enable removal of said cover, the appearance of said releasing grip and said non-releasing grip being substantially the same.

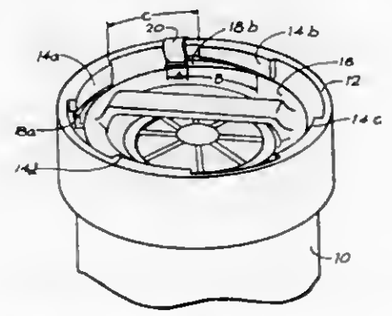
4,032,036

RETAINING CLIP

Junius Sycle, Jr., New Shrewsbury, N.J., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Nov. 1, 1976, Ser. No. 737,635
Int. Cl.² B65D 45/16
U.S. Cl. 220—324 12 Claims

1. Sealing means for a tubular casing having a plurality of cammed lugs equally spaced about the interior of a rim formed at the open end thereof, comprising, in combination: a circular cover adapted to be inserted in the rim of the casing for locking therewith, said cover having equally spaced about the periphery thereof a plurality of cammed lugs for rotatably engaging the lugs of the casing when said cover is rotated in one direction; and a U-shaped retaining clip having a pair of legs for compressively engaging the opposing surfaces of the casing rim between succeeding ones of the rim lugs and having a jutting portion on one leg for blocking the rotation of a selected one of said cover lugs in a direction opposite to said one direction thereby to retain said cover in locking engagement with the casing.

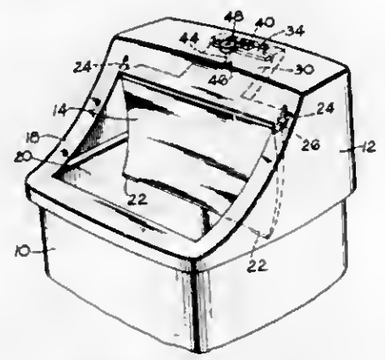


4,032,037

CLOSURE AND FASTENER FOR TRASH BINS

Roy Frederick Dubery, Hanworth, and Ronald Arther Chivrall, London, both of England, assignors to Airfix Plastics Limited, Hanworth, England

Filed Apr. 7, 1976, Ser. No. 674,403
Claims priority, application United Kingdom, Mar. 6, 1976, 09090/76.
Int. Cl.² B65D 43/24
U.S. Cl. 220—335 4 Claims



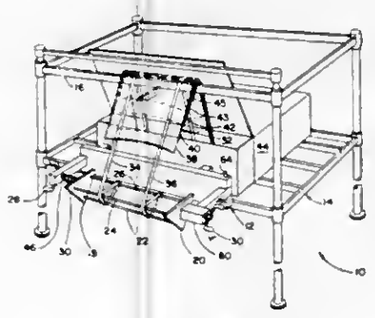
1. A bin comprising an aperture affording access to the bin interior, and a lid hinged to the bin for movement between an open position and a position closing said aperture, the lid being movable by gravity to closed position, wherein the improvement comprises a catch consisting of a magnet mounted on the bin, and a keeper carried in a pocket in the lid in a position to engage said magnet when the lid is in open position, the keeper being free to move in the pocket to a limited extent to enable it to conform to the opposing face of the magnet, and release means for disengaging the keeper from the magnet to allow the lid to close.

4,032,038

DEVICE, APPARATUS AND PROCESS FOR DISPENSING TAPED BAGS

David Allen Hendricks; Milton Albert Howe, Jr., both of Spartanburg; Stephen Royall Luck, Greenville, all of S.C.; Alfred Ray Morris, Cedar Rapids, Iowa, and Dave Leslie Owen, Wellford, S.C., assignors to W. R. Grace & Co., Duncan, S.C.

Filed Jan. 29, 1976, Ser. No. 653,420
Int. Cl.² B65H 19/12
U.S. Cl. 221—71 16 Claims



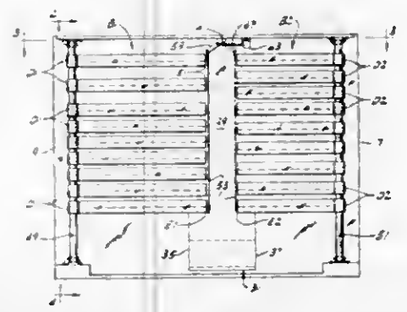
1. A device comprising
a. a first carrier,
b. means for rotatably mounting the carrier to permit rotation of the carrier about an axis of rotation,
c. means defining a surface adapted to rotate in response to rotation of the carrier to wind-up at least one flexible support,
d. means for permitting rotation of the surface in a first rotational direction and for substantially precluding rotation of the surface in a direction opposite to the first direction, and
e. a second carrier spaced from and opposite said first carrier, said surface-defining means extending from one of said carriers to the other of said carriers, and means for permitting relative displacement of at least one of said carriers away from said surface-defining means.

4,032,039

ARTICLE-DISPENSING APPARATUS

James T. Schuller, St. Louis County, Mo., assignor to UMC Industries, Inc., Stamford, Conn.

Filed Nov. 13, 1975, Ser. No. 631,531
Int. Cl.² G07F 11/36
U.S. Cl. 221—75 9 Claims



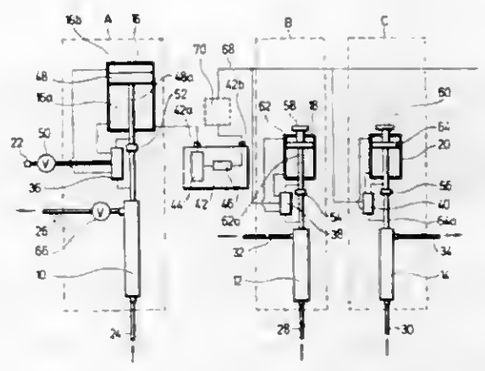
1. Article-dispensing apparatus comprising a cabinet, a first and a second bank of article dispensers in the cabinet, each bank comprising a plurality of dispensers located one above another, each dispenser being adapted to hold a series of articles to be dispensed in a row extending toward one end of the dispenser and having means for feeding the articles toward said one end of the dispenser and discharging the leading article of the series to drop by gravity, the first bank and the second bank of dispensers being arranged in the cabinet with the dispensers of the first bank feeding in one direction and the dispensers of the second bank feeding in the opposite direction and with the discharge ends of the dispensers of the first bank spaced from the discharge ends of the dispensers of the second bank providing a common vertical discharge chute between said banks, said cabinet having a delivery station to which an article delivered from any of the dispensers drops down in said chute, and a closure movable between a first position extending heightwise in said chute at the discharge ends of the dispensers of the first bank for closing off the first bank from the chute and a second position extending heightwise in the chute at the discharge ends of the dispensers of the second bank for closing off the second bank from the chute.

4,032,040

METHOD AND CONTROL SYSTEM FOR BATCHING PLURAL SUBSTANCES AND PUMP SYSTEM

Géza Kecskeméthy; Róbert Tihanyi, and György Virág, all of Budapest, Hungary, assignors to Muanyagipari Kutato Intezet, Budapest, Hungary

Filed Sept. 22, 1975, Ser. No. 615,661
Claims priority, application Hungary, Sept. 23, 1974, MU 529
Int. Cl.² B67D 5/08, 5/52
U.S. Cl. 222—1 8 Claims



1. In a method of batching at least two substances, more particularly synthetic resins and other materials such as catalysts and accelerants in preselected and adjustable amounts and proportions, each substance being delivered by individual batchers, the steps of driving said batchers by means of reciprocating pressure cylinders, selecting a first pressure cylinder for being supplied with a pressure medium from a source of such medium, feeding further pressure cylinders with a pressure medium dependent on the number of strokes per minute of said first pressure cylinder, controlling the total amount of discharge of the batchers by varying the number of strokes per minute of said first pressure cylinder, and controlling the mutual proportions of delivered substances by varying the stroke lengths of said further pressure cylinders.

4,032,041

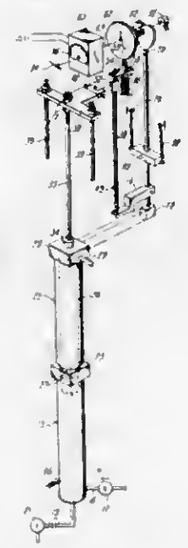
DISPENSING APPARATUS HAVING TEMPERATURE COMPENSATING FLUID METERING

Ralph E. Bruce, Dayton, Ohio, assignor to Production Control Units, Inc., Dayton, Ohio

Filed Aug. 11, 1975, Ser. No. 603,759
Int. Cl.² B67D 5/30
U.S. Cl. 222—14 18 Claims

13. In apparatus for metering and dispensing a fluid and adapted to charge a refrigeration system with a liquid refrigerant, said apparatus including a positive displacement pump having a movable fluid displacement member, means for moving said displacement member to effect dispensing of the fluid, and means for controlling the movement of said displacement member in response to changes in temperature of

the fluid, the improvement wherein said means for controlling the movement of said displacement member comprise a deformable control member having a plurality of elements successively arranged generally in a row, means including an electro-optical unit for counting said elements in response to



movement of said displacement member, means responsive to said counting means for controlling the movement of said displacement member, and means for deforming said control member for changing the spacing between adjacent said elements in response to changes in temperature of the fluid.

4,032,042

APPARATUS FOR COMPUTING AND METERING LIQUID DISCHARGES

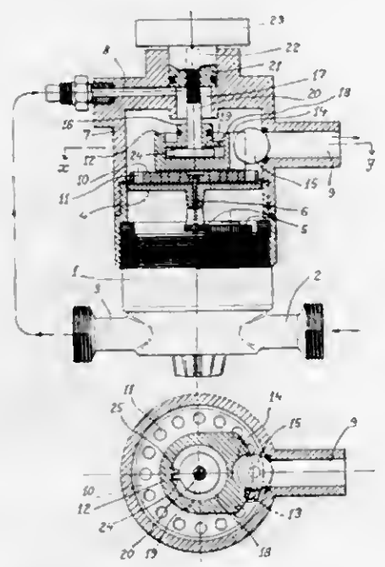
Moise Plat, Residences Clair Horizon, Bat. 1 Bloc A Avenue Joseph Giordan, 06000 Nice, France

Filed May 10, 1976, Ser. No. 684,894

Claims priority, application France, Oct. 2, 1975, 75.30740

Int. Cl.² B67D *5/30*

U.S. Cl. 222—20 **8 Claims**



1. A computing and metering device allowing only predetermined controllable quantities of a liquid to be discharged from a liquid outlet aperture, comprising a turbine flowmeter, metering means driven by said flowmeter and having a rotatable plate which carries a ball located in such a way as to block the arrival of the liquid when the said plate has moved through a given angle of revolution from a position predetermined by a setting component, the flowmeter and the metering means being disposed in separate chambers and being in communication with one another such that the whole of the flow passing through one said chamber then passes into the other chamber via an external duct.

4,032,043

DISPENSING CONTAINER NECK THREAD PROTECTION

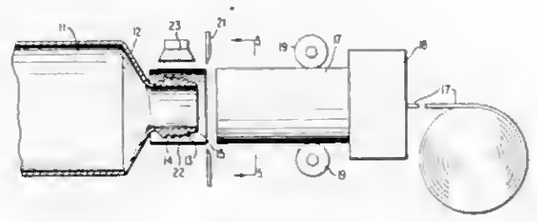
Dusan S. Lajovic, Smithfield, Australia, assignor to Colgate-Palmolive Company, New York, N.Y.

Continuation of Ser. No. 75,840, Sept. 28, 1970, abandoned. This application Feb. 5, 1973, Ser. No. 329,399

Claims priority, application Australia, Oct. 2, 1969, 61800/69

Int. Cl.² B65D *35/08*

U.S. Cl. 222—92 **12 Claims**



1. A dispensing tube assembly containing a fluent substance containing abrasive material comprising a collapsible metal body formed integrally at one end with a stiff shoulder terminating in a relatively rigid reduced diameter hollow discharge nozzle having an externally threaded section, an internally threaded closure cap for mounting on said nozzle and means for protecting said metal neck threads against abrasion by the substance contained in the body as the cap is repeatedly removed and replaced during successive discharges of portions of said substance in use of the assembly comprising a thin-walled smooth surfaced covering consisting of an integral heat shrunk element of non-metallic synthetic plastic material tightly permanently mounted and anchored against axial displacement on said nozzle in close internal and external contour following conformance with said threaded section, said nozzle being formed intermediate the shoulder and said threaded section with an annular anchor section distinct from the threaded section, the inner end of said element surrounding said annular section in snug internal and external contour following conformance and thereby anchoring said element against axial displacement on said nozzle when said threaded closure cap is rotatably applied upon or removed from said nozzle threads, said covering of plastic material resulting in only an immaterial increase in diameter of said threaded nozzle section thereby not requiring a larger closure cap than did the initial metal threaded section, and said covered threaded section providing a composite threaded region having a smooth abrasion protected thread surface stabilized and directly internally supported by the metal threads of the nozzle.

4,032,044

LIQUID DISPENSING UNIT AND SYSTEM

Jac B. Flynn, Elgin; Jerry C. Janquart, Crystal Lake, and Werner K. Priese, Barrington, all of Ill., assignors to Hills-McCanna Company, Carpentersville, Ill.

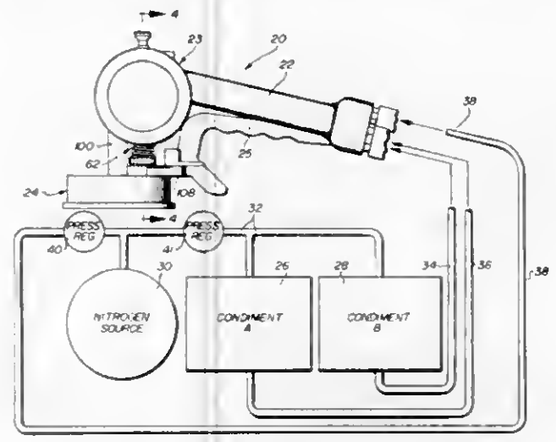
Filed Mar. 8, 1976, Ser. No. 664,556

Int. Cl.² G01F *11/08;* **B67D** *5/52*

U.S. Cl. 222—135 **32 Claims**

1. A dispensing unit for use in the controlled, metered dispensing of a liquid product, said unit adapted for use in a system wherein said product is supplied under pressure, said dispenser comprising: a body assembly, at least one metering chamber and discharge passage means provided in said body assembly, with a flexible diaphragm forming a wall of said

metering chamber, means for establishing a force on the side of said diaphragm opposite said metering chamber, and control means operable to effect supply of pressurized product to said metering chamber to create a pressure differential across said diaphragm in a direction which will overcome any force established on said oppoiste side, thereby permitting complete filling of said metering chamber with pressurized product said



control means also being operable to produce blackage of pressurized product to said metering chamber while establishing communication between said metering chamber and said discharge passage means, such that a pressure differential across said diaphragm will then be created in the opposite direction forcing a predetermined volume of product out of said metering chamber.

4,032,045

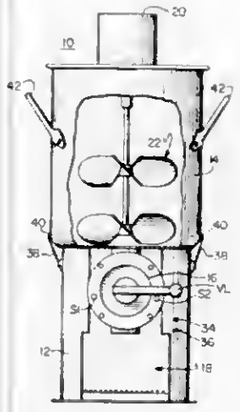
SOUP DISPENSER

Richard R. Epple, Glen Burnie, Md., assignor to Maryland Cup Corporation, Owings Mills, Md.

Filed June 20, 1975, Ser. No. 588,903

Int. Cl.² B67D *5/62;* **G01F** *11/22*

U.S. Cl. 222—146 HE **17 Claims**



1. A dispensing apparatus for hot soup and the like comprising:

a base stand;

heating and control means housed in said base stand for supplying controlled heat;

a reservoir and integral dispensing valve assembly mounted on said base stand with the lower end of said reservoir in immediate proximity to said heating means;

said base stand having a generally cylindrical configuration interrupted by inwardly extending vertical walls defining a vertical dispensing chamber for receiving receptacles to be filled;

said dispensing chamber freely receiving said dispensing valve assembly;

said dispensing valve assembly including a discharge spout positioned in the upper portion of said dispensing chamber;

said reservoir having an open top;

split lid means closing said reservoir and comprising a major section and a minor section; and

motor driven rotary impeller means removably mounted in said major section of said split lid means;

said impeller means extending into close proximity with the bottom of said reservoir and imparting upward thrust to soup and solid particles entrained therein when said reservoir contains soup to be dispensed to preclude settling of solid particles in said reservoir; and

said minor section of said lid means being freely removable independently of said major portion to provide access to said reservoir without removing said impeller means;

wherein said base stand includes an internal shelf positioned adjacent the top thereof and the bottom of said reservoir; and

wherein said heating and control means comprises: at least one heating element mounted on said shelf,

biasing means mounting said heating element on said shelf and constraining said heating element into positive engagement with the bottom of said reservoir, and

thermostat means for controlling said heating element and the temperature of said reservoir mounted adjacent the latter on said shelf and in close proximity to the bottom of said reservoir.

4,032,046

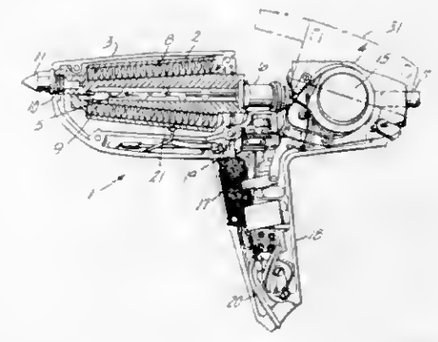
APPARATUS FOR FEEDING GLUE TO A HOT MELT GLUE DISPENSING APPLIANCE

Richard Montgomery Elliott; Albert Eugene Newtoo, both of Beverly, and John Sherburne Kelley, Wenham, all of Mass., assignors to USM Corporation, Boston, Mass.

Filed Nov. 1, 1976, Ser. No. 737,565

Int. Cl.² B67D *5/62*

U.S. Cl. 222—146 HE **7 Claims**



1. In an appliance having a heated melt chamber constructed within the appliance housing, the chamber adapted to receive a flexible rod of thermally activatable glue, to melt the rod of glue, and to intermittently dispense melted glue therefrom; apparatus to feed said flexible rod of glue to the melt chamber comprising:

A. a mounting frame secured within the appliance housing for sliding movement towards and away from the melt chamber, said movement being biased away from the melt chamber;

B. power driven means mounted on the frame to engage the rod of glue and urge it towards the melt chamber;

C. an actuating lever pivotally secured on the appliance housing and operatively connected to the mounting frame to move the frame towards the melt chamber and to feed the rod of glue into the chamber when the lever is operated, said frame and rod of glue being retracted upon release of the actuating lever; and

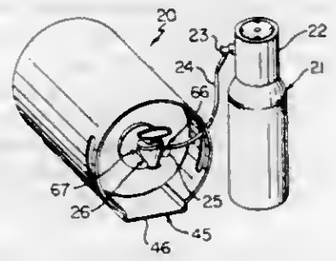
D. a switch operatively connected to the actuating lever and to the engaging means to energize said means upon operation of the actuating lever.

4,032,047

LIQUID DISPENSING CONTAINER CONSTRUCTION

Calvin L. Wilson, Richmond, Va., assignor to Reynolds Metals Company, Richmond, Va.

Continuation of Ser. No. 550,979, Feb. 19, 1975, abandoned.
This application May 5, 1976, Ser. No. 683,411
Int. Cl.² B67D 5/64
U.S. Cl. 222—183 17 Claims



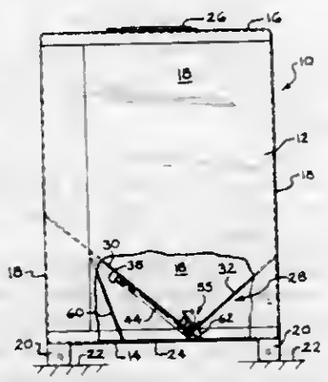
1. A dispensing container construction for a liquid under gaseous pressure comprising, a housing defining a product chamber for said liquid, said housing comprising a cylindrical central portion and a pair of outwardly convex end portions, a spigot device carried by one of said end portions for dispensing said liquid from within said chamber, a closeable filler device for said chamber provided in the other of said end portions, a protective sleeve disposed around said housing and said devices, said sleeve having opposed end edges each arranged outwardly of its associated device and each for supporting said container construction, said end edges defining the axial length of said sleeve therebetween and said sleeve having a uniform single thickness throughout its entire axial length, said sleeve having an identical peripheral outline at each cross section along said length, said sleeve being a tubular single piece sleeve having integral anti-roll means, said anti-roll means being a bottom trough provided as a portion of said single piece sleeve and extending the full length thereof, said trough having a bottom which has a substantially planar bottom supporting surface said trough serving to collect any liquid dripping from said spigot device, said cylindrical central portion of said housing having its entire lower periphery disposed within said trough adjacent said bottom, and means holding said sleeve and housing together.

4,032,048

BIN WITH INTERNAL SLOPING WALLS

Dwight E. Nichols, Beatrice, Nebr., assignor to Hoover Ball and Bearing Company, Saline, Mich.

Filed Dec. 29, 1975, Ser. No. 644,591
Int. Cl.² B67D 5/06
U.S. Cl. 222—185 2 Claims



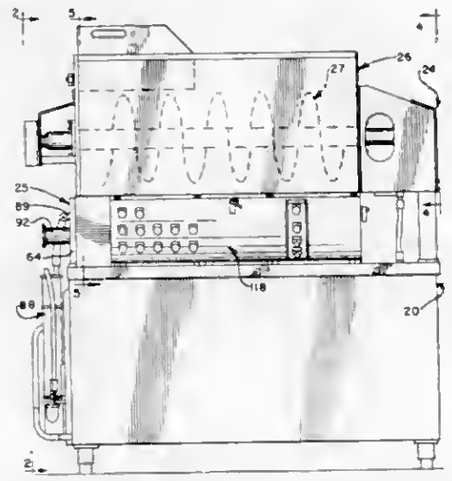
1. A bin for storing and transporting bulk material comprising a bin body having a generally horizontal bottom wall having a discharge opening formed therein, a top wall, side walls extending between said top and bottom walls, and body support legs on said bottom wall, an internal hopper assembly in said body below said top wall consisting of two inclined walls arranged in a generally V-formation for directing all bulk material in said body toward said discharge opening, each of said internal walls having the upper end thereof secured to one of said side walls at a position substantially above said bottom wall and having the lower end thereof located adjacent to and above said bottom wall, means in one of said internal walls forming a feed opening located directly above said discharge opening so that bulk material flowing downwardly in said bin through said feed opening will fall through said discharge opening, a door member pivotally mounted on the underside of said one internal wall for movement between closed and open positions with respect to said feed opening, said door member in the open position thereof extending downwardly through said discharge opening, and coacting releasable latch means on said door member and said one internal wall operable to secure said door in said closed position relative to said feed opening.

4,032,049

FOOD PRODUCT STUFFING PUMP WITH VACUUM LINE

Gary F. Roberts, East Moline, Ill., assignor to The Kartridg Pak Co., Davenport, Iowa

Filed Aug. 18, 1975, Ser. No. 605,609
Int. Cl.² A22C 11/08; G01F 11/20
U.S. Cl. 222—238 14 Claims



1. A stuffing pump for handling a food product comprising a helical gear metering pump having a single outlet passage and dual inlet passages, first means for driving said metering pump at variable speed; vacuum means connected to the metering pump to remove air from the food product, an elongated hopper above the metering pump for receiving food product, a feed conveyer in the bottom of the hopper feeding food product to the inlet passages of the metering pump at a rate faster than the intake capacity of said metering pump, and second means for driving said conveyer at variable speed.

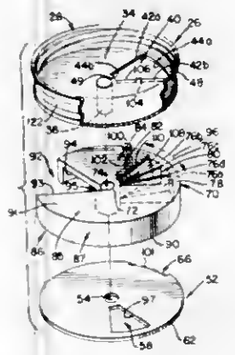
4,032,050

MEASURING CLOSURE FOR CONTAINERS

Richard J. Funk, 344 N. Mulberry, Lancaster, Pa. 17603

Filed Feb. 19, 1976, Ser. No. 659,470
Int. Cl.² G01F 11/06
U.S. Cl. 222—284 1 Claim

1. A measuring and dispensing closure formed of plastic materials for a container or the like, comprising:
a container lid member attachable to the container for readily covering and uncovering the container, said lid having a center post extending outardly therefrom, a dispensing slot defined therein for dispensing material from the container, and screw threads for cooperating with screw threads on the container to selectively attach and detach said lid from the container;
a dispensing wedge rotatably attached to said center post and having a plurality of walls, two of which walls define therebetween a material measuring chamber for receiving material from the container via said lid dispensing slot when said measuring chamber and said lid dispensing slot are aligned, a chamfered portion on one wall of said material measuring chamber adjacent said lid for passing said material thereover into said chamber, and two of which walls have attached thereto a sealing means which is essentially imperforate to seal said lid dispensing slot when said sealing means is oriented to cover said lid dispensing slot when said dispensing slot is not in use to effect an essentially air-tight seal of the container, and further ones of said walls in said measuring chamber dividing that chamber into thirds for dispensing a measured amount of material which is less than that amount



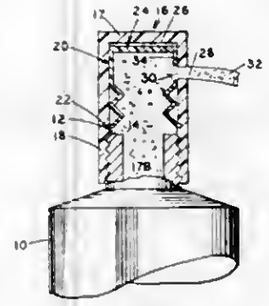
dispensed by a full chamber, and a housing on said dispending wedge having a floor and a skirt attached to said floor, said floor and said skirt contacting said lid, said floor having defined therein a slot and said dispensing wedge being attached to a hub having a cutout portion aligned with said slot for receiving said center post therein; and
an outer top member fixedly secured to said center post and having a measured dispensing slot defined therein and adjustment means thereon for adjusting the amount of material dispensed from said material chamber, said measured material dispensing slot being positioned to cooperate with said dispensing wedge material measuring chamber to dispense material from said chamber for ultimately dispensing a measured amount of material from the container.

4,032,051

SELF SEALING CAP FOR A COLLAPSIBLE TUBE

James V. Testa, 31 Carlton Terrace, Bloomfield, N.J. 07003

Filed Dec. 23, 1975, Ser. No. 643,785
Int. Cl.² B65D 25/40
U.S. Cl. 222—492 2 Claims



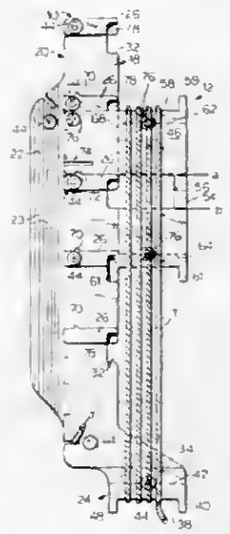
1. A dispensing cap for providing a flow of cream from a delivery opening in the neck of a collapsible tube, comprising:
a cylindrical shell open at a bottom end adapted for connection to said neck, said shell having a dispensing hole therethrough in a sidewall thereof;
a contractible and expandible bellows located wholly within the interior of said shell having an open end connected to the interior of said shell to receive a flow of cream from said bottom and into said open end, said bellows having a feed hole therethrough which is in alignment with said dispensing hole in said shell in response to a pressure being applied to said tube whereby said bellows is expanded and cream flows through said delivery opening, said feed hole and said dispensing hole,
said bellows including an axially movable sealing segment within the interior of said shell which covers said dispensing hole in response to said bellows being contracted upon cessation of pressure being applied to said tube.

4,032,052

FRINGE AND TASSEL MAKER

Hamilton Canfield Bates, Jr., Chester, Conn., assignor to C. J. Bates & Son, Inc., Chester, Conn.

Filed Aug. 9, 1976, Ser. No. 712,486
Int. Cl.² A41H 43/00
U.S. Cl. 223—46 4 Claims



1. A fringe and tassal maker comprising, a base member having a winding and cutting abutment at one end thereof and having a slide member releasably fixed thereto, the slide member having a pair of winding surfaces and a pair of cutting areas thereon, the winding and cutting abutment having a winding surface and a cutting area thereon, and the slide member being selectively positionable along and relative to the base member for providing different lengths of fringes and tassels obtained by winding yarn around selected ones of the winding surfaces and cutting the yarn at selected ones of the cutting areas.

4,032,053

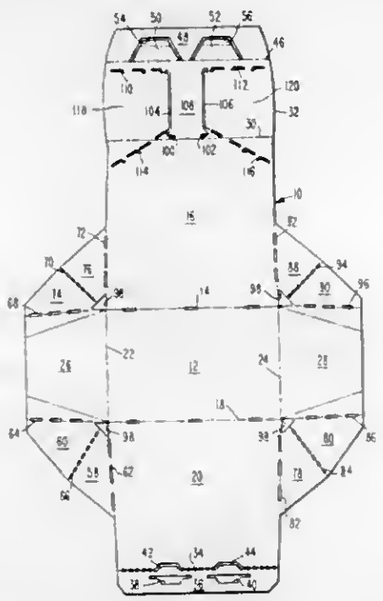
ARTICLE CARRIER WITH HANDLE FEATURE

Jerry F. Wilson, Monroe, La., assignor to Olinkraft, Inc., West Monroe, La.

Filed June 30, 1976, Ser. No. 701,274
Int. Cl.² A45C 11/24
U.S. Cl. 224—45 AB 1 Claim

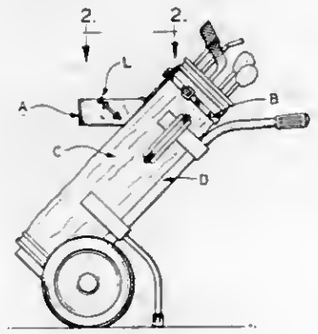
1. An article carrier comprising
a bottom panel with two sides and two ends,
a side panel upstanding from each side of the bottom panel,
end panel means extending across the ends of the carrier for retaining the articles in the carrier,
a top panel extending between the side panels and having two ends, a scoreline connecting the top panel to a first one of the side panels, locking flap means connecting the top panel to a second one of the side panels,
a pair of transverse handle die-cuts formed in the top panel,
a pair of rip guide die-cuts for each handle die-cut extending

from the respective handle die-cut to one of the ends of the carrier, and
a handle portion defined between the handle die-cuts,
a first one of each pair of rip guide die-cuts extending at a



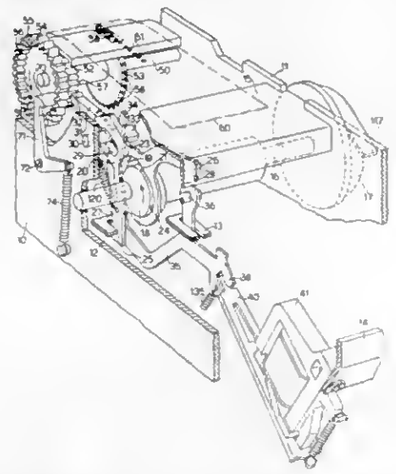
diagonal angle so that it extends onto the first one of the side panels,
a second one of each pair of rip guide die-cuts extending straight from the respective handle die-cut to the end of the top panel.

4,032,054
GOLF ARTICLE CARRIER
Norman E. Duncan, 713 Wesley Drive, Park Ridge, Ill. 60068
Filed Aug. 14, 1975, Ser. No. 604,594
Int. Cl.² B60R *11/00*
U.S. Cl. 224—29 B **7 Claims**



1. In an article carrier adapted to be detachably secured to a golf bag, the combination of:
a. a bottom wall, front and rear end walls, and opposed side walls interconnected to form a tray-like receptacle open at the top;
b. said rear wall sloping rearwardly and upwardly from said bottom wall at an angle of between 90° and 180°, so that when said carrier is attached to a golf bag which is disposed in an inclined position, said bottom wall will be disposed in a substantially horizontal position;
c. said rear wall including an upper portion extending a substantial distance above said side walls and including means for detachably securing said carrier to said golf bag;
d. a sloping transverse wall member extending between said side walls and projecting upwardly and inwardly from said rear end wall in spaced relation with said bottom wall.

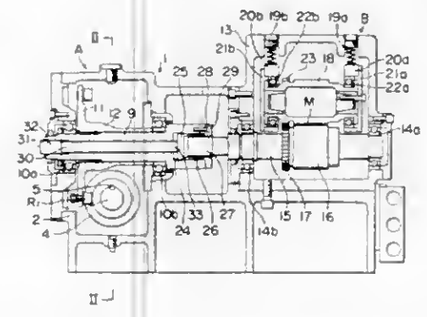
4,032,055
FEED DEVICE FOR TAPE PERFORATORS
Armando Costa, Ivrea (Turin), Italy, assignor to Ing. C. Olivetti & C., S.p.A. and Ufficio Brevetti, both of Turin, Italy
Filed Apr. 9, 1976, Ser. No. 675,368
Claims priority, application Italy, Apr. 18, 1975, 67985/75
Int. Cl.² B65H *17/40*
U.S. Cl. 226—76 **3 Claims**



1. A tape feeding apparatus for perforators or readers of a punched tape, comprising:
a frame;
a supporting shaft rotatably mounted to said frame;
a sprocket pulley mounted on said supporting shaft for rotation therewith for advancing the tape;
a first lever pivotally mounted to the frame and having a first and a second slot and a tab on one end thereof, said second slot disposed between said first slot and said one end;
a guiding element fixed to said frame and in cooperative engagement with said second slot;
a saw toothed pulley integral with said sprocket pulley and coactive with said first lever to be jogged by said tab;
spring means connecting said first lever to said frame, said spring means urging said tab into positive contact with a tooth of said saw toothed pulley; to effect the rotation of said saw toothed pulley; and
a circular cam rotatably mounted inside said first slot and acting positively in only one sense on said first lever in opposition to said spring means, to withdraw said tab from said saw toothed pulley and to impart to said one end movement along a substantially circular path, wherein in a first arc of said circular path said tab is moved away from a contacted tooth, in a second arc of said path, said tab is spaced away from the contacted tooth of said toothed pulley, and in a third arc of said path said tab returns towards the next tooth of said toothed pulley.

4,032,056
ROLL FEEDER DEVICE FOR PRESS WORKS
Sakumatsu Ito, 112 Daijoujijimonyama-cho, Kaga, Ichikawa, Japan
Filed Sept. 23, 1975, Ser. No. 616,014
Int. Cl.² B65H *17/22*
U.S. Cl. 226—154 **4 Claims**

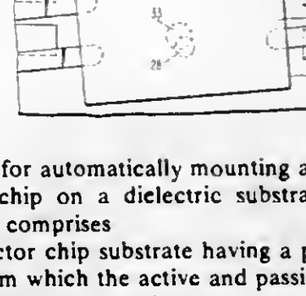
1. A roller-type feed device for press works, comprising:
a roll feed mechanism having
a driving feed roll means,
a driven feed roll means,
gear means drivingly connecting the driving feed roll means to the driven feed roll means,
the driving feed roll means and the driven feed roll means being in spaced relation such that they will frictionally engage a material to be fed between them and feed the same due to rotation of the driving and driven feed roll means;
a motion transmission mechanism having
a main drive shaft associated with and driven by a crank shaft in the press works,
a barrel cam mounted on the main drive shaft for rotation therewith,
an index means mounted for rotation and in driven engagement with the barrel cam,
the barrel cam having at least one groove in the surface thereof a portion of which is a sine-curve groove such that will produce constant velocity rotation of the index means and another portion of which is a rectilinear groove such that will produce no rotational motion of the index means;
the driven feed roll means of the roll feed mechanism being in driven engagement with the index means whereby movement of the index means causes movement of the driving feed roll means so as to feed the material between the driving feed roll means and the driven feed roll means at predetermined intervals;
the driving feed roll means including:
a driving feed roll shaft mounted for axial rotation,



a driving feed roll mounted on the driving feed roll shaft for rotation therewith;
the driven feed roll means includes:
a driven feed roll mounted for axial rotation and for axial translation in a plane containing the axis of the driving feed roll shaft,
spring means biasing the driven feed roll towards the driving feed roll;
the gear means includes:
a driving gear secured to the driving feed roll shaft for rotation therewith,
a driven gear secured to the driven feed roll and in driven engagement with the driving gear;
the main drive shaft is connected to the press works drive shaft through an endless belt means;
the index means includes:
a circular index plate mounted for rotation about the central axis thereof,
a plurality of rollers mounted on one side of the index plate equidistant from the axis of rotation thereof and engageble with the grooves in the barrel cam;
the index plate being connected to the driving feed roll shaft so as to cause rotation thereof when the index plate is rotated by the barrel cam.

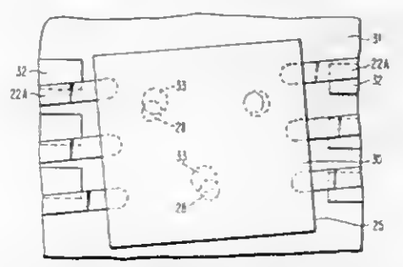
4,032,057
BRAZING CLIP
Phillip S. Linscott, Jr., Rockford, Ill., assignor to Sundstrand Corporation, Rockford, Ill.
Filed Mar. 18, 1976, Ser. No. 667,931
Int. Cl.² B23K *1/04, 35/14*
U.S. Cl. 228—56 **11 Claims**

1. A brazing clip for use in brazing two wires and a spacer element together wherein the brazing clip is maintained in a predetermined position between the wires and with respect to the spacer element during the brazing operation, wherein the brazing clip comprises:
a first leg suitable for inserting between a first wire and the spacer element;
a second leg suitable for insertion between a second wire and the spacer element;
a first retaining portion secured to one end of said first leg and configured to abut a first side of said first wire;



a second retaining portion secured to one end of said second leg and configured to abut a first side of said second wire; and
a connecting crosspiece secured to the other end of said first leg and the other end of said second leg wherein said crosspiece is configured with an end portion abuttable with a second side of said second wire effective to retain the brazing clip in the predetermined position during a brazing operation.

4,032,058
BEAM-LEAD INTEGRATED CIRCUIT STRUCTURE AND METHOD FOR MAKING THE SAME INCLUDING AUTOMATIC REGISTRATION OF BEAM-LEADS WITH CORRESPONDING DIELECTRIC SUBSTRATE LEADS
Jacob Riseman, Poughkeepsie, N.Y., assignor to IBM Corporation, Armonk, N.Y.
Division of Ser. No. 566,570, April 9, 1975, Pat. No. 3,997,963, which is a division of Ser. No. 375,296, June 29, 1973, Pat. No. 3,893,156. This application July 30, 1976, Ser. No. 710,054
Int. Cl.² H01L *21/60*
U.S. Cl. 228—180 A **8 Claims**



1. A method for automatically mounting a beam-lead integrated circuit chip on a dielectric substrate wherein said beam-lead chip comprises
a semiconductor chip substrate having a passivated planar surface from which the active and passive devices in the circuit extend into the substrate,
a plurality of peripheral beam-leads interconnected with the circuit devices extending beyond the periphery of the chip, and
a plurality of solder mounds having a lower melting point than said beam-leads extending from said surface to a plane further from said surface than the plane of said beam-leads, and
said dielectric substrate comprises
a metallic land pattern formed on a surface of said substrate,
a plurality of land leads extending from said conductive

land pattern on said substrate disposed so as to correspond with said plurality of beam-leads, and

a plurality of solder-wettable land pads on said non-wettable dielectric substrate disposed so as to correspond to said plurality of solder mounds,

which method comprises the steps of

placing the chip on the substrate so that said plurality of solder mounds are respectively in registration with said plurality of land pads,

heating the structure to melt the solder mounds whereby said solder mounds selectively wet the corresponding land pads to bring the plurality of beam-leads respectively into registration with said plurality of corresponding land leads, and

cooling the structure to solidify said solder mounds to thereby fix said registration.

4,032,059

METHOD USING A SOLDERING ALLOY FOR CONNECTING PARTS OF WHICH AT LEAST SOME ARE MADE OF ALUMINIUM

Alain Edouard Piegat, Asnieres, France, assignor to Societe Anonyme des Usines Chausson, Asnieres, France

Division of Ser. No. 566,991, April 11, 1975, Pat. No. 3,969,110. This application Mar. 26, 1976, Ser. No. 670,846
Claims priority, application France, Mar. 28, 1975, 75.13565
Int. Cl.² B23K *35/26*
U.S. Cl. 228—183 **4 Claims**

1. A method of soldering parts of which at least one is made of aluminum or aluminum alloy, comprising the steps of:

fluxing the parts to be connected together by means of an organic flux;

covering at least said fluxed portions with a soldering alloy comprising

65–85% lead by weight

12–30% cadmium by weight

1–6% antimony by weight

0.5–1% tin by weight;

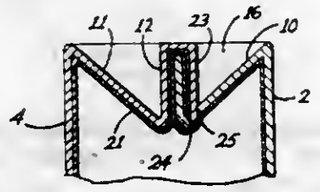
heating said portions up to the liquidus temperature of the soldering alloy while holding said portions together; and cooling down to ambient temperature.

4,032,060

CARTON WITH SELF-SEALING RECLOSABLE END CLOSURE

Frank D. Bergstein, Cincinnati, Ohio, assignor to Bergstein Packaging Trust, Middletown, Ohio

Filed Dec. 24, 1975, Ser. No. 644,303
Int. Cl.² B65D *5/46, 5/56*
U.S. Cl. 229—14 BA **9 Claims**



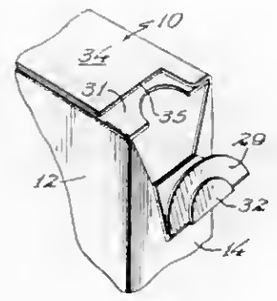
1. In a rectangular carton having opposing side and end walls forming a carton body, a self-sealing reclosable end closure comprising a pair of opposing end closure flaps hingedly connected to the end edges of the carton side walls, said end closure flaps having a width somewhat greater than one-half the width of the carton end walls, a pair of mating sealing flaps hingedly connected to the outermost side edges of said pair of end closure flaps, a flap extension hingedly connected to the outer side edge of one of said sealing flaps, and a tubular liner in said carton body, the mouth of said liner projecting from said carton body to overlie said flap extension, the mouth of said liner having its opposite sides secured to said sealing flaps, said sealing flaps being juxtaposed in face-to-face parallel relation to the carton side walls with portions of the liner mouth sandwiched therebetween, said sealing flaps and the projecting end of the liner being jointly displaceable downwardly to lie within the confines of the carton body and with said opposing pair of closure flaps extending downwardly and inwardly within the carton to bias the sealing flaps and the portions of the liner mouth secured thereto into engagement with each other, said flap extension and the portion of the liner mouth overlying said flap extension being jointly foldable over the upper edge of the other of said sealing flaps, and attachment means for securing said flap extension in its folded position.

4,032,061

POUR SPOUT

Daniel P. Dutcher, Shoreview, and Edwin C. McLaren, Apple Valley, both of Minn., assignors to Hoerner Waldorf Corporation, St. Paul, Minn.

Filed Apr. 12, 1976, Ser. No. 675,769
Int. Cl.² B65D *5/72*
U.S. Cl. 229—17 R **1 Claim**



1. A rectangular, tube like carton having bottom closure flaps and a top closure, said top closure including an improved reclosable pour spout, said closure and spout comprising:

an insertable tab hingedly attached to a first side wall panel of said carton and foldable inwardly along with a minor closure flap on the opposite side wall panel;

a section of said first side wall panel adjacent said insertable tab hingedly connected to said tab and having a pair of laterally spaced-apart frangible score lines connected along their bottom ends by a horizontal fold line to define a spout opening;

a first folded major flap contacting the top surface of said tab;

said first folded major flap having a removable section formed therein and defined by a frangible score line, said section in said flap positioned above and adhered to said tab; and

an outer major flap positioned above said first folded major flap and adhered thereto except in the area adjacent to said tab so that said tab and said removable section are insertable between the edges of said major flaps to reclose said spout opening.

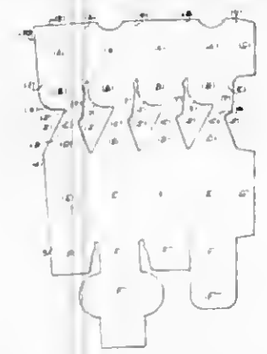
4,032,062

BOX AND METHOD OF MAKING THE SAME

Minoro Kawai, and Kenji Moramatsu, both of Tokyo, Japan

Filed Feb. 9, 1976, Ser. No. 656,737
Int. Cl.² B65D *5/38, 85/10*
U.S. Cl. 229—20 **7 Claims**

1. A polygonal box formed from a sheet of paperboard or the like, comprising a plurality of panels corresponding in number to the number of sides of said box, each of said panels comprising in combination an outer face, an outer cover portion, an inner cover portion, , a connecting piece, , an inner face and a bottom portion, said portions being connected together in the order named, said outer cover portion being provided on a first side with a protruding lobe adapted to cooperate in overlapping relation with similar lobes on other outer cover portions, to form a closure for the top of said box, and on a second side opposite said first side with a tuck piece connecting said outer cover portion with said inner



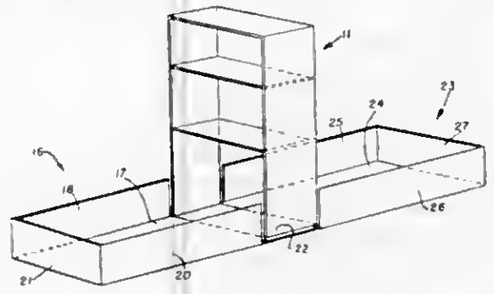
cover portion, said inner cover portion and said connecting piece being shaped to define a notched aperture effective to provide clearance between the edges of said tuck piece on the one hand and the flat surfaces of said inner cover portion and connecting piece on the other hand, during the operations of opening and closing said package.

4,032,063

RETURNABLE SHIPPING BOX FOR FURNITURE

Phillip J. Davis, and M. Vincent Sanderford, both of Morganton, N.C., assignors to Champion International Corporation, Stamford, Conn.

Filed Oct. 2, 1975, Ser. No. 618,919
Int. Cl.² B65D *5/35, 85/00*
U.S. Cl. 229—23 C **4 Claims**



1. A returnable shipping box for furniture comprising:

a. a wooden planar base having a top and bottom surface and a pair of opposed side edges for supporting a piece of furniture on said top surface;

b. a first foldable portion comprising a plurality of base flaps attached to the bottom surface about said side edges of said base, and a front panel for engaging the front portion of a furniture piece, said front panel joined by side and top members which slidably engage the sides and top of the furniture piece when folded to form a closed box;

c. a second foldable portion including a plurality of base flaps attached to the bottom surface about said side edges of said base and a back panel for engaging the back portion of the furniture piece, said back panel joined by side and top members which slidably engage the sides and top of the first foldable portion when folded to form a closed box, the base laps of said first and second foldable portions defining a marginal area around said base when said base flaps are attached to said base, said marginal area including a portion of the base flaps of said first and second foldable portions overlying the opposed side edges of said base whereby said marginal area can be slit with the side edges of said base serving as a backing member for a slitting device so that said first and second portions can be pivoted relative to each other to an open position to expose the furniture piece within said box and can be repivoted to a closed position to reseal said box; and

d. plural tapes holding the first and second foldable portions in their closed positions.

4,032,064

BARRIER BAG ASSEMBLY FOR AEROSOL CONTAINER

Earl D. Giggard, Clarendon Hills, Ill., assignor to The Continental Group, Inc., New York, N.Y.

Filed Jan. 5, 1976, Ser. No. 646,458
Int. Cl.² B65D *33/02*
U.S. Cl. 229—55 **9 Claims**

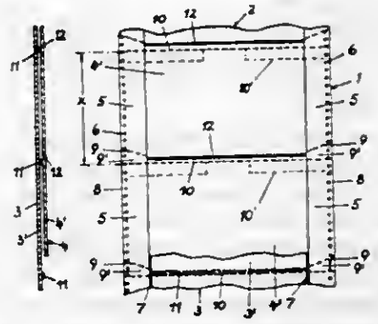
1. A plastic bag for an aerosol container comprising a generally cylindrical collapsible body and top and bottom end members, and means on said bottom member for resisting collapse of the bottom member upon the imposition of pressure on the body and bottom member, said body having portions adapted to fold in radially and the top end member of said bag being generally frusto conical and having an upper neck portion and gradually becoming thinner toward its juncture with the upper end of the body portion and being collapsible therewith inwardly.

4,032,065

FILE FOLDER WEB OF INDETERMINATE LENGTH

Egon Heimann, Falkenberg 61, D-56 Wuppertal-Elberfeld, Germany

Filed Apr. 1, 1975, Ser. No. 564,219
Claims priority, application Germany, Apr. 3, 1974, 2416247; Dec. 18, 1974, 2459741
Int. Cl.² B65D *27/10*
U.S. Cl. 229—69 **19 Claims**

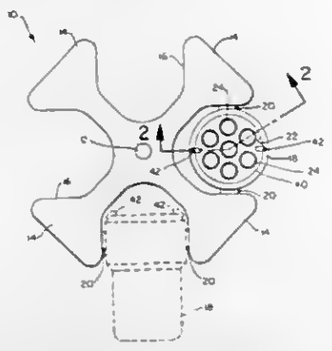


1. A file folder web of indeterminate length formed of a series of interconnected individual file folders each having a length and a width, comprising in combination:

a. upper and lower sheets of indeterminate length arranged face-to-face and constituting, respectively, a front and a rear cover wall of each individual file folder;

b. main weakened lines provided in said sheets and extending along and through the length of each file folder;
c. a strip of adhesive extending between said sheets along the length of each file folder adjacent the main weakened line along one longitudinal edge of each file folder for bonding together said sheets; said strip of adhesive being the sole strip of adhesive in each individual file folder; and
d. a fold line extending in one of said sheets parallel to and adjacent said main weakened lines; said strip of adhesive extending between the main weakened line along said longitudinal edge and said fold line.

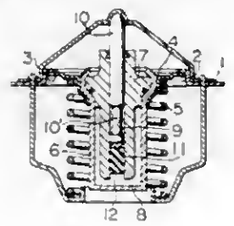
4,032,066
ADAPTERS FOR CENTRIFUGE ROTORS
Herschel Eugene Wright, Santa Clara, Calif., assignor to Beckman Instruments, Inc., Fullerton, Calif.
Filed Mar. 15, 1976, Ser. No. 666,987
Int. Cl.² B04B 5/02
U.S. Cl. 233—26 **14 Claims**

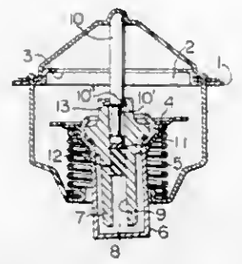


1. An adapter assembly for use within a centrifuge rotor to convert a single cell receptacle within said rotor to a multi-cell receptacle for receipt of a plurality of sample carrying holders, said assembly comprising a plurality of adapter sections positioned adjacent to each other in a stacked relation within said single cell receptacle, each of said adapter sections having at least two holes for alignment with similar holes in adjacent adapter sections to form said multi-cell receptacle, said plurality of adapter sections being variable in number to provide adjustment to the desired depth of said adapter assembly within said rotor to establish substantially the same depth in said adapter assembly as the depth of any of a number of various sized sample carrying holders.

4,032,067
THERMOSTAT VALVE
Masanori Hanaoka, Toyota, and Masao Inagaki, Okazaki, both of Japan, assignors to Toyota Jidosha Kogyo Kabushiki Kaisha, Toyota, Japan
Filed Dec. 11, 1975, Ser. No. 639,973
Claims priority, application Japan, Aug. 4, 1975, 50-107963
Int. Cl.² F01P 7/02
U.S. Cl. 236—34.5 **2 Claims**

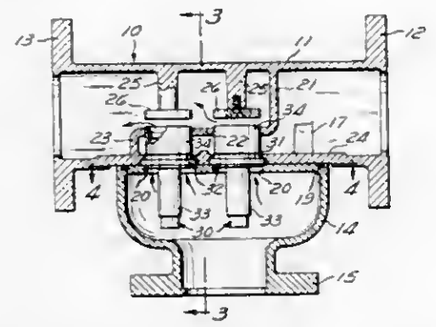
1. A thermostat valve comprising a housing having a valve seat portion which defines a valve port, first and second supporting frame portions provided at opposite sides of said valve seat portion, a valve member adapted to cooperate with said valve seat portion to selectively open and close said valve port, a casing member provided with a centrally disposed cylindrical bore, said casing member containing a thermally expandable material therein, said centrally disposed cylindrical bore communicating with said thermally expandable material and carrying said valve member, a coil spring which elastically and slightly, tiltably supports said casing member against said first supporting frame portion in a manner so that said valve member carried by said casing member is elastically engageable onto said valve seat portion, and a needle member having one end portion thereof disposed in said bore so as to be slideable therealong and adapted to be driven out of said bore by said thermally expandable material in accordance with the thermal expansion thereof, the other end portion of said needle being pivotably supported by said second supporting frame portion in a manner so that said valve member carried by said casing member is adapted to be moved away from said valve seat portion under the reaction applied by said needle member





driven out of said bore due to the thermal expansion of said thermally expandable material, wherein a shoulder portion is formed in a part of said needle member disposed in said bore by reducing a part of said needle member, said shoulder portion being adapted to engage with an outer edge of said bore when said needle has been driven out of said bore beyond a predetermined distance.

4,032,068
THERMOSTATIC VALVE
Russell O. Luchtenberg, Hebron, and James P. Buchwald, Mount Vernon, both of Ohio, assignors to Thermo Valve Corporation, Mount Vernon, Ohio
Filed Apr. 8, 1975, Ser. No. 566,101
Int. Cl.² F01P 7/02
U.S. Cl. 236—34.5 **10 Claims**



1. In a thermostatic valve utilizing stock temperature-responsive valve element means comprised of a stem, a ring seat carried by the stem, and a skirted hollow head movable by a temperature-responsive element from a closed position on said ring seat to an open position, a main valve body provided with alternate outlet openings, a partition within said main valve body separating a first cavity within said body which leads to one outlet opening from a second cavity which leads to an alternate outlet opening, openings in said valve body and said partition to receive the skirted head of the stock valve

element means, means for removably holding said valve element means in said main body, spaced means to close said skirted head when it is moved axially from the ring seat, and inlet nozzle means for directing fluid to said valve elements, the stem of said valve element being offset from the axis of said inlet nozzle means, whereby fluid entering said inlet means is diverted to the offset stem of said valve element means and said fluid may pass either between said ring seat to one of said body outlets, or through the skirted head to an alternate body outlet, or simultaneously to both outlets, depending upon the position of said skirted head, and means for disconnecting at least a portion of said inlet means from said main valve body to provide access for inspection of said valve element means.

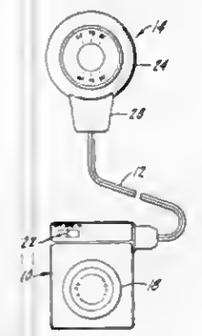
DAY-NIGHT PROGRAMMABLE THERMOSTAT
Joseph L. Cannella, Arlington Heights, Ill., assignor to Candel, Inc., Arlington Heights, Ill.
Continuation of Ser. No. 582,627, June 2, 1975, abandoned.
This application Aug. 18, 1976, Ser. No. 715,440
Int. Cl.² G05D 23/30
U.S. Cl. 236—46 R **1 Claim**



1. The combination with a thermostat having air temperature sensing means, a one-piece replaceable cover member positioned upon the thermostat and including a downwardly extending portion, a resistive heat source attached to and within said downwardly extending portion of the cover and positioned adjacent said temperature sensing means, a timer physically separated from the thermostat, cover and resistive heat source and having a power cord extending therefrom to be electrically connected to said resistive heat source and having a pair of terminals to be connected to a source of electric power, a transformer within said timer and electrically connected between said timer and resistive heat source for reducing the voltage from the source of power applied to said resistive heat source, a switch at said timer for controlling the application of power to said resistive heat source, and a resistor connected in parallel with said resistive heat source and physically located at said timer, said timer controlling the application of power to said resistive heat source which in turn affects the temperature of air immediately adjacent said thermostat temperature sensing means to control operation of said thermostat.

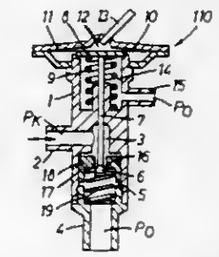
THERMOSTATIC EXPANSION VALVE FOR REFRIGERATION INSTALLATIONS
Leif Nielsen, Nordborg, Denmark, assignor to Danfoss A/S, Nordborg, Denmark
Continuation of Ser. No. 495,384, Aug. 7, 1974, abandoned.
This application Sept. 2, 1975, Ser. No. 609,608
Int. Cl.² F25B 41/04
U.S. Cl. 236—92 B **1 Claim**

1. A thermostatic expansion valve assembly for a refrigeration installation of the type having condenser and evaporator units, comprising, a housing, a condenser inlet port and an evaporator outlet port in said housing, an operating unit having a chamber pressure responsive to the superheat temperature of said evaporator unit, valve means between said ports including a piston and a cylinder with said piston being reciprocally mounted in said cylinder, a central opening in said piston forming a movable valve seat carried by said piston, said operating unit including a centrally disposed rod extending through said piston opening, said valve means including a closure member attached to the lower end of said rod which is cooperable with said valve seat, spring means biasing said



piston in an upstream valve opening direction, said piston pressure biasable by condenser pressure in a downstream valve closing direction, said operating unit being operable to move said rod and closure member thereof in a valve opening direction, said spring means having a characteristic curve relative to a range of values of said condenser pressure to maintain a flow quantity through said valve means over said range of condenser pressure values which corresponds only to said operating unit chamber pressure.
